PATENT REQUEST: STANDARD PATENT

I/We, the Applicant(s)/Nominated Person(s) specified below, request I/We be granted a patent for the invention disclosed in the accompanying standard complete specification.

[70,71] Applicant(s)/Nominated Person(s):

Callaway Golf Company, incorporated in California, of 2285 Rutherford Road, Carlsbad, California, 92008, UNITED STATES OF AMERICA

[54] Invention Title:

Golf Putter with Bottom Rail

[72] Inventor(s):

Glenn H. Schmidt and Richard C. Helmstetter

[74] Address for service in Australia:

Spruson & Ferguson, Patent Attorneys
Level 33 St Martins Tower
31 Market Street
Sydney New South Wales Australia (Code SF)

Details of Basic Application(s):

[31] Appl'n No(s):

008,628

[33] Country:

US

[32] Application Date:

28 January 1993

Basic Applicant(s):

Glenn H. Schmidt and Richard C. Helmstetter

DATED this TWENTIETH day of JANUARY 1994

Callaway Golf Company

By:

Registered Patent Attorney

Australia

Patents Act 1990

NOTICE OF ENTITLEMENT

I, John Gordon Hinde, of Spruson & Ferguson, St Martins Tower, 31 Market Street, Sydney, New South Wales 2000, Australia, being the patent attorney for the Applicant(s)/Nominated Person(s) in respect of an application entitled:

Golf Putter with Bottom Rail

state the following:-

The Applicant(s)/Nominated Person(s) has/have entitlement from the actual inventor(s) as follows:-

The Applicant(s)/Nominated Person(s) is/are the assignee(s) of the actual inventor(s).

The Applicant(s)/Nominated Person(s) is/are entitled to rely on the basic application(s) listed on the Patent Request as follows:

The Applicant(s)/Nominated Person(s) is/are the assignee(s) of the basic applicant(s).

The basic application(s) listed on the Patent Request is/are the first application(s) made in a Convention country in respect of the invention.

DATED this Twentieth day of January 1994

John Gordon Hinde

IRN: 258665

INSTR CODE: 63940

665P
Claim

1. A golf putter for use with a putter shaft supporting a head, the head comprising, in combination:
   a) a putter body having a heel, toe, sole defining a bottom wall, and a ball striking front face, the body elongated between the heel and toe, and
   b) a control rail projecting downwardly from said bottom wall, the rail being elongated in a direction between the heel and toe to engage the turf as the putter head is placed downwardly on a golf green, and in a manner tending to stabilize the head against twist during said head downward placement,
   c) said rail spaced rearwardly from said front face along the major length of the rail,
   d) the rail having a narrow bottom surface along the rail length, said surface being flat in a front to rear direction widthwise of the rail,
   e) the body forming a shaft bore extending downwardly in alignment with said rail narrow, flat bottom surface.

Invention Title: Golf Putter with Bottom Rail

The following statement is a full description of this invention, including the best method of performing it known to me/us:-
BACKGROUND OF THE INVENTION

This invention relates generally to golf putters, and more particularly to enhancing putter stability when the putter is maneuvered to address and stroke a golf ball on a golf green.

It is commonly found that golf putters tend to twist in response to their placement downwardly on a green in ball addressing position. Such twisting results in mis-alignment of the putter front face relative to the ball, and requires one or more re-alignment adjustments. Putters can also twist during back-swing away from the ball, and forward striking toward and with the ball, one cause of such twisting being putter bottom surface variable engagement with the turf during such swinging and stroking. There is need for improved means to reduce or eliminate these mis-alignment effects, as referred to, as well as need to improve the overall performance of golf putters.

SUMMARY OF THE INVENTION

It is a major object of the invention to provide an improved putter head so constructed as to reduce or eliminate the mis-alignment problem as referred to.

Basically, the improved putter of the present invention comprises, in combination:
typically extend equidistantly toward the toe and heel, from the said region of the head and rail, so that twisting forces due to turf engagement are counter balanced.

It is further preferred to provide a rail as referred to, which is curved, i.e. extends in a curved plane along the rail length, thereby to provide turf engaging rail support points that are not all in a line, so that stability against tilt of the head results from rail biting into the turf as the head is placed downwardly in position, addressing the ball.

A further preferred form of the invention includes the provision of an L-shaped putter head wherein the putter shaft receiving bore extends downwardly through the head, to intersect the rail, near the front face of the head, for enhanced head positioning control and head stability, during addressing of the ball and stroking of the head.

These and other objects and advantages of the invention, as well as the details of an illustrative embodiment, will be more fully understood from the following specification and drawings, in which:

DRAWING DESCRIPTION

Fig. 1 is a frontal elevation showing a putter head incorporating the invention;
Fig. 2 is a section taken on lines 2-2 of Fig. 1;
Fig. 3 is an enlarged fragmentary section, taken on lines 3-3 of Fig. 2;

Fig. 4 is a bottom plan view taken on lines 4-4 of Fig. 1;

Fig. 5 is a view like Fig. 4, showing a modification; and

Fig. 6 is a fragmentary plan view taken on lines 6-6 of Fig. 1.

DETAILED DESCRIPTION

In the drawings, the putter head 10 has a body 11 defining a sole 12, front ball striking face or surface 13, heel 14, and toe 14a. A shaft 16 is connected to the body, and extends upwardly, as shown. The head may be metallic, and typically consists of brass. The body is elongated between the heel and toe, as shown.

In accordance with the invention, a rail 20 projects downwardly from the bottom wall 12a of the sole, the rail 20 being elongated in a direction between the heel and toe to engage the turf 21 of the putting green and projects downwardly into the turf, as shown in Fig. 3, in a manner to stabilize the head for resisting twist as in either or both twist directions (indicated by arrows 22 and 22a in Fig. 4) as the putter sole is placed downwardly, on the green turf. See also the golf ball 24 in Fig. 2, immediately in front of face 13, the rail received in the turf tending to
maintain the head face 13 squared relative to the ball, just prior to stroking of the head by manual swing of the shaft 16.

As shown, the elongated rail is spaced rearwardly from the front face 13, beneath the upright head front flange 23, for substantially balanced support of the head. The head is L-shaped in cross section (see Fig. 2), and has a bottom and rearward flange 25 projecting rearwardly from lower extent of 23, to define the sole bottom wall 12a. The bottom includes bottom wall extent 12a' frontwardly of the rail, and bottom wall extent 12a'' rearwardly of the rail. In the example, the front to rear width w₁, of 12a' is substantially less than the front to rear width w₂ of 12a'', and typically, w₂ is two to six times w₁. Bottom wall extent 12a' is typically flat in a front to rear direction, and shallowly downwardly convex in a heel to toe direction (see Fig. 1); and bottom wall extent 12a'' is typically flat but slightly beveled upwardly and rearwardly at 27, in a front to rear direction, and 12a' is also shallowly downwardly convex, as in Fig. 1.

Rail 20 has a bottom surface 28 extending along the rail length, that surface typically having constant, or substantially constant width, and being flat or substantially flat in a front to rear direction, widthwise of the rail. Such width should be between 1/8 and 3/8 inches, and the rail should project below the sole surface by an amount "t" where t
decreases toward the toe, and toward the heel along the rail length (see Fig. 1). The maximum amount "t" should be between 1/16 and 1/8 inch, so as to effectively seat into the green turf, without extending too deeply into the turf so as to impede head stroking. Rail bottom surface 28 has greater curvature, than the curvature of sole 12 in a toe to heel direction to merge with the sole at 28c and 28d.

Further, the rail 20 has frontwardly facing surface 29 which tapers downwardly and rearwardly (see Fig. 3) so as to slide over the turf as the head is stroked, the impact of the turf against the tapered surface 29 tending to lift the putter head and prevent or minimize digging of the head further into the turf as the head is stroked. Surface 29 merges with surface 28 along a rounded edge 30, to enhance these effects.

Likewise, the rail 20 has a rearwardly facing surface 31 which tapers downwardly and forwardly (see Fig. 3) to merge with surface 28 along a rounded edge 32. Surfaces 31 and 32 enable rearward sliding of the putter over the green turf as the head is swung backwardly relative to the golf ball, tending to prevent or minimize digging of the head into the turf during the back-stroke.

Note that the rail middle extent extends lengthwise below the middle of the putter, i.e. the "sweet spot" region 32 directly rearwardly of the ball; also the rail extends from that middle extent toward the heel and toward the toe to equal, or substantially
equal extents, whereby rail engagement with the turf during the back and forward strokes is the same toward the toe and toward the heel (from the rail middle extent) to minimize twisting of the putter head as it is stroked.

In Figs. 1, 2 and 4, the putter shaft 16 is affixed to the body 11 to project downwardly toward the rail, where weight is downwardly concentrated for transfer to the turf. The body 11 defines or contains a shaft receiving bore 40 wherein the shaft lower end 16a is joined to the bore as by adhesive, at 41. The bore intersects the bottom surface of the rail at spaced arcuate locations 42 and 42a, and the sole 12 at arcuate locations 12g and 12d, as seen in Figs. 1 and 4, and the shaft end may also extend almost to the rail bottom surface between the heel and the mid region of the rail. Filler 48 fills space between the lower core of the shaft and the surfaces 12 and 28. Note that bore 40 extends in the upright front flange 23, and the shaft extends upwardly from that bore.

It will be noted that in Figs. 1-4, the rail lengthwise extent defines a flat upright plane 50 extending between the toe and heel. See Fig. 4. Such a straight rail allows some pivoting or tilting of the head forwardly or rearwardly, as indicated by lines 51 and 52 in Fig. 2. To eliminate or reduce such capacity for tilting, i.e. to help maintain the head in upright position as seen in Fig. 2, with face 13 squarely addressing the ball, the rail is formed to be
lengthwise curved, to provide enhanced support for the putter body on the turf --i.e. "3-point" support, in effect. See for example the curved plane 55 of the rail 56 in Fig. 5, and such curvature may take various forms. Three points of support, out of alignment, are seen at A, B and C, in Fig. 5. Such a rail 56, otherwise like the above described rail 20, provides all of the advantages of rail 20, plus the added, anti-pivot support for the putter body as described. Note that the front inclined surface of rail 56 has variable spacing from the ball striking surface 13 of the putter head.

In Fig. 6, the flange 23 is locally enlarged, rearwardly, at 23a, to provide a total front to rear thickness \( w_3 \) greater than bore 40 diameter.
The claims defining the invention are as follows:

1. A golf putter for use with a putter shaft supporting a head, the head comprising, in combination:
   a) a putter body having a heel, toe, sole defining a bottom wall, and a ball striking front face, the body elongated between the heel and toe, and
   b) a control rail projecting downwardly from said bottom wall, the rail being elongated in a direction between the heel and toe to engage the turf as the putter head is placed downwardly on a golf green, and in a manner tending to stabilize the head against twist during said head downward placement,
   c) said rail spaced rearwardly from said front face along the major length of the rail,
   d) the rail having a narrow bottom surface along the rail length, said surface being flat in a front to rear direction widthwise of the rail,
   e) the body forming a shaft bore extending downwardly in alignment with said rail narrow, flat bottom surface.

2. The combination of claim 1 wherein the rail has a frontward facing surface which tapers downwardly and rearwardly to merge with a forward extent of said rail bottom surface, and the rail also has a rearward facing surface which tapers downwardly and forwardly to merge with a rearward extent of said rail bottom surface.

3. The combination of claim 1 wherein said bottom surface has a substantially uniform width along the majority of the rail length, the rail extending lengthwise below the middle of the putter body between the heel and toe, and extending therefrom toward both the toe and heel.

4. The combination of claim 3 wherein said width is between 0.3175 cm and 0.9525 cm.

5. The combination of claim 1 wherein the rail defines a flat upright plane which extends between the toe and heel.

6. The combination of claim 1 wherein the rail has maximum projection of less than 0.635 cm below said sole bottom wall, along the rail length.

7. The combination of claim 1 wherein the putter body is metallic.

8. The combination of claim 7 wherein the putter body has L-shaped cross sections in upright planes normal to the length direction of the rail, the rail projecting below said L-shaped cross sections.

9. The combination of claim 1 including a putter shaft affixed to said body to project downwardly toward said rail.

10. A golf putter for use with a putter shaft supporting a head, the head comprising, in combination:
a) a putter body having a heel, toe, sole defining a bottom wall, and a ball striking front face, the body elongated between the heel and toe, and  
b) a control rail projecting downwardly from said bottom wall, the rail being elongated in a direction between the heel and toe to engage the turf as the putter head is placed downwardly on a golf green, and in a manner tending to stabilize the head against twist during said head downward placement,  
c) said rail spaced rearwardly from said front face along the major length of the rail,  
d) the rail having a narrow bottom surface along the rail length, said surface being flat in a front to rear direction widthwise of the rail, the rail defining a flat upright plane which extends between the toe and heel,  
e) said flat bottom surface being downwardly convex along said length in a direction between the heel and toe.  

11. A golf putter for use with a putter shaft supporting a head, the head comprising, in combination:  
a) a putter body having a heel, toe, sole defining a bottom wall, and a ball striking front face, the body elongated between the heel and toe, and  
b) a control rail projecting downwardly from said bottom wall, the rail being elongated in a direction between the heel and toe to engage the turf as the putter head is placed downwardly on a golf green, and in a manner tending to stabilize the head against twist during said head downward placement,  
c) said rail spaced rearwardly from said front face along the major length of the rail,  
d) the rail having a narrow bottom surface along the rail length, said surface being flat in a front to rear direction widthwise of the rail, and along the rail length,  
e) and wherein the rail defines a curved upright plane which extends between the toe and heel, whereby the rail bottom surface is lengthwise curved to provide anti-tilt body support on the turf.  

12. The combination of claim 11 wherein said rail flat bottom surface is downwardly convex along the said length in a direction between the heel and toe.  

13. The combination of claim 12 wherein the body defines a shaft bore extending downwardly toward the rail flat bottom surface, and a shaft extending downwardly in said bore and affixed thereto.  

14. The combination of claim 13 wherein the rail is spaced rearwardly from said head front face, and said shaft extends upwardly from said bore in spaced relation to the rail, the rail having a depth which decreases toward the toe and toward the heel.
15. A golf putter for use with a putter shaft supporting a head, the head comprising, in combination:
   a) a putter body having a heel, toe, sole defining a bottom wall, and a ball striking front face, the body elongated between the heel and toe, and
   b) a control rail projecting downwardly from said bottom wall, the rail being elongated in a direction between the heel and toe to engage the turf as the putter head is placed downwardly on a golf green, and in a manner tending to stabilize the head against twist during said head downward placement,
   c) said rail spaced rearwardly from said front face along the major length of the rail,
   d) the rail defining a curved upright plane which extends between the toe and heel, whereby the rail bottom surface is lengthwise curved to provide anti-tilt body support on the turf,
   e) the rail bottom surface being widthwise flat along the rail length, and said bottom surface being downwardly convex along the said length in a direction between the heel and toe.
   f) and wherein the body defines a shaft bore intersecting the rail, and a shaft extending downwardly in said bore and affixed thereto.

16. The combination of claim 15 wherein the rail is spaced rearwardly from said head front face, and said shaft extends upwardly from said bore, the shaft bore also intersecting the sole, and said sole also being downwardly convex along its length between the heel and toe, the rail having a depth which decreases toward the toe and toward the heel.

17. A golf putter, substantially as described herein with reference to Figs. 1 to 4 and Fig. 6 or Figs. 1 to 3 and Figs. 5 and 6 of the accompanying drawings.

Golf Putter with Bottom Rail

Abstract

A golf putter for use with a putter shaft (16) supporting a head (10), the head comprising in combination a putter body (11) having a heel (14), toe (14a), sole defining a bottom wall (12a), and a ball striking front face (13), the body (11) elongated between the heel (14) and toe (14a); a control rail (20) projecting downwardly from the bottom wall (12a), the rail (20) being elongated in a direction between the heel (14) and toe (14a) to engage the turf (21) as the putter is placed downwardly on a golf green, and in a manner to stabilize the head (10) against twist during the head downward placement, and the rail (20) spaced rearwardly from the front face (13) along the major length of the rail (20).

(Figure 1)
