The compounds of the invention can be prepared by a process comprising:
a) reacting a compound of formula (II)

\[
\begin{align*}
\text{R}_1 & \quad \text{N} \\
\text{R}_2 & \quad \text{N} \\
\text{O} & \quad \text{N} \\

\text{CH}_2\text{n} & \quad \text{N}
\end{align*}
\]

(II)
wherein

\( n, R, R_1 \) and \( R_2 \) are as defined above or a salt thereof,

with an aldehyde of formula (III)

\[
\text{CHO} \quad 
\begin{array}{c}
R_3 \\
R_4 \\
R_5
\end{array}
\]

(III)

wherein

\( R_3, R_4 \) and \( R_5 \) are as defined above; or

b) reducing a compound of formula (la)

\[
(0_2N)^{n_1} \quad 
\begin{array}{c}
R_2 \\
\text{(CH}_2\text{)}_n
\end{array} 
\begin{array}{c}
\text{N} \\
\text{O}
\end{array} 
\begin{array}{c}
R_3 \\
R_4 \\
R_5
\end{array}
\]

(1a)

wherein

\( n, R_2', R_3', R_4 \) and \( R_5 \) are as defined above, and \( n_1 \) is 1 or 2,

so obtaining a compound of formula (l) wherein \( R \) and/or \( R_1 \)

are amino;

and/or, if desired, converting a compound of formula (l) into

another compound of formula (l) and/or, if desired, converting

a compound of formula (l) into a pharmaceutically acceptable
salt and/or, if desired, converting a salt into a free base or into a free acid; and/or, if desired, resolving a mixture of isomers into the single isomers.

The reaction of a compound of formula (II) with an aldehyde of formula (III) is preferably carried out in the presence of basic condensing agents such as piperidine, sodium ethoxide, sodium methoxide, sodium hydride, sodium amide or sodium hydroxide, in a solvent such as methanol, ethanol, dioxane or water or their mixtures, at a temperature preferably ranging from about 0°C to about 120°C.

The reduction of a compound of formula (Ia) may be carried out, for example, by treatment with stannous chloride in concentrated hydrochloric acid, using if necessary an organic cosolvent such as acetic acid, dioxane, tetrahydrofuran, at a temperature varying between room temperature and the reflux temperature, preferably between room temperature and about 60°C.

A compound of formula (I) may be converted, as stated above, into another compound of formula (I) by known methods; for example, the compound of formula (I) wherein R₁ is an esterified carboxy group, may be converted into a compound of formula (I) wherein R₁ is carboxy by hydrolysis, e.g. basic hydrolysis, using, for example, sodium or potassium hydroxide, in a solvent, such as, water, lower aliphatic alcohols or their mixtures, and operating at a temperature ranging from room temperature to about 150°C; the same reaction may be also carried out e.g. by treatment with lithium bromide in dimethylformamide at a temperature higher than 50°C or by treatment with hydrochloric or hydrobromic or hydroiodic or sulphuric acid in acetic acid at temperature higher than 50°C.

A compound of formula (I) wherein R₁ is carboxy may be converted into a compound of formula (I) wherein R₁ is an esterified carboxy group, e.g. a carbalkoxy...
group unsubstituted or substituted by a lower dialkylamino group, by conventional methods, for example by reacting an alkaline salt of the acid with a suitable alkyl halide, in an inert solvent, such as acetone, dioxane, dimethylformamide hexamethylphosphorotriamide, at a temperature ranging from about 0°C to about 100°C.

A compound of formula (I) wherein R₁ is amino may be converted into a compound of formula (I) wherein R₁ is formylamino or C₂-C₆ alkanoylamino, for example by reaction with formic acid or with the corresponding alkanoyl anhydride without a solvent or in an organic solvent such as dioxane, dimethylformamide, tetrahydrofuran, usually in the presence of a base such as pyridine or triethylamine, at a temperature varying between 0°C and about 100°C.

Alternatively the esterification of a compound of formula (I) may be effected by:

a) converting the compound of formula (I) wherein R₁ is carboxy into the corresponding halocarbonyl, preferably chlorocarbonyl, derivative, by reaction, e.g. with the desired acid halide, for example oxalyl chloride, thionyl chloride, PCl₃, PCl₅ or POCl₃, either in the absence of solvents or in an inert organic solvent such as, benzene, toluene, xylene, dioxane, dichloroethane, methylene chloride or tetrahydrofurane, at a temperature ranging preferably from about 0°C to about 120°C; and then

b) reacting the resulting halocarbonyl derivative with a suitable alcohol of formula R₆-OH, wherein R₆ is as defined above, in an inert solvent such as, benzene, toluene, xylene, dioxane, dichloroethane, methylene chloride or tetrahydrofurane, at temperatures varying from about 0°C to about 120°C, preferably in the presence of a base, such as, triethylamine or pyridine.

A compound of formula (I), wherein R₁ is carboxy, may be converted into a compound of formula (I), wherein R₁ is a \(-\text{CON}^{\text{R₇}}\) group, wherein R₇ and R₈ are as
above defined, by known methods, for example, by converting
the carboxy group into the corresponding halide, preferably
the chloride, by reaction, e.g., with thionyl chloride in
benzene or dioxane dichloroethane, at a temperature ranging
from room temperature to about 100°C, then by reacting the
halide with ammonia or a suitable alkyl amine of formula
\[
\text{HN}<^\text{R}_7<^\text{R}_8
\]
wherein \( R_7 \) and \( R_8 \) are as above defined, at room
temperature in one of the above mentioned solvents. A compound
of formula (I) wherein \( R_1 \) is a \( - \text{CONH}_2 \) group may be converted
into a compound of formula (I) wherein \( R_1 \) is a \(-\text{CN}\) group,
by dehydrating the amide, e.g., by means of p-toluenesulphonyl chloride in pyridine and dimethylformamide at a
temperature ranging from room temperature to about 100°C.

A compound of formula (I) wherein \( R_1 \) is an
esterified or unesterified carboxy group may be converted
into a compound of formula (I) wherein \( R_1 \) is a \(-\text{CH}_2\text{OH}\) group,
by treatment with a reducing agent such as \( \text{LiAlH}_4 \) in an
inert solvent such as dioxane, tetrahydrofuran or diglyme,
at a temperature from about 0°C to about 30°C.

Free hydroxy groups may be, for example,
etherified by reacting with a suitable alkyl halide in the
presence of a base such as \( \text{NaOH}, \text{KOH}, \text{Na}_2\text{CO}_3, \text{K}_2\text{CO}_3, \text{NaH}, \text{NaNH}_2, \text{sodium methoxide}, \text{or sodium ethoxide}, \text{in a solvent}
\text{such as methanol, ethanol, dioxane, acetone, dimethyl-
formamide, hexamethylphosphorotriamide, tetrahydrofuran or}
water or their mixtures at a temperature ranging preferably
from about 0°C to about 150°C. Furthermore the etherified
hydroxy groups may be converted into free hydroxy groups,
for example, by treatment with pyridine hydrochloride or with
a strong acid such as, \( \text{HCl}, \text{HBr or HI}, \text{or with a Lewis acid}
such as, \( \text{AlCl}_3 \) or \( \text{BBr}_3 \).

Also the optional salification of a compound
of formula (I) as well as the conversion of a salt into the
free compound and the separation of a mixture of isomers into
the single isomers may be carried out by conventional methods.

For example the separation of a mixture of optical isomers into the individual isomers may be carried out by salification with an optically active base and subsequent fractional crystallization.

The compounds of formula (II) may, for example, be prepared by reacting a compound of formula (IV)

\[
\begin{align*}
&\text{CO} \\
&\text{R}_1 \\
&\text{R}
\end{align*}
\]

wherein

10 \( R \) and \( R_1 \) as defined above, with a compound of formula (V)

\[
\begin{align*}
&\text{R}_2 \\
&\text{N} \\
&\text{(CH}_2\text{n)} \\
&\text{R}_9 \text{O}
\end{align*}
\]

wherein

15 \( n \) and \( R_2 \) are as defined above and \( R_9 \) represents a hydrogen atom or a \( C_1-C_6 \) alkyl group. The reaction between a compound of formula (IV) and a compound of formula (V) may for example, be carried out in an inert organic solvent such as benzene, toluene, dioxane or tetrahydrofuran at a temperature varying from about 0°C to about 50°C, preferably at room temperature.

The compounds of formula (IV), which generally are not isolated because of their low chemical stability,
may be prepared for example by reacting a compound of
formula (VI)

![Chemical Structure](image)

(VI)

wherein

5  
R and R₁ are as defined above, with SOCl₂ at a temperature 
varying from room temperature to about 100°C, in an inert 
solvent such as benzene, toluene, dioxane or dichloroethane.

The compounds of formula (Ia) may be prepared 
by reacting compounds of formula (IIa)

(IIa)

wherein

n₁, n and R₂ are as defined above with an aldehyde of 
formula (III), following the same reaction conditions described 
above for the process a).

10  
The compounds of formula (III), (V) and (VI) 
are known compounds and are commercially available products 
or may be obtained by methods known in organic chemistry. 
The compounds of the present invention are 
active on the gastro-enterical system, in particular they 
are endowed with anti-ulcerogenic and anti-secretory 
activity and are therefore useful in therapy, for example in 
the prevention and treatment of peptic, e.g. duodenal, gastric 

was filtered and washed with water until neutral: crystalliza-
tion from CH₂Cl₂-methanol gave 3-benzylidene-6-nitro-1,2,3,9-
and esophageal ulcers and to inhibit gastric acid secretion. The compounds of the invention are also useful for reducing the undesirable gastrointestinal side-effects resulting from systemic administration of anti-inflammatory prostaglandin synthetase inhibitors and may be, therefore, used for this purpose in association with them.

The anti-ulcerogenic activity of the compounds of the invention is shown, e.g., by the fact that they are active in the test of the inhibition of restraint ulcers in rats, according to the method of Bonfils et al., (Therapie, 1960, 5, 1096; Jap. J. Pharmac. 1945, 43, 5).

The following Table shows, for example, the approximate ED_{50} value of the anti-ulcerogenic activity in the rat obtained for some compounds of the invention after oral administration:

<table>
<thead>
<tr>

</table>

The tested compound was administered per os (p.o.) one hour before the immobilization. Six Sprague-Dawley male rats (100-120 g) fasted 24 hours were used for the experiment: a square flexible small-mesh wire netting was used for the immobilization and 4 hours after the
immobilization the rats were sacrificed, their stomachs were removed and the lesions counted under a dissecting microscope.

The compounds of the invention own also antisecretory activity as shown, e.g., by the fact that they proved to be active after intraduodenal administration in inhibiting the gastric secretion in rats according to the method of H. Shay et al. (Gastroenter., 1945, 43, 5).

For example, as regards the antisecretory activity the compound 6-benzylidene-6,7,8,9-tetrahydro-11-oxo-11H-pyrido[2,1-b]quinazoline-3-carboxylic acid has an approximate ED50 value of 15 mg/kg after intraduodenal administration in rats according to the above method.

Considering that many anti-ulcer agents display, as does atropine, a remarkable but undesired anti-cholinergic activity, the compounds of the invention have been assessed for their antagonism against syndrome induced by oxotremorine in mice, according to the method described by Leszkovszky G.P. and Tardos L. (Europ. J. Pharmac. 1971, 15, 310).

Following this test the compounds of the invention have been found devoid of anticholinergic activity; for example the compounds:

- 3-benzylidene-1,2,3,9-tetrahydro-9-oxo-pyrrolo[2,1-b]quinazoline-7-carboxylic acid;
- 3-benzylidene-1,2,3,9-tetrahydro-9-oxo-pyrrolo[2,1-b]quinazoline-6-carboxylic acid;
- 6-benzylidene-6,7,8,9-tetrahydro-11-oxo-11H-pyrido[2,1-b]quinazoline-2-carboxylic acid;
- 6-benzylidene-6,7,8,9-tetrahydro-11-oxo-11H-pyrido[2,1-b]quinazoline-3-carboxylic acid,

are inactive in the above test at a dose of 100 mg/kg after oral administration.

In view of their high therapeutic index the compounds of the invention can be safely used in medicine. For example, the approximate acute toxicity (LD50) of the compounds [2,1-b]quinazolines is increasing per os.

The other compounds may be administered in the form of liquid solution, suppositories or intravenous injection under conditions that are common for humans rather daily.

Analogous toxicity data have been found for the other compounds of the invention.

The compounds of the invention can be administered in a variety of dosage forms, e.g. orally, in the form of tablets, capsules, sugar or film coated tablets, liquid solution or suspensions, rectally, in the form of suppositories, parenterally, e.g. intramuscularly, or by intravenous injection or infusion.

The dosage depends on the age, weight, conditions of the patient and administration route; for example the dosage adopted for oral administration to adult humans ranges from 50 to 200 mg pro dose, from 1 to 5 times daily.

The invention includes pharmaceutical compositions comprising a compound of the invention in association with a pharmaceutically acceptable excipient (which can be a carrier or diluent).

The pharmaceutical compositions containing the compounds of the invention are usually prepared following conventional methods and are administered in a pharmaceutically suitable form.

For example, the solid oral forms may contain, together with the active compound, diluents, e.g., lactose, dextrose, saccharose, cellulose, corn starch or potato starch; lubricants, e.g. silica, talc, stearic acid, magnesium or calcium stearate, and/or polyethylene glycols;
binding agents, e.g. starches, arabic gums, gelatin, methylcellulose, carboxymethyl cellulose or polyvinyl pyrrolidone; disaggregating agents, e.g. a starch, alginic acid, alginates or sodium starch glycolate; effervescing mixtures; dyestuffs; sweeteners; wetting agents, such as, lecithin, polysorbates, laurylsulphates; and, in general, non-toxic and pharmacologically inactive substances used in pharmaceutical formulations. Said pharmaceutical preparations may be manufactured in known manner, for example, by means of mixing, granulating, tabletting, sugar-coating, or film-coating processes. The liquid dispersions for oral administration may be e.g. syrups, emulsions and suspensions. The syrups may contain as carrier, for example, saccharose or saccharose with glycerine and/or mannitol and/or sorbitol; in particular a syrup to be administered to diabetic patients can contain as carriers only products not metabolizable to glucose, or metabolizable in very small amount to glucose, for example sorbitol.

The suspensions and the emulsions may contain as carrier, for example, a natural gum, agar, sodium alginate, pectin, methylcellulose, carboxymethylcellulose, or polyvinyl alcohol. The suspensions or solutions for intramuscular injections may contain together with the active compound a pharmaceutically acceptable carrier, e.g. sterile isotonic aqueous saline solution, olive oil, ethyl oleate, glycols, e.g. propylene glycol, and if desired, a suitable amount of lidocaine hydrochloride. The solutions for intravenous injections or infusions may contain as carrier, for example, sterile water or preferably they may be in the form of sterile aqueous isotonic saline solutions. The suppositories may contain together with the active compound a pharmaceutically acceptable carrier, e.g. cocoa-butter, polyethylene glycol, a polyoxyethylene sorbitan fatty acid ester surfactant or lecithin.

The following examples illustrate but do not
4-amino-isophthalic acid (27 g), dry methanol (500 ml) and conc. H₂SO₄ (27 ml) were heated at 60°C for 20 hours; after cooling the reaction mixture was concentrated in vacuo and the residue was diluted with ice-water. The precipitate was filtered and partitioned between chloroform and 5% NaHCO₃, the aqueous phase was separated, acidified with 37% HCl and the precipitate was collected by filtration and washed with water until neutral: the resulting 4-amino-benzene-1,3-dicarboxylic acid, 1-methyl ester, m.p. 224-227°C (19.5 g) was reacted with SOCl₂ (18 ml) in benzene (300 ml) at the reflux temperature for 3 hours. The solution was evaporated in vacuo to dryness and the residue was dissolved in dioxane (300 ml) and reacted with 2-pyrrolidinone (10.2 g) at room temperature for 20 hours.
