Invention Title: Inhibitors of Serine Proteases, Particularly HCV NS3-NS4A Protease

The following statement is a full description of this invention, including the best method of performing it known to the applicant:

TECHNICAL FIELD OF THE INVENTION

[0001] The present invention relates to compounds that inhibit serine protease activity, particularly the activity of hepatitis C virus NS3-NS4A protease. As such, they act by interfering with the life cycle of the hepatitis C virus and are also useful as antiviral agents. The invention further relates to pharmaceutical compositions comprising these compounds either for ex vivo use or for administration to a patient suffering from HCV infection. The invention also relates to processes for preparing the compounds and methods of treating an HCV infection in a patient by administering a pharmaceutical composition comprising a compound of this invention.

BACKGROUND OF THE INVENTION

Upon first exposure to HCV only about 20% of infected individuals develop acute clinical hepatitis while others appear to resolve the infection spontaneously. In almost 70% of instances, however, the virus establishes a chronic infection that persists for decades [S. Iwarson, "The Natural Course of Chronic Hepatitis," FEMS Microbiology Reviews, 14, pp. 201-204 (1994); D. Lavanchy, "Global Surveillance and Control of Hepatitis C," J. Viral Hepatitis, 6, pp. 35-47 (1999)]. This usually results in recurrent and progressively worsening liver inflammation, which often leads to more severe disease states such as cirrhosis and hepatocellular carcinoma [M.C. Kew, "Hepatitis C and Hepatocellular Carcinoma", FEMS Microbiology Reviews, 14, pp. 211-220 (1994); I. Saito et. al., “Hepatitis C Virus Infection is Associated with the Development of Hepatocellular Carcinoma,” Proc. Natl. Acad. Sci. USA, 87, pp. 6547-6549 (1990)]. Unfortunately, there are no broadly effective treatments for the debilitating progression of chronic HCV.

HCV is a RNA virus of the Flaviviridae family. Acute infection with HCV causes a generally mild, often asymptomatic, acute hepatitis. However, at least 85% of patients infected with HCV do not fully clear the virus and develop chronic infection of the liver. Once chronic hepatitis C is established, spontaneous clearance of the virus is rare and the majority of patients with chronic hepatitis C develop slowly progressive liver disease. Twenty years after infection, most patients have evidence of ongoing chronic hepatitis and at least 20% have cirrhosis. Long-term sequelae of chronic hepatitis C include cirrhosis, hepatic failure, and hepatocellular carcinoma. It is estimated that HCV infects 170 million persons worldwide. Over the next ten years, as a larger proportion of patients who are currently infected enter the third decade of
their infection, the number of deaths attributed to hepatitis C is expected to significantly increase. 

[0005] Typical symptoms of HCV infection include elevated ALT, positive test for anti-HCV antibodies, presence of HCV as demonstrated by a positive test for HCV-RNA, clinical stigmata of chronic liver disease, or hepatocellular damage. 

[0007] The HCV NS protein 3 (NS3) contains a serine protease activity that helps process the majority of the viral enzymes, and is thus considered essential for viral replication and infectivity. It is known that mutations in the yellow fever
virus NS3 protease decrease viral infectivity [Chambers, T.J. et. al., "Evidence that the N-terminal Domain of Nonstructural Protein NS3 From Yellow Fever Virus is a Serine Protease Responsible for Site-Specific Cleavages in the Viral Polyprotein", Proc. Natl. Acad. Sci. USA, 87, pp. 8898-8902 (1990)]. The first 181 amino acids of NS3 (residues 1027-1207 of the viral polyprotein) have been shown to contain the serine protease domain of NS3 that processes all four downstream sites of the HCV polyprotein [C. Lin et al., "Hepatitis C Virus NS3 Serine Proteinase: Trans-Cleavage Requirements and Processing Kinetics", J. Virol., 68, pp. 8147-8157 (1994)].

The HCV NS3 serine protease and its associated cofactor, NS4A, helps process all of the viral enzymes, and is thus considered essential for viral replication. This processing appears to be analogous to that carried out by the human immunodeficiency virus aspartyl protease, which is also involved in viral enzyme processing. HIV protease inhibitors, which inhibit viral protein processing, are potent antiviral agents in man, indicating that interrupting this stage of the viral life cycle results in therapeutically active agents. Consequently HCV NS3 serine protease is also an attractive target for drug discovery.

Furthermore, the current understanding of HCV has not led to any other satisfactory anti-HCV agents or treatments. Until recently, the only established therapy for HCV disease was interferon treatment (see, e.g., PCT publication No. WO 02/18369, the disclosure of which is herein incorporated by reference). However, interferons have significant side effects [M. A. Wlaker et al., "Hepatitis C Virus: An Overview of Current Approaches and Progress," DDT, 4, pp. 518-29 (1999); D. Moradpour et al., "Current and Evolving Therapies for Hepatitis C," Eur. J. Gastroenterol. Hepatol., 11, pp. 1199-1202 (1999); H. L. A. Janssen et al. "Suicide Associated with Alfa-Interferon Therapy for Chronic Viral Hepatitis," J. Hepatol., 21, pp. 241-

and induce long term remission in only a fraction (~ 25%) of cases [O. Weiland, "Interferon Therapy in Chronic Hepatitis C Virus Infection", FEMS Microbiol. Rev., 14, pp. 279-288 (1994)].

Ribavirin, a broad spectrum antiviral agent, has reported activity in chronic hepatitis C. Recent introductions of the pegylated forms of interferon (PEG-Intron® and Pegasys®) and the combination therapy of ribavirin and pegylated interferon (Rebetrol®) have resulted in only modest improvements in remission rates and only partial reductions in side effects (see, e.g., United States patent 6,299,872, United States patent 6,387,365, United States patent 6,172,046, United States patent 6,472,373, the disclosures of which are incorporated herein by reference). Moreover, the prospects for effective anti-HCV vaccines remain uncertain.

[0010] Thus, there is a need for more effective anti-HCV therapies particularly compounds that may be used as protease inhibitors. Such inhibitors would have therapeutic potential as protease inhibitors, particularly as serine protease inhibitors, and more particularly as HCV NS3 protease inhibitors. Specifically, such compounds may be useful as antiviral agents, particularly as anti-HCV agents.

[0011] The present invention provides compounds that are potent binders and inhibitors of the HCV NS3/NS4A serine protease and are, therefore, useful as anti-HCV agents.

Definitions

[0015] The term "aryl" as used herein means a monocyclic or bicyclic carbocyclic aromatic ring system. Phenyl is an example of a monocyclic aromatic ring system. Bicyclic aromatic ring systems include systems wherein both rings are aromatic, e.g., naphthyl, and systems wherein only one of the two rings is aromatic, e.g., tetralin. It is understood that as used herein, the term "(C6-C10)-aryl-" includes any one of a C6, C7, C8, C9, and C10 monocyclic or bicyclic carbocyclic aromatic ring.

[0016] The term "heterocyclyl" as used herein means a monocyclic or bicyclic non-aromatic ring system having 1 to 3 heteroatom or heteroatom groups in each ring selected from O, N, NH, S, SO, and SO₂ in a chemically stable arrangement. As used herein, P1, P2, P3, P4 refer to the residues of an HCV protease inhibitor as defined in the art [J. A. Landro et al., "Mechanistic Role of an NS4A Peptide Cofactor with the Truncated NS3 Protease of Hepatitis C Virus: Elucidation of the NS4A Stimulatory Effect via Kinetic analysis and Inhibitor Mapping", *Biochemistry*, 36, pp. 9340-9348 (1997)] and as such are well known to skilled practitioners.

The present invention provides potent binders and inhibitors of the HCV NS3/NS4a serine protease. In certain embodiments of compounds of formulae I and Ia of the present invention, the compounds have P4 caps that allow for additional hydrogen bonds with the enzyme backbone. In certain embodiments of the present invention, a P4 cap nitrogen atom and the carbonyl (adjacent to radical V or T in formulae I or Ia) form hydrogen bonds to the main chain carbonyl and NH groups respectively of the Cys-158 residue of the protease enzyme. In certain embodiments of the present invention, another hydrogen bond is formed by the NH moiety (represented by the N-R$_2$ group in formulae I and Ia, wherein R$_2$ is hydrogen) of the P3 group with the protease backbone. These P4 and P3 hydrogen bond interactions optimize the positioning of the P4 and P3 side chains in the HCV NS3/NS4a serine protease binding site. Additionally, the P2 spirocyclic proline group fills the P2 pocket and makes favorable van der Waals contact with the Arg-155 side chain in the HCV NS3/NS4A serine protease enzyme. This invention also provides W groups that bind efficiently to the catalytic site of the HCV NS3/NS4a serine protease located in the P1' pocket.

Scheme 1 above provides a general synthetic route for the preparation of compounds of formula IA wherein n, T, X, X', R^6, R^5, R^3, and R^1 are as defined in any of the embodiments herein. Intermediate 11 was prepared according to the procedures described by Schoellkopf, et al., Justus Liebigs Ann. Chem. GE, pp. 183-202 (1976) and Stemple et al., Organic Letters, 2(18), pp. 2769-2772 (2000). Compounds 1a-7a were prepared according to this scheme or variations thereof. As would be recognized by skilled practitioners, other suitable and commercially available coupling reagents may be used to prepare intermediates 5, 7, 9, and 12. Additionally, it will be recognized that the commercially available Boc protected amino acids represented by, for instance, Boc-R_3-COOH, may alternatively be substituted with the commercial Cbz protected amino acids. Suitable deprotection conditions to remove the Cbz protecting groups are known to those skilled in the art. Likewise the oxidation of intermediate 12 to compounds of formula IA can be accomplished using other suitable conditions known to the skilled artisan.
Scheme 1A above provides a synthetic route for the preparation of intermediate 46 from intermediate 40. Intermediate 40 was prepared according to the procedures described by Schoellkopf, et al., Justus Liebigs Ann. Chem. GE, pp. 183-202 (1976) and Stemple et al., Organic Letters, 2(18), pp. 2769-2772 (2000). Esterification to the ethyl ester hydrochloride 41 was accomplished using catalytic acidic conditions. Boc protection of the amine followed by basic hydrolysis afforded the Boc acid 43. Amine coupling with HN(R₆)₂ with EDC and succinic acid afforded amide 44 which was subsequently oxidized to the diketo amide 45 with Dess-Martin
periodinane. Boc removal under acidic conditions provided intermediate 46 as the hydrochloride salt wherein $R_5$ and $R_6$ are as defined in any of the embodiments herein.

The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally acceptable diluent or solvent, for example as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose, any bland fixed oil may be employed including synthetic mono- or di-glycerides. Fatty acids, such as oleic acid and its glyceride derivatives are useful in the preparation of injectables, as are natural pharmaceutically-acceptable oils, such as olive oil or castor oil, especially in their polyoxyethylated versions. These oil solutions or suspensions may also contain a long-chain alcohol diluent or dispersant, such as carboxymethyl cellulose or similar dispersing agents which are commonly used in the formulation of pharmaceutically acceptable dosage forms including emulsions and suspensions. Other commonly used surfactants, such as Tweens,
Spans and other emulsifying agents or bioavailability enhancers which are commonly used in the manufacture of pharmaceutically acceptable solid, liquid, or other dosage forms may also be used for the purposes of formulation.

[0156] Dosage levels of between about 0.01 and about 100 mg/kg body weight per day, preferably between about 0.5 and about 75 mg/kg body weight per day of the protease inhibitor compounds described herein are useful in a monotherapy for the prevention and treatment of antiviral, particularly anti-HCV mediated disease. Typically, the pharmaceutical compositions of this invention will be administered from about 1 to about 5 times per day or alternatively, as a continuous infusion. Such administration can be used as a chronic or acute therapy. The amount of active ingredient that may be combined with the carrier materials to produce a single dosage form will vary depending upon the host treated and the particular mode of administration. A typical preparation will contain from about 5% to about 95% active compound (w/w). Preferably, such preparations contain from about 20% to about 80% active compound.

[0157] When the compositions of this invention comprise a combination of a compound of formula I or formula Ia and one or more additional therapeutic or prophylactic agents, both the compound and the additional agent should be present at dosage levels of between about 10 to 100%, and more preferably between about 10 to 80% of the dosage normally administered in a monotherapy regimen.

[0158] The pharmaceutical compositions of this invention may be orally administered in any orally acceptable dosage form including, but not limited to, capsules, tablets, aqueous suspensions or solutions. In the case of tablets for oral use, carriers that are commonly used include lactose and corn starch. Lubricating agents, such as magnesium stearate, are also typically added. For oral administration in a capsule form,
useful diluents include lactose and dried cornstarch. When aqueous suspensions are required for oral use, the active ingredient is combined with emulsifying and suspending agents. If desired, certain sweetening, flavoring or coloring agents may also be added.

Alternatively, the pharmaceutical compositions of this invention may be administered in the form of suppositories for rectal administration. These may be prepared by mixing the agent with a suitable non-irritating excipient that is solid at room temperature but liquid at rectal temperature and therefore will melt in the rectum to release the drug. Such materials include cocoa butter, beeswax and polyethylene glycols.

The pharmaceutical compositions of this invention may also be administered topically, especially when the target of treatment includes areas or organs readily accessible by topical application, including diseases of the eye, the skin, or the lower intestinal tract. Suitable topical formulations are readily prepared for each of these areas or organs.

Topical application for the lower intestinal tract may be effected in a rectal suppository formulation (see above) or in a suitable enema formulation. Topically-transdermal patches may also be used.

For topical applications, the pharmaceutical compositions may be formulated in a suitable ointment containing the active component suspended or dissolved in one or more carriers. Carriers for topical administration of the compounds of this invention include, but are not limited to, mineral oil, liquid petrolatum, white petrolatum, propylene glycol, polyoxyethylene, polyoxypropylene compound, emulsifying wax and water. Alternatively, the pharmaceutical compositions may be formulated in a suitable lotion or cream containing the active components suspended or dissolved in one or more pharmaceutically acceptable carriers. Suitable carriers include, but are not limited to, mineral oil, sorbitan
monostearate, polysorbate 60, cetyl esters wax, cetearyl alcohol, 2-octyldodecanol, benzyl alcohol and water.

[0163] For ophthalmic use, the pharmaceutical compositions may be formulated as micronized suspensions in isotonic, pH adjusted sterile saline, or, preferably, as solutions in isotonic, pH adjusted sterile saline, either with or without a preservative such as benzylalkonium chloride. Alternatively, for ophthalmic uses, the pharmaceutical compositions may be formulated in an ointment such as petrolatum.

[0164] The pharmaceutical compositions of this invention may also be administered by nasal aerosol or inhalation. Such compositions are prepared according to techniques well known in the art of pharmaceutical formulation and may be prepared as solutions in saline, employing benzyl alcohol or other suitable preservatives, absorption promoters to enhance bioavailability, fluorocarbons, and/or other conventional solubilizing or dispersing agents.

[0165] In another embodiment, the pharmaceutical compositions are formulated for oral administration.

[0167] If an embodiment of this invention involves a CYP inhibitor, any CYP inhibitor that improves the pharmacokinetics of the relevant NS3/4A protease may be used in a method of this invention. These CYP inhibitors include, but are not limited to, ritonavir (WO 94/14436), ketoconazole, troleandomycin, 4-methyl pyrazole, cyclosporin, clomethiazole, cimetidine, itraconazole, fluconazole, miconazole, fluvoxamine, fluoxetine, nefazodone, sertraline, indinavir, nelfinavir, amprenavir, fosamprenavir, saquinavir, lopinavir, delavirdine, erythromycin, VX-944, and VX-497. According to one embodiment, the CYP
inhibitors include ritonavir, ketoconazole, troleandomycin, 4-methyl pyrazole, cyclosporin, and clomethiazole.

[0169] A CYP inhibitor employed in this invention may be an inhibitor of only one isozyme or more than one isozyme. If the CYP inhibitor inhibits more isozyme, the inhibitor may nevertheless inhibit one isozyme more selectively than another isozyme. Any such CYP inhibitors may be used in a method of this invention.

[0170] In a method of this invention, the CYP inhibitor may be administered together with the Hepatitis C virus NS3/4A protease inhibitor in the same dosage form or in separate dosage forms.

[0171] If the CYP inhibitor and protease inhibitor are administered in separate dosage forms, each inhibitor may be administered about simultaneously. Alternatively, the CYP inhibitor may be administered in any time period around administration of the protease inhibitor. That is, the CYP inhibitor may be administered prior to, together with, or following the NS3/4A protease inhibitor. The time period of administration should be such that the CYP inhibitor affects the metabolism of the protease inhibitor. For example, if the protease inhibitor is administered first, the CYP inhibitor should be administered before the protease inhibitor is substantially metabolized and/or excreted (e.g., within the half-life of the protease inhibitor).

[0172] In another embodiment, the compositions of this invention additionally comprise another anti-viral agent, preferably an anti-HCV agent. Such anti-viral agents include, but are not limited to, immunomodulatory agents, such as α-, β-, and γ-interferons, pegylated derivatized interferon-α compounds,

[0173] The term "interferon" as used herein means a member of a family of highly homologous species-specific proteins that inhibit viral replication and cellular proliferation, and modulate immune response, such as interferon alpha, interferon beta, or interferon gamma. The Merck Index, entry 5015, Twelfth Edition.

[0174] Upon improvement of a patient's condition, a maintenance dose of a compound, composition or combination of this invention may be administered, if necessary. Subsequently, the dosage or frequency of administration, or both, may be reduced, as a function of the symptoms, to a level at which the improved condition is retained when the symptoms have been alleviated to the desired level, treatment should cease. Patients may, however, require intermittent treatment on a long-term basis upon any recurrence of disease symptoms.

[0175] It should also be understood that a specific dosage and treatment regimen for any particular patient will depend upon a variety of factors, including the activity of the specific compound employed, the age, body weight, general health, sex, diet, time of administration, rate of excretion, drug combination, and the judgment of the treating physician and the severity of the particular disease being treated. The amount of active ingredients will also depend upon the
particular described compound and the presence or absence and
the nature of the additional anti-viral agent in the
composition.

According to another embodiment, the invention
provides a method for treating a patient infected with a virus
characterized by a virally encoded serine protease that is
necessary for the life cycle of the virus by administering to

said patient an anti-viral agent preferably an anti-HCV agent.
Such anti-viral agents include, but are not limited to,
immunomodulatory agents, such as α-, β-, and γ-interferons,
pegylated derivatized interferon-α compounds, and thymosin;
other anti-viral agents, such as ribavirin, amantadine, and
telbivudine; other inhibitors of hepatitis C proteases (NS2-NS3
inhibitors and NS3-NS4A inhibitors); inhibitors of other targets
in the HCV life cycle, including metalloprotease, helicase and
polymerase inhibitors; inhibitors of internal ribosome entry;
broad-spectrum viral inhibitors, such as IMPDH inhibitors (e.g.,
compounds of United States Patent 5,807,876, 6,498,178,
6,344,465, 6,054,472, WO 97/40028, WO 98/40381, WO 00/56331, and
mycophenolic acid and derivatives thereof, and including, but
not limited to VX-497, VX-148, and/or VX-944); or combinations

This method comprises the steps of providing a compound of this invention attached to a solid support; contacting said solid support with a sample containing a viral serine protease under conditions that cause said protease to bind to said solid support; and eluting said
serine protease from said solid support. Preferably, the viral serine protease isolated by this method is HCV NS3-NS4A protease.

Example 1

3-acetyl-4,5-dimethyl-2-pyrrole carboxylic acid (5b)
A solution of sodium nitrite (36.9 g, 0.534 mol) in 70 mL of water was added dropwise to a stirred solution of ethylacetoacetate (70 g, 0.538 mol) in 1401 mL of glacial acetic acid at 0°C. After the addition was complete, the light yellow reaction mixture was allowed to warm to room temperature. After 30 minutes, all the starting material had been consumed, the reaction was quenched with 350 mL of water and extracted with ethyl acetate (2 X 125 mL). The organic extracts were combined and washed with water (2 X 125 mL) and saturated sodium hydrogen carbonate aqueous solution (2 X 105 mL). The organic layer was dried with sodium sulfate and concentrated in vacuo to give 84.2 g (98%) of ethyl-2-Hydroxyimino-3-oxobutanoate 1b as a pale yellow oil.

\[ ^1H \text{NMR (CDCl}_3\text{)} \delta 10.3 (s, 1H), 4.2 (q, 2H), 2.3 (s, 3H), 1.3 (t, 3H) \text{ ppm.} \]

Crushed sodium (12.4 g, 0.540 mol) was added to a solution of 2-butanone (48.2 mL, 0.538 mol) and ethyl formate (43.47 mL, 0.538 mol) in dry ether (540 mL) with vigorous mechanical stirring over a period of 1 h, during which time the mixture was chilled in an ice-salt bath. The mixture was then stirred at room temp. for 14 hours. After cooling the reaction mixture to 4°C for a few hours, the precipitated sodium salt was obtained by filtration and washed thoroughly with cold, dry ether to afford 49.3 g (75%) of the desired sodium salt of 2-methy-3-oxobutyaldehyde 2b. \[ ^1H \text{NMR (DMSO-d}_6\text{)} \delta 9.1 (s, 1H), 1.9 (s, 3H), 1.3 (s, 3H) \text{ ppm.} \]

Sodium salt 2b (49.3 g, 0.404 mol) and oxime 1b (64.23, 0.404 mol) were stirred in 300 mL of 70% acetic acid/30% water and warmed to 50°C. Zinc powder (42.21 g, 0.646 mol) was added portion-wise over 30 minutes maintaining the temperature below 100°C. When the addition was complete, the suspension was refluxed for 15 minutes, then poured into 4 L of ice-water. After a short time, the product precipitated out to
give, after filtration, 30.1 g (45%) of the desired ethyl-4,5-dimethyl-2-pyrrole carboxylate 3b. $^1$H NMR (CDCl$_3$) $\delta$ 9.0 (bs, 1H), 6.7 (s, 1H), 4.3 (q, 2H), 2.3 (s, 3H), 2.0 (s, 3H), 1.3 (t, 3H) ppm.

5 [0189] To a solution of aluminum chloride (50.19 g, 0.376 mol) in dry dichloroethane (580 mL) at 25°C was added slowly acetic anhydride (17.75 mL, 0.188 mol). The resulting mixture was stirred at room temp. for 10 minutes, then a solution of pyrrole 3b (10.49 g, 0.0627 mol) in dichloroethane (30 mL) was added and the reaction mixture was stirred at room temp. for 2 hours. After an additional 3 hours at 80°C, the mixture was poured into ice water and extracted with dichloromethane. The organic layer was dried with anhydrous sodium sulfate and concentrated in vacuo to an orange residue. Short plug filtration over silica gel (30% ethyl acetate / 70% hexanes) gave 7.5 g (60%) of ethyl-3-acetyl-4,5-dimethyl-2-pyrrole carboxylate 4b. $^1$H NMR (CDCl$_3$) $\delta$ 9.0 (bs, 1H), 4.3 (q, 2H), 2.7 (s, 3H), 2.1 (s, 3H), 1.9 (s, 3H), 1.3 (t, 3H) ppm.

[0190] A mixture of pyrrole ester 4b (8.2 g, 0.0392 mol), in ethanol and 100 mL of 10% potassium hydroxide were refluxed for 1 hour. The mixture was cooled and concentrated in vacuo to an oil. Water was added to the oil, the mixture acidified with dilute HCl and extracted with ether. The organic phase was dried with anh. sodium sulfate and concentrated in vacuo to a solid residue. The compound was recrystallized in 80 mL of ethanol to give 5.8 g of pure 3-acetyl-4,5-dimethyl-2-pyrrole carboxylic acid 5b as a solid. $^1$H NMR (DMSO-d$_6$) $\delta$ 2.5 (s, 3H), 2.2 (s, 3H), 2.0 (s, 3H) ppm.

Example 4

HCV Replicon Cell Assay Protocol:

Cells containing hepatitis C virus (HCV) replicon were maintained in DMEM containing 10% fetal bovine serum (FBS), 0.25 mg per ml of G418, with appropriate supplements (media A).
On day 1, replicon cell monolayer was treated with a trypsin:EDTA mixture, removed, and then media A was diluted into a final concentration of 100,000 cells per ml with 10,000 cells in 100 ul were plated into each well of a 96-well tissue culture plate, and cultured overnight in a tissue culture incubator at 37°C.

On day 2, compounds (in 100% DMSO) were serially diluted into DMEM containing 2% FBS, 0.5% DMSO, with appropriate supplements (media B). The final concentration of DMSO was maintained at 0.5% throughout the dilution series.

Media on the replicon cell monolayer was removed, and then media B containing various concentrations of compounds was added. Media B without any compound was added to other wells as no compound controls.

Cells were incubated with compound or 0.5% DMSO in media B for 48 hours in a tissue culture incubator at 37°C. At the end of the 48-hour incubation, the media was removed, and the replicon cell monolayer was washed once with PBS and stored at -80°C prior to RNA extraction.

Culture plates with treated replicon cell monolayers were thawed, and a fixed amount of another RNA virus, such as Bovine Viral Diarrhea Virus (BVDV) was added to cells in each well. RNA extraction reagents (such as reagents from RNeasy kits) were added to the cells immediately to avoid degradation of RNA. Total RNA was extracted according the instruction of manufacturer with modification to improve extraction efficiency and consistency. Finally, total cellular RNA, including HCV replicon RNA, was eluted and stored at -80°C until further processing.

A Taqman real-time RT-PCR quantification assay was set up with two sets of specific primers and probe. One was for HCV and the other was for BVDV. Total RNA extractants from treated HCV replicon cells was added to the PCR reactions for quantification of both HCV and BVDV RNA in the same PCR well.
Experimental failure was flagged and rejected based on the level of BVDV RNA in each well. The level of HCV RNA in each well was calculated according to a standard curve run in the same PCR plate. The percentage of inhibition or decrease of HCV RNA level due to compound treatment was calculated using the DMSO or no compound control as 0% of inhibition. The IC50 (concentration at which 50% inhibition of HCV RNA level is observed) was calculated from the titration curve of any given compound.
