A compound of formula (Ia): Formula (Ia) The present invention relates to novel indazolyl derivatives, to pharmaceutical compositions comprising such derivatives, to processes for preparing such novel derivatives and to the use of such derivatives as medicaments.
Phenyl or pyridinyl substituted indazoles derivatives

The present invention relates to novel indazolyl derivatives, to pharmaceutical compositions comprising such derivatives, to processes for preparing such novel derivatives and to the use of such derivatives as medicaments (for example in the treatment of an inflammatory disease state).

It is known that certain non-steroidal compounds interact with the glucocorticoid receptor (GR) and, as a result of this interaction, produce a suppression of inflammation (see, for example, US6323199). Such compounds can show a clear dissociation between anti-inflammatory and metabolic actions making them superior to earlier reported steroidal and non-steroidal glucocorticoids. The present invention provides further non-steroidal compounds as modulators (for example agonists, antagonists, partial agonists or partial antagonists) of the glucocorticoid receptor. {Modulators of the glucocorticoid receptor are disclosed in WO 2007/122165, WO 2008/076048 and WO 2008/043788.} These new compounds are contemplated to have improved properties such as selectivity or efficacy over the known compounds. These new compounds are also contemplated to have an improved low LogD and thus an improved distribution volume in vivo. The systemic exposure of the compounds is also expected to be improved. Further the compounds are contemplated to have a lower melting point and improved crystallinity compared to the known compounds.

The present invention provides a compound of formula Ia:

As used herein the term "congestive heart failure" (CHF) or 'congestive heart disease' refers to a disease state of the cardiovascular system whereby the heart is unable to efficiently pump an adequate volume of blood to meet the requirements of the body's tissues and organ systems. Typically, CHF is characterized by left ventricular failure (systolic dysfunction) and fluid accumulation in the lungs, with the underlying cause being attributed to one or more heart or cardiovascular disease states including coronary artery disease, myocardial infarction, hypertension, diabetes, valvular heart disease, and cardiomyopathy. The term "diastolic congestive heart failure" refers to a state of CHF characterized by impairment in the ability of the heart to properly relax and fill with blood. Conversely, the term "systolic congestive heart failure" refers to a state of CHF characterized by impairment in the ability of the heart to properly contract and eject blood.

As will be appreciated by one of skill in the art, physiological disorders may present as a "chronic" condition, or an "acute" episode. The term "chronic", as used herein, means a condition of slow progress and long continuance. As such, a chronic condition is treated when it is diagnosed and treatment continued throughout the course of the disease. Conversely, the term "acute" means an exacerbated event or attack, of short course, followed by a period of remission. Thus, the treatment of physiological disorders contemplates both acute events and chronic conditions. In an acute event, compound is administered at the onset of symptoms and discontinued when the symptoms disappear.

**Pharmaceutical composition**

In order to use a compound of formula Ia, or a pharmaceutically acceptable salt thereof, for the therapeutic treatment of a mammal, said active ingredient is normally formulated in accordance with standard pharmaceutical practice as a pharmaceutical composition.
Therefore another aspect the present invention provides a pharmaceutical composition comprising a compound of formula Ia or Ib, or a pharmaceutically acceptable salt thereof, (active ingredient) and a pharmaceutically acceptable adjuvant, diluent or carrier. One embodiment relates to the use of a pharmaceutical composition comprising a compound of formula Ia, or a pharmaceutically acceptable salt thereof, for treating a glucocorticoid receptor mediated disease state (such as a disease state described above), an inflammatory condition, respiratory disorder, asthma and/or COPD.

A further aspect the present invention provides a process for the preparation of said composition comprising mixing the active ingredient with a pharmaceutically acceptable adjuvant, diluent or carrier. Depending on the mode of administration, the pharmaceutical composition can comprise from 0.05 to 99 %w (per cent by weight), for example from 0.05 to 80 %w, such as from 0.10 to 70 %w (for example from 0.10 to 50 %w), of active ingredient, all percentages by weight being based on total composition.

A pharmaceutical composition of the present invention can be administered in a standard manner for the disease condition that it is desired to treat, for example by topical (such as to the lung and/or airways or to the skin), oral, rectal or parenteral administration. Thus, a compound of formula Ia, or a pharmaceutically acceptable salt thereof, may be formulated into the form of, for example, an aerosol, a powder (for example dry or dispersible), a tablet, a capsule, a syrup, a granule, an aqueous or oily solution or suspension, an (lipid) emulsion, a suppository, an ointment, a cream, drops, or a sterile injectable aqueous or oily solution or suspension.

In one embodiment a compound of formula Ia or Ib, or a pharmaceutically acceptable salt thereof, is administered orally.

In another embodiment a compound of formula Ia or Ib, or a pharmaceutically acceptable salt thereof, is administered by inhalation.
Buffers, pharmaceutically-acceptable cosolvents such as polyethylene glycol, polypropylene glycol, glycerol or ethanol or complexing agents such as hydroxy-propyl β-cyclodextrin may be used to aid formulation.

The above formulations may be obtained by conventional procedures well known in the pharmaceutical art. Tablets may be enteric coated by conventional means, for example to provide a coating of cellulose acetate phthalate.

The invention further relates to a combination therapy or composition wherein a compound of formula Ia, or a pharmaceutically acceptable salt thereof, or a pharmaceutical composition comprising a compound of formula Ia or Ib, or a pharmaceutically acceptable salt thereof, is administered concurrently (possibly in the same composition) or sequentially with one or more agents for the treatment of any of the above disease states.

For example, for the treatment of rheumatoid arthritis, osteoarthritis, COPD, asthma or allergic rhinitis a compound of formula Ia or Ib, or a pharmaceutically acceptable salt thereof, can be combined with one or more agents for the treatment of such a condition. Where such a combination is to be administered by inhalation, then the one or more agents is selected from the list comprising:

- a PDE4 inhibitor including an inhibitor of the isoform PDE4D;
- a selective β₂ adrenoceptor agonist such as metaproterenol, isoproterenol, isoprenaline, albuterol, salbutamol, formoterol, salmeterol, terbutaline, orciprenaline, bitolterol mesylate, pirbuterol or indacaterol;
- a muscarinic receptor antagonist (for example a M1, M2 or M3 antagonist, such as a selective M3 antagonist) such as ipratropium bromide, tiotropium bromide, oxtropium bromide, pirenzepine or telenzepine;
- a modulator of chemokine receptor function (such as a CCR1 receptor antagonist);
- an inhibitor of p38 kinase function;
- an inhibitor of matrix metalloproteases, such as targeting MMP-2, -9 or MMP-12; or,
- an inhibitor of neutrophil serine proteases, such as neutrophil elastase or proteinase 3.
In another embodiment of the invention where such a combination is for the treatment of COPD, asthma or allergic rhinitis, a compound of formula Ia or Ib, or a pharmaceutically acceptable salt thereof, can be administered by inhalation or by the oral route and the other agent, e.g. xanthine (such as aminophylline or theophylline) can be administered by inhalation or by the oral route. A compound of formula Ia or Ib, or a pharmaceutically acceptable salt thereof, and the other agent, e.g. xanthine may be administered together. They may be administered sequentially. Or they may be administered separately.

At 0°C to 10°C 93g (495 mmol) 5-Brom-2-methoxypyridin were added over 30 min and stirred for 60min at room temperature. In parallel 91,91g (396 mmol) [(1S)-2-(methoxymethylamino)-1-methyl-2-oxoethyl] carbamic acid t-butyl ester were suspended
in 425 ml THF and over 40 min at 20° bis 25°C 198 ml isopropylmagnesium chlorid (2M in THF, 396 mmol) were added and stirred for additional 15 minutes at room temperature. The clear LiCl/5-Brom-2-methoxypyridin/iPrMgBr solution was slowly added to the Weinreb amid suspension at 20° to 25°C and stirred over night. The reaction mixture was cooled to 2°C and added slowly to a mixture of 70 ml conc. HCl and 210 ml water at 2°C. While the addition an external cooling bath at -15°C was used to keep the internal temperature in the range of 0° to 5°C. The pH was adjusted to 5 and 210 ml tert.-butyl methyl ether were added and the mixture stirred for 15 min at room temperature, phases were separated and the organic phase was washed with water (210 ml) and brine (210 ml). The solvent was evaporated and the residue resolved in 130 ml THF. 1050 ml n-heptane were added and the mixture was heated to 60°C to form a single phase. The volume was reduced to 675 ml and the mixture cooled to room temperature over 1 h and cooled to 2°C over 30 min. After 60 min at 2°C the product is filtered off and dried in vacuum to yield 87,45 g [(1S)-2-(6-methoxy-3-pyridinyl)-1-methyl-2-oxoethyl]-carbamic acid t-butyl ester.

Assay

Human Glucocorticoid Receptor (GR) Assay

The radioligand GR binding assay is based on a competition assay using ³H-labeled Dexamethasone. Dexamethasone is known to bind in the ligand binding domain of GR and compete for binding with endogenous ligands like e.g. cortisol (Necela, 2003). In the GR radioligand binding assay, test compounds were serially diluted in semi-log steps (10 concentrations) with a final concentration of 10 µM. Test compounds (1µL) and
controls (1µL) in 100% DMSO were added to 96 Greiner V-bottom polypropylene plates. 0% control was 6.7% DMSO (final concentration in assay) and 100% control was 6.7 µM Dexamethasone.

The full length GR was diluted to a final concentration of 3.3% (0.495 mg/ml) in assay buffer (20 mM Tris-HCl, 1 mM EDTA, 10% (w/v) Glycerol, 20 mM Sodium molbydate, pH 7.4). 45 µL of GR was added to each well and the plates were incubated for 15 min at room temperature.

\(^{3}H\)-dexamethasone solution was diluted to a concentration of 70 nM in assay buffer (7 nM final assay concentration) and 5 µL was added to each well. The samples were mixed for 5 min using a plate shaker at 700 rpm, before incubation for 2 h at room temperature.

50 µL ice-cold charcoal solution (pH 7.4: 2% Charcoal, 0.2% Dextran T70 in 20 mM Tris-HCl, 1 mM EDTA and 20 mM Sodium molbydate) was added to each well and the samples were mixed on plate shaker for 5 minutes. The plate was then centrifuged for 1.5 min at 1500 rpm, the samples (80 µL) were transferred from each well to a filter plate (Millipore, 0.45 µm, MHVBN45) on a vacuum manifold and then collected into new plates (Greiner, 96 well white/transparent, 655095). The filter plate was washed once with 20 µL of water and then 100 µL of scintillation liquid was added to each well and mixed by incubation on plate shaker for 5 min. Radioactivity was measured in a 1450 Microbeta Trilux Reader (Wallac) counting cpm for 2 minutes per well. The data obtained from each replicate experiment were analysed using the software ActivityBase, version 5.4.3 (ID Business Solutions Ltd) and IC\(_{50}\) values were calculated.
