DESCRIPTION OF THE PREFERRED EMBODIMENTS

The compounds of the invention having the structural formula III may be readily prepared by treating a corresponding compound having the structural formula IV or V with the desired cyclic amine VIa, VIb, or VIc. For purposes of this reaction, the alkylamine substituent c of Compound VIa, VIb, or VIc may, if desired, be protected by a group which renders it substantially inert to the reaction conditions. Thus, for example, protecting groups such as the following may be utilized:

carboxylic acyl groups such as formyl, acetyl, trifluoroacetyl;
alkoxycarbonyl groups such as ethoxycarbonyl, \( \delta - \)butoxycarbonyl, \( \delta , \delta , \delta - \)trichloroethoxycarbonyl, \( \delta - \)iodoethoxycarbonyl;
aryloxycarbonyl groups such as benzylxycarbonyl, \( p - \)methoxybenzylxycarbonyl, phenoxy carbonyl;
silyl groups such as trimethylsilyl; and groups such as trityl, tetrahydropyranyl, vinylxycarbonyl, \( o - \)nitrophenylsulfenyl, diphenylphosphinyl,
p-toluenesulfonyl, and benzyl, may all be utilized. The protecting group may be removed, after the reaction between Compound IV or V and Compound VIa, VIb, or VIc if desired, by procedures known to those skilled in the art. For example, the ethoxycarbonyl group may be removed by acid or base hydrolysis and the trityl group may be removed by hydrogenolysis.

The reaction between the compound of structural formula IV or V and a suitably protected compound of formula VIa, VIb, and VIc may be performed with or without a solvent, preferably at elevated temperature for a sufficient time so that the reaction is substantially complete. The reaction is preferably carried out in the presence of an acid acceptor such as an alkali metal or alkaline earth metal carbonate or bicarbonate, a tertiary amine such as triethylamine, pyridine, or picoline. Alternatively an excess of the compound of formula VI may be utilized as the acid acceptor.

Convenient solvents for this reaction are non-reactive solvents such as acetonitrile, tetra-hydrofuran, ethanol, chloroform, dimethylsulfoxide, dimethylformamide, pyridine, picoline, water, and the like. Solvent mixtures may also be utilized.

Convenient reaction temperatures are in the range of from about 20° to about 150°C; higher temperatures usually require shorter reaction times.

The removal of the protecting group R₄ may be accomplished either before or after isolating the product, III. Alternatively, the protecting group R₄ need not be removed.

The starting compounds having structural formulae IV and V are known in the art. Thus the following compounds are disclosed in the noted reference:
European Patent Application 80 40 1369

European Patent Application 0078362

European Patent 0 000 203 (1979)
British Patent 2,057,440

European Patent Application 81 10 6747
The compounds of the invention having structural formula VIa, VIb, or VIc are either known compounds or they may be prepared from known starting materials by standard procedures or by variations thereof. For example, 3-pyrrolidinemethanamines having the structural formula D

\[
\begin{align*}
\text{N-H} \\
\text{CH}_2\text{NHR}_3
\end{align*}
\]

may be readily prepared from the known starting material methyl 5-oxo-1-(phenylmethyl)-3-10 pyrrolidinecarboxylate, A, [J. Org. Chem., 26, 1519 (1961)] by the following reaction sequence.

\[
\begin{align*}
\text{CO}_2\text{CH}_3 & \quad \text{NH}_2\text{R}_3 \\
\text{CH}_2\text{C}_6\text{H}_5 & \quad \text{CONHR}_3 \\
\text{A} & \quad \text{B} \\
\text{CH}_2\text{NHR}_3 & \quad \text{CH}_2\text{NHR}_3 \\
\text{D} & \quad \text{C}
\end{align*}
\]

The compound wherein R3 is hydrogen, namely 3-pyrrolidinemethanamine, has been reported in J. Org. Chem., 26, 4955 (1961).
Thus Compound A may be converted to the corresponding amide B by treatment with \( R_3 \text{NH}_2 \); for example, a saturated solution of ethylamine in an alkanol such as methyl alcohol may be utilized. The diamide B may next be reduced to produce the corresponding diamine C. This reduction may be carried out using lithium aluminum hydride, for example, in a convenient solvent such as tetrahydrofuran. Compound C may next be debenzylated, for example using hydrogen and 20% palladium on carbon catalyst to produce the diamine D. Alternatively, when \( R = H \) in C, the primary amine function may be protected with a group \( R_4 \) as defined, hereinabove. For example, the primary amine function may be acylated with an acyl halide such as acetyl chloride by well known procedures. The primary amine function of C may also be converted to a carbamate ester such as the ethyl ester by treatment with ethyl chloroformate in the presence of a strong base such as 1,8-diazabicyclo[5.4.0]undec-7-ene in a convenient solvent such as methylene chloride. The benzyl group may next be removed, for example as described above for Compound C, thereby producing Compound D where \( R \) is \(-\text{CO}_2\text{Et}\), which after conversion to a compound of the type VIa or VIb may be reacted with a compound having the structural formula IV or V to thereby produce a corresponding compound having the structural formulae I or Ia. The \(-\text{CO}_2\text{Et}\) group may be removed by standard procedures.
Likewise spiroamino compounds represented by structural formula VIb may be readily prepared from the known starting material 3-ethoxycarbonyl-5-oxo-3-pyrroolidineacetic acid ethyl ester [J. Org. Chem., 46, 2757 (1981)] by the following reaction sequence.

\[ \begin{align*}
 E & \xrightarrow{\text{N-R3}} F \\
 C_6H_5CH_2-N & \xrightarrow{\text{N-R3}} H \\
 & \xrightarrow{\text{H-N}} J
\end{align*} \]

The compound 2,7-diazaspiro [4.4]nonane where R3 is H is described in the above reference. Thus Compound E may be converted to the corresponding amide F by treatment with R3NH2, for example, methyl amine in water followed by benzylolation which may be carried out with sodium hydride and benzyl chloride to give G. Reduction to the diamine H may be accomplished with lithium aluminum hydride. Subsequent debenzylation, for example, with hydrogen and 20% palladium on carbon catalyst produces the diamine J.
The invention also relates to a process for preparing compounds of the invention of the formula

\[
R_4R_3N(CR_5R_6)^{n''} \xrightarrow{\text{reacting}} \text{amidine having structural formula}
\]

with an amidine having structural formula

\[
\text{wherein } X, Y, R_1-R_6, \text{ and } n'' \text{ are defined for formula I.}
\]

In addition, the invention also relates to a process for preparing a compound having structural formula
which comprises: a) reacting a compound having the structural formula

with a dihalo ketone of the formula \( \text{Hal-CH}_2\text{-C-5} \) \((\text{CR}_5\text{R}_6)^{n''}\)\text{-Hal} wherein \(X, Y, R, R_2, R_5,\) and \(R_6\) are defined for formula I; \(n''\) is 1 or 2, and \(\text{Hal}\) is any convenient halogen, preferably chlorine, to produce the halomethylthiazole;

b) displacing the halogen atom of \(X\) with an amino group of the formula \(R_3R_4N^-\) or with azide ion;
c) reducing the azide group to produce the compound Ib wherein R3 and R4 are hydrogen; and d) optionally alkylating the primary amino function to produce compounds Ic wherein R3 and/or R4 are alkyl of from one to three carbon atoms.

The final process of this invention is for preparing compounds of the structural formula

\[
\begin{align*}
&\text{Y} \quad \text{CO}_2 \text{R}_1 \\
&\text{X} \quad \text{N} \quad \text{R}_4 \quad \text{R}_3 \\
&\text{N} \quad \text{C} \quad \text{R}_5 \quad \text{R}_6 \\
&\text{R}_2
\end{align*}
\]

Id

which comprises reacting a compound having the structural formula

\[
\begin{align*}
&\text{Y} \quad \text{CO}_2 \text{R}_1 \\
&\text{BrCH}_2 \text{CO}_2 \text{R}_1 \\
&\text{X} \quad \text{N} \quad \text{R}_4 \quad \text{R}_3 \\
&\text{R}_2
\end{align*}
\]

XI

with a thioamide having structural formula XII

\[
\begin{align*}
&\text{H}_2 \text{NC}-(\text{CR}_5 \text{R}_6)_n \quad \text{NR}_3 \text{R}_4
\end{align*}
\]

XII
wherein \( X, Y, R_1-R_6, \) and \( n' \) are defined as in formula I.

The compounds of the invention having structural formula I wherein \( Z \) is

\[
\begin{align*}
\text{XIII} \\
\end{align*}
\]

wherein \( X, Y, R_1-R_6, \) and \( n' \) are defined above.

Thus compound XIII may be treated with \( t \)-butoxy-bis-dimethylaminomethane to give a compound having the structural formula XIV

\[
\begin{align*}
\text{XIV} \\
\end{align*}
\]
This reaction may be carried out by mixing the two reactants in a nonreactive solvent such as dimethylformamide at an elevated temperature.

Compound XIV may then be reacted with any of a variety of substituted amidines having the structural formula

\[
\begin{align*}
\text{NH} \\
\text{H}_2\text{N-C-(CR}_5\text{R}_6)_n\text{NR}_3\text{R}_4
\end{align*}
\]

XV

wherein \( R_1-R_6 \) and \( n'' \) are defined as in formula I to produce the correspondingly substituted pyrimidines. This reaction may be carried out by mixing the two reactants in an inert solvent such as t-butanol in the presence of a base such as potassium t-butoxide at elevated temperature. Variations in these reactions, for example to maximize a particular yield is within the skill of the art.

The compounds of the invention having structural formula I wherein \( Z \) is

\[
\begin{align*}
\text{S} \\
\text{N} \\
\text{(CR}_5\text{R}_6)_n\text{NR}_3\text{R}_4
\end{align*}
\]
may also be prepared from the correspondingly substituted methyl ketone XIII. Thus, compound XIII is first brominated to produce the α-bromoketone, XVI.

\[
\begin{align*}
& \begin{array}{c}
\text{CO}_2 R_1 \\
\text{BrCH}_2 - & \text{C} \\
\text{X合伙} & \text{N} \\
\text{R}_2 \\
\end{array}
\end{align*}
\]

This reaction may be carried out by treating compound XIII with potassium bromate and hydrobromic acid in a nonreactive solvent such as acetic acid. Compound XVI is then reacted with any of a variety of thioamides having structural formula

\[
\begin{align*}
& \begin{array}{c}
\text{S} \\
\text{H}_2 \text{NC} - (CR_5R_6)n''\text{NR}_3R_4
\end{array}
\end{align*}
\]

wherein \( R_1 - R_6 \) and \( n'' \) are defined above to produce the correspondingly substituted 2-(substituted)-thiazol-4-yl compounds. This reaction may be carried out by mixing Compounds XVI and XVII in a non-reactive solvent such as ethanol or dimethylformamide.
usually at room temperature. Variations in these reactions, for example, to maximize a particular yield is within the skill of the art.

The compounds of the invention having structural formula I wherein

\[
Z = \text{N} (\text{CR}_5 \text{R}_6)_n\text{NR}_3 \text{R}_4
\]

may be prepared from the correspondingly substituted thioamide

\[
\text{VIII}
\]

by first reacting \text{VIII} with a dihaloketone \text{Hal-CH}_2\text{-C-CH}_2\text{-Hal} to produce the halomethylthiazole

\[
\text{XIX}
\]

In the preferred procedure, 1,3-dichloroacetone is mixed with \text{VIII} in a nonreactive solvent such as \text{N,N-dimethylformamide} and heated to about 100°C for approximately four hours. The product \text{XIX} wherein \text{Hal} represents chlorine, may be isolated and purified by
standard procedures. This compound is then treated with azide ion, preferably sodium azide, in a convenient nonreactive solvent such as N,N-dimethylformamide by heating at about 100°C for about four hours. The thus produced azido compound

\[
\begin{array}{c}
\text{O} \\
\text{Y} \\
\text{S} \\
\text{X} \\
\text{N} \\
\text{N}_3\text{CH}_2\text{N} \\
\text{XX}
\end{array}
\]

may then be reduced to produce the corresponding primary amine Ic where R₃, R₄, R₅, and R₆ are hydrogen. In the preferred procedure, the azide is dissolved in acetic acid and treated with hydrogen gas at atmospheric pressure using a 10% palladium on carbon catalyst. The corresponding secondary and tertiary amines may be produced by reacting XIX with the appropriate amine. When Z is VIa, VIb, or VIc in formula I, compounds where R₂ is cycloalkyl may be prepared by methods outlined in United States Patent 4,359,578 or by the method described in European Patent Publication Number 00078362.
Compounds of formulae Ia where Z is

\[
\begin{align*}
(CR_5R_6)_nNR_3R_4
\end{align*}
\]

\[
\begin{align*}
(CR_5R_6)_nNR_3R_4
\end{align*}
\]

may be prepared by methods described above for compounds of the formula Ib and Id starting with a methyl ketone of the formula

\[
\begin{align*}
\text{Y} & \text{C}_2\text{R}_1 \\
\text{H}_3\text{C} & \text{N} \\
\text{O} & \text{CO}_2\text{R}_1 \\
\text{O} & \text{R}_8 \\
\text{R}_9
\end{align*}
\]

wherein \( R_1, R_8, R_9, \) and \( Y \) have been defined above.

The compounds of the invention display antibacterial activity when tested by the microtitration dilution method as described in Heifetz, et al, Antimicr. Agents & Chemoth., 6, 124 (1974), which is incorporated herein by reference.

By use of the above referenced method, the followed minimum inhibitory concentration values (MICs in \( \mu g/ml \)) were obtained for representative compounds of the invention and the prior art compound 7-(3-amino-1-pyrrolidinyl)-1-ethyl-6-fluoro-1,4-dihydro-4-oxo-1,8-naphthyridine-3-carboxylic acid designated as ** in the table.

The compounds of the invention are capable of forming both pharmaceutically acceptable acid addition and/or base salts. Base salts are formed with metals or amines, such as alkali and alkaline earth metals or organic amines. Examples of metals used as cations are sodium, potassium, magnesium, calcium, and the like. Examples of suitable amines are N,N'-dibenzylethylenediamine, chloroprocaine, choline, diethanolamine, ethylenediamine, N-methylglucamine, and procaine.

Pharmaceutically acceptable acid addition salts are formed with organic and inorganic acids. Examples of suitable acids for salt formation are hydrochloric, sulfuric, phosphoric, acetic, citric, oxalic, malonic, salicylic, malic, gluconic, fumaric, succinic, ascorbic, maleic, methanesulfonic, and the like. The salts are prepared by contacting the free base form with a sufficient amount of the desired acid to produce either a mono or di, etc salt in the conventional manner. The free base forms may be regenerated by treating the salt form with a base. For example, dilute solutions of aqueous base may be utilized. Dilute aqueous sodium hydroxide, potassium carbonate, ammonia, and sodium bicarbonate solutions are suitable for this purpose. The free base forms differ from their respective salt forms somewhat in certain physical properties such as solubility in polar solvents, but the salts are otherwise equivalent to their respective free base forms for purposes of the invention. Use of excess base where R' is hydrogen gives the corresponding basic salt.

The compounds of the invention can exist in unsolvated as well as solvated forms, including hydrated forms. In general, the solvated forms, including hydrated forms and the like are equivalent to the unsolvated forms for purposes of the invention.
The alkyl groups contemplated by the invention comprise both straight and branched carbon chains of from one to about three carbon atoms except when specifically stated to be greater than three carbon atoms. Representative of such groups are methyl, ethyl, propyl, isopropyl, and the like.

The cycloalkyl groups contemplated by the invention comprise those having three to six carbons atoms such as cyclopropyl, cyclobutyl, cyclopentyl, and cyclohexyl.

The alkoxy groups contemplated by the invention comprise both straight and branched carbon chains of from one to about six carbon atoms unless otherwise specified. Representative of such groups are methoxy, ethoxy, propoxy, i-propoxy, t-butoxy, hexoxy, and the like.

The term, haloalkyl, is intended to include halogen substituted straight and branched carbon chains of from two to four carbon atoms. Those skilled in the art will recognize that the halogen substituent may not be present on the α-carbon atom of the chain. Representative of such groups are β-fluoroethyl, β-chloroethyl, β, β-dichloroethyl, β-chloropropyl, β-chloro-2-propyl, γ-iodobutyl, and the like.

The term halogen is intended to include fluorine, chlorine, bromine, and iodine unless otherwise specified.

Certain compounds of the invention may exist in optically active forms. The pure D isomer, pure L isomer as well as mixtures thereof; including the racemic mixtures, are contemplated by the invention. Additional assymmetric carbon atoms may be present in a substituent such as an alkyl group. All such isomers as well α-mixtures thereof are intended to be included in the invention.
The compounds of the invention can be prepared and administered in a wide variety of oral and parenteral dosage forms. It will be obvious to those skilled in the art that the following dosage forms may comprise as the active component, either a compound of formula I or a corresponding pharmaceutically acceptable salt of a compound of formula I.

For preparing pharmaceutical compositions from the compounds described by this invention, inert, pharmaceutically acceptable carriers can be either solid or liquid. Solid form preparations include powders, tablets, dispersible granules, capsules, cachets, and suppositories. A solid carrier can be one or more substances which may also act as diluents, flavoring agents, solubilizers, lubricants, suspending agents, binders, or tablets disintegrating agents; it can also be an encapsulating material. In powders, the carrier is a finely divided solid which is in admixture with the finely divided active compound.

In the tablet the active compound is mixed with carrier having the necessary binding properties in suitable proportions and compacted in the shape and size desired. The powders and tablets preferably contain from 5 or 10 to about 70 percent of the active ingredient. Suitable solid carriers are magnesium carbonate, magnesium stearate, talc, sugar, lactose, pectin, dextrin, starch, gelatin, tragacanth, methyl cellulose, sodium carboxymethyl cellulose, a low melting wax, cocoa butter, and the like. The term "preparation" is intended to include the formulation of the active compound with encapsulating material as carrier providing a capsule in which the active component (with or without other carriers) is surrounded by carrier, which is thus in association with it. Similarly, cachets are included. Tablets, powders, cachets, and capsules can be used as solid dosage forms suitable for oral administration.
Liquid form preparations include solutions, suspensions, and emulsions. As an example may be mentioned water or water-propylene glycol solutions for parenteral injection. Such solutions are prepared so as to be acceptable to biological systems (isotonicity, pH, etc). Liquid preparations can also be formulated in solution in aqueous polyethylene glycol solution. Aqueous solutions suitable for oral use can be prepared by dissolving the active component in water and adding suitable colorants, flavors, stabilizing, and thickening agents as desired. Aqueous suspension suitable for oral use can be made by dispersing the finely divided active component in water with viscous material, i.e., natural or synthetic gums, resins, methyl cellulose, sodium carboxymethyl cellulose, and other well-known suspending agents.

Preferably, the pharmaceutical preparation is in unit dosage form. In such form, the preparation is subdivided into unit doses containing appropriate quantities of the active component. The unit dosage form can be a packaged preparation, the package containing discrete quantities of preparation, for example, packeted tablets, capsules, and powders in vials or ampoules. The unit dosage form can also be a capsule, cachet, or tablet itself or it can be the appropriate number of any of these packaged forms.

The quantity of active compound in a unit dose of preparation may be varied or adjusted from 1 mg to 100 mg according to the particular application and the potency of the active ingredient.

In therapeutic use as agents for treating bacterial infections the compounds utilized in the pharmaceutical method of this invention are administered at the initial dosage of about 3 mg to about 40 mg per
kilogram daily. A daily dose range of about 6 mg to about 14 mg per kilogram is preferred. The dosages, however, may be varied depending upon the requirements of the patient, the severity of the condition being treated, and the compound being employed. Determination of the proper dosage for a particular situation is within the skill of the art. Generally, treatment is initiated with smaller dosages which are less than the optimum dose of the compound. Thereafter, the dosage is increased by small increments until the optimum effect under the circumstances is reached. For convenience, the total daily dosage may be divided and administered in portions during the day if desired. The following nonlimiting examples illustrate the inventors' preferred methods for preparing the compounds of the invention.

A solution of 26.4 g (0.17 mole) 3-acetyl-4-fluoroaniline and 34.6 ml (0.35 mole) 1,3-propanedithiol in 2.5 l chloroform was cooled to 5°C. Hydrogen chloride gas was bubbled into the stirred solution for 15 minutes at 5°-10°C, and the reaction was warmed to room temperature with stirring overnight. The solvent was removed in vacuo at 60°C, and the solid residue twice taken into 800 ml toluene and stripped in vacuo at 60°C. The solid material was dissolved in 1.5 l chloroform, washed twice with 200 ml saturated sodium bicarbonate solution, twice with 200 ml water, and dried with magnesium sulfate.

Removal of the solvent in vacuo gave a brown oil, containing 4-fluoro-3-(2-methyl-1,3-dithian-2-yl)benzenamine. This oil was dissolved in 1.2 l toluene, and 34.4 ml (0.17 mole) diethyl ethoxymethylenemalonate was added. The toluene was distilled off over two hours, until the head temperature reached 120-125°C. The resulting brown oil, containing diethyl \([4\text{-fluoro}-3\text{-}(2\text{-methyl-1,3-dithian-2-yl})\text{phenyl}][\text{amino}]\text{methylene}][\text{propanedioate},

was poured directly into 500 ml Dowtherm A preheated to 250°C. The temperature of the mixture was raised back to 250°C, and heated 15 minutes.
