CROSS-REFERENCE TO RELATED APPLICATION

[0001] This application claims the benefit of U.S. Provisional Pat. App. No. 61/380,596, filed September 7, 2010, which is incorporated by reference in its entirety for all purposes.

BACKGROUND OF THE INVENTION

[0002] The global rise of bacteria and other microorganisms resistant to antibiotics and antimicrobials in general, poses a major threat. Deployment of massive quantities of antimicrobial agents into the ecosphere during the past 60 years has introduced a powerful selective pressure for the emergence and spread of antimicrobial-resistant pathogens. Thus, there is a need to discover new broad spectrum antimicrobials, such as antibiotics, useful in combating microorganisms, especially those with multidrug-resistance.

[0003] Boron-containing molecules, such as 1-hydroxy-1,3-dihydro-benzo[c][1,2]oxaborole (also sometimes known as 1-hydroxy-benzo[c][1,2]oxaborole or oxaboroles or cyclic boronic esters), useful as antimicrobials have been described previously, such as in U.S. Pat. Apps. 12/142,692; 11/505,591 and 11/357,687. Generally speaking, a 1-hydroxy-1,3-dihydro-benzo[c][1,2]oxaborole has the following structure and substituent numbering system:

![Structure of 1-hydroxy-1,3-dihydro-benzo[c][1,2]oxaborole]

Surprisingly, it has now been discovered that certain classes of 1-hydroxy-1,3-dihydro-benzo[c][1,2]oxaboroles are effective antibacterials. This, and other uses of these 1-hydroxy-1,3-dihydro-benzo[c][1,2]oxaboroles are described herein.

[0014] "Compound of the invention," as used herein refers to the compounds discussed herein, salts (e.g. pharmaceutically acceptable salts), prodrugs, solvates and hydrates of these compounds.

[0015] The term "poly" as used herein means at least 2. For example, a polyvalent metal ion is a metal ion having a valency of at least 2.

[0016] "Moiety" refers to a radical of a molecule that is attached to the remainder of the molecule.
The symbol  \( \equiv \equiv \equiv \equiv \), whether utilized as a bond or displayed perpendicular to a bond, indicates the point at which the displayed moiety is attached to the remainder of the molecule.

The term “alkyl,” by itself or as part of another substituent, means, unless otherwise stated, a straight or branched chain, or cyclic hydrocarbon radical, or combination thereof, which may be fully saturated, mono- or polyunsaturated and can include di- and multivalent radicals, having the number of carbon atoms designated (i.e. \( \text{C}_1-\text{C}_{10} \) means one to ten carbons). In some embodiments, the term “alkyl” means a straight or branched chain, or combinations thereof, which may be fully saturated, mono- or polyunsaturated and can include di- and multivalent radicals. Examples of saturated hydrocarbon radicals include, but are not limited to, groups such as methyl, ethyl, n-propyl, isopropyl, n-butyl, t-butyl, isobutyl, sec-butyl, cyclohexyl, (cyclohexyl)methyl, cyclopropylmethyl, homologs and isomers of, for example, n-pentyl, n-hexyl, n-heptyl, n-octyl, and the like. An unsaturated alkyl group is one having one or more double bonds or triple bonds. Examples of unsaturated alkyl groups include, but are not limited to, vinyl, 2-propenyl, crotol, 2-isopentenyl, 2-(butadienyl), 2,4-pentadienyl, 3-(1,4-pentadienyl), ethynyl, 1- and 3-propynyl, 3-butynyl, and the higher homologs and isomers.

The term “alkylene” by itself or as part of another substituent means a divalent radical derived from an alkane, as exemplified, but not limited, by \( -\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{-} \). Typically, an alkyl (or alkylenic) group will have from 1 to 24 carbon atoms, with those groups having 10 or fewer carbon atoms being preferred in the invention. A “lower alkyl” or “lower alkylenic” is a shorter chain alkyl or alkylenic group, generally having eight or fewer carbon atoms.

The term “alkenylene” by itself or as part of another substituent means a divalent radical derived from an alkene.

The term “cycloalkylene” by itself or as part of another substituent means a divalent radical derived from a cycloalkyl.

The term “heteroalkylene” by itself or as part of another substituent means a divalent radical derived from an heteroalkane.
The term “heterocycloalkylene” by itself or as part of another substituent means a divalent radical derived from an heterocycloalkane.

The term “arylene” by itself or as part of another substituent means a divalent radical derived from an aryl.

The term “heteroarylene” by itself or as part of another substituent means a divalent radical derived from heteroaryl.

The terms "alkoxy," "alkylamino" and "alkylthio" (or thioalkoxy) are used in their conventional sense, and refer to those alkyl groups attached to the remainder of the molecule via an oxygen atom, an amino group, or a sulfur atom, respectively.

The term “heteroalkyl,” by itself or in combination with another term, means, unless otherwise stated, a stable straight or branched chain, or cyclic hydrocarbon radical, or combinations thereof, consisting of the stated number of carbon atoms and at least one heteroatom. In some embodiments, the term “heteroalkyl,” by itself or in combination with another term, means a stable straight or branched chain, or combinations thereof, consisting of the stated number of carbon atoms and at least one heteroatom. In an exemplary embodiment, the heteroatoms can be selected from the group consisting of B, O, N and S, and wherein the nitrogen and sulfur atoms may optionally be oxidized and the nitrogen heteroatom may optionally be quaternized. The heteroatom(s) B, O, N and S may be placed at any interior position of the heteroalkyl group or at the position at which the alkyl group is attached to the remainder of the molecule. Examples include, but are not limited to, -CH₂-CH₂-O-CH₃, -CH₂-CH₂-NH-CH₃, -CH₂-CH₂-N(CH₃)-CH₃, -CH₂-S-CH₂-CH₃, -CH₂-CH₂-S(O)-CH₃, -CH₂-CH₂-S(O)₂-CH₃, -CH=CH-O-CH₃, -CH₂-CH=CH=O, -CH₂-CH₂-S(0)₂-CH₃, -CH₂-CH₂-CH=CH₂, and -CH=CH-N(CH₃)-CH₃. Up to two heteroatoms may be consecutive, such as, for example, -CH₂-NH-OCH₃. Similarly, the term “heteroalkylene” by itself or as part of another substituent means a divalent radical derived from heteroalkyl, as exemplified, but not limited by, -CH₂-CH₂-S-CH₂-CH₂- and -CH₂-S-CH₂-CH₂-NH-CH₂-. For heteroalkylene groups, heteroatoms can also occupy either or both of the chain termini (e.g., alkyleneoxy, alkylenedioxy, alkyleneamino, alkylenediamino, and the like). Still further, for alkylene and heteroalkylene linking groups, no orientation of the linking group is implied by the direction in which the formula of the linking group
is written. For example, the formula \(-\text{C(O)R}\) represents both \(-\text{C(O)R}'\) and \(-\text{R'C(O)}\).

[0028] The terms “cycloalkyl” and “heterocycloalkyl”, by themselves or in combination with other terms, represent, unless otherwise stated, cyclic versions of “alkyl” and “heteroalkyl”, respectively. Additionally, for heterocycloalkyl, a heteroatom can occupy the position at which the heterocycle is attached to the remainder of the molecule. Examples of cycloalkyl include, but are not limited to, cyclopentyl, cyclohexyl, 1-cyclohexenyl, 3-cyclohexenyl, cycloheptyl, and the like. Examples of heterocycloalkyl include, but are not limited to, 1 - (1,2,5,6-tetrahydro-1H-pyridinyl), 1-piperidinyl, 2-piperidinyl, 3-piperidinyl, 4-morpholinyl, 3-morpholinyl, tetrahydrofuran-2-yl, tetrahydrofuran-3-yl, tetrahydrothien-2-yl, tetrahydrothien-3-yl, 1 -piperazinyl, 2-piperazinyl, and the like.

[0029] The terms “halo” or “halogen,” by themselves or as part of another substituent, mean, unless otherwise stated, a fluorine, chlorine, bromine, or iodine atom. Additionally, terms such as “haloalkyl,” are meant to include monohaloalkyl and polyhaloalkyl. For example, the term “halo(C1-C4)alkyl” is mean to include, but not be limited to, trifluoromethyl, 2,2,2-trifluoroethyl, 4-chlorobutyl, 3-bromopropyl, and the like.

[0030] The term “aryl” means, unless otherwise stated, a polyunsaturated, aromatic, substituent that can be a single ring or multiple rings (preferably from 1 or 2 or 3 rings), which are fused together or linked covalently. The term “heteroaryl” refers to aryl groups (or rings) that contain from one to four heteroatoms. In an exemplary embodiment, the heteroatom is selected from B, N, O, and S, wherein the nitrogen and sulfur atoms are optionally oxidized, and the nitrogen atom(s) are optionally quaternized. A heteroaryl group can be attached to the remainder of the molecule through a heteroatom. Non-limiting examples of aryl and heteroaryl groups include phenyl, 1-naphthyl, 2-naphthyl, 4-biphenyl, 1-pyrrolyl, 2-pyrrolyl, 3-pyrrolyl, 3-pyrazolyl, 2-imidazolyl, 4-imidazolyl, pyrazinyl, 2-oxazolyl, 4-oxazolyl, 2-phenyl-4-oxazolyl, 5-oxazolyl, 3-isoxazolyl, 4-isoxazolyl, 5-isoxazolyl, 2-thiazolyl, 4-thiazolyl, 5-thiazolyl, 2-furyl, 3-furyl, 2-thienyl, 3-thienyl, 2-pyridyl, 3-pyridyl, 4-pyridyl, 2-pyrimidyl, 4-pyrimidyl, 5-benzothiazolyl, purinyl, 2-benzimidazolyl, 5-indolyl, 1-isoquinolyl, 5-isoquinolyl, 2-quinolinyl, 5-quinolinyl, 3-quinolyl, and 6-quinolyl.
Substituents for each of the above noted aryl and heteroaryl ring systems are selected from the group of acceptable substituents described below.

[0031] For brevity, the term “aryl” when used in combination with other terms (e.g., aryloxy, arylthioxy, arylalkyl) includes those radicals in which an aryl group is attached through the next moiety to the rest of the molecule. Thus, the term “arylalkyl” is meant to include those radicals in which an aryl group is attached to an alkyl group (e.g., benzyl, 1-(3-nitrophenyl)ethyl and the like). A substituent such as benzyl or 1-(3-nitrophenyl)ethyl can also be represented by ‘substituted alkyl’ wherein the ethyl radical is substituted with a 3-nitrophenyl moiety. The term “aryloxy” is meant to include those radicals in which an aryl group is attached to an oxygen atom. The term “aryloxyalkyl” is meant to include those radicals in which an aryl group is attached to an oxygen atom which is then attached to an alkyl group (e.g., phenoxyethyl, 3-(1-naphthoxy)propyl, and the like).

[0032] For brevity, the term “heteroaryl” when used in combination with other terms (e.g., heteroaryloxy, heteroarylthioxy, heteroarylalkyl) includes those radicals in which a heteroaryl group is attached through the next moiety to the rest of the molecule. Thus, the term “heteroarylalkyl” is meant to include those radicals in which a heteroaryl group is attached to an alkyl group (e.g., pyridylmethyl and the like). The term “heteroaryloxy” is meant to include those radicals in which a heteroaryl group is attached to an oxygen atom. The term “heteroaryloxyalkyl” is meant to include those radicals in which an aryl group is attached to an oxygen atom which is then attached to an alkyl group (e.g., 2-pyridyloxymethyl and the like).

[0033] Each of the above terms (e.g., “alkyl,” “heteroalkyl,” “aryl” and “heteroaryl”) are meant to include both substituted and unsubstituted forms of the indicated radical. Preferred substituents for each type of radical are provided below.

[0034] Substituents for the alkyl and heteroalkyl radicals (including those groups often referred to as alkylenyl, alkenyl, heteroalkylenyl, heteroalkenyl, alkynyl, cycloalkyl, heterocycloalkyl, cycloalkenyl, and heterocycloalkenyl) are generically referred to as “alkyl group substituents,” and they can be one or more of a variety of groups selected from, but not limited to: -R’, -OR’, =O, =NR’, =N-OR’, -NR’R”, -SR’, -halogen, -SiR’R”R”‘, -OC(O)R’, -C(O)R’, -C(O)2R’, -CONR’R”, -OC(O)NR’R”, -NR”C(O)R’, -NR”-C(O)NR’R”, -NR”C(O)2R’, -NR”’-C(NR’R”R’)NR”’-C(NR’R”R’)NR”’-C(NR’R”R’)NR”’
-NR'''-C(NR'R'')=NR'”, -S(O)R’, -S(O)2R’, -S(O)2NR’R”, -NR”SO2R’, -CN, -NO2,
-N3, -CH(Ph)2, fluoro(C1-C4)alkoxy, and fluoro(C1-C4)alkyl, in a number ranging
from zero to (2m’+1), where m’ is the total number of carbon atoms in such radical.
R’, R”’, R’”’ and R’’’’ each preferably independently refer to hydrogen,
substituted or unsubstituted heteroalkyl, substituted or unsubstituted aryl, e.g., aryl
substituted with 1 or 2 or 3 halogens, substituted or unsubstituted alkyl, alkoxy or
thioalkoxy groups, or arylalkyl groups. When a compound of the invention includes
more than one R group, for example, each of the R groups is independently selected
as are each R’, R”’, R’”’ and R’’’’ groups when more than one of these groups is
present. When R’ and R” are attached to the same nitrogen atom, they can be
combined with the nitrogen atom to form a 5-, 6-, or 7-membered ring. For example,
-NR’R” is meant to include, but not be limited to, 1-pyrrolidinyl and 4-morpholinyl.
From the above discussion of substituents, one of skill in the art will understand that
the term “alkyl” is meant to include groups including carbon atoms bound to groups
other than hydrogen groups, such as haloalkyl (e.g., -CF3 and -CH2CF3) and acyl
(e.g., -C(O)CH3, -C(O)CF3, -C(O)CH2OCH3, and the like).

[0035] Similar to the substituents described for the alkyl radical, substituents for the
aryl and heteroaryl groups are generically referred to as “aryl group substituents.”
The substituents are selected from, for example: -R’, -OR’, =O, =NR’, =N-OR’, -
NR’R”, -SR’, -halogen, -SiR’R”R’”, -OC(O)R’, -C(O)R’, -CO2R’, -CONR’R”, -
OC(O)NR’R”, -NR’C(O)R’, -NR’-C(O)NR”R”’, -NR”C(O)2R’, -NR’”’-
C(NR’R”R’”)=NR’”, -NR’”’-C(NR’R”)=NR’”, -S(O)R’, -S(O)2R’, -S(O)2NR’R”,
-NR’SO2R’, -CN, -NO2, -N3, -CH(Ph)2, fluoro(C1-C4)alkoxy, and fluoro(C1-C4)alkyl,
in a number ranging from zero to the total number of open valences on the aromatic
ring system; and where R’, R”’, R’”’ and R’’’’ are preferably independently
selected from hydrogen, substituted or unsubstituted alkyl, substituted or
unsubstituted heteroalkyl, substituted or unsubstituted aryl and substituted or
unsubstituted heteroaryl. When a compound of the invention includes more than one
R group, for example, each of the R groups is independently selected as are each R’,
R”’, R’”’ and R’’’’ groups when more than one of these groups is present.

[0036] Two of the substituents on adjacent atoms of the aryl or heteroaryl ring may
optionally be replaced with a substituent of the formula –T-C(O)-(CRR’)q-U–,
wherein T and U are independently –NR-, -O-, -CRR’- or a single bond, and q is an
integer from 0 to 3. Alternatively, two of the substituents on adjacent atoms of the aryI or heteroaryl ring may optionally be replaced with a substituent of the formula –
A-(CH₂)r-B-, wherein A and B are independently –CRR′-, -O-, -NR-, -S-, -S(O)–,
-S(O)₂-, -S(O)₂NR′- or a single bond, and r is an integer from 1 or 2 or 3 or 4. One of
the single bonds of the new ring so formed may optionally be replaced with a double
bond. Alternatively, two of the substituents on adjacent atoms of the aryI or
heteroaryl ring may optionally be replaced with a substituent of the formula –
(CRR′)ₜ-X-(CR''R′′)ₘ-, where s and d are independently integers from 0 or 1 or 2 or
3, and X is –O-, -NR′-, -S-, -S(O)–, -S(O)₂-, or –S(O)₂NR′-.

The substituents R, R′,
R″ and R′′ are preferably independently selected from hydrogen or substituted or
unsubstituted (C₁ or C₂ or C₃ or C₄ or C₅ or C₆)alkyl.

[0037] “Ring” as used herein, means a substituted or unsubstituted cycloalkyl,
substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryI, or
substituted or unsubstituted heteroaryl. A ring includes fused ring moieties. The
number of atoms in a ring is typically defined by the number of members in the ring.
For example, a “5– to 7-membered ring” means there are 5 or 6 or 7 atoms in the
encircling arrangement. Unless otherwise specified, the ring optionally includes a
heteroatom. Thus, the term “5– to 7-membered ring” includes, for example phenyl,
pyridinyl and piperidinyl. The term “5– to 7-membered heterocycloalkyl ring”, on the
other hand, would include pyridinyl and piperidinyl, but not phenyl. The term “ring”
further includes a ring system comprising more than one “ring”, wherein each “ring”
is independently defined as above.

[0038] As used herein, the term “heteroatom” includes atoms other than carbon (C)
and hydrogen (H). Examples include oxygen (O), nitrogen (N) sulfur (S), silicon (Si),
and boron (B).

[0039] The term “leaving group” means a functional group or atom which can be
displaced by another functional group or atom in a substitution reaction, such as a
nucleophilic substitution reaction. By way of example, representative leaving groups
include triflate, chloro, bromo and iodo groups; sulfonic ester groups, such as
mesylate, tosylate, brosylate, nosylate and the like; and acyloxy groups, such as
acetoxy, trifluoroacetooxy and the like.
[0040] The symbol "R" is a general abbreviation that represents a substituent group that is selected from substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted aryl, substituted or unsubstituted heteroaryl, substituted or unsubstituted cycloalkyl and substituted or unsubstituted heterocycloalkyl groups.

[0041] By “effective” amount of a drug, formulation, or permeant is meant a sufficient amount of an active agent to provide the desired local or systemic effect. A “Topically effective,” “pharmaceutically effective,” or “therapeutically effective” amount refers to the amount of drug needed to effect the desired result.

[0042] The term "pharmaceutically acceptable salt" is meant to include a salt of a compound of the invention which is prepared with relatively nontoxic acids or bases, depending on the particular substituents found on the compounds described herein. When compounds of the invention contain relatively acidic functionalities, base addition salts can be obtained by contacting the neutral form of such compounds with a sufficient amount of the desired base, either neat or in a suitable inert solvent. Examples of pharmaceutically acceptable base addition salts include sodium, potassium, calcium, ammonium, organic amino (such as choline or diethylamine or amino acids such as d-arginine, l-arginine, d-lysine or l-lysine), or magnesium salt, or a similar salt. When compounds of the invention contain relatively basic functionalities, acid addition salts can be obtained by contacting the neutral form of such compounds with a sufficient amount of the desired acid, either neat or in a suitable inert solvent. Examples of pharmaceutically acceptable acid addition salts include those derived from inorganic acids like hydrochloric, hydrobromic, nitric, carbonic, monohydrogencarbonic, phosphoric, monohydrogenphosphoric, dihydrogenphosphoric, sulfuric, monohydrogensulfuric, hydriodic, or phosphorous acids and the like, as well as the salts derived from relatively nontoxic organic acids like acetic, propionic, isobutyric, maleic, malonic, benzoic, succinic, suberic, fumaric, lactic, mandelic, phthalic, benzenesulphonic, p-tolylsulphonic, citric, tartaric, methanesulphonic, and the like. Also included are salts of amino acids such as arginate and the like, and salts of organic acids like glucuronic or galactunoric acids and the like (see, for example, Berge et al., "Pharmaceutical Salts", Journal of Pharmaceutical Science 66: 1-19 (1977)). Certain specific compounds of the invention contain both
basic and acidic functionalities that allow the compounds to be converted into either base or acid addition salts.

[0043] The neutral forms of the compounds are preferably regenerated by contacting the salt with a base or acid and isolating the parent compounds in the conventional manner. The parent form of the compound differs from the various salt forms in certain physical properties, such as solubility in polar solvents.

[0044] In addition to salt forms, the invention provides compounds which are in a prodrug form. Prodrugs of the compounds described herein readily undergo chemical changes under physiological conditions to provide the compounds of the invention. Additionally, prodrugs can be converted to the compounds of the invention by chemical or biochemical methods in an ex vivo environment.

[0045] Certain compounds of the invention can exist in unsolvated forms as well as solvated forms, including hydrated forms. In general, the solvated forms are equivalent to unsolvated forms and are encompassed within the scope of the invention. Certain compounds of the invention may exist in multiple crystalline or amorphous forms.

[0046] Certain compounds of the invention possess asymmetric carbon atoms (optical centers) or double bonds; the racemates, diastereomers, geometric isomers and individual isomers are encompassed within the scope of the invention. The graphic representations of racemic, ambiscalemic and scalemic or enantiomerically pure compounds used herein are taken from Maehr, J. Chem. Ed. 1985, 62: 114-120. Solid and broken wedges are used to denote the absolute configuration of a stereocenter unless otherwise noted. When the compounds described herein contain olefinic double bonds or other centers of geometric asymmetry, and unless specified otherwise, it is intended that the compounds include both E and Z geometric isomers. Likewise, all tautomeric forms are included.

[0047] Compounds of the invention can exist in particular geometric or stereoisomeric forms. The invention contemplates all such compounds, including cis- and trans-isomers, (-)- and (+)-enantiomers, (R)- and (S)-enantiomers, diastereomers, (D)-isomers, (L)-isomers, the racemic mixtures thereof, and other mixtures thereof, such as enantiomerically or diastereomerically enriched mixtures, as falling within the scope of the invention. Additional asymmetric carbon atoms can be present in a
substituent such as an alkyl group. All such isomers, as well as mixtures thereof, are intended to be included in this invention.

Optically active (R)- and (S)-isomers and d and l isomers can be prepared using chiral synthons or chiral reagents, or resolved using conventional techniques. If, for instance, a particular enantiomer of a compound of the invention is desired, it can be prepared by asymmetric synthesis, or by derivatization with a chiral auxiliary, where the resulting diastereomeric mixture is separated and the auxiliary group cleaved to provide the pure desired enantiomers. Alternatively, where the molecule contains a basic functional group, such as an amino group, or an acidic functional group, such as a carboxyl group, diastereomeric salts can be formed with an appropriate optically active acid or base, followed by resolution of the diastereomers thus formed by fractional crystallization or chromatographic means known in the art, and subsequent recovery of the pure enantiomers. In addition, separation of enantiomers and diastereomers is frequently accomplished using chromatography employing chiral, stationary phases, optionally in combination with chemical derivatization (e.g., formation of carbamates from amines).

The compounds of the invention may also contain unnatural proportions of atomic isotopes at one or more of the atoms that constitute such compounds. For example, the compounds may be radiolabeled with radioactive isotopes, such as for example tritium ($^3$H), iodine-125 ($^{125}\text{I}$) or carbon-14 ($^{14}\text{C}$). All isotopic variations of the compounds of the invention, whether radioactive or not, are intended to be encompassed within the scope of the invention.

The term “pharmaceutically acceptable carrier” or “pharmaceutically acceptable vehicle” refers to any formulation or carrier medium that provides the appropriate delivery of an effective amount of an active agent as defined herein, does not interfere with the effectiveness of the biological activity of the active agent, and that is sufficiently non-toxic to the host or patient. Representative carriers include water, oils, both vegetable and mineral, cream bases, lotion bases, ointment bases and the like. These bases include suspending agents, thickeners, penetration enhancers, and the like. Their formulation is well known to those in the art of cosmetics and topical pharmaceuticals. Additional information concerning carriers can be found in
The term “excipients” is conventionally known to mean carriers, diluents and/or vehicles used in formulating drug compositions effective for the desired use.

The term "microbial infection" or “infection by a microorganism” refers to any infection of a host tissue by an infectious agent including, but not limited to, bacteria or protozoa (see, e.g., Harrison's Principles of Internal Medicine, pp. 93-98 (Wilson et al., eds., 12th ed. 1991); Williams et al., J. of Medicinal Chem. 42:1481-1485 (1999), herein each incorporated by reference in their entirety).

"Biological medium," as used herein refers to both in vitro and in vivo biological milieus. Exemplary in vitro "biological media" include, but are not limited to, cell culture, tissue culture, homogenates, plasma and blood. In vivo applications are generally performed in mammals, preferably humans.

"Inhibiting" and "blocking,” are used interchangeably herein to refer to the partial or full blockade of enzyme. In an exemplary embodiment, the enzyme is an editing domain of a tRNA synthetase.

Boron is able to form additional covalent or dative bonds with oxygen, sulfur or nitrogen under some circumstances in this invention.

Embodiments of the invention also encompass compounds that are poly- or multi-valent species, including, for example, species such as dimers, trimers, tetramers and higher homologs of the compounds of use in the invention or reactive analogues thereof.

“Salt counterion”, as used herein, refers to positively charged ions that associate with a compound of the invention when the boron is fully negatively or partially negatively charged. Examples of salt counterions include H⁺, H₃O⁺, ammonium, potassium, calcium, magnesium (such as choline or diethylamine or amino acids such as d-arginine, l-arginine, d-lysine or l-lysine) and sodium.

The compounds comprising a boron bonded to a carbon and three heteroatoms (such as three oxygens described in this section) can optionally contain a fully negatively charged boron or partially negatively charged boron. Due to the
negative charge, a positively charged counterion may associate with this compound, thus forming a salt. Examples of salt counterions include H⁺, H₂O⁺, ammonium, potassium, calcium, magnesium (such as choline or diethylamine or amino acids such as d-arginine, l-arginine, d-lysine or l-lysine) and sodium. The salts of the compounds are implicitly contained in descriptions of these compounds.

[0108] Compounds of use in the invention can be prepared using commercially available starting materials, known intermediates, or by using the synthetic methods published in references described and incorporated by reference herein, such as U.S. Pat. Apps. 12/142,692 and U.S. Pat. Pubs. US20060234981, US20070155699 and US20070293457.

[0109] The following general procedures were used as indicated in generating the examples and can be applied, using the knowledge of one of skill in the art, to other appropriate compounds to obtain additional analogues.

**General reaction scheme 1**

Scheme 1 describes a synthesis for compounds of (I), wherein R^4 is fluorine or chlorine and Y and R^5 are as described herein. The fluoro or chloro compound of formula A, which may be prepared or maybe available commercially from Sigma-Aldrich, is reacted with a strong base (such as n-BuLi, sec-BuLi, or t-BuLi, 2 equiv)
followed by quenching with a formylating agent (such as DMF, dimethylformamide, formanilide, N-formylmorpholine, large excess) to give the compound of formula B. Treatment of compound B with a demethylating agent (typically BBr₃, 2 equiv) in a suitable solvent (dichloromethane, THF) gives the phenol of formula C. Compound C can react with a corresponding bromide or mesylate (1-1.5 equiv) in the presence of a base (such as KOrBu, K₂CO₃, or Cs₂CO₃, 1.5-2 equiv) in an aprotic solvent such as DMF or DMSO to afford the compound of formula D. Compound D may be converted to triflate E by the reaction with 1.2 equiv of trifluoromethanesulfonic anhydride and pyridine in dichloromethane. The conversion of triflate E to boronate F can be achieved by the reaction with bis(pinacolato)diborane (2 equiv), KOAc (3 equiv) and catalytic amount of PdCl₂(dppf) (4-8 mol%). The reaction of compound F with nitromethane (3 equiv) in the presence of sodium hydroxide (3 equiv) in water or THF gives the nitro compound of formula G. The compound G can be converted to the final product of formula H by the Raney-Ni reduction (Raney Ni, 2 equiv w/w, 2.0 M NH₃ in EtOH, absolute EtOH).

**General reaction scheme 2**

![Scheme 2](image)

[0111] Scheme 2 describes a synthesis for compounds of (I), wherein R² is chlorine, Y and R⁵ are as described herein. The phenol or thiophenol of formula I, which may be prepared or maybe available commercially from Sigma-Aldrich, react with a solution of bromine and catalytic amount of iron powder in glacial acetic acid to give the bromo substituted compound of formula J. The alkylation of J can be achieved by reacting with a bromide in the presence of a base such as potassium.
carbonate in solvents like DMF or acetonitrile. The protection of aldehyde K may be achieved by refluxing with ethylene glycol in toluene, in the presence of catalytic amount of p-toluenesulfonic acid. The reaction of the compound L with BuLi and triisopropyl borate, followed by treating with hydrochloric acid yields boronic acid M. The reaction of compound M with nitromethane in the presence of sodium hydroxide gives the nitro compound of formula N. The treatment of N with 1 equivalent of sulfuryl chloride affords the chloro substituted compound O. The Raney-Ni reduction of compound O in MeOH gives the final product of formula P.

The compound of formula N, which may be prepared according to Scheme 2, can be reduced to the amine of formula S, by hydrogenation in the presence of palladium hydroxide or Raney-Ni reduction as described above. The amine of formula S reacts with an N-Protecting reagent such as Boc anhydride in the presence of base like triethylamine in dichloromethane to give Boc-protected compound of formula T. The treatment of T with N-bromosuccinimide and catalytic amount of AIBN in acetonitrile gives the bromo substituted compound of formula U. Deprotection of compound U in the presence of acid such as HCl in dioxane will afford the final compound of formula U.

Compound $X$ can be reduced to the final compound of formula $Y$ by hydrogenation in the presence of palladium on carbon or Raney-Ni reduction as described above. Alternatively, Stille reaction of $W$ with an organotin compound such as vinyltributyltin in the presence of catalytic amount of $\text{Pd}(\text{Ph}_3\text{P})_4$ in DMF affords the compound of formula $Z$. Racemic compound AD can be resolved via chiral HPLC using a chiral column such as ChiralPak AD-H and SF CO$_2$/methanol as eluent. Two compounds collected are enantiomer AE and enantiomer AF. Analysis of the enantiomeric purity of each isomer can be achieved using a chiral column such as ChiralPak AD column. The Boc-protected compounds AE and AF can be converted to the final chiral compounds AG and AH, by deprotection using acid such as HCl in dioxane.
Scheme 6 describes an alternative method to separate chiral compounds Al into their enantiomeric isomers, wherein R₄, Y, and R⁵ are as described herein. The compound of formula Al may be prepared according to Scheme 1 or Scheme 2 or Scheme 3 or Scheme 4. The separation of the two enantiomers was achieved by dissolving the racemic material Al in a suitable solvent and applying to an appropriate chiral column and eluent system. The collected separated enantiomer samples were then concentrated and used in the next step without further purification. Using this technique, it is possible to achieve a range of enantiomeric excesses of the separated enantiomers. The nitro compound AJ and AK can be converted to the final chiral compounds AL and AM, respectively, by Raney-Ni reduction (Raney Ni, 2 equiv w/w, 2.0 M NH₃ in EtOH, absolute EtOH).

IV. Assays

Art-recognized techniques of genetics and molecular biology are of use to identify compounds that bind to and/or inhibit an enzyme, such as a tRNA synthetase. Moreover, these techniques are of use to distinguish whether a compound binds to and/or inhibits a particular domain of the enzyme. For example, for leucyl tRNA synthetase (LeuRS), these techniques can distinguish whether a compound binds to and/or inhibits the synthetic domain, the editing domain, or both the editing and synthetic domains. The Mycobacterium tuberculosis leuS gene was synthesized by Genscript (Piscataway, NJ) using E. coli optimized codons and protein was made using standard T7 RNA polymerase over-expression protocols and standard purification protocols.
IV. a) LeuRS

[0117] In an exemplary assay, activity of a representative compound against the editing domain was confirmed. To identify the target of a novel boron-containing antibacterial compound, mutants in E.coli showing resistance to the compound were isolated. Characterization of mutants showed that they have an 32-256 fold increase in resistance to the compound over wildtype. The mutants were furthermore shown to be sensitive to various antibacterial agents with known modes of action, suggesting that the cellular target of the compound is distinct from the target of the other antibacterial agents. The leuS gene from the mutants was cloned onto a plasmid and their resistance was confirmed by MIC. The editing domain from these mutants were sequenced and the mutations were all located in the editing domain of this enzyme.

[0118] Assays to determine whether, and how effectively, a particular compound binds to and/or inhibits the editing domain of a selected tRNA synthetase are also set forth herein, and additional assays are readily available to those of skill in the art. Briefly, in an exemplary assay, an improperly charged tRNA and a tRNA synthetase that is capable of editing the improperly charged tRNA are combined. The resulting mixture is contacted with the putative inhibitor and the degree of editing inhibition is observed.

[0119] Another assay uses genetics to show that a drug works via the editing domain. In this assay, the compound is first tested against a strain of cells over-expressing copies of the tRNA synthetase gene. The compound’s effect on the over-expressing strain is compared with a control strain to determine whether the compound is active against the synthetase. If the minimum inhibitory concentration (MIC) is 2-fold higher in the strain with extra copies of the synthetase gene than the MIC of the inhibitor against a wild type cell, a further genetic screen is conducted to determine whether the increased resistance is due to mutations in the editing domain. In this second screen, the control strain is challenged against a high concentration of the inhibitor. The colonies surviving the challenge are isolated and DNA from these cells is isolated. The editing domain is amplified using a proof-reading PCR enzyme and the appropriate primers. The PCR product can be purified using standard procedures. The sequence amplified mutant DNA is compared to wild-type. If the mutant DNA bears mutations in the editing domain, such results would suggest that
the compound binds to the editing domain and affects the editing function of the molecule through this domain.

[0120] Generally, the compounds to be tested are present in the assays in ranges from about 1 pM to about 100 mM, preferably from about 1 pM to about 1 µM. Other compounds range from about 1 nM to about 100 nM, preferably from about 1 nM to about 1 µM.

[0121] The effects of the test compounds upon the function of the enzymes can also be measured by any suitable physiological change. When the functional consequences are determined using intact cells or animals, one can also measure a variety of effects such as transmitter release, hormone release, transcriptional changes to both known and uncharacterized genetic markers, changes in cell metabolism such as cell growth or pH changes, and changes in intracellular second messengers such as Ca\(^{2+}\), or cyclic nucleotides.

[0122] Utilizing the assays set forth herein and others readily available in the art, those of skill in the art will be able to readily and routinely determine other compounds and classes of compounds that operate to bind to and/or inhibit the editing domain of tRNA synthetases.

In an exemplary embodiment, the biological activity is hydrolysis of noncognate amino acid. In another exemplary embodiment, the hydrolysis of said noncognate amino acid is detected through the use of one or more labels. In another exemplary embodiment, the labels include a radiolabel, a fluorescent marker, an antibody, or a combination thereof. In another exemplary embodiment, said labels can be detected using spectroscopy. In another exemplary embodiment, said editing domain of a tRNA synthetase is derived from leucyl tRNA synthetase.

In another exemplary embodiment, the mutated tRNA synthetase contains one or more amino acid mutations in an editing domain. [0161] The pharmaceutical formulations of the invention can take a variety of forms adapted to the chosen route of administration. Those skilled in the art will recognize various synthetic methodologies that may be employed to prepare non-toxic pharmaceutical formulations incorporating the compounds described herein. Those skilled in the art will recognize a wide variety of non-toxic pharmaceutically acceptable solvents that may be used to prepare solvates of the compounds of the
invention, such as water, ethanol, propylene glycol, mineral oil, vegetable oil and dimethyl sulfoxide (DMSO).

[0162] The compositions of the invention may be administered orally, topically, parenterally, by inhalation or spray or rectally in dosage unit formulations containing conventional non-toxic pharmaceutically acceptable carriers, adjuvants and vehicles. It is further understood that the best method of administration may be a combination of methods. Oral administration in the form of a pill, capsule, elixir, syrup, lozenge, troche, or the like is particularly preferred. The term parenteral as used herein includes subcutaneous injections, intradermal, intravascular (e.g., intravenous), intramuscular, spinal, intrathecal injection or like injection or infusion techniques.

[0163] The pharmaceutical formulations containing compounds of the invention are preferably in a form suitable for oral use, for example, as tablets, troches, lozenges, aqueous or oily suspensions, dispersible powders or granules, emulsion, hard or soft capsules, or syrups or elixirs.

[0164] Compositions intended for oral use may be prepared according to any method known in the art for the manufacture of pharmaceutical formulations, and such compositions may contain one or more agents selected from the group consisting of sweetening agents, flavoring agents, coloring agents and preserving agents in order to provide pharmaceutically elegant and palatable preparations. Tablets may contain the active ingredient in admixture with non-toxic pharmaceutically acceptable excipients that are suitable for the manufacture of tablets. These excipients may be for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, corn starch, or alginic acid; binding agents, for example starch, gelatin or acacia; lubricating agents, for example magnesium stearate, stearic acid or talc; and extenders and bulking agents, such as microcrystalline cellulose. The tablets may be uncoated or they may be coated by known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate may be employed.

[0165] Formulations for oral use may also be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent, for example,
calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein
the active ingredient is mixed with water or an oil medium, for example peanut oil,
liquid paraffin or olive oil.

[0166] Aqueous suspensions contain the active materials in admixture with
excipients suitable for the manufacture of aqueous suspensions. Such excipients are
suspending agents, for example sodium carboxymethylcellulose, methylcellulose,
hydroxypropylmethylcellulose, sodium alginate, polyvinylpyrrolidone, gum
tragacanth and gum acacia; and dispersing or wetting agents, which may be a
naturally-occurring phosphatide, for example, lecithin, or condensation products of an
alkylene oxide with fatty acids, for example polyoxyethylene stearate, or
condensation products of ethylene oxide with long chain aliphatic alcohols, for
example heptadecaethyleneoxyctanol, or condensation products of ethylene oxide
with partial esters derived from fatty acids and a hexitol such as polyoxyethylene
sorbitol monooleate, or condensation products of ethylene oxide with partial esters
derived from fatty acids and hexitol anhydrides, for example polyethylene sorbitan
monooleate. The aqueous suspensions may also contain one or more preservatives,
for example ethyl, or n-propyl p-hydroxybenzoate, one or more coloring agents, one
or more flavoring agents, and one or more sweetening agents, such as sucrose or
saccharin.

[0167] Oily suspensions may be formulated by suspending the active ingredients
in a vegetable oil, for example arachis oil, olive oil, sesame oil or coconut oil, or in a
mineral oil such as liquid paraffin. The oily suspensions may contain a thickening
agent, for example beeswax, hard paraffin or cetyl alcohol. Sweetening agents such
as those set forth above, and flavoring agents may be added to provide palatable oral
preparations. These compositions may be preserved by the addition of an anti-oxidant
such as ascorbic acid.

[0168] Dispersible powders and granules suitable for preparation of an aqueous
suspension by the addition of water provide the active ingredient in admixture with a
dispersing or wetting agent, suspending agent and one or more preservatives. Suitable
dispersing or wetting agents and suspending agents are exemplified by those already
mentioned above. Other dispersing agents include hydrophilic polymers, electrolytes,
Tween™ 60 or 80, PEG, polyvinylpyrrolidone (PVP; commercially known as
Plasdone™), and the carbohydrate-based dispersing agents such as, for example, hydroxypropylcellulose and hydroxypropylcellulose ethers (e.g., HPC, HPC-SL, and HPC-L), hydroxypropylmethylcellulose and hydroxypropylmethylcellulose ethers (e.g. HPMC K100, HPMC K4M, HPMC K15M, and HPMC K100M), carboxymethylcellulose sodium, methylcellulose, hydroxyethylcellulose,
hydroxypropylmethylcellulose phthalate, hydroxypropylmethylcellulose acetate stearate, noncrystalline cellulose, magnesium aluminum silicate, triethanolamine, polyvinyl alcohol (PVA), polyvinylpyrrolidone/vinyl acetate copolymer (Plasdone™, e.g., S-630), 4-(1,1,3,3-tetramethylbutyl)-phenol polymer with ethylene oxide and formaldehyde (also known as tyloxapol), poloxamers (e.g., Pluronics F68™, F88™, and F108™, which are block copolymers of ethylene oxide and propylene oxide); and poloxamines (e.g., Tetronic 9080, also known as Poloxamine 9080, which is a tetrafunctional block copolymer derived from sequential addition of propylene oxide and ethylene oxide to ethylenediamine (BASF Corporation, Parsippany, N.J.)).

Additional excipients, for example sweetening, flavoring and coloring agents, may also be present.

[0169] Pharmaceutical formulations of the invention may also be in the form of oil-in-water emulsions and water-in-oil emulsions. The oily phase may be a vegetable oil, for example olive oil or arachis oil, or a mineral oil, for example liquid paraffin or mixtures of these. Suitable emulsifying agents may be naturally-occurring gums, for example gum acacia or gum tragacanth; naturally-occurring phosphatides, for example soy bean, lecithin, and esters or partial esters derived from fatty acids and hexitol; anhydrides, for example sorbitan monooleate; and condensation products of the said partial esters with ethylene oxide, for example polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening and flavoring agents.

[0170] Syrups and elixirs may be formulated with sweetening agents, for example glycerol, propylene glycol, sorbitol or sucrose. Such formulations may also contain a demulcent, a preservative, and flavoring and coloring agents. The pharmaceutical formulations may be in the form of a sterile injectable aqueous or oleaginous suspension. This suspension may be formulated according to the known art using those suitable dispersing or wetting agents and suspending agents, which have been mentioned above. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally acceptable diluent or solvent, for
example as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

[0171] The composition of the invention may also be administered in the form of suppositories, e.g., for rectal administration of the drug. These compositions can be prepared by mixing the drug with a suitable non-irritating excipient that is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release the drug. Such materials are cocoa butter and polyethylene glycols.

[0172] Alternatively, the compositions can be administered parenterally in a sterile medium. The drug, depending on the vehicle and concentration used, can either be suspended or dissolved in the vehicle. Advantageously, adjuvants such as local anesthetics, preservatives and buffering agents can be dissolved in the vehicle.

[0173] For administration to non-human animals, the composition containing the therapeutic compound may be added to the animal's feed or drinking water. Also, it will be convenient to formulate animal feed and drinking water products so that the animal takes in an appropriate quantity of the compound in its diet. It will further be convenient to present the compound in a composition as a premix for addition to the feed or drinking water. The composition can also added as a food or drink supplement for humans.

[0174] Dosage levels of the order of from about 5 mg to about 250 mg per kilogram of body weight per day and more preferably from about 25 mg to about 150 mg per kilogram of body weight per day, are useful in the treatment of the above-indicated conditions. The amount of active ingredient that may be combined with the carrier materials to produce a single dosage form will vary depending upon the condition being treated and the particular mode of administration. Dosage unit forms will generally contain between from about 1 mg to about 500 mg of an active ingredient.
Frequency of dosage may also vary depending on the compound used and the particular disease treated. However, for treatment of most disorders, a dosage regimen of 4 times daily or less is preferred. It will be understood, however, that the specific dose level for any particular patient will depend upon a variety of factors including the activity of the specific compound employed, the age, body weight, general health, sex, diet, time of administration, route of administration and rate of excretion, drug combination and the severity of the particular disease undergoing therapy.

Preferred compounds of the invention will have desirable pharmacological properties that include, but are not limited to, oral bioavailability, low toxicity, low serum protein binding and desirable in vitro and in vivo half-lives. Penetration of the blood brain barrier for compounds used to treat CNS disorders is necessary, while low brain levels of compounds used to treat peripheral disorders are often preferred.

The amount of the composition required for use in treatment will vary not only with the particular compound selected but also with the route of administration, the nature of the condition being treated and the age and condition of the patient and will ultimately be at the discretion of the attendant physician or clinician.

In an exemplary embodiment, the pharmaceutical composition described herein includes an additional active ingredient. In another exemplary embodiment, the additional active ingredient is a compound that has been approved for human use by the United States Food and Drug Administration. In another exemplary embodiment, the additional active ingredient is an immunosuppressive agent. In still another exemplary embodiment, the additional active ingredient is selected from the group consisting of corticosteroids, aminosalicylates, azathioprine (6-mercaptopurine), methotrexate and cyclosporine, etanercept, infliximab, adalimumab, alefacept, efalizumab and anakinra.

In still another exemplary embodiment, the additional active ingredient is selected from the group consisting of an activated vitamin D analog and an arotinoid (an aromatic retinoic acid analog). In still another exemplary embodiment, the additional active ingredient is carcioptriol, such as Tazorac (tazarotene).
**Topical formulations**

In a preferred embodiment, the methods of the invention can be employed through the topical application of the compounds described herein. Topical administration includes for example, transmucosal, transdermal, ungual and transungual routes of administration. The topical compositions useful in the subject invention can be made into a wide variety of product types. These include, but are not limited to, lotions, creams, gels, sticks, sprays, ointments, pastes, foams, mousses, masks, eye ointments, eye or ear drops, impregnated dressings, wipes, cleansers including soaps, body washes and shampoos, and make-up products, such as bases, blushes, lipsticks, and eye shadows, among others. These product types can comprise several types of carrier systems including, but not limited to particles, nanoparticles, and liposomes. If desired, disintegrating agents can be added, such as the cross-linked polyvinyl pyrrolidone, agar or alginic acid or a salt thereof such as sodium alginate. Techniques for formulation and administration can be found in *Remington: The Science and Practice of Pharmacy*, supra. The formulation can be selected to maximize delivery to a desired target site in the body. The formulations can also include various conventional colorants, fragrances, thickeners, preservatives, humectants, emollients, demulcents, solubilizing excipients, dispersants, penetration enhancers, plasticizing agents, preservatives, stabilizers, demulsifiers, wetting agents, sunscreens, emulsifiers, moisturizers, astringents, deodorants, and the like, which can be added to provide additional benefits such as, for example, improving the feel and/or appearance of the topical preparation.

Lotions, which are preparations that are to be applied to the skin, nail, hair, claw or hoof surface without friction, are typically liquid or semi-liquid preparations in which finely divided solid, waxy, or liquid are dispersed. Lotions will typically contain suspending agents to produce better dispersions as well as compounds useful for localizing and holding the active agent in contact with the skin, nail, hair, claw or hoof, e.g., methylcellulose, sodium carboxymethyl-cellulose, or the like.

Creams containing the active agent for delivery according to the invention are viscous liquid or semisolid emulsions, either oil-in-water or water-in-oil. Cream bases are water-washable, and contain an oil phase, an emulsifier and an aqueous phase. The oil phase is generally comprised of petrolatum or a fatty alcohol, such as cetyl- or stearyl alcohol; the aqueous phase usually, although not necessarily, exceeds
the oil phase in volume, and generally contains a humectant. The emulsifier in a
cream formulation, as explained in Remington: The Science and Practice of
Pharmacy, supra, is generally a nonionic, anionic, cationic or amphoteric surfactant.

Ointments, which are semisolid preparations, are typically based on
petrolatum or other petroleum derivatives. As will be appreciated by the ordinarily
skilled artisan, the specific ointment base to be used is one that provides for optimum
delivery for the active agent chosen for a given formulation, and, preferably, provides
for other desired characteristics as well, e.g., emolliency or the like. As with other
carriers or vehicles, an ointment base should be inert, stable, nonirritating and non-
sensitizing. As explained in Remington: The Science and Practice of Pharmacy, 19th
may be grouped in four classes: oleaginous bases; emulsifiable bases; emulsion bases;
and water-soluble bases. Oleaginous ointment bases include, for example, vegetable
oils, fats obtained from animals, and semisolid hydrocarbons obtained from
petroleum. Preferred water-soluble ointment bases are prepared from polyethylene
glycols of varying molecular weight; again, reference may be had to Remington: The
Science and Practice of Pharmacy, supra, for further information.

Useful formulations of the invention also encompass sprays and aerosols.
Sprays generally provide the active agent in an aqueous and/or alcoholic solution
which can be misted onto the skin, nail, hair, claw or hoof for delivery. Such sprays
include those formulated to provide for concentration of the active agent solution at
the site of administration following delivery, e.g., the spray solution can be primarily
composed of alcohol or other like volatile liquid in which the drug or active agent can
be dissolved. Upon delivery to the skin, nail, hair, claw or hoof, the carrier
evaporates, leaving concentrated active agent at the site of administration. Examples
of aerosol technology are disclosed in US Patents 6,682,716; 6,716,415; 6,716,417;
6,783,753; 7,029,658; and 7,033,575.

Examples of solubilizing excipients include polyethoxylated fatty acids,
PEG-fatty acid diesters, PEG-fatty acid mono-ester and di-ester mixtures,
polyethylene glycol glycerol fatty acid esters, alcohol-oil transesterification products,
polyglycerized fatty acids, propylene glycol fatty acid esters, mixtures of propylene
glycol esters-glycerol esters, mono- and diglycerides, sterol and sterol derivatives,
polyethylene glycol sorbitan fatty acid esters, polyethylene glycol alkyl ethers, sugar esters, polyethylene glycol alkyl phenols, polyoxyethylene-polyoxypropylene block copolymers, sorbitan fatty acid esters, lower alcohol fatty acid esters, ionic surfactants, tocopherol esters, and sterol esters.

EXAMPLES

[0240]  Proton NMR are recorded on Varian AS 300 spectrometer and chemical shifts are reported as δ (ppm) down field from tetramethyilsilane. Mass spectra are determined on Micromass Quattro II.

[0241]  The *M. tuberculosis* LeuRS gene (DNA sequence listed herein) was prepared by GenScript and cloned into the T7 expression vector pET28a(+) at the Ndel-Xhol sites. Over-expression of *M. tuberculosis* LeuRS from this construct generated a version of *M. tuberculosis* LeuRS with an N-terminal his-tag, which will use the standard procedures for purification of his-tagged proteins.

After a second run 40.8 g of crude was dissolved in DMF (1 L), cooled to 0 °C, added to \( \text{Cs}_2\text{CO}_3 \) (340 g, 1.04 mol) portion-wise. Then methyl iodide (330 mL, 5.28 mol) was added. After warming to room temperature and stirring overnight the solution was filtered, ethyl acetate was added and the organic layer was washed with water (3 X). After concentration in vacuo the product was purified by Biotage silica gel chromatography (2% to 3% to 10% to 20% EtOAc/ hexanes) resulting in 14.8 g of dimethoxy compound. This material was dissolved in DCM and cooled to -30 °C and BCl\(_3\) (1 M in DCM, 134 mL, 0.1343 mol) was added to the solution at -30 °C. EXAMPLE 2

LeuRS IC₅₀ Testing

Experiments were performed in 96-well microtiter plates, using 80 μL reaction mixtures containing 50 mM HEPES-KOH (pH 8.0), 30 mM MgCl₂ and 30 mM KCl, 13μM [¹⁴C]leucine (306 mCi/mm, Perkin-Elmer), 15 μM total E.coli tRNA (Roche, Switzerland), 0.02% (w/v) BSA, 1 mM DTT, 0.2 pM LeuRS and 4 mM ATP at 30°C. Reactions were started by the addition of 4 mM ATP. After 7 minutes, reactions were quenched and tRNA was precipitated by the addition of 50 μL of 10% (w/v) TCA and transferred to 96-well nitrocellulose membrane filter plates (Millipore Multiscreen HTS, MSHAN4B50). Each well was then washed three times with 100 μL of 5% TCA. Filter plates were then dried under a heat lamp and the precipitated [¹⁴C]leucine tRNALeu was quantified by liquid scintillation counting using a Wallac MicroBeta Trilux model 1450 liquid scintillation counter (PerkinElmer, Waltham MA).

To determine the inhibitor concentration which reduces enzyme activity by 50% (IC₅₀), increasing concentrations of inhibitor were incubated with LeuRS enzyme, tRNA and leucine for 20 minutes. Reactions were initiated by the addition of 4 mM ATP and stopped after 7 minutes then precipitated and counted to quantify radioactivity.
Biochemical testing results for exemplary compounds of the invention are provided in FIG. 1.

**Antibacterial MIC Testing**

Antibacterial MIC testing results for exemplary compounds of the invention are provided in FIG. 1.

**EXAMPLE 4**

**Microplate Alamar Blue Assay (MABA)**

The microplate alamar blue assay (MABA) was essentially performed as described by Collins, L., *et al.*, *Antimicrob Agents Chemother* 41: 1004-1009 (1997). For example, black, clear-bottomed 96-well microplates (black view plates; Packard Instrument Company, Meriden, Conn.) with the outer perimeter wells filled with sterile water to prevent dehydration in experimental wells. Initial drug dilutions were prepared in dimethyl sulfoxide and subsequent two fold dilutions were performed in 0.1 ml of 7H9GC (no Tween 80) in the microplates. Frozen inocula were initially diluted 1:20 in BACTEC 12B medium followed by a 1:50 dilution in 7H9GC. Addition of 100 μL to wells resulted in final bacterial titers of between $2.0 \times 10^5$ and $5 \times 10^4$ CFU/mL for H37Rv and H37Ra, respectively. Wells containing drug only were used to detect autofluorescence of compounds plus additional control wells consisted of bacteria only (B) and medium only (M). Plates were incubated at 37°C. Starting at day 4 of incubation, 20 μL of 10x alamar Blue solution (Alamar Biosciences/Accumed, Westlake, Ohio) and 12.5 μL of 20% Tween 80 were added to one B well and one M well, and plates were reincubated at 37°C. Wells were observed at 12 and 24 h for a color change from blue to pink and for a reading of greater than or equal to 50,000 fluorescence units (FU). Fluorescence was measured in a Cytofluor II microplate fluorometer (PerSeptive Biosystems, Framingham, Mass.)
in bottom-reading mode with excitation at 530 nm and emission at 590 nm. If the B
wells became pink by 24 h, reagent was added to the entire plate. If the well remained
blue or 50,000 FU was measured, additional M and B wells were tested daily until a
color change occurred, at which time reagents were added to all remaining wells.

Plates were then incubated at 37°C, and results were recorded at 24 h post-reagent
addition. Visual MICs were defined as the lowest concentration of drug that
prevented a color change. For fluorometric MICs, a background subtraction was
performed on all wells with a mean of triplicate M wells. Percent inhibition was
defined as 1 - (test well FU/mean FU of triplicate B wells) x 100. The lowest drug
concentration effecting an inhibition of 90% was considered the MIC.

provided in FIG. 1.

EXAMPLE 5

Low Oxygen Recovery Assay (LORA)

[0354] The low-oxygen recovery assay (LORA) was essentially performed as
recombinant M. tuberculosis H37Rv bearing luxAB on a plasmid, pFCA-luxAB, was
used in all the LORA experiments. Frozen aliquots from a low oxygen adapted
culture were thawed, diluted in Middlebrook 7H12 broth (Middlebrook 7H9 broth
containing 1 mg/mL Casitone, 5.6 μg/mL palmitic acid, 5 mg/mL bovine serum
albumin, and 4 μg/ml filter-sterilized catalase), and sonicated for 15s. The cultures
were diluted to obtain an A570 of 0.03 to 0.05 and 3,000 to 7,000 RLUs per 100 μL.
This corresponds to 5 x 10^5 to 2 x 10^6 CFU/mL. Twofold serial dilutions were
prepared in a volume 100 μL in black 96-well microtiter plates, and 100 μL of the cell
suspension was added. For LORA, the microplate cultures were placed under
anaerobic conditions (oxygen concentration, less than 0.16%) by using an Anoxomat
model WS-8080 (MART Microbiology) and three cycles of evacuation and filling
with a mixture of 10% H₂, 5% CO₂, and 85% N₂. An anaerobic indicator strip was
placed inside the chamber to visually confirm the removal of oxygen. The plates were
incubated at 37°C for 10 days and then transferred to an ambient gaseous condition
(5% CO₂-enriched air) incubator for a 28-h “recovery.” On day 11 (after the 28-h
aerobic recovery), 100 μL culture was transferred to white 96-well microtiter plates
for determination of luminescence. A 10% solution of n-decanal aldehyde (Sigma) in ethanol was freshly diluted 10-fold in PBS, and 100 µl was added to each well with an autoinjector. Luminescence was measured in a Victor2 multilabel reader (Perkin-Elmer Life Sciences) by using a reading time of 1 s. The MIC was defined as the lowest drug concentration effecting growth inhibition of 90% relative to the growth for the drug-free controls.

EXAMPLE 6

[Tuberculosis in vivo efficacy experiments]

[0356] The TB in vivo efficacy experiments were essentially performed as described in Lenaerts et al. Antimicrob Agents Chemother 47: 783-785 (2003) with a few modifications. A highly susceptible gamma interferon specific pathogen-free C57BL/6-Ifngtm1ts (GKO) mice (Jackson Laboratories, Bar Harbor, Maine) were exposed to a low-dose aerosol infection with M. tuberculosis strain Erdman in a Glas-Col inhalation exposure system as previously described in Kelly et al. Antimicrob Agents Chemother 40: 2809-2812 (1996). Every treatment group consisted of five mice for every following time point. Treatment was started 10 days after infection. One control group of infected mice was sacrificed at the start of treatment. A second group of infected but untreated mice was sacrificed after the cessation of treatment at 24 days. C and L were formulated in saline and E was formulated in 50% water/35% PEG400/5% PG, while rifampicin was formulated in 20% cyclodextrin. All compounds were administered by oral gavage. Rifampicin was dosed at 10 mg/kg QD PO. C was dosed at 100 mg/kg BID PO. E was dosed at 100 mg/kg BID PO. L was dosed at 100 mg/kg QD PO. After completion of therapy, the mice were sacrificed by carbon dioxide inhalation. Lungs were aseptically removed and disrupted in a tissue homogenizer. The number of viable organisms was determined by serial dilution of the homogenates on nutrient Middlebrook 7H11 agar plates (GIBCO BRL, Gaithersburg, Md.). The plates were incubated at 37°C in ambient air for 4 weeks prior to the counting of viable M. tuberculosis colonies (CFU).

[0357] On day 3, the control group had a mean log10 CFU/lung of 2.83 (0.40). On day 10, the control group had a log10 CFU/lung of 4.81 (0.08). On day 24, the control group had a log10 CFU/lung of 8.96 (0.14). On day 24, the group treated with rifampicin had a log10 CFU/lung of 6.16 (0.10). On day 24, the group treated with C
