Title: APOPTOSIS-INDUCING AGENTS FOR THE TREATMENT OF CANCER AND IMMUNE AND AUTOIMMUNE DISEASES

Abstract: Disclosed are compounds which inhibit the activity of anti-apoptotic Bcl-2 proteins, compositions containing the compounds and methods of treating diseases during which is expressed anti-apoptotic Bcl-2 protein.
APOPTOSIS-INDUCING AGENTS FOR THE TREATMENT OF CANCER AND IMMUNE AND AUTOIMMUNE DISEASES

This application is a continuation-in-part of U.S. Patent Application Serial No. 12/787,682, filed May 26, 2010, which claims priority to United States Provisional Application Serial No. 61/181,203 filed May 26, 2009, both of which are incorporated by reference in their entirety.

FIELD OF THE INVENTION

This invention pertains to compounds which inhibit the activity of Bcl-2 anti-apoptotic proteins, compositions containing the compounds, and methods of treating diseases during which anti-apoptotic Bcl-2 proteins are expressed.

BACKGROUND OF THE INVENTION

Anti-apoptotic Bcl-2 proteins are associated with a number of diseases. There is therefore an existing need in the therapeutic arts for compounds which inhibit the activity of anti-apoptotic Bcl-2 proteins.

Overexpression of Bcl-2 proteins correlates with resistance to chemotherapy, clinical outcome, disease progression, overall prognosis or a combination thereof in various cancers and disorders of the immune system.

SUMMARY OF THE INVENTION

In one aspect there is provided a compound, or a pharmaceutically acceptable salt thereof, wherein the compound is selected from the group consisting of:

DETAILED DESCRIPTION OF THE INVENTION

Variable moieties herein are represented by identifiers (capital letters with numerical and/or alphabetical superscripts) and may be specifically embodied.

It is meant to be understood that proper valences are maintained for all moieties and combinations thereof, that monovalent moieties having more than one atom are drawn from left to right and are attached through their left ends, and that divalent moieties are also drawn from left to right.

It is also meant to be understood that a specific embodiment of a variable moiety herein may be the same or different as another specific embodiment having the same identifier.

The term "alkenyl" as used herein, means a straight or branched hydrocarbon chain containing from 2 to 10 carbons and containing at least one carbon-carbon double bond. The term “Cₓ-Cᵧ alkenyl” means a straight or branched hydrocarbon chain containing at least one carbon-carbon double bond containing x to y carbon atoms. The term “Cₓ-Cᵧ alkenyl” means an alkenyl group containing 3-6 carbon atoms. Representative examples of alkenyl include, but are not limited to, buta-2,3-dienyl, ethenyl, 2-propenyl, 2-methyl-2-propenyl, 3-butenyl, 4-pentenyl, 5-hexenyl, 2-heptenyl, 2-methyl-1-heptenyl, and 3-decenyl.

The term "alkenylen" means a divalent group derived from a straight or branched chain hydrocarbon of 2 to 4 carbon atoms and contains at least one carbon-carbon double bond. The term “Cₓ-Cᵧ alkenylene” means a divalent group derived from a straight or branched hydrocarbon chain containing at least one carbon-carbon double bond and
containing x to y carbon atoms. Representative examples of alkenylene include, but are not limited to, -CH=CH- and -CH2CH=CH-.

The term "alkyl" as used herein, means a straight or branched, saturated hydrocarbon chain containing from 1 to 10 carbon atoms. **Compounds**

Geometric isomers may exist in the present compounds. Compounds of this invention may contain carbon-carbon double bonds or carbon-nitrogen double bonds in the E or Z configuration, wherein the term “E” represents higher order substituents on opposite sides of the carbon-carbon or carbon-nitrogen double bond and the term “Z” represents higher order substituents on the same side of the carbon-carbon or carbon-nitrogen double bond as determined by the Cahn-Ingold-Prelog Priority Rules. The compounds of this invention may also exist as a mixture of “E” and “Z” isomers. Substituents around a cycloalkyl or heterocycloalkyl are designated as being of cis or trans configuration. Furthermore, the invention contemplates the various isomers and mixtures thereof resulting from the disposal of substituents around an adamantane ring system. Two substituents around a single ring within an adamantane ring system are designated as being of Z or E relative configuration. For examples, see C. D. Jones, M. Kaselj, R. N. Salvatore, W. J. le Noble *J. Org. Chem.* 1998, 63, 2758-2760.

Compounds of this invention may contain asymmetrically substituted carbon atoms in the R or S configuration, in which the terms "R" and "S" are as defined by the IUPAC 1974 Recommendations for Section E, Fundamental Stereochemistry, Pure Appl. Chem. (1976) 45, 13-10. Compounds having asymmetrically substituted carbon atoms with equal amounts of R and S configurations are racemic at those carbon atoms. Atoms with an excess of one configuration over the other are assigned the configuration present in the higher amount, preferably an excess of about 85%-90%, more preferably an excess of about 95%-99%, and still more preferably an excess greater than about 99%. Accordingly, this invention includes racemic mixtures, relative and absolute stereoisomers, and mixtures of relative and absolute stereoisomers.
Isotope Enriched or Labeled Compounds

Compounds of the invention can exist in isotope-labeled or -enriched form containing one or more atoms having an atomic mass or mass number different from the atomic mass or mass number most abundantly found in nature. Isotopes can be radioactive or non-radioactive isotopes. Isotopes of atoms such as hydrogen, carbon, phosphorous, sulfur, fluorine, chlorine, and iodine include, but are not limited to, $^2$H, $^3$H, $^{13}$C, $^{14}$C, $^{15}$N, $^{18}$O, $^{32}$P, $^{35}$S, $^{18}$F, $^{36}$Cl, and $^{125}$I. Compounds that contain other isotopes of these and/or other atoms are within the scope of this invention.

In another embodiment, the isotope-labeled compounds contain deuterium ($^2$H), tritium ($^3$H) or $^{14}$C isotopes. Isotope-labeled compounds of this invention can be prepared by the general methods well known to persons having ordinary skill in the art. Such isotope-labeled compounds can be conveniently prepared by carrying out the procedures disclosed in the Examples disclosed herein and Schemes by substituting a readily available isotope-labeled reagent for a non-labeled reagent. In some instances, compounds may be treated with isotope-labeled reagents to exchange a normal atom with its isotope, for example, hydrogen for deuterium can be exchanged by the action of a deuteric acid such as D$_2$SO$_4$/D$_2$O. In addition to the above, relevant procedures and intermediates are disclosed, for instance, in Lizondo, J et al., Drugs Fut, 21(11), 1116 (1996); Brickner, S J et al., J Med Chem, 39(3), 673 (1996); Mallesham, B et al., Org Lett, 5(7), 963 (2003); PCT publications WO1997010223, WO2005099353, WO1995007271, WO2006008754; US Patent Nos. 7538189; 7534814; 7531685; 7528131; 7521421; 7514068; 7511013; and US Patent Application Publication Nos. 20090137457; 20090131485; 20090131363; 20090118238; 20090111840; 20090105338; 20090105307; 20090105147; 20090093422; 20090088416; and 20090082471, the methods are hereby incorporated by reference.

The isotope-labeled compounds of the invention may be used as standards to determine the effectiveness of Bcl-2 inhibitors in binding assays. Isotope containing compounds have been used in pharmaceutical research to investigate the in vivo metabolic fate of the compounds by evaluation of the mechanism of action and metabolic pathway of the nonisotope-labeled parent compound (Blake et al. J. Pharm. Sci. 64, 3, 367-391 (1975)). Such metabolic studies are important in the design of safe, effective therapeutic drugs, either because the in vivo active compound administered to the patient or because the metabolites produced from the parent compound prove to be toxic or carcinogenic (Foster et al., Advances in Drug Research Vol. 14, pp. 2-36, Academic press, London, 1985; Kato et al., J.
In addition, non-radio active isotope containing drugs, such as deuterated drugs called “heavy drugs,” can be used for the treatment of diseases and conditions related to Bcl-2 activity. Increasing the amount of an isotope present in a compound above its natural abundance is called enrichment. Examples of the amount of enrichment include from about 0.5, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 16, 21, 25, 29, 33, 37, 42, 46, 50, 54, 58, 63, 67, 71, 75, 79, 84, 88, 92, 96, to about 100 mol%. Replacement of up to about 15% of normal atom with a heavy isotope has been effected and maintained for a period of days to weeks in mammals, including rodents and dogs, with minimal observed adverse effects (Czajka D M and Finkel A J, Ann. N.Y. Acad. Sci. 1960 84: 770; Thomson J F, Ann. New York Acad. Sci 1960 84: 736; Czajka D M et al., Am. J. Physiol. 1961 201: 357). Acute replacement of as high as 15%-23% in human fluids with deuterium was found not to cause toxicity (Blagojevic N et al. in "Dosimetry & Treatment Planning for Neutron Capture Therapy", Zamenhof R, Solares G and Harling O Eds. 1994. Advanced Medical Publishing, Madison Wis. pp.125-134; Diabetes Metab. 23: 251 (1997)).

Stable isotope labeling of a drug can alter its physico-chemical properties such as pKa and lipid solubility. These effects and alterations can affect the pharmacodynamic response of the drug molecule if the isotopic substitution affects a region involved in a ligand-receptor interaction. While some of the physical properties of a stable isotope-labeled molecule are different from those of the unlabeled one, the chemical and biological properties are the same, with one important exception: because of the increased mass of the heavy isotope, any bond involving the heavy isotope and another atom will be stronger than the same bond between the light isotope and that atom. Accordingly, the incorporation of an isotope at a site of metabolism or enzymatic transformation will slow said reactions potentially altering the pharmacokinetic profile or efficacy relative to the non-isotopic compound.

BiTE antibodies are bi-specific antibodies that direct T-cells to attack cancer cells by simultaneously binding the two cells. The T-cell then attacks the target cancer cell. Examples of BiTE antibodies include adecatumumab (Micromet MT201), blinatumomab
Without being limited by theory, one of the mechanisms by which T-cells elicit apoptosis of the target cancer cell is by exocytosis of cytolytic granule components, which include perforin and granzyme B. In this regard, Bcl-2 has been shown to attenuate the induction of apoptosis by both perforin and granzyme B. These data suggest that inhibition of Bcl-2 could enhance the cytotoxic effects elicited by T-cells when targeted to cancer cells (V.R. Sutton, D.L. Vaux and J.A. Trapani, *J. of Immunology* 1997, 158 (12), 5783).

SiRNAs are molecules having endogenous RNA bases or chemically modified nucleotides. The modifications do not abolish cellular activity, but rather impart increased stability and/or increased cellular potency. Examples of chemical modifications include phosphorothioate groups, 2'-deoxynucleotide, 2'-OCH₃-containing ribonucleotides, 2'-F-ribonucleotides, 2'-methoxyethyl ribonucleotides, combinations thereof and the like. The siRNA can have varying lengths (e.g., 10-200 bps) and structures (e.g., hairpins, single/double strands, bulges, nicks/gaps, mismatches) and are processed in cells to provide active gene silencing. A double-stranded siRNA (dsRNA) can have the same number of nucleotides on each strand (blunt ends) or asymmetric ends (overhangs). The overhang of 1-2 nucleotides can be present on the sense and/or the antisense strand, as well as present on the 5'- and/or the 3'-ends of a given strand. For example, siRNAs targeting Mcl-1 have been shown to enhance the activity of ABT-263, (i.e., N-(4-(4-((2-(4-chlorophenyl)-5,5-dimethyl-1-cyclohex-1-en-1-yl)methyl)piperazin-1-yl)benzoyl)-4-(((1R)-3-(morpholin-4-yl)-1-((phenylsulfanyl)methyl)propylamino)-3-((trifluoromethyl)sulfonyl)benzenesulfonamide) or ABT-737 (i.e., N-(4-(4-((4'-chloro(1,1'-biphenyl)-2-yl)methyl)piperazin-1-yl)benzoyl)-4-(((1R)-3-(dimethylamino)-1-(phenylsulfanyl)methyl)propylamino)-3-nitrobenzenesulfonamide) in multiple tumor cell lines (Tse et. al, *Cancer Research* 2008, 68(9), 3421 and references therein).

Multivalent binding proteins are binding proteins comprising two or more antigen binding sites. Multivalent binding proteins are engineered to have the three or more antigen binding sites and are generally not naturally occurring antibodies. The term “multispecific binding protein” means a binding protein capable of binding two or more related or unrelated targets. Dual variable domain (DVD) binding proteins are tetravalent or multivalent binding proteins binding proteins comprising two or more antigen binding sites. Such DVDs may be monospecific (i.e., capable of binding one antigen) or multispecific (i.e., capable of binding two or more antigens). DVD binding proteins comprising two heavy chain DVD polypeptides and two light chain DVD polypeptides are referred to as DVD Ig's. Each half of
a DVD Ig comprises a heavy chain DVD polypeptide, a light chain DVD polypeptide, and two antigen binding sites. Each binding site comprises a heavy chain variable domain and a light chain variable domain with a total of 6 CDRs involved in antigen binding per antigen binding site.

*General Procedure For Solid-Phase Peptide Synthesis (SPPS)*

Peptides were synthesized with, at most, 250 μmol preloaded Wang resin/vessel on an ABI 433A peptide synthesizer using 250 μmol scale Fastmoc™ coupling cycles. Preloaded cartridges containing 1 mmol standard Fmoc-amino acids, except for the position of attachment of the fluorophore, where 1 mmol Fmoc-Lys(Mtt)-OH was placed in the cartridge, were used with conductivity feedback monitoring. N-terminal acetylation was accomplished by using 1 mmol acetic acid in a cartridge under standard coupling conditions.

*Removal Of 4-Methyltrityl (Mtt) From Lysine*

The resin from the synthesizer was washed thrice with DCM and kept wet. 150 mL of 95:4:1 dichloromethane:triisopropylsilane:trifluoroacetic acid was flowed through the resin bed over 30 minutes. The mixture turned deep yellow then faded to pale yellow. 100 mL of DMF was flowed through the bed over 15 minutes. The resin was then washed thrice with DMF and filtered. Ninhydrin tests showed a strong signal for primary amine.

*Resin Labeling With 6-Carboxyfluorescein-NHS (6-FAM-NHS)*

The resin was treated with 2 equivalents 6-FAM-NHS in 1% DIEA/DMF and stirred or shaken at ambient temperature overnight. When complete, the resin was drained, washed thrice with DMF, thrice with (1× DCM and 1× methanol) and dried to provide an orange resin that was negative by ninhydrin test.

*General Procedure For Cleavage And Deprotection Of Resin-Bound Peptide*

Peptides were cleaved from the resin by shaking for 3 hours at ambient temperature in a cleavage cocktail consisting of 80% TFA, 5% water, 5% thioanisole, 5% phenol, 2.5% TIS, and 2.5% EDT (1 mL/0.1 g resin). The resin was removed by filtration and rinsing twice with TFA. The TFA was evaporated from the filtrates, and product was precipitated with ether (10 mL/0.1 g resin), recovered by centrifugation, washed twice with ether (10 mL/0.1 g resin) and dried to give the crude peptide.

*General Procedure For Purification Of Peptides*

The crude peptides were purified on a Gilson preparative HPLC system running Unipoint® analysis software (Gilson, Inc., Middleton, WI) on a radial compression column containing two 25 × 100 mm segments packed with Delta-Pak™ C18 15 μm particles with 100 Å pore size and eluted with one of the gradient methods listed below. One to two milliliters of crude peptide solution (10 mg/mL in 90% DMSO/water) was purified per
injection. The peaks containing the product(s) from each run were pooled and lyophilized. All preparative runs were run at 20 mL/min with eluents as buffer A: 0.1% TFA-water and buffer B: acetonitrile.

**General Procedure For Analytical HPLC**

Analytical HPLC was performed on a Hewlett-Packard 1200 series system with a diode-array detector and a Hewlett-Packard 1046A fluorescence detector running HPLC 3D ChemStation software version A.03.04 (Hewlett-Packard, Palo Alto, CA) on a 4.6 x 250 mm YMC column packed with ODS-AQ 5 μm particles with a 120 Å pore size and eluted with one of the gradient methods listed below after preequilibrating at the starting conditions for 7 minutes. Eluents were buffer A: 0.1% TFA-water and buffer B: acetonitrile. The flow rate for all gradients was 1 mL/min.

**F-Bak:** Peptide Probe Acetyl-(SEQ ID NO: 1)GQVGRQLAIIGDK(6-FAM)-(SEQ ID NO: 2)INR-NH₂

Fmoc-Rink amide MBHA resin was extended using the general peptide synthesis procedure to provide the protected resin-bound peptide (1.020 g). The Mtt group was removed, labeled with 6-FAM-NHS and cleaved and deprotected as described hereinabove to provide the crude product as an orange solid (0.37 g). This product was purified by RP-HPLC. Fractions across the main peak were tested by analytical RP-HPLC, and the pure fractions were isolated and lyophilized, with the major peak providing the title compound (0.0802 g) as a yellow solid; MALDI-MS m/z = 2137.1 [(M+H)+].

**Alternative Synthesis of Peptide Probe F-Bak:** Acetyl-(SEQ ID NO: 1)GQVGRQLAIIGDK(6-FAM)-(SEQ ID NO: 2)INR-NH₂

The protected peptide was assembled on 0.25 mmol Fmoc-Rink amide MBHA resin (Novabiochem) on an Applied Biosystems 433A automated peptide synthesizer running Fastmoc™ coupling cycles using pre-loaded 1 mmol amino acid cartridges, except for the fluorescein(6-FAM)-labeled lysine, where 1 mmol Fmoc-Lys(4-methyltrityl) was weighed into the cartridge. The N-terminal acetyl group was incorporated by putting 1 mmol acetic acid in a cartridge and coupling as described hereinabove. Selective removal of the 4-methyltrityl group was accomplished with a solution of 95:4:1 DCM:TIS:TFA (v/v/v) flowed through the resin over 15 minutes, followed by quenching with a flow of dimethylformamide. Single-isomer 6-carboxyfluorescein-NHS was reacted with the lysine side-chain in 1% DIEA in DMF and confirmed complete by ninhydrin testing. The peptide was cleaved from the resin and side-chains deprotected by treating with 80:5:5:2.5:2.5 TFA/water/phenol/
thioanisole/triisopropylsilane: 3,6-dioxo-1,8-octanedithiol (v/v/v/v/v/v), and the crude peptide was recovered by precipitation with diethyl ether. The crude peptide was purified by reverse-phase high-performance liquid chromatography, and its purity and identity were confirmed by analytical reverse-phase high-performance liquid chromatography and matrix-assisted laser-desorption mass-spectrometry (m/z = 2137.1 ((M+H)\(^{+}\)).

**Time Resolved-Fluorescence Resonance Energy Transfer (TR-FRET) Assay**

Representative compounds were serially diluted in dimethyl sulfoxide (DMSO) starting at 50 \(\mu\)M (2\(\times\) starting concentration; 10% DMSO) and 10 \(\mu\)L were transferred into a 384-well plate. Then 10 \(\mu\)L of a protein/probe/antibody mix was added to each well at final concentrations listed in TABLE 1. The samples are then mixed on a shaker for 1 minute and incubated for an additional 3 hours at room temperature. For each assay, the probe/antibody and protein/probe/antibody were included on each assay plate as negative and positive controls, respectively. Fluorescence was measured on the Envision (Perkin Elmer) using a 340/35 nm excitation filter and 520/525 (F-Bak peptide) and 495/510 nm (Tb-labeled anti-Histidine antibody) emission filters. Dissociation constants (\(K_i\)) are shown in TABLE 2 below and were determined using Wang’s equation (Wang Z.-X., An Exact Mathematical Expression For Describing Competitive Binding Of Two Different Ligands To A Protein Molecule. *FEBS Lett.* **1995**, 360:111-4).

Inhibition constants (Ki) for compounds according to the invention are shown in TABLE 2 below. Where the Ki for a compound is represented as “<” (less than) a certain numerical value, it is intended to mean that the binding affinity value (e.g., for Bcl-2) is lower than the limit of detection of the assay used. Inhibition constants were determined using Wang’s equation (Wang Zx., An Exact Mathematical Expression For Describing Competitive Binding Of Two Different Ligands To A Protein Molecule. *FEBS Lett.* **1995**, 360:111-4).

</table>
The inhibition constant (K_i) is the dissociation constant of an enzyme-inhibitor complex or a protein/small molecule complex, wherein the small molecule is inhibiting binding of one protein to another protein or peptide. So a large K_i value indicates a low binding affinity and a small K_i value indicates a high binding affinity.

TABLE 2 shows inhibition constants for the inhibition of a Bak BH3 peptide probe to Bcl-2 protein and indicate that compounds according to the invention have high binding affinities for anti-apoptotic Bcl-2 protein. The compounds are therefore expected to have utility in treatment of diseases during which anti-apoptotic Bcl-2 protein is expressed.

RS4;11 Cell Viability Assay

The acute lymphoblastic leukemia (ALL) cell line RS4;11 was used as the primary human cell line to assess the cellular activity of Bcl-2 selective agents in vitro and their efficacy in vivo. Previous studies have shown by BH3 profiling, a mitochondrial assay that classifies blocks in the intrinsic apoptotic pathway, that RS4;11 cells were highly dependant on BCL-2 for survival and sensitive to the Bcl-2 family member inhibitor ABT-737 (Blood, 2004).
The prevalence of Bcl-2 complexed to the proapoptotic BH3 protein Bim in RS4;11 suggests that these cells are "primed" or more susceptible to cell death by antagonism of the antiapoptotic protein Bcl-2 for which they depend on for survival.

RS4;11 cells were cultured in RPMI-1640 supplemented with 2 mM L-glutamine, 10% FBS, 1 mM sodium pyruvate, 2 mM HEPES, 1% penicillin/streptomycin (Invitrogen), 4.5 g/L glucose and maintained at 37 C containing 5% CO₂. To test for the cellular activity of compounds in vitro, cells were treated at 50,000 cells per well in 96-well microtiter plates in the presence of 10% human serum for 48 hours in a humidified chamber with 5% CO₂. Cell cytotoxicity EC₅₀ values were assessed using CellTiter Glo (Promega) according to the manufacturer’s recommendations. The EC₅₀ values were determined as a percentage of viable cells following treatment compared to the untreated control cells.

TABLE 3 shows the utility of compounds having Formula I to functionally inhibit anti-apoptotic Bcl-2 protein in a cellular context. The acute lymphoblastic leukemia (ALL) cell line RS4;11 has been shown by BH3 profiling, a mitochondrial assay that classifies blocks in the intrinsic apoptotic pathway, to be highly dependant on Bcl-2 for survival and is sensitive to the Bcl-2 family member inhibitor ABT-737 (Blood, 2008, Vol. 111, 2300-2309). The ability of compounds to kill RS4;11 cells is a direct measure of the compounds ability to inhibit anti-apoptotic Bcl-2 protein function. Compounds of Formula I are very effective in killing RS4;11 cells as demonstrated by low EC$_{50}$ values.
Compounds taught in U.S. Patent Application No. 12/631404, entitled “BCL-2-SELECTIVE APOPTOSIS-INDUCING AGENTS FOR THE TREATMENT OF CANCER AND IMMUNE DISEASES,” filed on December 4, 2009, have utility for the treatment of various cancers and auto-immune diseases due to their activity against Bcl-2 family proteins, and more specifically Bcl-2. These compounds bind to Bcl-2 with high affinity in a FRET based assay described in 12/631404. The administration of a one or more of these compounds to cells that are dependant on Bcl-2 or Bcl-2 family proteins for survival, such as the RS4:11 B-cell leukemia human tumor cell line, results in apoptosis, also known as programmed cell death. The amount of apoptosis caused by administration of the compound is represented by the EC50 in the cell viability assay, which is a measure of the number of living cells after administration of compound.

TABLE 4 identifies certain compounds (described below in Examples in 19, 20, 23 and 92 and described more fully in 12/631404, the disclosure of which is incorporated herein by reference) with the various substituents being defined by R, X and Y as set forth. As can be seen from TABLE 4, these compounds exhibit a trend of increasing binding affinity (Ki) for Bcl-2 with increasing levels of apoptosis, or cell death, in the Bcl-2 dependant tumor cell line RS4;11. On this basis, the inventors expect that compounds with even greater affinity towards Bcl-2 than those compounds shown in Table 4 will exhibit a similar trend, potentially eliciting even greater levels of apoptosis, when administered to cells dependent on Bcl-2 for survival.

Table 4. Selected compounds in US Patent Application No. 12/631404
To this end, binding affinity and cellular activity for compounds according to the present invention were compared with structurally similar indole compounds. In particular, the compounds of the present invention, in which a nitrogen is contained at a specific position within the heteroarene fused to the heteroaryl ring were compared with the corresponding indole compounds, which latter compounds lack only the specific nitrogen substitution included in the compounds of the present invention.

As can be seen in TABLE 5, compounds of the present invention having the specific nitrogen substitutions shown (i.e., compounds of Examples 1, 2, 3, 4, 5, 6, 9, 10, 11, 12, 13, 15, 16, and 17, where Z = N) in fact achieve relatively greater levels of apoptosis when administered to cells that depend on Bcl-2 for survival and have increased affinity towards Bcl-2 relative to the corresponding structural analogs lacking the specific nitrogen substitution (i.e., compounds of Examples 87, 88, 89, 90, 91, 19, 20, 21, 92, 22, 23, 93, and 94, respectively, where Z = C, taught in 9696USL2, the disclosure of which is incorporated herein by reference).

Specifically, the seventh column of TABLE 5 compares binding affinity of compounds of the present invention (the compound identified by the designated substituents in the uppermost row in each pair of rows set apart by blank rows) to corresponding compounds lacking the described nitrogen substitution. In each comparison, compounds of the present application (upper row of each pair of rows separated by a blank row) bind Bcl-2

As can be seen in TABLE 5, compounds of the present invention having the specific nitrogen substitutions shown (i.e., compounds of Examples 1, 2, 3, 4, 5, 6, 9, 10, 11, 12, 13, 15, 16, and 17, where Z = N) in fact achieve relatively greater levels of apoptosis when administered to cells that depend on Bcl-2 for survival and have increased affinity towards Bcl-2 relative to the corresponding structural analogs lacking the specific nitrogen substitution (i.e., compounds of Examples 87, 88, 89, 90, 91, 19, 20, 21, 92, 22, 23, 93, and 94, respectively, where Z = C, taught in 9696USL2, the disclosure of which is incorporated herein by reference).
with greater affinity to Bcl-2 than the corresponding analogs (lower row of each pair of rows separated by a blank row).

Further, column 8 of TABLE 5 compares the amount of apoptosis in the Bcl-2 dependant RS4;11 cell line achieved using compounds of the present invention (again the compound identified by the designated substituents in the uppermost row in each pair of rows set apart by blank rows) to that achieved using compounds of Examples 87, 88, 89, 90, 91, 19, 20, 21, 92, 22, 23, 93, and 94, where Z = C . In each comparison, compounds of the present invention (upper row of each pair of rows separated by a blank row) achieve greater extent of apoptosis in Bcl-2 dependent RS4;11 cells than the corresponding analogs (lower row of each pair of rows separated by a blank row).

The increase in binding affinity between the compounds of the present invention and corresponding analogs ranges from 2.7x to greater than 100x, and the increased potency in RS4;11 cells ranges from a 1.65x increase to greater than 10x increase.

As detailed below, a specific substitution of a nitrogen atom for a carbon atom leads to unexpected increase in binding affinity to antiapoptotic Bcl-2 and increase in potency in cell viability assays assessing apoptosis in Bcl-2 dependent cell lines.

This invention therefore comprises a series of compounds that demonstrate unexpected properties with respect to their binding to and inhibiting the activity of anti-apoptotic Bcl-2 protein to a significantly greater extent than corresponding analog compounds.

More specifically, compounds of the present invention contain a substitution pattern shown in the diagram below.

Other compounds that contain isomeric ring systems to that shown above, such as those rings systems containing a nitrogen adjacent to the oxygenated carbon within the ring, as shown below, are compromised by instability.
Specifically, this was discovered by the inventors in the following compound preparation. The intermediate structure F, that directly precedes the final product of the unstable compound, was prepared according to the route below. All intermediates A-F were stable and isolable using techniques known to those skilled in the art.

Intermediate F, shown in the scheme above, was reacted with intermediate G using standard coupling conditions that are known to those skilled in the art. The reaction mixture was analyzed via HPLC/MS to monitor the formation of a peak corresponding to the compound H. While this peak formed within hours of initiating the reaction below, the peak progressively disappeared during workup and chromatography, until it no longer was present. The lack of stability of the putative compound originates from the position of the nitrogen within the fused ring-system described above. This position, which is adjacent to the oxygen-
bearing carbon in the 5-substituted-1H-pyrrolo[2,3-c]pyridine ring system shown below and
described above, makes the compound H unstable.

It is expected that a compound containing the fused 5-substituted-1H-pyrrolo[3,2-b]pyridine ring system below would be similarly unstable, since the position of the nitrogen
is adjacent to the oxygen-bearing carbon within the ring.

Therefore, compounds with the 5-substituted-1H-pyrrolo[2,3-b]pyridines are
preferred over the isomeric compounds.

It is expected that, because compounds having Formula (I) bind to Bcl-2, they would
also have utility as binders to anti-apoptotic proteins having close structural homology to Bcl-
2, such as, for example, anti-apoptotic Bcl-X\textsubscript{L}, Bcl-w, Mcl-1 and Bfl-1/A1 proteins.

Involvement of Bcl-2 proteins in bladder cancer, brain cancer, breast cancer, bone
marrow cancer, cervical cancer, chronic lymphocytic leukemia, colorectal cancer, esophageal
cancer, hepatocellular cancer, lymphoblastic leukemia, follicular lymphoma, lymphoid
malignancies of T-cell or B-cell origin, melanoma, myelogenous leukemia, myeloma, oral

Sodium cyanoborohydride resin (1.334 g) was added to a mixture of EXAMPLE 253B (0.534 g) in tetrahydrofuran (11.72 mL) and acetic acid (3.91 mL). Oxetan-3-one (0.108 g) was added and the mixture was stirred at room temperature for 46 hours. Additional oxetan-3-one (0.108 g) was added and stirring was continued for another 2.5 days. The reaction mixture was set aside without stirring for 16 weeks and was then filtered to remove the resin. The resin was rinsed with methanol and tetrahydrofuran. The filtrate was concentrated, taken up in dichloromethane, washed with saturated NaHCO₃ solution and brine, dried (MgSO₄), filtered and concentrated. The concentrate was slurried in methanol and filtered. The solid was then slurried in CH₃CN and filtered. The solid was collected and dried in a vacuum oven at 80 °C to provide the title compound.
