Title: IMPROVING CONDITION OF ELDERLY PETS

Abstract: A method is provided for improving the condition and/or increasing the longevity of elderly pets. The elderly pet is administered an effective amount of a nutritional composition which contains a calcium source and an antioxidant source, such as of vitamins or vitamin precursors which have antioxidant properties. Examples of such vitamins and precursors include β-carotene and vitamin E.
IMPROVING CONDITION OF ELDERLY PETS

Field of the Invention

This invention relates to a composition for improving the condition of elderly pets. The invention also relates to a method for improving the condition of elderly pets.

Background of the Invention

Any discussion of the prior art throughout the specification should in no way be considered as an admission that such prior art is widely known or forms part of common general knowledge in the field.

Elderly pets often become frail in their last few years of life. From an appearance point of view, they become thin and have poor skin and coat condition. Other symptoms include weight gain, increased water intake, digestive system problems, and joint stiffness and energy loss or lower activity levels in general. Also, the density of their bones may decrease making them susceptible to bone breakage. Further, elderly pets may be more susceptible to cancers than younger animals.

Certain of these problems may be effectively treated using medication. However, a better alternative would be to delay the onset of these problems, or treat these problems, through diet adjustments. In particular, elderly animals should be fed a balanced, maintenance food that contains high quality protein, lower amounts of fat to reduce energy intake, dietary fiber, and antioxidants.

Dietary requirements for geriatric pets are addressed by Branam, 'Dietary management of geriatric dogs and cats', Veterinary Technician, vol. 8, no. 10, 1987, pages 501-503, where he advocates properly formulated diets containing moderate levels of high quality protein, essential fatty acids, vitamins, calcium, zinc and fiber in amounts greater that for younger animals. The vitamins he lists are A, B_1, B_6, B_12 and E.

However, despite the use of balanced, maintenance foods, the condition of elderly animals may deteriorate rapidly. Therefore there is a need for nutritional ways of improving the condition and/or increasing the longevity of elderly pets.
Summary of the Invention

Accordingly, in a first aspect, this invention provides a method for improving the condition of an elderly cat, the method comprising administering to the cat an effective amount of a nutritional composition comprising a calcium source, a source of vitamins D, E and K and β-carotene.

In a second aspect, this invention provides a method for increasing the longevity or quality of life of an elderly cat, the method comprising administering to the pet an effective amount of a nutritional composition which comprises a calcium source, a source of vitamins D, E and K and β-carotene.

It is surprisingly found that the condition of elderly pets, which are administered a calcium source and a source of a nutritional agent, such as a vitamin or a vitamin precursor which has antioxidant properties, markedly improves. Further, the survivability and hence longevity of the pets improve.

Preferably, the nutritional composition includes a source of zinc. The nutritional composition may also contain a source of glutamine.

The antioxidant source may be selected from β-carotene, vitamin C and vitamin E.

In a third aspect, the invention provides a method for increasing the longevity of an elderly cat, the method comprising administering to the cat an effective amount of a nutritional composition which comprises a calcium source, a zinc source, β-carotene at a level of at least 4 mg/1000 kcal, and vitamin E at a level of at least 75 IU/1000 kcal.

The composition preferably is administered in an amount effective to increase the activity level of the pet.

In a fourth aspect, the invention provides a method for reversing a sign of ageing in an elderly cat comprising administering to the cat a nutritional composition comprising a source of calcium, a source of vitamins D, E and K and β-carotene.

In a fifth aspect, the present invention provides a pet food for elderly cats, the pet food comprising a protein source, a lipid source, a calcium source, a zinc source, β-carotene at a level of at least 4 mg/1000 kcal and vitamin E at a level of at least 75 IU/1000 kcal.
The nutritional composition may also include a nutritional agent, which promotes the growth of bifido- and lactic-bacteria in the gastro-intestinal tract of the pet. For example, the nutritional agent may be a prebiotic or a probiotic micro-organism.

Preferably, the nutritional composition is a complete and nutritionally balanced pet food.

The pet food may comprise at least about 3 g/1000 kcal of calcium, at least about 50 mg/1000 of zinc, at least about 5 mg/1000 kcal of β-carotene, and at least about 150 IU/1000 kcal of vitamin E.

In a sixth aspect, the present invention a method for reversing the signs of ageing in an elderly cat comprising administering to the cat a nutritional compositions comprising a source of calcium and a source of β-carotene and a source of vitamin E.

In a seventh aspect, this invention provides a process for maintaining or increasing total blood protein in an elderly cat comprising administering to the cat a nutritional composition comprising a source of calcium and a source of β-carotene and a source of vitamin E.

In an eighth aspect, the invention provides use of a calcium source, a source of vitamins D, E and K, and β-carotene in the manufacture of a nutritional composition for improving the condition of an elderly cat.

In a ninth aspect, the invention provides use of a calcium source, a source of vitamins D, E and K, and β-carotene in the manufacture of a nutritional composition for increasing the longevity or quality of life of an elderly cat.

In a tenth aspect, the invention provides use of a calcium source, a zinc source, β-carotene at a level of at least 4 mg/1000 kcal and vitamin E at a level of at least 75 IU/1000 kcal in the manufacture of a nutritional composition for increasing the longevity of an elderly cat.

In an eleventh aspect, the invention provides use of a source of calcium, a source of vitamins D, E and K, and β-carotene in the manufacture of a nutritional composition for reversing a sign of ageing in an elderly cat.

In a twelfth aspect, the invention provides use of a source of calcium and a source of β-carotene and a source of vitamin E in the manufacture of a composition for reversing a sign of ageing in an elderly cat.
In a thirteenth aspect, the invention provides use of a source of calcium and source of β-carotene and a source of vitamin E in the manufacture of a nutritional composition for maintaining or increasing total blood protein in an elderly cat.

"Prebiotic" means a substance or compound which is fermented by the intestinal flora of the pet and hence promotes the growth or development of bifido- and lactic-bacteria in the gastro-intestinal tract of the pet at the expense of pathogenic bacteria. The result of this fermentation is a release of fatty acids, in particular short-chain fatty acids in the colon. This has the effect of reducing the pH value in the colon.

"Probiotic micro-organism" means a micro-organism which beneficially affects a host by improving its intestinal microbial balance (Fuller, R; 1989; J. Applied Bacteriology, 66: 365-378). In general, probiotic micro-organisms produce organic acids such as lactic acid and acetic acid which inhibit the growth of pathogenic bacteria such as Clostridium perfringens and Helicobacter pylori.

Unless the context clearly requires otherwise, throughout the description and the claims, the words 'comprise', 'comprising', and the like are to be construed in an inclusive sense as opposed to an exclusive or exhaustive sense; that is to say, in the sense of "including, but not limited to".

Detailed Description of the Preferred Embodiments

Embodiments of the invention are now described by way of example only. The invention is based upon the finding that the administration to an elderly pet of an effective amount of a calcium source and a source of an antioxidant having antioxidant properties, improves the condition and/or longevity of the pet. By "elderly" is meant a pet of age 7 years or more, although in certain cases, younger pets may exhibit characteristics and conditions generally associated with older animals. In preferred embodiments, the source of antioxidant is a source of vitamins or vitamin precursors.

The calcium source and the source of vitamins which have antioxidant properties, are administered as part of a nutritional composition. The nutritional composition is conveniently formulated into a pet food. The pet food may be any suitable pet food, for example a canned pet food, a semi-moist pet food, or a dried pet food. Further, the exact composition of the pet food is not critical.

The pet food thus contains a source of antioxidants, advantageously selected from the group of sources of vitamins and vitamin precursors. Suitable examples of
such antioxidants include β-carotene, vitamin E and vitamin C. Preferably the pet food contains β-carotene and vitamin E.

If β-carotene is used, it may be present in an amount above about 4 mg/1000 kcal. For example, the nutritional composition may contain about 5 mg/1000 kcal of β-carotene. The vitamin E may be present in an amount of above about 75 IU/1000 kcal; for example above about 150 IU/1000 kcal.
The pet food contains a calcium source. Suitable calcium sources include calcium carbonate, calcium phosphate (di or tribasic), calcium chloride, calcium citrate bone meal (or bones, for example, chicken necks & backs), or other bioavailable sources of calcium. The pet food preferably contains about 1.5 g/1000 kcal to about 6 g/1000 kcal of calcium; for example about 4.5 g/1000 kcal.

The pet food may also contain vitamin D, vitamin K and zinc. The vitamin D may be present in an amount of about 500IU/1000kcal to about 190000IU/1000kcal. The vitamin K may be present in an amount of above about 0.07mg/1000kcal; for example about 0.125mg/1000kcal. Other minerals and vitamins may also be included.

The pet food preferably contains a source of zinc. Zinc may be provided, by way of example, in the form of zinc sulfate, zinc oxide and zinc-methionine. Further, many ingredients commonly used in pet foods are sources of zinc. The pet food preferably contains about 50 mg/1000 kcal to 500 mg/1000 kcal of zinc.

The pet food may contain a protein source. Any suitable protein source may be used. Suitable protein sources may be selected from any suitable animal or vegetable protein source; for example muscular or skeletal meat, meat and bone meal, poultry meal, fish meal, milk proteins, corn gluten, wheat gluten, soy flour, soy protein concentrates, egg proteins, whey, casein, gluten, and the like. For elderly animals, it is preferred for the protein source to contain a high quality animal protein.

The amount of protein provided by the protein source may be selected as desired. For example, the pet food may contain about 12% to about 70% by weight of protein on a dry basis.

The pet food may contain a carbohydrate source. Any suitable carbohydrate source may be used. Preferably the carbohydrate source is provided in the form of grains, flours and starches. For example, the carbohydrate source may be rice, barley, sorghum, millet, oat, corn meal or wheat flour. Simple sugars such as sucrose, glucose and corn syrups may also be used.

The amount of carbohydrate provided by the carbohydrate source may be selected as desired. For example, the pet food may contain up to about 60% by weight of carbohydrate.

The pet food may contain a fat source. Any suitable fat source may be used; both animal fats and vegetable fats. Preferably the fat source is an animal
fat source such as tallow. Vegetable oils such as corn oil, sunflower oil, safflower oil, rape seed oil and the like, may also be used. If desired, the fat source may include long chain fatty acids. Suitable long chain fatty acids include alpha-linoleic acid, gamma linolenic acid, linoleic acid, eicosapentanoic acid, and docosahexanoic acid. Fish oils are a suitable source of eicosapentanoic acids and docosahexanoic acid. Borage oil, blackcurrent seed oil and evening primrose oil are suitable sources of gamma linolenic acid. Safflower oils, sunflower oils, corn oils and soy bean oils are suitable sources of linoleic acid.

The amount of fat provided by the fat source may be selected as desired. For example, the pet food may contain about 5% to about 50% by weight of fat on a dry basis. Preferably, the pet food has a relatively reduced amount of fat.

The exact composition of the protein source, the carbohydrate source and the fat source is not critical and will be selected based upon palatability, availability, cost and processing considerations.

The pet food may also include additional ingredients such as salts, spices, seasonings, flavoring agents, gums, prebiotics and probiotic micro-organisms. Suitable prebiotics include oligosaccharides, such as inulin and its hydrolysis products commonly known as fructooligosaccharides, galacto-oligosaccharides, xylo-oligosaccharides or oligo derivatives of starch.

The prebiotics may be provided in any suitable form. For example, the prebiotic may be provided in the form of plant material which contains the prebiotic. Suitable plant materials includes asparagus, artichokes, onions, wheat or chicory, or residues of these plant materials. Alternatively, the prebiotic may be provided as an inulin extract or a hydrolyzed inulin extract. Extracts from chicory are particularly suitable. Suitable inulin extracts are commercially available.

The probiotic micro-organism may be selected from one or more micro-organisms suitable for animal consumption and which is able to improve the microbial balance in the intestine.

Examples of suitable probiotic micro-organisms include yeasts such as *Saccharomyces, Debaromyces, Candida, Pichia* and *Torulopsis*, moulds such as *Aspergillus, Rhizopus, Mucor, and Penicillium* and *Torulopsis* and bacteria such as the genera *Bifidobacterium, Bacteroides, Fusobacterium, Melissococcus, Propionibacterium, Streptococcus, Enterococcus, Lactococcus, Staphylococcus, Peptostreptococcus, Bacillus, Pediococcus, Micrococcus, Leuconostoc, Weissella, Aerococcus, Oenococcus* and *Lactobacillus*. Specific examples of suitable
probiotic micro-organisms are: *Saccharomyces cerevisae*, *Bacillus coagulans*, *Bacillus licheniformis*, *Bacillus subtilis*, *Bifidobacterium bifidum*, *Bifidobacterium infantis*, *Bifidobacterium longum*, *Enterococcus faecium*, *Enterococcus faecalis*, *Lactobacillus acidophilus*, *Lactobacillus alimentarius*, *Lactobacillus casei* subsp. *casei*, *Lactobacillus casei* Shirota, *Lactobacillus curvatus*, *Lactobacillus delbruckii* subsp. *lactis*, *Lactobacillus farciminus*, *Lactobacillus gasserii*, *Lactobacillus helveticus*, *Lactobacillus johnsonii*, *Lactobacillus reuteri*, *Lactobacillus rhamnosus* (Lactobacillus GG), *Lactobacillus sake*, *Lactococcus lactis*, *Micrococcus varians*, *Pediococcus acidilactici*, *Pediococcus pentosaceus*, *Pediococcus acidilactici*, *Pediococcus halophilus*, *Streptococcus faecalis*, *Streptococcus thermophilus*, *Staphylococcus carnosus*, and *Staphylococcus xylosus*. The probiotic micro-organisms may be in powdered, dried form; especially in spore form for micro-organisms which form spores. Further, if desired, the probiotic micro-organism may be encapsulated to further increase the probability of survival; for example in a sugar matrix, fat matrix or polysaccharide matrix. Alternatively, the micro-organism may be applied to a body or particle of pet food such as a kibble in a coating mixture. Such mixture may comprise a lipid-based carrier and suitable preserving or protective agents for the micro-organism. Further alternatively, it may be provided as a separately contained supplement to the main food composition, such as for example in a sachet provided with the composition in its packaged form, preferably at point of sale.

The pet food may also include a glutamine source. Suitable sources of glutamine include glutamine in free amino acid form, glutamine in di-peptide form and proteins obtained sorghum, millet, oat, and carob. Gluten also provides a suitable source of glutamine.

The pet food may be produced using any suitable process. Suitable processes for wet products include the following:-

Process (i): To produce a thermally gelled emulsion which sets upon cooling, a suitable meat material is comminuted to produce a meat batter. Suitable gelling agents, for example starches and gums such as kappa-carrageenan, locust bean gum, guar gum, and xanthan gum may be added to the meat batter. Usually no more than about 1% by weight of gum is needed.

Water may also be added the meat batter to provide from about 70% to about 85% by weight of moisture. If sufficient moisture is present in the meat material, water need not be added.
The meat batter is then heated to a temperature suitable to initiate thermal gelling of the mixture; for example a temperature of about 40°C to about 65°C in a mixer-cooker. Steam may be injected into the meat batter if desired. The heated meat batter may be emulsified if desired. The meat batter is then maintained at a temperature of about 40°C to about 65°C until needed. After retorting and cooling to room temperature, the meat batter forms a thermally gelled emulsion which is substantially solid or at least holds its form.

Process (ii): To produce solid food pieces in gravy or gel, solid pieces of meat or other material, or both, may be mixed with a gravy. Solid pieces of other materials may also be used; such as rice grains, pasta or noodles, vegetable pieces, and the like.

The solid food pieces may be in the form of pieces of a thermally gelled matrix. The pieces of the thermally gelled matrix may be produced by any suitable procedure, for example the procedures described in any one of US patents 4,781,939, 5,132,137 and 5,567,466 and PCT application WO 97/02760.

The thermally gelled matrix may be formed in suitable equipment such as an emulsion mill or an extruder to form pieces or chunks. If an extruder is used, the emulsion may be forced through an orifice to provide the emulsion with a desired shape; for example of oval, square or rectangular cross-section. The extrudate may then be cooked in a suitable continuous cooking system; for example a tunnel oven using hot air, steam, mixtures of hot air and steam, or microwaves as the heating medium. The core temperature of the extrudate is raised such that the extrudate undergoes thermal gelling. For example, the core temperature may be raised to at least about 80°C; for example about 85°C to about 95°C. The gelled extrudate may then be cut into pieces and the pieces cooled to provide pieces of a thermally gelled matrix. The pieces may be subjected to flaking if desired. The cooling may be carried out by spraying water on the pieces. Alternatively, other cooling media may be used.

If a gravy is used with the solid food pieces, it may be produced from water, one or more starch or gums, and suitable flavoring agents. The gravy preferably comprises about 20% to about 80% by weight of the mixture of solid pieces and gravy. Suitable gums are kappa-carrageenan, locust bean gum, guar gum and xanthan gum.

If a gel is used with the solid food pieces, it may be produced from a suitable gelling agent, water and suitable flavoring agents. The gel preferably comprises about 20% to about 80% by weight of the mixture of solid pieces and
gravy. Suitable gelling agents are proteins such as gelatin; gums such as alginates, kappa-carrageenan, locust bean gum, guar gum and xanthan gum, and the like. The gel or aspic may be prepared as is conventional.

Products which use a combination of the processes described above may also be used. For example, a thermally gelled emulsion may be prepared as described above. Then solid food pieces, which may be pieces of a thermally gelled matrix, meat pieces, vegetable pieces, combinations of these pieces, and the like, are combined with the thermally gelled emulsion. As a further alternative, combinations of thermally gelled emulsions and solid food pieces in gravy or gel, may be used. Suitable combinations are described in WO 98/05218 and WO 98/05219; the disclosures of which are incorporated by reference.

The pet foods are then filled into cans or other containers, the containers sealed, and the products retorted in the normal manner. Suitable equipment is commercially available.

A suitable process for a dried pet food is cooking a feed mixture of the various ingredients, forming the cooked mixture into pellets, drying, and then coating the pellets with flavors. The cooking and forming steps are preferably carried out using an extruder, as is well known in the art. However, the pellets may be produced by other cooking procedures such as baking a preformed food body comprising the selected ingredients, preferably in nutritionally balanced proportions.

The amount of the pet food to be consumed by the pet to obtain a beneficial effect will depend upon the size or the pet, the type of pet and the age of the pet. However an amount of the nutritional composition to provide a daily amount of at least about 0.2 mg/kg body weight of β-carotene, at least about 3 IU/kg body weight of vitamin E, and at least about 0.12 g/kg body weight of calcium, would usually be adequate. Preferably at least about 2 mg/kg body weight of zinc is administered. For example, for a cat weighing about 4 kg, a daily amount of at least about 0.25 mg/kg body weight of β-carotene, at least about 3.5 IU/kg body weight of vitamin E, at least about 0.15 g/kg body weight of calcium and at least about 2.5 mg/kg body weight of zinc, may be fed.

For example, for a dog weighing about 20 kg, a daily amount of at least about 0.2 mg/kg body weight of β-carotene, at least about 3 IU/kg body weight of vitamin E, at least about 0.12 /kg body weight of calcium and at least about 2 mg/kg body weight of zinc, may be fed.
It is believed that by providing a pet food composition as provided for above, making it available to minders or owners of elderly pets and drawing attention to the prospect that regular feeding of the composition to such pets can bring about at least a temporary reversal of at least some of the signs of aging in their pet, the pet minder will be encouraged to administer the pet the composition on a regular basis. A suitable way of drawing the attention of the minder to the benefits of the composition would be by way of notice on the packaging of the food composition, alternatively by separate advertising thereof.

Numerous modifications may be made to the embodiments described above without departing from the scope of the invention. Specific examples are now described for further illustration.

Example 1

Thirty six cats are used in a trial. The cats are at least 10 years of age and are in a frail or borderline frail condition. Both male and female cats are used and the numbers are roughly equal across treatments. The cats are screened for hyperthyroidism.

The cats are separated into 4 groups of 9 cats each. Each group has roughly the same amount of hyperthyroid cats as any other group. Also, the male:female ratio for each group is roughly the same.

Each cat is housed in a cage and is subjected to a light cycle of 12 hours darkness and 12 hours light. The temperature is ambient. The cages are cleaned daily. Each cat has ad libitum access to food and water except prior to the taking of any blood sample when the cats are fasted overnight.

All cats are fed a canned control diet for a pre-test period of 7 weeks. A blood sample is taken and blood superoxide dismutase levels, calcium, Complete Blood Count (hemoglobin, hematocrit, red blood cell number), albumin and protein are determined.

Each group of cats is then fed a different diet for a period of 6 months. The diets are as follows:

Control Diet: A canned pet food which is highly palatable to cats. The food contains 24.7% added water, about 73.7% meat, about 1% starch and flavors, minerals and vitamins; all by weight. The food contains normal levels of vitamins and minerals.

Diet A: The control diet but containing an additional 5 mg/1000kcal of β-carotene and 100 IU/1000 kcal of vitamin E;
Diet B: The control diet but containing an additional 3 g/100 kcal calcium, 1500 IU/1000 kcal vitamin D, 0.05 mg/1000 kcal vitamin K and 40 mg/1000 kcal zinc.

Diet C: The control diet but containing and additional 5 mg/1000 kcal of β-carotene, 100 IU/1000 kcal of vitamin E, 3 g/100 kcal calcium, 1500 IU/1000 kcal vitamin D, 0.05 mg/1000 kcal vitamin K and 40 mg/1000 zinc.

The cats are examined upon commencement of the trial, after 3 months and after 6 months. The examination includes:
- a physical examination;
- a subjective assessment of body condition;
- determination of blood superoxide dismutase levels, calcium balance, Complete Blood Count (hemoglobin, hematocrit, red blood cell number), albumin and protein.

The results are as follows:

<table>
<thead>
<tr>
<th>Change in:</th>
<th>Control Diet</th>
<th>Diet A</th>
<th>Diet B</th>
<th>Diet C</th>
</tr>
</thead>
<tbody>

<td>Total protein</td>
<td>-0.6</td>
<td>-0.3</td>
<td>-0.8</td>
<td>0.3</td>
</tr>
</tbody>
</table>

All cats fed Diet C have improved longevity. The cats fed diets A and C have a significant improvement in hematocrit, hemoglobin, and red blood cell levels. Indeed, these represent at least a partial reversal to levels associated with far younger cats. While total blood protein decreases in cats fed the control diet, it does not decrease in cats fed diets A and C. Decreased hemoglobin, hematocrit, red blood cell number, and protein are commonly observed in elderly pets. Diet B, which contains calcium but not the antioxidant vitamins A and E, performs worse than the control. Hence combining calcium with the antioxidant vitamins A and E offers a surprising and synergistic improvement.

Example 2

The effect of the diet of the present invention was monitored over a period of six months in a group of thirty six elderly cats. Each cat was over 8 years of age at commencement of the trial. The cats were divided into two groups
(Control and Diet A) of 18 cats each having similar age profiles. The cats are screened prior to being chosen for the trial to eliminate those with known pre-existing disease conditions. Preliminary screening is performed by: physical examination, cbc, serum chemistries, thyroid hormone and urinalysis including urine protein/creatinine ratio. These parameters are all routinely recommended in the veterinary evaluation of geriatric pets.. In each group, cats are blocked for assignment to diets on the basis of sex, age, and a “health status” parameter to be derived from initial screening tests listed above.

Each cat is housed in a cage and is subjected to a light cycle of 12 hours darkness and 12 hours light. The temperature is ambient. The cages are cleaned daily. Each cat has ad libitum access to food and water. For a month prior to commencement of the trial, both groups are fed a standard diet, available commercially under the brand name Friskies Salmon.

From the commencement date, Control continued to be fed the Friskies Salmon diet as a control, while Diet A was fed a diet consisting of Friskies Salmon plus the following additives: 5 mg/1000 kcal of β-carotene and 100 IU/1000 kcal of vitamin E. Calcium content was approximately 4.5 g/1000 kcal ME.

Each participating cat wears a collar having an activity monitor that contains an accelerometer mounted thereon. The activity monitor was a model Actiwatch 16 manufactured by Mini Mitter Co., Inc., (Sunriver, Oregon, USA). The activity monitor is capable of sensing any motion and integrates degree and intensity of motion. The monitor provides the data tabulated below:

The cats in the control diet group (Control) experience a decline in activity. This decline is in line with expectations for a 6 month period at their age. In contrast, elderly cats fed on the antioxidant-containing diet of Diet A demonstrate remarkable increases in activity levels. This provides evidence of an increase in ease of movement and therefore of a general improvement in quality of life.
THE CLAIMS DEFINING THE INVENTION ARE AS FOLLOWS:-

1. A method for improving the condition of an elderly cat, the method comprising administering to the cat an effective amount of a nutritional composition comprising a calcium source, a source of vitamins D, E and K and β-carotene.

2. A method according to claim 1 in which the nutritional composition includes a zinc source.

3. A method according to claim 1 or claim 2 in which the nutritional composition is a nutritionally complete pet food.

4. A method according to any one of the preceding claims in which the nutritional composition further comprises a prebiotic and/or a probiotic micro-organism.

5. A method according to claim 4 in which the prebiotic is selected from the group of inulin, fructooligosaccharides and plant materials which contain inulin and/or fructooligosaccharides.

6. A method according to any one of the preceding claims in which the nutritional composition further comprises a source of glutamine.

7. A method for increasing the longevity or quality of life of an elderly cat, the method comprising administering to the cat an effective amount of a nutritional composition which comprises a calcium source, a source of vitamins D, E and K and β-carotene.

8. A method according to claim 7 in which the nutritional composition includes a zinc source.

9. A method according to claim 7 or claim 8 in which the nutritional composition is a nutritionally complete pet food.

10. A method according to any one of claims 7 to 9 in which the nutritional composition further comprises a prebiotic and/or a probiotic micro-organism.
11. A method according to claim 10 in which the prebiotic is selected from the group of inulin, fructooligosaccharides and plant materials which contain inulin and/or fructooligosaccharides.

12. A method according to any one of claims 7 to 11 in which the nutritional composition further comprises a source of glutamine.

13. A method according to any one of claims 7 to 12 in which the composition is administered in an amount effective to increase the activity level of the cat.

14. A method for increasing the longevity of an elderly cat, the method comprising administering to the cat an effective amount of a nutritional composition which comprises a calcium source, a zinc source, β-carotene at a level of at least 4 mg/1000 kcal, and vitamin E at a level of at least 75 IU/1000 kcal.

15. A method according to claim 14 in which the elderly cat is administered a daily amount of at least about 0.2 mg/kg body weight of β-carotene, at least about 3 IU/kg body weight of vitamin E, at least about 0.12 g/kg body weight of calcium and at least about 2 mg/kg body weight of zinc.

17. A method according to claim 16 wherein the sign of ageing is a decrease in activity.

18. A pet food for elderly cats, the pet food comprising a protein source, a lipid source, a calcium source, a zinc source, β-carotene at a level of at least 4 mg/1000 kcal and vitamin E at a level of at least 75 IU/1000 kcal.

19. A pet food according to claim 18 which comprises at least about 3 g/1000 kcal of calcium, at least about 50 mg/1000 kcal of zinc, at least about 5 mg/1000 kcal of β-carotene, and at least about 150 IU/1000 kcal of vitamin E.
20. A pet food according to claim 18 or claim 19 including a nutritional agent which promotes the growth of bifido- and lactic-bacteria in the gastro-intestinal tract of the pet.

21. A pet food according to claim 20 in which the nutritional agent is selected from the group comprising prebiotics and probiotic micro-organisms.

22. A method for reversing the signs of ageing in an elderly cat comprising administering to the cat a nutritional composition comprising a source of calcium and a source of β-carotene and a source of vitamin E.

23. A process for maintaining or increasing total blood protein in an elderly cat comprising administering to the cat a nutritional composition comprising a source of calcium and a source of β-carotene and a source of vitamin E.

24. A process according to claim 23 wherein the nutritional composition is capable of providing the cat a daily amount of at least about 0.25 mg/kg of the cat's body weight of β-carotene, at least about 3.5 IU/kg body weight of vitamin E, at least about 0.15 g/kg body weight of calcium and at least about 2.5 mg/kg body weight of zinc.

26. Use according to claim 25 in which the nutritional composition includes a zinc source.

27. Use according to claim 25 or claim 26 in which the nutritional composition is a nutritionally complete pet food.

28. Use according to any one of claims 25 to 27 in which the nutritional composition further comprises a prebiotic and/or a probiotic micro-organism.

29. Use according to claim 28 in which the prebiotic is selected from the group of inulin, fructooligosaccharides and plant materials which contain inulin and/or fructooligosaccharides.

30. Use according to any one of claims 25 to 29 in which the nutritional composition further comprises a source of glutamine.
31. Use of a calcium source, a source of vitamins D, E and K, and β-carotene in the manufacture of a nutritional composition for increasing the longevity or quality of life of an elderly cat.

32. Use according to claim 31 in which the nutritional composition includes a zinc source.

33. Use according to claim 31 or claim 32 in which the nutritional composition is a nutritionally complete pet food.

34. Use according to any one of claims 31 to 33 in which the nutritional composition further comprises a prebiotic and/or a probiotic micro-organism.

35. Use according to claim 34 in which the prebiotic is selected from the group of inulin, fructooligosaccharides and plant materials which contain inulin and/or fructooligosaccharides.

36. Use according to any one of claims 31 to 35 in which the nutritional composition further comprises a source of glutamine.

37. Use according to any one of claims 31 to 36 in which the composition is administered in an amount effective to increase the activity level of the cat.

38. Use of a calcium source, a zinc source, β-carotene at a level of at least 4 mg/1000 kcal and vitamin E at a level of at least 75 IU/1000 kcal in the manufacture of a nutritional composition for increasing the longevity of an elderly cat.

39. Use according to claim 38 in which the elderly cat is administered a daily amount of at least about 0.2 mg/kg body weight of β-carotene, at least about 3 IU/kg body weight of vitamin E, at least about 0.12 g/kg body weight of calcium and at least about 2 mg/kg body weight of zinc.

41. Use according to claim 40 wherein the sign of ageing is a decrease in activity.
42. Use of a source of calcium and a source of β-carotene and a source of vitamin E in the manufacture of a composition for reversing a sign of ageing in an elderly cat.

43. Use of a source of calcium and source of β-carotene and a source of vitamin E in the manufacture of a nutritional composition for maintaining or increasing total blood protein in an elderly cat.

44. Use according to claim 43 wherein the nutritional composition is capable of providing the cat a daily amount of at least about 0.25 mg/kg of the cat's body weight of β-carotene, at least about 3.5 IU/kg body weight of vitamin E, at least about 0.15 g/kg body weight of calcium and at least about 2.5 mg/kg body weight of zinc.

45. A method for improving the condition of an elderly cat substantially as herein described with reference to any one of the embodiments of the invention illustrated in the accompanying examples.

46. A method for increasing the longevity or quality of life of an elderly cat substantially as herein described with reference to any one of the embodiments of the invention illustrated in the accompanying examples.

47. A method for increasing the longevity of an elderly cat substantially as herein described with reference to any one of the embodiments of the invention illustrated in the accompanying examples.

48. A method for reversing a sign of ageing in an elderly cat substantially as herein described with reference to any one of the embodiments of the invention illustrated in the accompanying examples.

49. A pet food for elderly cats substantially as herein described with reference to any one of the embodiments of the invention illustrated in the accompanying examples.

50. A process for maintaining or increasing total blood protein in an elderly cat substantially as herein described with reference to any one of the embodiments of the invention illustrated in the accompanying examples.
51. Use of a calcium source, a source of vitamins D, E and K and \( \beta \)-carotene substantially as herein described with reference to any one of the embodiments of the invention illustrated in the accompanying examples.

52. Use of a calcium source, a zinc course, \( \beta \)-carotene substantially as herein described with reference to any one of the embodiments of the invention illustrated in the accompanying examples.

53. Use of a source of calcium, a source of \( \beta \)-carotene and a source of vitamin E substantially as herein described with reference to any one of the embodiments of the invention illustrated in the accompanying examples.
