COMMONWEALTH of AUSTRALIA
Patents Act 1952
APPLICATION FOR A STANDARD PATENT

I/We
Turbex 2000 S.A.
of
Via Carpetana 328, 28047 Madrid, Spain

hereby apply for the grant of a Standard Patent for an invention entitled:

Gasifying, economizing, decontaminating and power enhancing apparatus for improving the operation of engines, appliances, burners and equipment

which is described in the accompanying complete specification.

Details of basic application(s):

The address for service is care of DAVIES & COLLISON, Patent Attorneys, of 1 Little Collins Street, Melbourne, in the State of Victoria, Commonwealth of Australia.

DATED this ELEVENTH day of NOVEMBER 1988

To: THE COMMISSIONER OF PATENTS

a member of the firm of DAVIES & COLLISON for and on behalf of the applicant(s)

Davies & Collison, Melbourne
COMMONWEALTH OF AUSTRALIA
THE PATENTS ACT 1952
DECLARATION IN SUPPORT OF A
CONVENTION APPLICATION FOR A PATENT

In support of the Convention Application made for a patent for an invention entitled: "GASIFYING, ECONOMIZING, DECONTAMINATING AND POWER ENHANCING APPARATUS FOR IMPROVING THE OPERATION OF ENGINES, APPLIANCES, BURNERS AND EQUIPMENT WHICH USE SOLID, LIQUID OR GASEOUS FUELS"

We, Baltasar Miguel Ayuso and Gaspar Humanes Jurado, domiciled at Via Carpetana, 328 - 28047 Madrid, Spain, do solemnly and sincerely declare as follows:

1. We are the applicant(s) for the patent
   (or, in the case of an application by a body corporate)
   1. We are authorised by TURBEX 2000, S.A.

   the applicant(s) for the patent to make this declaration on its/our behalf.

2. The basic application(s) defined by Section 141 of the Act was/were made
   in Spain
   on 13 November, 1987
   by Gaspar Humanes Jurado

3. Gaspar Humanes Jurado
   of Via Carpetana, 328 - 28047 Madrid, Spain.

   (respectively)

   is/are the actual inventor(s) of the invention and the facts upon which the applicant(s) is/are entitled to make the application are as follows:

   The applicant is the assignee of the actual inventor in respect of the invention.

4. The basic application referred to in paragraph 2 of this Declaration was the first application made in a Convention country in respect of the invention(s) the subject of the application.

Declared at Madrid this 3rd day of November 1988.

Signature of Declarant(s)

To. The Commissioner of Patents

11/8
HEATING LIQUID FUEL BY HEAT EXCHANGE WITH COOLANT

Gasifying, economizing, decontaminating and power enhancing apparatus for improving the operation of amongst others internal combustion engines, appliances, burners and equipment which use solid, liquid or gaseous fuels, which acts as a gasifier and economizer of solid, liquid or gaseous fuels as well as a decontaminator of exhaust gases, which is made up of one or more coils or spiral tubes which encircle the pipe through which the hot liquid or gas for cooling the engine or equipment circulates, the fuel which is going towards the engine or equipment passing through the said coil(s) for its heating and vaporization, undergoing a release and a neutralisation of negative ions, wherein the said circulation pipe of cooling liquid is formed internally by a metal tube around which the said coil winds and wherein a diversion pipe equipped with a thermostat, situated at the junction of the exit end of the said coil with the deviation pipe, is positioned between the entry and exit of it, to detect the temperature of the fuel which is flowing along the said coil or spiral tube for the purpose of regulating, by opening or closing the diversion pipe, the temperature of the fuel which reaches the engine, preventing it from exceeding a predetermined excessive temperature.
NAME & ADDRESS
OF APPLICANT:

Turbex 2000 S.A.
Via Carpetana 328
28047 Madrid
Spain

NAME(S) OF INVENTOR(S):

Gaspar Humanes JURADO

ADDRESS FOR SERVICE:

1 Little Collins Street, Melbourne, 3000.

COMPLETE SPECIFICATION FOR THE INVENTION ENTITLED:

Gasifying, economizing, decontaminating and power enhancing apparatus for improving the operation of engines, appliances, burners and equipment

The following statement is a full description of this invention, including the best method of performing it known to me/us:-
The present invention refers to several substantial improvements introduced into the subject of Spanish Utility Model No. 289401, presented on 4 October 1985 in the name of the present applicant.

The present invention refers to a gasifying, economizing, decontaminating and power enhancing apparatus for improving the operating conditions of amongst others internal combustion engines, appliances, burners and equipment which use solid, liquid or gaseous fuels, both with regard to the efficiency of the said appliances as well as with respect to the cleanliness or non contaminated state of the exhaust gases resulting from the said operation.

The aforementioned apparatus acts in the first place as a gasifier, by making the liquid fuel fed to the engine arrive in a completely vaporized state at the cylinders where combustion takes place, and, in second place, it also acts as a fuel economizer, since, on the one hand, this undergoes prior heating, entering the combustion cylinders at a high temperature, by which the thermic efficiency of combustion is improved and, on the other hand, it brings about a more effective mixing of the air and fuel, which results in a practically complete combustion, as a consequence of which uncontaminated emission of exhaust gases is produced, and at the same time the power of the internal combustion engine is increased and considerably enhanced.

With this, the present problems of contamination caused by incomplete combustion, carburation or burning of the mixtures of air and fuel at any speed of the engine or equipment and no matter what fuels are used, whether they
are solid, liquid or gaseous, are solved.

The apparatus consists of a metal tube, preferably of copper, positioned tightly like a lining inside the usual pipe for the passage of the hot water coming from the engine on its way towards the radiator to be cooled, with another metal tube, which may be of the same or of a different material, winding itself in a spiral over the said tube or pipe, and which consists of a fixed and specific number of spirals, according to the power of the engine to which the apparatus is applied.

The whole assembly of the pipe for the passage of water, any other liquid or hot gases with its lining tube and the spiral tube or coil wound over it, is encircled by a forged casing of an appropriate material, such as aluminium, and which may present an optional shape, with the specific and appropriate thicknesses depending on the type and power of the engine to which the apparatus of this invention is applied, the said casing being possibly an integral enlargement of its own external protective covering. Also, more than one single coil may be envisaged.

An illustrative version, which is in no way limitative, of the subject of the invention, will be described below with reference to the attached drawings, in which:

Figure 1 is a general diagramatic view, in cross-section, of the whole apparatus of the invention;

Figure la is a diagramatic view of the apparatus of the invention, without the diversion or the thermostat;

Figure 2 is an external view, partially sectionalised, of the whole pipe for carrying the cooling water, with a thermostat positioned on it;

Figure 3 shows a longitudinal cross-section of a heating device, which can be coupled to the apparatus of the invention as an independent mechanism for some fuels and to assist the initial operation of the engine when it is cold,
Figures 4a, 4b and 4c show views of an apparatus of the invention and its external frame, usable, as an alternative version, operationally equivalent; and Figure 5 shows a longitudinal cross-section of a compensating element for the fuel pump.

Referring now to the drawings, in figure 1 is shown a general layout of the apparatus, which consists essentially of an external protective covering 1 equipped with another internal tube 2, preferably copper or another material, through which the water, air, oil or other coolant from the cooling system of an internal combustion engine or other equipment circulates, the said tubes corresponding to the section of piping positioned at the outlet of the engine (not shown) and which takes the liquid to the radiator to be cooled, as a result of which the liquid of the said pipe will be at a considerably high temperature. That is liquid or gas.

Around the aforementioned cooling liquid or gas pipe 2 is positioned an external frame or casing 3 which encircles the said coolant pipe in close contact with it so that there is a good heat transfer between these two, the external protective covering 1 being possibly an expanded part 3 of the apparatus of the invention. A fuel carrying tube 4 is inserted in the said expanded part 3 wound in a spiral around the pipe 2 of coolant liquid, by which means the fuel impelled towards the engine through the said spiral tube or coil will undergo prior heating and, as a consequence, complete vaporization before reaching the combustion cylinders, as well a release and a neutralization of negative ions will be created by the difference between materials due to the difference which exists between the atoms of the materials which make up the apparatus of the invention. This is activated by making a current of hot water pass in such a way that it passes at right angles to
the flow of the fuel.

Between the entry 5 and exit 6 ends of the fuel from the spiral tube or coil, there is optionally, depending on the climate in which it is being operated (figure 1 or 1a) a diversion 7 which includes a thermostat 8 by means of which the amount of fuel which is circulating through the spiral tube 4 can be regulated according to its temperature, that is, the thermostat 8 opens the diversion pipe 7 after a determined excessive temperature, the temperature of the fuel which arrives at the combustion cylinders for example, being regulated in this way, within a fixed margin.

In the event of the diversion pipe 7 or the thermostat 8 not being provided, the entry (5) and exit (6) ends for the fuel lead directly into the carburettor or into the fuel filter.

In the fuel entry pipe 9, before the point of diversion, a section of pipe or tube 10 can be made available for the fuel to pass along (Figure equipped with a heating element 11 and a thermostat 12, usable in the initial operating periods of the engine, that is when the cooling liquid is cold, in order to achieve the effect of initial heating and vaporization of the fuel which reaches the engine, the thermostat switching off the said heating element when the appropriate temperature has been reached. A return check valve 13 is positioned at the exit end of the said heating tube 10 which prevents the fuel from returning.

At the exit from the diversion section of pipe 7 there is a compensating element 14 in the form of a trap, shown in figure 5, which prevents the fuel pump from remaining empty.

The circulation of the fuel through the coil or spiral tube 4 must take place in countercurrent with relation to the circulation of the engine cooling liquid, as is shown in figure 1, or it may have the same direction of
circulation, the location of the apparatus in relation to
the engine being likewise optional, whatever is the most
convenient in each case.

The coil or spiral tube apparatus shown in figures
4a, 4b and 4c operates in the same way as the one described
above, the only difference being in the different length of
the spiral tube, the length of which corresponds to the
power of the engine to which it is applied, the
aforementioned alternative version being envisaged for lorry
and bus engines or similar, or any other equipment or
device.

Although one version of the invention has been
described and shown, it is obvious that modifications can be
introduced in this which are included within the scope of
the invention, and this must not be considered to be limited
to the said version, but only to the content of the
following Claims:
CLAIMS
The claims defining this invention are as follows:

1.- Gasifying, economizing, decontaminating and power enhancing apparatus for improving the operation of amongst others internal combustion engines, appliances, burners and equipment which use solid, liquid or gaseous fuels, which acts as a gasifier and economizer of solid, liquid or gaseous fuels as well as a decontaminator of exhaust gases, which is made up of one or more coils or spiral tubes which encircle the pipe through which the hot liquid or gas for cooling the engine or equipment circulates, the fuel which is going towards the engine or equipment passing through the said coil(s) for its heating and vaporization, undergoing a release and a neutralisation of negative ions, wherein the said circulation pipe of cooling liquid is formed internally by a metal tube around which the said coil winds and wherein a diversion pipe equipped with a thermostat, situated at the junction of the exit end of the said coil with the deviation pipe, is positioned between the entry and exit of it, to detect the temperature of the fuel which is flowing along the said coil or spiral tube for the purpose of regulating, by opening or closing the diversion pipe, the temperature of the fuel which reaches the engine, preventing it from exceeding a predetermined excessive temperature.

2.- Apparatus as in Claim 1, wherein at the delivery end of the coil or spiral tube for the fuel in front of the point of diversion, there is a section of pipe which has a heating element with a thermostat, for the purpose of preheating the fuel at times of initial operating of the engine, the said heater switching off when the fuel reaches an appropriate temperature.

3.- Apparatus as in the above Claims, wherein there is positioned at the exit end of the diversion pipe a compensation element in the form of a small trough or
similar intercalated in the pipe for the fuel to pass along, to prevent the fuel pump from emptying.

4. - Apparatus as in Claim 1, wherein the entry and exit ends for the fuel lead directly into the carburettor or into the fuel filter.
5. A gasifying, economizing, decontaminating and power enhancing apparatus substantially as hereinbefore described with reference to the accompanying drawings.

6. The steps, features, compositions and compounds disclosed herein or referred to or indicated in the specification and/or claims of this application, individually or collectively, and any and all combinations of any two or more of said steps or features.
