TITLE OF THE INVENTION
AZACYCLOHEXANE DERIVATIVES AS INHIBITORS OF STEAROYL-COEZYME A DELTA-9
DESATURASE

FIELD OF THE INVENTION
The present invention relates to azacyclohexane derivatives which are inhibitors of
stearoyl-coenzyme A delta-9 desaturase (SCD) and the use of such compounds to control, prevent and/or
treat conditions or diseases mediated by SCD activity. The compounds of the present invention are
useful for the control, prevention and treatment of conditions and diseases related to abnormal lipid
synthesis and metabolism, including cardiovascular disease; atherosclerosis; obesity; diabetes;
neurological disease; metabolic syndrome; insulin resistance; cancer; and hepatic steatosis.

BACKGROUND OF THE INVENTION
At least three classes of fatty acyl-coenzyme A (CoA) desaturases (delta-5, delta-6 and
delta-9 desaturases) are responsible for the formation of double bonds in mono- and polyunsaturated fatty
acyl-CoAs derived from either dietary sources or de novo synthesis in mammals. The delta-9 specific
stearoyl-CoA desaturases (SCDs) catalyze the rate-limiting formation of the cis-double bond at the C9-
C10 position in monounsaturated fatty acyl-CoAs. The preferred substrates are stearoyl-CoA and
palmitoyl-CoA, with the resulting oleoyl and palmitoleoyl-CoA as the main components in the
biosynthesis of phospholipids, triglycerides, cholesterol esters and wax esters (Dobrzyn and Natami,
Obesity Reviews, 6: 169-174 (2005)).

The rat liver microsomal SCD protein was first isolated and characterized in 1974
(Strittmatter et al., PNAS, 71: 4565-4569 (1974)). A number of mammalian SCD genes have since been
cloned and studied from various species. For example, two genes have been identified from rat (SCD1
and SCD2, Thiede et al., J. Biol. Chem., 261, 13230-13235 (1986)), Mihara, K., J. Biochem. (Tokyo),
108: 1022-1029 (1990)); four genes from mouse (SCD1, SCD2, SCD3 and SCD4) (Miyazaki et al., J.
Biol. Chem., 278: 33904-33911 (2003)); and two genes from human (SCD1 and ACOD4 (SCD2)),
Biochem. J., 388: 135-142 (2005)). The involvement of SCDs in fatty acid metabolism has been known
in rats and mice since the 1970's (Oshino, N., Arch. Biochem. Biophys., 149: 378-387 (1972)). This has
been further supported by the biological studies of a) Asebia mice that carry the natural mutation in the
SCD1 gene (Zheng et al., Nature Genetics, 23: 268-270 (1999)), b) SCD1-null mice from targeted gene
deletion (Ntambi, et al., PNAS, 99: 11482-11486 (2002), and c) the suppression of SCD1 expression
during leptin-induced weight loss (Cohen et al., Science, 297: 240-243 (2002)). The potential benefits of
pharmacological inhibition of SCD activity has been demonstrated with anti-sense oligonucleotide
activity reduced fatty acid synthesis and increased fatty acid oxidation in primary mouse hepatocytes.
Treatment of mice with SCD-ASOs resulted in the prevention of diet-induced obesity, reduced body adiposity, hepatomegaly, steatosis, postprandial plasma insulin and glucose levels, reduced \textit{de novo} fatty acid synthesis, decreased expression of lipogenic genes, and increased expression of genes promoting energy expenditure in liver and adipose tissues. Thus, SCD inhibition represents a novel therapeutic strategy in the treatment of obesity and related metabolic disorders.

There is compelling evidence to support that elevated SCD activity in humans is directly implicated in several common disease processes. For example, there is an elevated hepatic lipogenesis to triglyceride secretion in non-alcoholic fatty liver disease patients (Diraison, et al., \textit{Diabetes Metabolism}, 29: 478-485 (2003)); Donnelly, et al., \textit{J. Clin. Invest.}, 115: 1343-1351 (2005)). The postprandial \textit{de novo} lipogenesis is significantly elevated in obese subjects (Marques-Lopes, et al., \textit{American Journal of Clinical Nutrition}, 73: 252-261 (2001)). There is a significant correlation between a high SCD activity and an increased cardiovascular risk profile including elevated plasma triglycerides, a high body mass index and reduced plasma HDL (Attie, et al., \textit{J. Lipid Res.}, 43: 1899-1907 (2002)). SCD activity plays a key role in controlling the proliferation and survival of human transformed cells (Scaglia and Igal, \textit{J. Biol. Chem.}, (2005)).

The present invention is concerned with novel azacyclohexane derivatives as inhibitors of stearoyl-CoA delta-9 desaturase which are useful in the treatment and/or prevention of various conditions and diseases mediated by SCD activity including those related, but not limited, to elevated lipid levels, as exemplified in non-alcoholic fatty liver disease, cardiovascular disease, obesity, diabetes, metabolic syndrome, and insulin resistance.

Compounds of structural formula I may contain one or more asymmetric centers and can thus occur as racemates and racemic mixtures, single enantiomers, diastereomeric mixtures and individual diastereomers. The present invention is meant to comprehend all such isomeric forms of the compounds of structural formula I.

Compounds of structural formula I may be separated into their individual diastereoisomers by, for example, fractional crystallization from a suitable solvent, for example methanol or ethyl acetate or a mixture thereof, or via chiral chromatography using an optically active stationary phase. Absolute stereochemistry may be determined by X-ray crystallography of crystalline products or crystalline intermediates which are derivatized, if necessary, with a reagent containing an asymmetric center of known absolute configuration.

Alternatively, any stereoisomer of a compound of the general structural formula I may be obtained by stereospecific synthesis using optically pure starting materials or reagents of known absolute configuration.

If desired, racemic mixtures of the compounds may be separated so that the individual enantiomers are isolated. The separation can be carried out by methods well known in the art, such as the coupling of a racemic mixture of compounds to an enantiomerically pure compound to form a diastereomeric mixture, followed by separation of the individual diastereomers by standard methods, such as fractional crystallization or chromatography. The coupling reaction is often the formation of salts using an enantiomerically pure acid or base. The diastereomeric derivatives may then be converted to the pure enantiomers by cleavage of the added chiral residue. The racemic mixture of the compounds can also be separated directly by chromatographic methods utilizing chiral stationary phases, which methods are well known in the art.

The present invention is further directed to a method for the manufacture of a medicament for inhibiting stearoyl-coenzyme A delta-9 desaturase enzyme activity in humans and animals comprising combining a compound of the present invention with a pharmaceutically acceptable carrier or diluent. More particularly, the present invention is directed to the use of a compound of structural formula I in the manufacture of a medicament for use in treating a condition selected from the group consisting of hyperglycemia, Type 2 diabetes, insulin resistance, obesity, and a lipid disorder in a mammal, wherein the lipid disorder is selected from the group consisting of dyslipidemia, hyperlipidemia, hypertriglyceridemia, hypercholesterolemia, low HDL, and high LDL.

The subject treated in the present methods is generally a mammal, preferably a human being, male or female, in whom inhibition of stearoyl-coenzyme A delta-9 desaturase enzyme activity is desired. The term "therapeutically effective amount" means the amount of the subject compound that
will elicit the biological or medical response of a tissue, system, animal or human that is being sought by the researcher, veterinarian, medical doctor or other clinician.

The term "composition" as used herein is intended to encompass a product comprising the specified ingredients in the specified amounts, as well as any product which results, directly or indirectly, from combination of the specified ingredients in the specified amounts. Such term in relation to pharmaceutical composition, is intended to encompass a product comprising the active ingredient(s) and the inert ingredient(s) that make up the carrier, as well as any product which results, directly or indirectly, from combination, complexation or aggregation of any two or more of the ingredients, or from dissociation of one or more of the ingredients, or from other types of reactions or interactions of one or more of the ingredients. Accordingly, the pharmaceutical compositions of the present invention encompass any composition made by admixing a compound of the present invention and a pharmaceutically acceptable carrier. By "pharmaceutically acceptable" it is meant the carrier, diluent or excipient must be compatible with the other ingredients of the formulation and not deleterious to the recipient thereof.

The utility of the compounds in accordance with the present invention as inhibitors of stearoyl-coenzyme A delta-9 desaturase (SCD) enzyme activity may be demonstrated by the following microsomal and whole-cell based assays:

1. SCD-induced rat liver microsome assay:

The activity of compounds of formula I against the SCD enzyme is determined by following the conversion of radiolabeled-stearoyl-CoA to oleoyl-CoA using SCD1-induced rat liver microsome and a previously published procedure with some modifications (Joshi, et al., J. Lipid Res., 18: 32-36 (1977)). After feeding wistar rats with a high carbohydrate/fat-free rodent diet (LabDiet # 5803, Purina) for 3 days, the SCD-induced livers were homogenized (1:10 w/v) in 250 mM sucrose, 1 mM EDTA, 5 mM DTT and 50 mM Tris-HCl (pH 7.5). After a 20 min centrifugation (18,000 x g/4 °C) to remove tissue and cell debris, the microsome was prepared by a 100,000 x g centrifugation (60 min) with the resulting pellet suspended in 100 mM sodium phosphate, 20% glycerol and 2 mM DTT. Test compound in 2 µL DMSO was incubated for 15 min at room temperature with 180 µL of the microsome (typically at about 100 µg/mL, in Tris-HCl buffer (100 mM, pH 7.5), ATP (5 mM), Coenzyme A (0.1 mM), Triton X-100 (0.5 mM) and NADH (2 mM)). The reaction was initiated by the addition of 20 µL of [3H]-Stearoyl-CoA (final concentration at 2 µM with the radioactivity concentration at 1 µCi/mL), and terminated by the addition of 150 µL of 1N sodium hydroxide. After 60 min at room temperature to hydrolyze the oleoyl-CoA and stearoyl-CoA, the solution was acidified by the addition of 150 µL of 15% phosphoric acid (v/v) in ethanol supplemented with 0.5 mg/mL stearic acid and 0.5 mg/mL oleic acid. [3H]-oleic acid and [3H]-stearic acid were then quantified on a HPLC that is equipped with a C-18 reverse
phase column and a Packard Flow Scintillation Analyzer. Alternatively, the reaction mixture (80 µL) was mixed with a calcium chloride-charcoal aqueous suspension (100 µL of 15% (w/v) charcoal plus 20 µL of 2 N CaCl₂). The resulting mixture was centrifuged to precipitate the radioactive fatty acid species into a stable pellet. Tritiated water from SCD-catalyzed desaturation of 9,10-[³H]-stearoyl-CoA was quantified by counting 50 µL of the supernatant on a scintillation counter.

II. Whole cell-based SCD (delta-9), delta-5 and delta-6 desaturase assays:

Human HepG2 cells were grown on 24-well plates in MEM media (Gibco cat# 11095-072) supplemented with 10% heat-inactivated fetal bovine serum at 37 °C under 5% CO₂ in a humidified incubator. Test compound dissolved in the media was incubated with the subconfluent cells for 15 min at 37 °C. [1-¹⁴C]-stearic acid was added to each well to a final concentration of 0.05 µCi/mL to detect SCD-catalyzed [¹⁴C]-oleic acid formation. 0.05 µCi/mL of [¹⁴C]-eicosatrienoic acid or [¹⁴C]-linolenic acid plus 10 µM of 2-amino-N-(3-chlorophenyl)benzamide (a delta-5 desaturase inhibitor) was used to index the delta-5 and delta-6 desaturase activities, respectively. After 4 h incubation at 37 °C, the culture media was removed and the labeled cells were washed with PBS (3 x 1 mL) at room temperature. The labeled cellular lipids were hydrolyzed under nitrogen at 65 °C for 1 h using 400 µL of 2N sodium hydroxide plus 50 µL of L-α-phosphatidylcholine (2 mg/mL in isopropanol, Sigma #P-3556). After acidification with phosphoric acid (60 µL), the radioactive species were extracted with 300 µL of acetonitrile and quantified on a HPLC that was equipped with a C-18 reverse phase column and a Packard Flow Scintillation Analyzer. The levels of [¹⁴C]-oleic acid over [¹⁴C]-stearic acid, [¹⁴C]-arachidonic acid over [¹⁴C]-eicosatrienoic acid, and [¹⁴C]-eicosatetraenoic acid (8,11,14,17) over [¹⁴C]-linolenic acid were used as the corresponding activity indices of SCD, delta-5 and delta-6 desaturase, respectively.

The SCD inhibitors of formula I generally exhibit an inhibition constant IC₅₀ of less than 1 µM and more typically less than 0.1 µM. Generally, the IC₅₀ ratio for delta-5 or delta-6 desaturases to SCD for a compound of formula I is at least about ten or more, and preferably about hundred or more.

In Vivo Efficacy of Compounds of the Present Invention:

The in vivo efficacy of compounds of formula I was determined by following the conversion of [¹⁴C]-stearic acid to [¹⁴C]oleic acid in animals as exemplified below. Mice were dosed with a compound of formula I and one hour later the radioactive tracer, [¹⁴C]-stearic acid, was dosed at 20 µCi/kg IV. At 3 h post dosing of the compound, the liver was harvested and then hydrolyzed in 10 N sodium hydroxide for 24 h at 80 °C, to obtain the total liver fatty acid pool. After phosphoric acid acidification of the extract, the amount of [¹⁴C]-stearic acid and [¹⁴C]-oleic acid was quantified on a HPLC that was equipped with a C-18 reverse phase column and a Packard Flow Scintillation Analyzer.
The subject compounds are further useful in a method for the prevention or treatment of the aforementioned diseases, disorders and conditions in combination with other agents.

The compounds of the present invention may be used in combination with one or more other drugs in the treatment, prevention, suppression or amelioration of diseases or conditions for which compounds of Formula I or the other drugs may have utility, where the combination of the drugs together are safer or more effective than either drug alone. When a compound of the present invention is used contemporaneously with one or more other drugs, a pharmaceutical composition containing such other drugs in addition to the compound of the present invention is preferred. Accordingly, the pharmaceutical compositions of the present invention include those that also contain one or more other active ingredients, in addition to a compound of the present invention.

The weight ratio of the compound of the present invention to the second active ingredient may be varied and will depend upon the effective dose of each ingredient. Generally, an effective dose of each will be used. Thus, for example, when a compound of the present invention is combined with another agent, the weight ratio of the compound of the present invention to the other agent will generally range from about 1000:1 to about 1:1000, preferably about 200:1 to about 1:200. Combinations of a compound of the present invention and other active ingredients will generally also be within the aforementioned range, but in each case, an effective dose of each active ingredient should be used.
In such combinations the compound of the present invention and other active agents may be administered separately or in conjunction. In addition, the administration of one element may be prior to, concurrent to, or subsequent to the administration of other agent(s).

The compounds of the present invention may be administered by oral, parenteral (e.g., intramuscular, intraperitoneal, intravenous, ICV, intracisternal injection or infusion, subcutaneous injection, or implant), by inhalation spray, nasal, vaginal, rectal, sublingual, or topical routes of administration and may be formulated, alone or together, in suitable dosage unit formulations containing conventional non-toxic pharmaceutically acceptable carriers, adjuvants and vehicles appropriate for each route of administration. In addition to the treatment of warm-blooded animals such as mice, rats, horses, cattle, sheep, dogs, cats, monkeys, etc., the compounds of the invention are effective for use in humans.

The pharmaceutical compositions for the administration of the compounds of this invention may conveniently be presented in dosage unit form and may be prepared by any of the methods well known in the art of pharmacy. All methods include the step of bringing the active ingredient into association with the carrier which constitutes one or more accessory ingredients. In general, the pharmaceutical compositions are prepared by uniformly and intimately bringing the active ingredient into association with a liquid carrier or a finely divided solid carrier or both, and then, if necessary, shaping the product into the desired formulation. In the pharmaceutical composition the active object compound is included in an amount sufficient to produce the desired effect upon the process or condition of diseases. As used herein, the term "composition" is intended to encompass a product comprising the specified ingredients in the specified amounts, as well as any product which results, directly or indirectly, from combination of the specified ingredients in the specified amounts.

The pharmaceutical compositions containing the active ingredient may be in a form suitable for oral use, for example, as tablets, troches, lozenges, aqueous or oily suspensions, dispersible powders or granules, emulsions, hard or soft capsules, or syrups or elixirs. Compositions intended for oral use may be prepared according to any method known to the art for the manufacture of pharmaceutical compositions and such compositions may contain one or more agents selected from the group consisting of sweetening agents, flavoring agents, coloring agents and preserving agents in order to provide pharmaceutically elegant and palatable preparations. Tablets contain the active ingredient in admixture with non-toxic pharmaceutically acceptable excipients which are suitable for the manufacture of tablets. These excipients may be for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, corn starch, or alginic acid; binding agents, for example starch, gelatin or acacia, and lubricating agents, for example magnesium stearate, stearic acid or talc. The tablets may be uncoated or they may be coated by known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glycercyl monostearate or glycercyl distearate may be employed. They may also be coated by the
techniques described in the U.S. Patents 4,256,108; 4,166,452; and 4,265,874 to form osmotic therapeutic tablets for control release.

Formulations for oral use may also be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredient is mixed with water or an oil medium, for example peanut oil, liquid paraffin, or olive oil.

Aqueous suspensions contain the active materials in admixture with excipients suitable for the manufacture of aqueous suspensions. Such excipients are suspending agents, for example sodium carboxymethylcellulose, methylcellulose, hydroxypropylmethylcellulose, sodium alginate, polyvinylpyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents may be a naturally-occurring phosphatide, for example lecithin, or condensation products of an alkylene oxide with fatty acids, for example polyoxyethylene stearate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or condensation products of ethylene oxide with partial esters derived from fatty acids and hexitol anhydrides, for example polyethylene sorbitan monooleate. The aqueous suspensions may also contain one or more preservatives, for example ethyl or n-propyl p-hydroxybenzoate, one or more coloring agents, one or more flavoring agents, and one or more sweetening agents, such as sucrose or saccharin.

Oily suspensions may be formulated by suspending the active ingredient in a vegetable oil, for example arachis oil, olive oil, sesame oil or coconut oil, or in a mineral oil such as liquid paraffin. The oily suspensions may contain a thickening agent, for example beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as those set forth above, and flavoring agents may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an anti-oxidant such as ascorbic acid.

Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water provide the active ingredient in admixture with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients, for example sweetening, flavoring and coloring agents, may also be present.

The pharmaceutical compositions of the invention may also be in the form of oil-in-water emulsions. The oily phase may be a vegetable oil, for example olive oil or arachis oil, or a mineral oil, for example liquid paraffin or mixtures of these. Suitable emulsifying agents may be naturally-occurring gums, for example gum acacia or gum tragacanth, naturally-occurring phosphatides, for example soy bean, lecithin, and esters or partial esters derived from fatty acids and hexitol anhydrides, for example sorbitan monooleate, and condensation products of the said partial esters with ethylene oxide, for example polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening and flavoring agents.
Syrups and elixirs may be formulated with sweetening agents, for example glycerol, propylene glycol, sorbitol or sucrose. Such formulations may also contain a demulcent, a preservative and flavoring and coloring agents.

The pharmaceutical compositions may be in the form of a sterile injectable aqueous or oleagenous suspension. This suspension may be formulated according to the known art using those suitable dispersing or wetting agents and suspending agents which have been mentioned above. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

The compounds of the present invention may also be administered in the form of suppositories for rectal administration of the drug. These compositions can be prepared by mixing the drug with a suitable non-irritating excipient which is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release the drug. Such materials are cocoa butter and polyethylene glycols.

For topical use, creams, ointments, jellies, solutions or suspensions, etc., containing the compounds of the present invention are employed. (For purposes of this application, topical application shall include mouthwashes and gargles.)

The pharmaceutical composition and method of the present invention may further comprise other therapeutically active compounds as noted herein which are usually applied in the treatment of the above mentioned pathological conditions.

In the treatment or prevention of conditions which require inhibition of stearoyl-CoA delta-9 desaturase enzyme activity an appropriate dosage level will generally be about 0.01 to 500 mg per kg patient body weight per day which can be administered in single or multiple doses. Preferably, the dosage level will be about 0.1 to about 250 mg/kg per day; more preferably about 0.5 to about 100 mg/kg per day. A suitable dosage level may be about 0.01 to 250 mg/kg per day, about 0.05 to 100 mg/kg per day, or about 0.1 to 50 mg/kg per day. Within this range the dosage may be 0.05 to 0.5, 0.5 to 5 or 5 to 50 mg/kg per day. For oral administration, the compositions are preferably provided in the form of tablets containing 1.0 to 1000 mg of the active ingredient, particularly 1.0, 5.0, 10.0, 15.0, 20.0, 25.0, 50.0, 75.0, 100.0, 150.0, 200.0, 250.0, 300.0, 400.0, 500.0, 600.0, 750.0, 800.0, 900.0, and 1000.0 mg of the active ingredient for the symptomatic adjustment of the dosage to the patient to be treated. The compounds may be administered on a regimen of 1 to 4 times per day, preferably once or twice per day.

When treating or preventing diabetes mellitus and/or hyperglycemia or hypertriglyceridemia or other diseases for which compounds of the present invention are indicated, generally satisfactory results are obtained when the compounds of the present invention are administered
at a daily dosage of from about 0.1 mg to about 100 mg per kilogram of animal body weight, preferably given as a single daily dose or in divided doses two to six times a day, or in sustained release form. For most large mammals, the total daily dosage is from about 1.0 mg to about 1000 mg, preferably from about 1 mg to about 50 mg. In the case of a 70 kg adult human, the total daily dose will generally be from about 7 mg to about 350 mg. This dosage regimen may be adjusted to provide the optimal therapeutic response.

It will be understood, however, that the specific dose level and frequency of dosage for any particular patient may be varied and will depend upon a variety of factors including the activity of the specific compound employed, the metabolic stability and length of action of that compound, the age, body weight, general health, sex, diet, mode and time of administration, rate of excretion, drug combination, the severity of the particular condition, and the host undergoing therapy.

**Preparation of Compounds of the Invention:**

The compounds of structural formula I can be prepared according to the procedures of the following Schemes and Examples, using appropriate materials and are further exemplified by the following specific examples. The compounds illustrated in the examples are not, however, to be construed as forming the only genus that is considered as the invention. The Examples further illustrate details for the preparation of the compounds of the present invention. Those skilled in the art will readily understand that known variations of the conditions and processes of the following preparative procedures can be used to prepare these compounds. All temperatures are degrees Celsius unless otherwise noted. Mass spectra (MS) were measured by electrospray ion-mass spectroscopy (ESMS).

**Method A:**

An appropriately substituted heteroaryl halide 1 is reacted with an appropriately substituted cyclic amine 2 in the presence of a base such as DBU and an alkali metal (K, Na, Cs) carbonate in a solvent such as THF, 1,4-dioxane, and DMF at a temperature range of about room temperature to about refluxing temperature. Extractive work up and purification by flash column chromatography gives desired product 3.

**Method B:**

An appropriately substituted heteroaryl dibromide 4 is reacted with an appropriately substituted cyclic amine 5 in the presence of a base such as 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU) or

Extractive work up and purification by flash column chromatography gives desired heteroaryl bromide 6. Reaction of heteroaryl bromide 6 with copper (I) cyanide in a solvent such as DMF, acetonitrile, and 1,4-dioxane at a temperature range of about room temperature to about refluxing temperature followed by extractive work up and purification by flash column chromatography gives desired heteroaryl cyanide 7.

Method C:

The heteroaryl cyanide 7 is converted into amidate 8 by reaction with an appropriate amine in the presence of a base such as 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU) and an alkali metal (K, Na, Cs) carbonate in a solvent such as N,N-dimethylformamide (DMF), EtOH, THF, and 1,4-dioxane at a temperature range of about room temperature to about refluxing temperature. Extractive work up and purification by flash column chromatography gives desired amidate 8. The amidate 8 is reacted with an appropriate (a) orthoformate ester in the presence of an acid, such as p-toluenesulfonic acid or BF3-etherate, (b) an acid chloride or an activated anhydride in a solvent such as pyridine, or (c) an ester, in the presence of a base such as sodium ethoxide in a solvent such as ethanol, to generate the biheteroaryl 9.

Method D:

An appropriately substituted heteroaryl bromide 10 is reacted with an appropriately substituted cyclic amine 11 in the presence of a base such as DBU or an alkali metal (K, Na, Cs)

5 **Method E:**

The ester 12 is hydrolyzed with an alkaline base such as NaOH in a solvent such as aqueous THF with an alcoholic solvent such as MeOH at a temperature range of about room temperature to about refluxing temperature to give the carboxylic acid 13. The carboxylic acid 13 is converted to the corresponding acid chloride and then reacted with an appropriately substituted W-NH₂ amine to give the desired amide product 14. Alternatively, the carboxylic acid 13 is reacted with an appropriately substituted W-NH₂ amine in the presence of a standard peptide coupling reagent such as HATU or N,N'-dicyclohexylcarbodiimide (DCC) to give the desired amide product 14. The amide 14 can be reacted with an appropriate orthoformate ester in the presence of an acid such as pTSA or BF₃-etherate to generate the biheteroaryl 15. Alternatively, the amide can be converted to its thioamide by reaction with an appropriate reagent such as a Lawesson reagent or P₄S₁₀. The thioamide in turn can be converted to its corresponding heterocycle.

PREPARATION OF INTERMEDIATES:

INTERMEDIATE 1

4-{{2-(Trifluoromethyl)phenoxy}piperidine}

To a solution of Boc-4-hydroxy-1-piperidine (25 g, 124 mmol), 2-hydroxybenzotri fluoride (22 g, 136 mmol) and triphenylphosphine (39 g, 149 mmol) in THF was added diethyl azodicarboxylate dropwise (23.5 mL, 149 mmol) at 0 °C. The mixture was then warmed to room temperature and stirred for 14 h. The mixture was concentrated and diluted with ethyl ether, washed with 1N NaOH, water then dried over Na₂SO₄. The mixture was concentrated and diluted with Et₂O/hexanes (35:65). The precipitated phosphine oxide was filtered and the filtrate was concentrated. The residue was purified by silica gel chromatography using Et₂O/hexanes (35:65) as eluent to give 1-piperidinecarboxylic acid, 4-{{2-(trifluoromethyl)phenoxy}-1,1-dimethylethyl ester as a solid.

15 Trifluoroacetic acid (26.3 mL, 342 mmol) was added to a solution of 1-piperidinecarboxylic acid, 4-{{2-(trifluoromethyl)phenoxy}-1,1-dimethylethyl ester (29.5 g, 85 mmol) in CH₂Cl₂ (171 mL). The mixture was stirred at room temperature for 16 h. The solvent was evaporated. The residue was diluted with
