Description

[Technical Field]

5 The present invention relates to a method of manufacturing a 4-substituted-γ-lactone and a novel substance as a useful intermediate product thereof. The 4-substituted-γ-lactones include sex pheromones of vermins. More specifically, examples are (R,Z)-5-tetradecene-4-olide known as the sex pheromone of mamekogane (common name: Japanese beetle, scientific name: Popillia japonica) [J.H. Tumlinson et al, Science, 789, 197 (1977)] and (R,Z)-5-dodecene-4-olide known as the sex pheromone of a cupreous chafer. Therefore, the present invention is suitable in the verminous extermination of the mamekogane and the cupreous chafer in accordance with a pheromone trap (catching and killing by attraction).

[Background Art]

15 The mamekogane and the cupreous chafer are vermins for fruit trees such as grape trees and lawn. In recent years, damage to lawn by the mamekogane and the cupreous chafers in a golf course poses a serious problem.

Conventionally, these mamekogane and cupreous chafer are exterminated by pesticide applications. However, since a large amount of pesticide is used, the environmental pollution caused by contamination with pesticides in the vicinities of a golf course is a serious problem.

On the other hand, catching and killing by attraction using the sex pheromone of a vermin has an advantage in that a large number of vermins can be exterminated with a small amount of pheromone. This method is applied to some vermins in practice. Therefore, catching and killing by attraction of the mamekogane and cupreous chafers is assumed as an extremely effective means to solve the above problem.

The following methods are known as methods of synthesizing the pheromone of the mamekogane, i.e., (R,Z)-5-tetradecene-4-olide (18).

1) A method in which, as indicated by reaction formula (1) below, (4R,5S,6S)-5,6-dihydroxytetradecane-4-olide (40) as an optically active intermediate is derived from arabinose, an intermediate (41) is then derived from the intermediate (40), and diols at the 5-and 6-positions of the intermediate (41) are eliminated to obtain a compound (18) [Y. Nishida, M. Kanno, H. Hori, H. Ohru, H. Meguro, Agric. Biol. Chem., 51, 635 (1987)].

Reaction Formula (I)

(40)

\[
\text{CH(O Me)3} \rightarrow \text{Ac_2O}
\]

(41)

(18)

(wherein \( R_1 \) represents \( C_2H_{17} \)).

2) A method in which, as indicated by reaction formula (II) below, an acetylenic ketoester (52) synthesized from a 1-decyne derivative (51) is asymmetrically reduced (53) in the presence of (2S,3R)-(-)-4-dimethylamino-1,2-diphe-
nyl-3-methyl-2-butanol (Chirald available from Aldrich Chemical Co., Inc.) and Li\(\text{AlH}_4\), and the reduction product is subjected to fractional crystallization as an (R)-(+)\(\alpha\)-naphthylethylamime salt, thereby obtaining a compound (18) having high optical purity [S. Senda and K. Morii, Agric. Biol. Chem., 47, 2595 (1983)].

3) A method in which, as indicated by reaction formula (III), a compound (18) is obtained from (R)-glutamic acid, through butyrolactone, by using a Wittig reaction [R.E. Doolittle, et al, J. Chem. Ecol., 6, 473 (1980)].

The conventional methods of manufacturing the compound (18) described above pose the following problems. Thus, in the method (1), a total of 12 steps are required from arabinose as the starting material, and the yield of the final compound (18) against arabinose is very low.

In the method (2), (2S,3R)-(+)\(-\)4-dimethylamino-1,2-diphenyl-3-methyl-2-butanol and (R)-(+)\(-\)\(\alpha\)-naphthylethylamine which are required to obtain the optically active compound (18) are very expensive reagents, resulting in high manufacturing cost. In addition, in order to finally obtain the compound (18) having high optical purity, the (R)-(+)\(-\)\(\alpha\)-naphthylethylamime salt must be subjected to fractional crystallization, thus complicating the process.

In the method (3), when nitric acid is reacted with (R)-glutamic acid to close the lactone ring, thereby obtaining
tetrahydro-5-oxy-2-furanonecarboxylic acid which is partially racemized. The racemic product must be purified to (R)-
(-)-tetrahydro-5-oxy-2-furanonecarboxylic acid having high optical purity. In the final step, a cumbersome Wittig reaction
for purification must be performed. For this reason, purification is cumbersome and the process is complicated.

For descriptive convenience, the method of synthesizing (R,Z)-5-tetradecene-4-oxide (18) as the pheromone of
the mamekogane is exemplified. The same problems as described above are also posed by a method of synthesizing
(R,Z)-5-docosene-4-oxide (28) as the pheromone of the cupreous chafer represented by formula (28).

\[ \text{(28)} \]

(wherein \( R_2 \) represents \( C_9H_{12} \))

The present invention has been made in consideration of the above problems, and has as its object to provide a
method of manufacturing a 4-substituted \( \gamma \)-lactone and a novel substance as an intermediate product thereof, which
include neither an optical purity step nor a practically difficult step, can manufacture a target compound by a short
process, and is suitable for mass production.

[Disclosure of Invention]

According to the present invention, there is provided a method of manufacturing a 4-substituted \( \gamma \)-lactone repres-
ented by formula (8)

\[ \text{(8)} \]

(wherein \( R \) represents an alkyl group having 4 to 14 carbon atoms), characterized by comprising the steps of:

(A) introducing an alkynyl group having a triple bond at the 1-position thereof and 6 to 16 carbon atoms in a carbon
atom at the 1-position of a compound (1) represented by formula (1), thereby obtaining a compound (2) represented
by formula (2)

\[ \text{(1)} \quad \text{arrow} \quad \text{(2)} \]

(wherein \( R \) represents the same content as described above),
(B) performing oxidation cleavage of a 1,2-diol part of the compound (2) obtained in step (A) to obtain a compound
(3) represented by formula (3)
(wherein R represents the same content as described above);
(C) oxidizing the compound (3) obtained in step (B) to obtain a compound (4) represented by formula (4)

(3)

(4)

(wherein R represents the same content as described above);
(D) treating the compound (4) obtained in step (C) with an acid to hydrolyze the ketal part of the compound (4) to obtain a compound (5) represented by formula (5)

(4)

(5)

(wherein R represents the same content as described above);
(E) subjected the compound (5) obtained in step (D) to a reduction reaction and an elimination reaction of hydroxyl groups at the 2- and 3-positions to obtain a compound (7) represented by formula (7)

(5)

(7)

(wherein R represents the same content as described above); and
(F) reducing a double bond between the 2- and 3-positions of the compound (7) obtained in step (E) to obtain a compound (8) represented by formula (8)
(wherein \( R \) represents the same content as described above).

There is also provided a novel substance represented by formula (5) below:

(5)

(wherein \( R \) represents an alkyl group having 4 to 14 carbon atoms).

There is further provided a novel substance represented by formula (7) below:

(7)

(wherein \( R \) represents an alkyl group having 4 to 14 carbon atoms).

The method of manufacturing a 4-substituted-\( \gamma \)-lactone according to the present invention will be described in detail below.

The compound (1) as the starting material is obtained by condensing a 2,3-diol of D-ribose with acetone to convert a ketal [Acetone Derivatives of D-Ribose, P.A. Levene and E.T. Stiller, J. Biol. Chem 102, PP. 187 - 201 (1933)]. Since D-ribose is easily accessible and inexpensive, it is one of the advantages of the present invention that D-ribose as the starting material of the present invention.

In step (A), the reaction for obtaining the compound (2) by introducing an alkynyl group having a triple bond at the 1-position thereof and 6 to 16 carbon atoms to the 1-position of the compound (1) is exemplified such that a Grignard reagent \( \text{X-MgCl=Cl-R} \) (\( \text{X} \) represents a halogen atom and \( \text{R} \) represents an alkyl group having 4 to 14 carbon atoms) having the alkynyl group is reacted with the compound (1). A solvent used in the reaction of step (A) is not particularly limited to a specific one. Examples of the solvent are tetrahydrofuran, diethyl ether, dioxane, and benzene.

The introduction means of the alkynyl group having a triple bond at its 1-position and 6 to 16 carbon atoms to the 1-position of the compound is not limited to the use of the Grignard reagent. An acetylide \( \text{Y-C=Cl-R} \) (\( \text{Y} \) represents \( \text{Na, Li, K, Cu, Ca, or the like, and R represents an alkyl group having 4 to 14 carbon atoms} \)) of each of various metals can be used.

Examples of the alkynyl group having a triple bond at its 1-position and 6 to 16 carbon atoms are a 1-decynyl group and a 1-octynyl group.

In step (B), the reaction for performing oxidation cleaving of the 1,2-diol part of the compound (2) to obtain the compound (3) is performed by causing the compound (2) to react with an aqueous sodium periodide solution. The solvent used in the reaction of step (B) is not particularly limited to a specific one. Example, ether, tetrahydrofuran, methanol, ethanol, petroleum ether, or the like can be used.

Chromic acid, zinc tetracetaete, or the like can be used in place of sodium periodide as an oxidizing agent.

In step (C), the reaction for oxidizing the hydroxyl group at the 1-position of the compound (3) to obtain the compound (4) is not particularly limited to a specific one if it is a normal oxidation reaction. For example, the compound (3) is reacted with acetic anhydride in dimethylsulfoxide anhydride. The oxidizing agent used in this reaction is exemplified by silver carbonate, silver oxide, or the like.

In step (D), the reaction for obtaining the compound (5) by oxidizing the compound (4) to hydrolyze the ketal part at the 2- and 3-positions with an acidic treatment can be performed by the acidic treatment using, e.g., 90% trifluoroacetic acid. The acidic treatment can be performed using hydrochloric acid, perhydrochloric acid, paratoluensulfonic
acid, or the like in place of trifluoroacetic acid.

In step (E), the step of obtaining the compound (7) by performing the reduction reaction and the elimination reaction of the hydroxyl groups at the 2- and 3-positions can be exemplified as follows. The triple bond between the carbon atoms at the 5- and 6-positions of the compound (5) is reduced to obtain a compound (6) represented by formula (6), and the hydroxyl groups at the 2- and 3-positions of the compound (6) are eliminated:

\[
\text{(6)}
\]

(wherein R represents an alkyl group having 4 to 14 carbon atoms).

First, the step of obtaining the compound (6) by reducing the triple bond between the carbon atoms at the 5- and 6-positions of the compound (5) can be performed by normal catalytic reduction. More specifically, after the compound (5) is dissolved in a proper solvent, the solution is stirred in a hydrogen atmosphere in the presence of a Lindlar catalyst, Raney-nickel, platinum, palladium carbonate, or the like. The solvent is not particularly limited to a specific one. An alcohol solvent such as ethanol or methanol is generally used.

This reduction reaction can also be performed by reduction using diimine or diisobutylaluminum hydride in place of catalytic reduction.

The reaction for obtaining the compound (7) by eliminating the hydroxyl groups at the 2- and 3-positions of the compound (6) can be performed in accordance with a method disclosed in Agric. Biol. Chem., 51, 635 - 640 (1987) as represented by scheme (IV) below. More specifically, the compound (6) is reacted with orthoformate (60) to obtain an orthoester derivative (61). The orthoester is eliminated from the orthoester derivative to obtain the compound (7). The orthoformate (60) is not particularly limited to a specific one, but trimethyl orthoformate or triethyl orthoformate can be appropriately used. The elimination reaction of the orthoester derivative (61) can be performed by a reaction with acetic anhydride.

\[
\text{Scheme (IV)}
\]

(wherein R is an alkynyl group having a triple bond at its 1-position and 6 to 16 carbon atoms, and \( R' \) represents \( C_2H_5 \) or \( CH_3 \)).

However, the reaction of the hydroxyl groups at the 2- and 3-positions of the compound (6) is not limited to the above reaction. Any reaction can be employed if the hydroxyl groups at the 2- and 3-positions are eliminated to obtain the compound (7). For example, a method of obtaining cyclic thiocarbonate (E.J. Corey, R.A.E. Winter, J. Am. Chem. Soc., 87, 934 (1965)) is available as a method used in the above reaction.

The compound (7) may also be derived from the compound (5) in an order opposite to the above step. More specifically, first, the hydroxyl groups at the 2- and 3-positions of the compound (5) are eliminated to obtain a compound (6') represented by formula (6'). Thereafter, a triple bond between the carbon atoms at the 5- and 6-positions of the compound (6') is then reduced to obtain a double bond, thereby obtaining the compound (7).
(wherein R represents an alky group having 4 to 14 carbon atoms).

In step (F), the reaction of obtaining the compound (6) by reducing the double bond between the 2- and 3-positions of the compound (7) can be performed in accordance with, e.g., a method proposed by B.H. Lipshutz et al. (SYNLETT, PP. 64 - 66, September 1989). More specifically, the compound (7) is added in a tetrahydrofuran solution containing copper iodide and lithium chloride, and chlorotrimethylsilane is added thereto. Thereafter, the resultant solution is reacted by adding n-Bu₂SnH thereto, thereby obtaining the compound (6).

The compound (8) can also be obtained by a method of reducing the compound (7) using phenylsilane in the presence of Mo(CO)₆ or Pd(PPh₃)₄ in chloroform, or a method reducing the compound (7) by Fe(CO)₅ in an aqueous sodium hydroxide solution.

The reduction reaction can be performed by the normal contact reduction described above with reference to step (E). However, a reduction method using the method proposed by B.H. Lipshutz et al., as described above, can provide the compound (8) with a higher yield.

According to the method of manufacturing a 4-substituted-γ-lactone and a novel substance of the present invention, D-ribose as an easily accessible, inexpensive material is used as the starting material, the number of steps is relatively small, and reactions easy to perform in practice are used. Therefore, the manufacturing cost can be advantageously reduced, and a 4-substituted-γ-lactone having high optical purity can be easily manufactured.

The 4-substituted-γ-lactone represented by formula (8) is generally known as an insect pheromone. More specifically, the 4-substituted-γ-lactone can be exemplified by (R,Z)-5-tetradecene-4-olide (R=C₉H₁₇) as the pheromone of the namekogane and (R,Z)-5-dodecene-4-olide (R=C₈H₁₇) as the pheromone of the cuprige chafer. According to the method of the present invention, these 4-substituted-γ-lactones can be easily manufactured with high optical purity. As a result, the industrial applicability of these compounds to catching and killing by attraction can be enhanced.

[Best Mode of Carrying Out the Invention]

The present invention will be described in detail by way of its examples below.

Example 1

Manufacture of (R,Z)-5-Tetradecene-4-Olide (18) [R=C₉H₁₇ in Formula (8) above]

Step a

Synthesis of 2,3-O-isopropylidene-D-ribofuranose: Compound (1)

20 g of D-ribose as a starting material were reacted with 400 ml of acetone to obtain 14 g of a compound (1) in accordance with the method described in J. Biol. Chem. 102, PP. 187 - 201 (1933). The physical data of the product coincided with reference values.

Step b

Synthesis of (2R,3R,4R,5R)-2,5-dihydroxy-3,4-isopropylidenedioxypentadeca-6-yne-1-ol:

Compound (12)

240 ml of a 0.99M tetrahydrofuran solution of ethylmagnesium bromide (EtMgBr) were added to a solution of 52 ml of 1-decyn and 50 ml of anhydrous tetrahydrofuran in a nitrogen flow within the temperature range of 25°C to 30°C for about an hour. After the resultant solution was stirred at room temperature for an hour, a solution obtained by dissolving 15 g (78.9 mmol) of the compound (1) obtained in step a in 50 ml of tetrahydrofuran was cooled to the solution temperature range of 5°C to 10°C with ice and water. The cooled solution was dropped into the above stirred solution, and the mixture was stirred at 5°C for 2 hours. This mixture was poured in a saturated aqueous ammonium chloride solution, and the reaction solution was extracted with ether three times. The extracted solution was sequentially
washed with water and brine solution and was dried with magnesium sulfate anhydride. Thereafter, the solvent and 1-decyne in the extracted solution were distilled to obtain 15.7 g of a compound (12) as a viscous oily substance (yield: 70.9%). The physical data of the compound (12) were as follows:

\[ \eta_D 1.4754, 22.5^\circ C \]
\[ [\alpha]_D ^{-36} 6^\circ (c 1.955, CHCl_3, 22^\circ C) \]
\[ IR \nu_{max} \text{ cm}^{-1}: 3366 (s), 2998 (m), 2930 (s), 2860 (s), 1222 (s), 1075 (s) \]
\[ ^1H-NMR \delta \text{ ppm CDCl}_3: 0.82 (3H, t, J = 6.0 Hz), 1.20 - 1.40 (10H), 1.36 (3H, s), 1.42 (3H, s), 1.49 (2H, m), 2.24 (2H, dt, J = 1.9, 7.0 Hz), 3.68 (1H, dd, J = 5.9, 11.2 Hz), 3.85 (1H, dd, J = 3.4, 11.2 Hz), 3.92 (1H, ddd, J = 3.4, 5.9, 9.2 Hz), 4.13 (1H, dd, J = 5.3, 8.0 Hz), 4.19 (1H, dd, J = 5.3, 8.0 Hz), 4.57 (1H, td, J = 1.7, 8.1 Hz) \]

**Step c**

Synthesis of (3S,4R,5R)-5-(1-decylnyl)-2-hydroxy-3,4-isopropylidenedioxytetrahydrofuran:

**Compound (13)**

15.7 g (47.8 mmol) of the compound (12) obtained in step b were dissolved in 50 ml of ether and were strongly stirred with 200 ml of a 10 wt% aqueous sodium periodide solution at room temperature. After two hours, the stirred solution was extracted with ether three times, and the extracted solution was sequentially washed with water and brine solution. The washed solution was dried with magnesium sulfate anhydride. Thereafter, the solvent in the extracted solution was distilled at a reduced pressure to obtain 12.46 g of a compound (13) as a viscous oily substance (yield: 86%). The physical data of the resultant compound (13) were as follows:

**Step d**

Synthesis of (2S,3S,4R)-2,3-isopropylidenedioxy-5-tetradecy-4-olide: **Compound (14)**

13.27 g (44.8 mmol) of the compound (13) obtained in step c were dissolved in 40 ml of anhydrous dimethylsulfoxide. 40 ml of acetic anhydride were added thereto, and the resultant solution was stirred overnight at room temperature. 300 ml of water were added to the stirred solution, and this aqueous solution was extracted with ether three times. This extracted solution was washed with water and saline solution, and was dried with anhydrous magnesium sulfate. Then, the solvent of the extracted solution was distilled at a reduced pressure to obtain 20 g of a compound (14) as a viscous oily substance. This oily substance was purified by a silica gel chromatograph (silica gel: 300 g; developing solution: hexane and ethyl acetate) to obtain 7.35 g of the pure compound (14) in a yield of 65%. The physical data of the resultant compound (14) were as follows:
Calculated Values:
C_{17}H_{36}O_{4}

**Step e**

Synthesis of (2S,3S,4R)-2,3-dihydroxy-5-tetradecyn-4-olide: Compound (15)

200 m$^3$ of 90 wt% trifluoroacetic acid were added to 6.87 g (23.3 mmol) of the compound (14) obtained in step d, and the resultant solution was stirred at room temperature for 15 minutes. After the solvent was distilled at a reduced pressure, ether was added to the residue. This solution was stirred with an aqueous sodium bicarbonate solution, and the water layer was removed, thereby eliminating the residual acidic substance. The remaining ether layer was sequentially washed with water and brine solution and was dried with magnesium sulfate anhydride. Thereafter, the solvent in the ether layer was distilled at a reduced pressure to obtain 5.47 g of a brown solid product (yield: 92%).

The solid product was recrystallized using 130 m$^3$ of a hexane/isopropyl ether solution mixture obtained by mixing hexane and isopropyl ether at a mixing ratio of 75:55, thereby obtaining 4.84 g of a colorless fibrous compound (15) (yield: 89%). 0.89 (3H, t, $J = 6.3$ Hz), 1.2 - 1.4 (10H), 1.50 (2H, m), 2.22 (2H, dt, $J = 2.1$, 7.0 Hz), 4.45 (1H, d, $J = 4.5$ Hz), 4.69 (1H, d, $J = 4.5$ Hz), 5.08 (1H, t, $J = 2.1$ Hz)

**Step f**

Synthesis of (2S,3S,4S,5Z)-2,3-dihydroxy-5-tetradecyn-4-olide: Compound (16)

1.924 g (7.58 mmol) of the compound (15) obtained in step e were dissolved in 20 m$^3$ of ethanol, 40 mg of 5 wt% Pd-CaCO$_3$/Pb (Lindlar catalyst) were added thereto, and the resultant solution was strongly stirred in a hydrogen flow. The solid product in the reaction solution was filtered, and the solvent was distilled at a reduced pressure, thereby obtaining a colorless solid product. This solid product was recrystallized using 50 m$^3$ of a hexane/isopropyl ether solution mixture obtained by mixing hexane with isopropyl ether at a mixing ratio of 20:30 to obtain 1.45 g of a colorless fibrous compound (16) (yield: 74.6%). 5.23 (1H, d, J = 9.2 Hz), 5.31 (1H, dddd, J = 10.4, 9.0, 1.4, 1.4 Hz), 5.75 (1H, ddd, J = 7.8, 7.8, 10.4 Hz)

Step g

Synthesis of (2S,3S,4S,5Z)-2,3-methoxymethyldenedioxy-5-tetradecen-4-oxide:

Compound (101) [R=C₆H₁₄] in compound (61) above]

598 mg (2.33 mmol) of the compound (16) obtained in step f were dissolved in 10 ml of trimethyl orthoformate, 2
μl of concentrated sulfuric acid were added thereto, and the resultant solution, was stirred at room temperature for 15
minutes. 30 ml of ether were added to this reaction solution, and the solution was extracted. This extracted solution
was subsequently washed with an aqueous sodium bicarbonate solution and brine solution and was dried with mag-
nesium sulfate anhydride. The solvent in the extracted solution was distilled at a reduced pressure to obtain 770 mg
of a compound (101) as a colorless oily product. The physical data of the resultant compound (101) were as follows:

Step h

Synthesis of (4S,5Z)-tetradeca-2,5-dien-4-olide: Compound (17)

In an argon atmosphere, 21 ml of acetic anhydride and 864 μl of acetic acid were added to 1.23 g (480 mmol) of
the compound (101) obtained in step f, and the resultant mixture was heated to 140°C and reacted for 5 hours.
The solvent of the reaction solution was distilled at a reduced pressure to obtain 1.21 g of a compound (17) as a yellow
oily substance. The physical data of the resultant compound (17) were as follows:

IR νmax cm⁻¹:
2926 (s), 2860 (s), 1794 (s), 1780 (s), 1480 (m), 1156, 1094, 1019 (s), 818 (s)
¹H-NMR ¹H ppm CDCl₃:
0.89 (3H, t, J = 6.5 Hz), 1.25 - 1.50 (12H), 2.1 - 2.35 (2H, m), 5.14 (1H, tt, J = 1.6, 9.1 Hz), 5.8 (2H, m), 6.14 (1H, dd, J = 2.0, 5.6 Hz), 7.33 (1H, dd, J = 1.6, 5.6 Hz)
Step i

Synthesis of (R,Z)-5-tetradecen-4-olide:

In an argon atmosphere, 10 ml of anhydrous tetrahydrofuran were added to 570 mg (3.0 mmol) of purified copper iodide (CuI) and 318 mg (7.5 mmol) of lithium chloride (LiCl) dried at a reduced pressure and 130°C, and the resultant solution was stirred at room temperature for about 30 minutes. The resultant transparent solution was cooled to about -60°C, a solution obtained by dissolving 336 mg (1.511 mmol) of the compound (17) obtained in step h in 3.5 ml of tetrahydrofuran was added to the above transparent solution, and 0.81 ml (6 mmol) of chlorotrimethylsilane chloride immediate after distillation were added to the above solution. The resultant mixture was stirred for 10 minutes, and 1.5 ml (5.5 mmol) of distilled and purified n-Bu₂SnH were added thereto in a small amount each time over 5 minutes. Thereafter, cooling was stopped, and the temperature of the reaction solution was raised to 0°C at room temperature over about 30 minutes. 20 ml of a 10% aqueous potassium fluoride solution were added to this reaction solution, and the mixture was stirred. The produced precipitate was filtered. This filtrate was extracted with tetrahydrofuran and concentrated, 30 ml of a 10% aqueous potassium fluoride solution were added to the residue, and the solution was stirred for 15 minutes. 30 ml of ether were further added to the above solution, and the resultant solution was stirred for 15 minutes. The stirred solution was filtered, the filtrate was separated, and the water layer thereof was extracted with ether. The extracted solution was collected and sequentially washed with water and brine solution and was dried with anhydrous magnesium sulfate. Then, a crude product obtained by concentrating the extracted solution was purified by a chromatograph using silica gel (270 - 400 meshes, 10 g, developing solution of hexane : ethyl acetate at a mixing ratio of 98: 2 to 96: 4), thereby obtaining 265 mg of a compound (18) (yield: 78%). The IR and NMR spectra of the resultant compound (18) coincided with the reported data [References: Y. Nishida, et al, Agric. Biol. Chem., 51, 635 (1987) (to be referred to as reference 1 hereinafter) and R.E. Doilite, et al, J. Chem. Ecol., 6, 473 (1980) (to be referred to as reference 2 hereinafter)].

Other physical data were as follows.

Example 2

Step d-2

1 g of a Felizon reagent (Ag₂CO₃/Celite) prepared in accordance with a method proposed by V. Balogh et al. (V. Balogh, M. Felizon, M. Goffler, J. Org. Chem., 36, 1393) was added to 15 ml of benzene, and about 10 ml of benzene were distilled from the resultant solution to obtain an anhydrous condition. 91 mg (0.31 mmol) of the compound (13) obtained in step c of Example 1 were added to the above solution, and the mixture was heated and refluxed for 8.5 hours. The resultant solid product was filtered, and the solvent was distilled at a reduced pressure to obtain 85 mg of a compound (14) as an oily substance (yield: 94%). The physical data of the compound (14) coincided with those of the compound (14) obtained in step d of Example 1. A compound (18) as in Example 1 was obtained following the
same procedures as in steps a to i of Example 1.

Example 3

100 mg of the compound (7) obtained in step h of Example 1 were dissolved in 1.5 ml of ethanol, 5 mg of 1% Pd-C were added thereto, and the resultant solution was stirred for 1.5 hours under cooling with ice in a hydrogen atmosphere. Thereafter, the Pd-C was filtered off, and the filtrate was concentrated. The concentrate was fractionated by a high-performance liquid chromatograph (silica gel: YMC, A-014, 6 x 300 mm, elute: isopropyl ether : hexane (2 : 1)); stream speed 3 ml/min, detection by a differential refractometer), thereby obtaining 8 mg of a compound (18) eluted in a retention time of 20 to 22 minutes. The physical data of the compound (18) coincided with those of the compound (18) obtained in step h of Example 1.

Example 4

Manufacture of (R,Z)-5-dodecen-4-olide [R=C16H3 in Formula (8) above]

Step b'

Synthesis of (2R,3R,4R,5R)-2,5-dihydroxy-3,4-isopropylidenedioxy-trideca-6-yne-1-ol:

Compound (22)

32 ml (24.2 g, 220 mmol) of 1-octyne and 50 ml of tetrahydrofuran were added to 100 ml (200 mmol) of an ether solution of hexylmagnesium bromide (2N-Hex-MgBr) in an argon atmosphere over 25 minutes under cooling with ice. The resultant mixture was stirred for one hour and 20 minutes after the temperature was raised to 40 to 50°C. A solution obtained by dissolving 10.0 g (52.7 mmol) of the compound (1) synthesized following the same procedures as in step a of Example 1 in 30 ml of tetrahydrofuran was dropped in the above mixture over 20 minutes under cooling with ice. The organic layer of the solution obtained by stirring the above mixture at room temperature for an hour was separated, and the water layer was extracted with chloroform three times. All of the resultant organic layers were combined, the combined organic layers were sequentially washed with water and brine solution, and dried with anhydrous magnesium sulfate. The solvent and the remaining 1-octyne were distilled at a reduced pressure to obtain 15.6 g (52.0 mmol) of a compound (22) as a viscous oily substance (yield: 99%).

The physical data of the resultant compound (2) were as follows:

\[ \lambda_0 1.4566, 23.9°C \]
\[ \delta_0 -36.0° (c 1.00, CHCl_3, 27°C) \]
\[ IR \ \nu_{max} \ \text{cm}^{-1} \]
\[ 3336 (s), 2980 (m), 2914 (s), 2864 (s), 2236 (s), 1222 (s), 1073 (s) \]

Step c'

Synthesis of (3S,4R,5R)-5-(1-octynyl)-2-hydroxy-3,4-isopropylidenedioxytetrahydrofuran:

Compound (23)

15.3 g (51.0 mmol) of the compound (22) obtained in step b' was dissolved in 50 ml of ether, and the resultant solution was strongly stirred with 200 ml of a 10 wt% aqueous sodium periodide solution at room temperature. After two hours, the organic layer was separated, and the water layer was extracted with ether three times. Then, the combined organic layers were sequentially washed with water and brine solution, and were dried with anhydrous magnesium sulfate. Thereafter, the solvent was distilled at a reduced pressure to obtain 10.6 g (39.6 mmol) of a compound (23) as a viscous substance (yield: 78%). The physical data of the resultant compound (23) were as follows:

\[ \lambda_0 1.7062, 22.4°C \]
\[ \delta_0 -5.9° (c 1.00, CHCl_3, 25°C) \]
\[ IR \ \nu_{max} \ \text{cm}^{-1} \]
\[ 3416 (s), 2936 (s), 2864 (s), 2230 (w), 1073 (s), 1035 (s) \]
Step d'

Synthesis of (2S,3S,4R)-2,3-isopropylidenedioxy-5-dodecyn-4-olide: Compound (24)

1.00 g (3.74 mmol) of the compound (23) obtained in step c' was dissolved in 10 ml of methylene chloride. 4.21 g of molecular sieve (MS-4A) and 4.21 g (11.2 mmol) of pyridinium dichromate (PDC) were added thereto, and the resultant solution was stirred for 5 hours. Thereafter, 100 ml of methylene chloride were added to the above solution, and the mixture was filtered with florisil (60 - 100 meshes). The resultant filtrate was sequentially washed with a saturated aqueous copper sulfate solution, water, and brine solution, and was dried with anhydrous magnesium sulfate. The solvent was distilled at a reduced pressure to obtain 590 mg (2.22 mmol) of a compound (24) as a viscous substance (yield: 59%). The physical data of the resultant compound (24) were as follows:

Calculated Values:

\[
\text{C}_{15}\text{H}_{22}\text{O}_4
\]

C: 67.64%, H: 8.33%

Measured Values:

C: 67.66%, H: 8.36%

Step e'

Synthesis of (2S,3S,4R)-2,3-dihydroxy-5-dodecyn-4-olide: Compound (25)

20 ml of 90 wt% trifluoroacetic acid were added to 590 mg (2.22 mmol) of the compound (24) obtained in step d', and the resultant mixture was stirred at room temperature for 20 minutes. The solvent was distilled at a reduced pressure, ether was added to the residue, the resultant solution was stirred with an aqueous sodium bicarbonate solution, and the remaining acidic substance was eliminated by leaving off the water layer. The remaining ether layer was then sequentially washed with water and brine solution and was dried with anhydrous magnesium sulfate. Thereafter, the solvent in the ether layer was distilled at a reduced pressure to obtain 484 mg of an opaline solid product. This solid product was recrystallized using a dichloromethane/hexane solution mixture to obtain 381 mg (1.69 mmol) of a white fibrous compound (25) (yield: 76%). The physical data of the resultant compound (25) were as follows:

Step f' 

Synthesis of (2S,3S,4S,5Z)-2,3-dihydroxy-5-dodecen-4-olide: Compound (26) 

1.02 g (4.51 mmol) of the compound (25) obtained in step e' were dissolved in 20 mL of ethanol. 40 mg of 5 wt% Pd-CaCl$_2$/Pb (Lindlar catalyst) were added thereto, and the resultant solution was strongly stirred in a hydrogen atmosphere. The solid product in the reaction solution was filtered with Celite, and the solvent was distilled at a reduced pressure, thereby obtaining a white crystal. This crystal was recrystallized from a dichloromethane/hexane solution mixture to obtain 967 mg (4.24 mmol) of a white fibrous compound (26) (yield: 94%). The physical data of the resultant compound (26) were as follows:

Step h' 

Synthesis of (4S,5Z)-dodeca-2,5-dien-4-olide: 

Compound (27)

25 mL of acetic anhydride and 1 mL of acetic acid were added to 1.50 g of the compound (201) obtained in step f' in an argon atmosphere, and the resultant solution was heated to 140°C and reacted for 6 hours. The solvent of the reaction solution was distilled at a reduced pressure to obtain 1.16 g (quantitatively) of a compound (27) as a light yellow oily substance. The physical data of the resultant compound (27) were as follows:

IR $\nu_{\text{max}}$ cm$^{-1}$
2928 (s), 2860 (s), 1794 (s), 1760 (s), 1466 (w), 1158 (s), 1094 (m), 1025 (m), 818 (m)
EP 0 528 044 B1

1H-NMR δppm CDCl₃:
0.89 (3H, t, J = 6.9 Hz), 1.20 - 1.50 (8H, m), 2.05 - 2.35 (2H, m), 5.14 (1H, tt, J = 1.5, 9.1 Hz), 5.71 - 5.85 (2H, m), 6.14 (1H, dd, J = 2.0, 5.6 Hz), 7.32 (1H, dd, J = 1.5, 5.6 Hz)

Step i'

Synthesis of (R,Z)-5-dodecen-4-olide:

Compound (28)

In an argon atmosphere, 40 ml of anhydrous tetrahydrofuran were added to 1.95 g (10.2 mmol) of copper (II) iodide (CuI) and 1.09 g (25.7 mmol) of lithium chloride dried at a reduced pressure and 130°C, and the resultant solution was stirred at room temperature for about 15 minutes. The resultant transparent solution was cooled to about -60°C, and a solution obtained by dissolving 1.16 g of the compound (27) obtained in step i’ in 21 ml of tetrahydrofuran was added to the above cooled solution. Subsequently, 2.72 ml (20.4 mmol) of chlorotrimethylsilane (TMSCl) was added to the resultant solution, this mixture was stirred for 10 minutes, and 5.04 ml (16.0 mmol) of distilled and purified n-Bu₂SnH were added to the stirred solution mixture in a small amount each time over about 5 minutes. Cooling was then stopped, and the temperature of the reaction solution was raised to 60°C at room temperature over about 30 minutes. 60 ml of a 10% aqueous potassium fluoride (KF) solution were added to the above reaction solution, the mixture was stirred, and the produced precipitate was filtered. An organic layer was separated from this filtrate, and the remaining water layer was extracted with 100 ml of ether three times. The extract was filtered over to the resultant residue, and the solution mixture was stirred for 15 minutes. Ether was added to this solution and stirred for 15 minutes. The resultant solution was filtered, the filtrate was separated, and its water layer was extracted with 100 ml of ether three times. These organic layers were collected, sequentially washed with water and brine solution, and dried with anhydrous magnesium sulfate. The organic layers were concentrated to obtain a crude product, and the crude product was purified by a column chromatography using a developing solvent (hexane : diethyl ether = 91 : 9 to 83 : 17), thereby obtaining 875 mg (4.46 mmol) of a compound (28) as a colorless transparent oily substance (yield: 74%). The physical data of the resultant compound (28) were as follows:

Claims

1. A method of manufacturing a 4-substituted-γ-lactone represented by formula (8):

```
O
```

(8)
wherein R represents the same content as described above).

(B) performing oxidation cleavage of a 1,2-diol part of the compound (2) obtained in step (A) to obtain a compound (3) represented by formula (3)

(2)

(3)

(2)

(3)

(3)

(2)

(3)

(4)

wherein R represents the same content as described above).

(C) oxidizing the compound (3) obtained in step (B) to obtain a compound (4) represented by formula (4)

(3)

(4)

(3)

(4)

(3)

(4)
EP 0 528 044 B1

(\text{wherein } R \text{ represents the same content as described above}):  
(E) subjecting the compound (5) obtained in step (D) to a reduction reaction and an elimination reaction of hydroxyl groups at the 2- and 3-positions to obtain a compound (7) represented by formula (7)

(\text{wherein } R \text{ represents the same content as described above}); and 
(F) reducing a double bond between the 2- and 3-positions of the compound (7) obtained in step (E) to obtain a compound (8) represented by formula (8)

(\text{wherein } R \text{ represents the same content as described above}).

2. A method of manufacturing a 4-substituted-\(\gamma\)-lactone according to claim 1, characterized in that in step (E), the compound (5) is subjected to the reduction reaction to obtain a compound (6) represented by formula (6), and hydroxyl groups at the 2- and 3-positions of the compound (6) are eliminated to obtain the compound (7):

(\text{wherein } R \text{ represents an alkyl group having 4 to 14 carbon atoms}).

3. A method of manufacturing a 4-substituted-\(\gamma\)-lactone according to claim 1, characterized in that in step (E), the hydroxyl groups at the 2- and 3-positions of the compound (5) are eliminated to obtain a compound (6') represented by formula (6'), and the compound (6') is subjected to the reduction reaction to obtain the compound (7).
4. A compound represented by formula (5):

(5)

(wherein R represents an alkyl group having 4 to 14 carbon atoms).

5. A compound represented by formula (7):

(7)

(wherein R represents an alkyl group having 4 to 14 carbon atoms).

6. A method of manufacturing (R,Z)-5-tetradecen-4-olide represented by formula (18):

(18)

(wherein R₁ represents C₂₉H₅₇), characterized by comprising the steps of:

(A) introducing a 1-decynyl group to a carbon atom at the 1-position of 2,3-O-isopropylidene-D-ribofuranose (1) to obtain (2R,3R,4R,5R)-2,5-dihydroxy-3,4-isopropylidenedioxypentadeca-6-yn-1-ol (12)

(1)

(12)

(wherein R₁ represents the same content as described above);
(B) performing oxidation cleavage of a 1,2-diol part of the \( (2R,3R,4R,5R)-2,5\text{-dihydroxy-3,4-isopropylidenedioxypentadeca-6-yn-1-ol} \) (12) obtained to obtain \( (3S,4R,5R)-5\text{-}(1\text{-decynyl})\text{-2-hydroxy-3,4-isopropylidenedioxytetrahydrofuran} \) (13)

\[
\begin{align*}
&\text{(12)} \\
&\begin{array}{c}
\text{HO} \\
\text{HO} \\
\text{OH} \\
\text{C} \quad \text{C} \\
\text{Me} \\
\end{array} \\
\text{Me} \\
&\text{C} \quad \text{C} \\
&\text{(13)} \\
&\begin{array}{c}
\text{HO} \\
\text{O} \\
\text{C} \quad \text{C} \\
\text{Me} \\
\end{array}
\end{align*}
\]

(wherein \( R_1 \) represents the same content as described above);

(C) oxidizing the \( (3S,4R,5R)-5\text{-}(1\text{-decynyl})\text{-2-hydroxy-3,4-isopropylidenedioxytetrahydrofuran} \) (13) obtained to obtain \( (2S,3S,4R)-2,3\text{-isopropylidenedioxy-5-tetradecyn-4-olide} \) (14)

\[
\begin{align*}
&\text{(13)} \\
&\begin{array}{c}
\text{HO} \\
\text{O} \\
\text{C} \quad \text{C} \\
\text{Me} \\
\end{array} \\
\text{Me} \\
&\text{C} \quad \text{C} \\
&\text{(14)} \\
&\begin{array}{c}
\text{HO} \\
\text{O} \\
\text{C} \quad \text{C} \\
\text{Me} \\
\end{array}
\end{align*}
\]

(wherein \( R_1 \) represents the same content as described above);

(D) treating the \( (2S,3S,4R)-2,3\text{-isopropylidenedioxy-5-tetradecyn-4-olide} \) (14) obtained with an acid to hydrolyze the ketal part of the compound (14), thereby obtaining \( (2S,3S,4R)-2,3\text{-dihydroxy-5-tetradecyn-4-olide} \) (15)

\[
\begin{align*}
&\text{(14)} \\
&\begin{array}{c}
\text{O} \\
\text{O} \\
\text{C} \quad \text{C} \\
\text{Me} \\
\end{array} \\
\text{Me} \\
&\text{C} \quad \text{C} \\
&\text{(15)} \\
&\begin{array}{c}
\text{OH} \\
\text{OH} \\
\text{C} \quad \text{C} \\
\text{Me} \\
\end{array}
\end{align*}
\]

(wherein \( R_1 \) represents the same content as described above);

(E) subjecting the \( (2S,3S,4R)-2,3\text{-dihydroxy-5-tetradecyn-4-olide} \) (15) obtained to a reduction reaction and an elimination reaction of the hydroxyl groups at the 2- and 3-positions, thereby obtaining \( (4S,5Z)\text{-tetradeca-2,5-dien-4-olide} \) (17)

\[
\begin{align*}
&\text{(15)} \\
&\begin{array}{c}
\text{OH} \\
\text{OH} \\
\text{C} \quad \text{C} \\
\text{R_1} \\
\end{array} \\
&\text{(17)} \\
&\begin{array}{c}
\text{O} \\
\text{O} \\
\text{C} \quad \text{C} \\
\text{R_1} \\
\end{array}
\end{align*}
\]
(wherein \( R_1 \) represents the same content as described above); and
(F) reducing a double bond between the 2- and 3-positions of the \((4S,5Z)\)-tetradeca-2,5-dien-4-olide (17) obtained to obtain \((R,Z)\)-5-tetradecen-4-olide (18)

\[
\text{O} \quad \text{H} \quad \text{R}_1
\]
\[
(17) \quad \rightarrow \quad \text{O} \quad \text{H} \quad \text{R}_1
\]
\[
(18)
\]
(wherein \( R_1 \) represents the same content as described above).

\[
\text{O} \quad \text{H} \quad \text{R}_2
\]
\[
(28)
\]
(wherein \( R_2 \) represents \( C_6H_{13} \), characterized by comprising the steps of:

(A) introducing a 1-octynyl group to a carbon atom at the 1-position of \(2,3\)-O-isopropylidene-D-ribofuranose (1) to obtain \((2R,3R,4R,5R)\)-2,5-dihydroxy-3,4-isopropylidenedi oxy tri deca-6-yn-1-ol (22)

\[
\text{O} \quad \text{O} \quad \text{C} \quad \text{O} \quad \text{OH} \quad \text{Me} \quad \text{Me}
\]
\[
(1) \quad \rightarrow \quad \text{HO} \quad \text{OH} \quad \text{O} \quad \text{C} \quad \text{O} \quad \text{C} \quad \text{O} \quad \text{OH} \quad \text{Me} \quad \text{Me}
\]
\[
(22)
\]
(wherein \( R_2 \) represents the same content as described above);

(B) performing oxidation cleavage of a 1,2-diol part of the \((2R,3R,4R,5R)\)-2,5-dihydroxy-3,4-isopropylidene dioxy tri deca-6-yn-1-ol (22) obtained to obtain \((3S,4R,5R)\)-5-(1-octynyl)-2-hydroxy-3,4-isopropylidenedioxytetrah ydrofuran (23)

\[
\text{HO} \quad \text{OH} \quad \text{OH} \quad \text{C} \quad \text{C} \quad \text{R}_2
\]
\[
(22) \quad \rightarrow \quad \text{HO} \quad \text{OH} \quad \text{OH} \quad \text{C} \quad \text{C} \quad \text{R}_2
\]
\[
(23)
\]
(wherein \( R_2 \) represents the same content as described above);

(C) oxidizing the \((3S,4R,5R)\)-5-(1-octynyl)-2-hydroxy-3,4-isopropylidenedioxytetrah ydrofuran (23) obtained to obtain \((2S,3S,4R)\)-2,3-isopropylidenedioxy-5-dodecyn-4-olide (24)

\[
\text{HO} \quad \text{OH} \quad \text{OH} \quad \text{C} \quad \text{C} \quad \text{R}_2
\]
\[
(22) \quad \rightarrow \quad \text{HO} \quad \text{OH} \quad \text{OH} \quad \text{C} \quad \text{C} \quad \text{R}_2
\]
\[
(23)
\]
(wherein \(R_2\) represents the same content as described above);

(D) treating the \((2S,3S,4R)-2,3\)-isopropylidenedioxy-5-dodecyn-4-olide (24) obtained with an acid to hydrolyze the ketal part of the compound (24), thereby obtaining \((2S,3S,4R)-2,3\)-dihydroxy-5-dodecyn-4-olide (25)

(24) → (25)

(wherein \(R_2\) represents the same content as described above);

(E) subjecting the \((2S,3S,4R)-2,3\)-dihydroxy-5-dodecyn-4-olide (25) obtained to a reduction reaction and an elimination reaction of the hydroxyl groups at the 2- and 3-positions, thereby obtaining \((4S,5Z)\)-dodeca-2,5-dien-4-olide (27)

(25) → (27)

(wherein \(R_2\) represents the same content as described above); and

(F) reducing a double bond between the 2- and 3-positions of the \((4S,5Z)\)-dodeca-2,5-dien-4-olide (27) obtained to obtain \((R,Z)\)-5-dodecen-4-olide (28)

(27) → (28)

(wherein \(R_2\) represents the same content as described above).

**Patentansprüche**

1. Verfahren zur Herstellung eines 4-substituierten-\(\gamma\)-Lactons der Formel (B):
(wobei R eine Alkylgruppe mit 4 bis 14 Kohlenstoffatomen darstellt), gekennzeichnet durch die nachfolgenden Schritte:

(A) Einführen einer Alkinyllgruppe mit einer Dreibindung an ihrer 1-Position und 6-16 Kohlenstoffatomen in ein Kohlenstoffatom an der 1-Position einer Verbindung (1) der Formel (1), wodurch eine Verbindung (2) der Formel (2) erhalten wird

(B) Durchführen einer oxidativen Spaltung des 1,2-Diol-Teils der im Schritt (A) erhaltenen Verbindung (2), um eine Verbindung (3) der Formel (3) zu erhalten

(C) Oxidieren der im Schritt (B) erhaltenen Verbindung (3), um eine Verbindung (4) der Formel (4) zu erhalten

(D) Behandeln der im Schritt (C) erhaltenen Verbindung (4) mit einer Säure, um den Ketalteil der Verbindung (4) zu hydrolysieren, um eine Verbindung (5) der Formel (5) zu erhalten
(wobei R die gleiche Bedeutung wie oben beschrieben aufweist);
(E) Umsetzen der im Schritt (D) erhaltenen Verbindung (5) in einer Reduktionsreaktion und einer Eliminierungsreaktion der Hydroxylgruppen an den 2- und 3-Positionen, um eine Verbindung (7) der Formel (7) zu erhalten

(wobei R die gleiche Bedeutung wie oben beschrieben aufweist);
(F) Reduzieren der Doppelbindung zwischen den 2- und 3-Positionen der im Schritt (E) erhaltenen Verbindung (7), um eine Verbindung (8) der Formel (8) zu erhalten

(wobei R die gleiche Bedeutung wie oben beschrieben aufweist).

2. Verfahren zur Herstellung eines 4-substituierten-γ-Lactons nach Anspruch 1, dadurch gekennzeichnet, daß im Schritt (E) die Verbindung (5) einer Reduktionsreaktion unterzogen wird, um eine Verbindung (6) der Formel (6) zu erhalten, und die Hydroxylgruppen an den 2- und 3-Positionen der Verbindung (6) eliminiert werden, um die Verbindung (7) zu erhalten:

(wobei R eine Alkylgruppe mit 4 bis 14 Kohlenstoffatomen darstellt).

3. Verfahren zur Herstellung eines 4-substituierten-γ-Lactons nach Anspruch 1, dadurch gekennzeichnet, daß im Schritt (E) die Hydroxylgruppen an den 2- und 3-Positionen der Verbindung (5) eliminiert werden, um eine Verbindung (6') der Formel (6') zu erhalten, und die Verbindung (6') einer Reduktionsreaktion unterzogen wird, um die Verbindung (7) zu erhalten
(wobei \( R \) eine Alkylgruppe mit 4 bis 14 Kohlenstoffatomen darstellt).

4. Verbindung der Formel (5)

(wobei \( R \) eine Alkylgruppe mit 4 bis 14 Kohlenstoffatomen darstellt)

5. Verbindung der Formel (7)

(wobei \( R \) eine Alkylgruppe mit 4 bis 14 Kohlenstoffatomen darstellt).

6. Verfahren zur Herstellung von \((R,Z)-5\)-Tetradecen-4-ol) der Formel (18)

(wobei \( R_1 \) \( C_8H_{17} \) darstellt), gekennzeichnet durch die nachfolgenden Schritte:

(A) Einführen einer 1-Decynylgruppe in ein Kohlenstoffatom an der 1-Position von 2,3-O-Isopropyliden-D-ribofuranose (1), um \((2R,3R,4R,5R)-2,5\)-Dihydroxy-3,4-isopropylidioxypentadeca-6-yn-1-ol (12) zu erhalten

(B) Durchführen einer oxidativen Spaltung des 1,2-Diol-Teils von \((2R,3R,4R,5R)-2,5\)-Dihydroxy-3,4-isopropy-
lidendioxypentadeca-6-y1-1-ol (12), um (3S,4R,5R)-5-(1-Decynyl)-2-hydroxy-3,4-isopropyldioxotetrahydrofururan (13)

(wobei R₁ die gleiche Bedeutung wie oben beschrieben aufweist);
(C) Oxidieren von (3S,4R,5R)-5-(1-Decynyl)-2-hydroxy-3,4-isopropyldioxotetrahydrofururan (13), um (2S, 3S,4R)-2,3-isopropyldioxoy-5-tetradecyn-4-olid (14) zu erhalten

(wobei R₁ die gleiche Bedeutung wie oben beschrieben aufweist);
(D) Behandeln von (2S,3S,4R)-2,3-isopropyldioxoy-5-tetradecyn-4-olid (14) mit einer Säure, um den Ketalteil der Verbindung (14) zu hydrolysieren, um hierdurch (2S,3S,4R)-2,3-Dihydroxy-5-tetradecyn-4-olid (15) zu erhalten

(wobei R₁ die gleiche Bedeutung wie oben beschrieben aufweist);
(E) Durchführen einer Reduktionsreaktion und einer Eliminierungsreaktion der Hydroxygruppen an den 2- und 3-Positionen von (2S,3S,4R)-2,3-Dihydroxy-5-tetradecyn-4-olid (15), um hierdurch (4S,5Z)-Tetradeca-2,5-dien-4-olid (17) zu erhalten

(wobei R₁ die gleiche Bedeutung wie oben beschrieben aufweist);
(F) Reduzieren der Doppelbindung zwischen den 2- und 3-Positionen von (4S,5Z)-Tetradeca-2,5-dien-4-olid
(17), um (R,Z)-5-Tetradecen-4-olid (18) zu erhalten

(wobei $R_1$ die gleiche Bedeutung wie oben beschrieben aufweist);

7. Verfahren zur Herstellung von (R,Z)-5-Dodecen-4-olid der Formel (28)

(wobei $R_2 C_8 H_{13}$ bedeutet), gekennzeichnet durch die nachfolgenden Schritte:

(A) Einführen einer 1-Octylngruppe in das Kohlenstoffatom an der 1-Position von 2,3-O-Isopropyliden-D-ribofuranose (1), um (2R,3R,4R,5R)-2,5-Isopropylidenoxytrideca-6-yn-1-ol (22) zu erhalten.

(B) Durchführen einer oxidativen Spaltung des 1,2-Diol-Teils von (2R,3R,4R,5R)-2,5-Dihydroxy-3,4-isopropylidenoxytrideca-6-yn-1-ol (22), um (3S,4R,5R)-5-(1-octylnyl)-2-hydroxy-3,4-isopropylidendioxytetrahydrofuran (23) zu erhalten.

(C) Oxidieren von (3S,4R,5R)-5-(1-octylnyl)-2-hydroxy-3,4-isopropylidendioxytetrahydrofuran (23), um (2S, 3S,4R)-2,3-Isopropylidendoxy-5-dodecyln-4-olid (24) zu erhalten
EP 0 528 044 B1

(wobei R₂ die gleiche Bedeutung wie oben beschrieben aufweist);
(D) Behandeln von (2S,3S,4R)-2,3-Isopropylidendoxy-5-dodecyn-4-olid (24) mit einer Säure, um den Ketaltail der Verbindung (24) zu hydrolysieren, um hierdurch (2S,3S,4R)-2,3-Dihydroxy-5-dodecyn-4-olid (25) zu erhalten

(wobei R₂ die gleiche Bedeutung wie oben beschrieben aufweist);
(E) Durchführen einer Reduktionsreaktion und einer Eliminierungsreaktion der Hydroxylgruppen von (2S,3S,4R)-2,3-Dihydroxy-5-dodecyn-4-olid (25) an den 2- und 3-Positionen, um hierdurch (4S,5Z)-Dodeca-2,5-dien-4-olid (27) zu erhalten

(wobei R₂ die gleiche Bedeutung wie oben beschrieben aufweist);
(F) Reduzieren der Doppelbindung zwischen den 2- und 3-Positionen von (4S,5Z)-Dodeca-2,5-dien-4-olid (27), um (R,Z)-5-Dodecen-4-olid (28) zu erhalten

(wobei R₂ die gleiche Bedeutung wie oben beschrieben aufweist).

Revidications
1. Procédé de fabrication d'une γ-lactone 4-substituée représentée par la formule (8)
(dans laquelle R représente un groupe alkyle ayant de 4 à 14 atomes de carbone), caractérisé en ce qu'il comprend les étapes de :

(A) introduction d'un groupe alcynyle ayant une triple liaison dans sa position 1 et de 6 à 16 atomes de carbone, sur un atome de carbone en position 1 d'un composé (1) représenté par la formule (1), pour obtenir un composé (2) représenté par la formule (2)

(dans laquelle R la même signification que celle donnée ci-dessus) ;
(B) réalisation de fermeture par oxydation de la partie 1,2-diol du composé (2) obtenu dans l'étape (A) pour obtenir un composé (3) représenté par la formule (3)

(dans laquelle R a la même signification que celle donnée ci-dessus) ;
(C) oxydation du composé (3) obtenu dans l'étape (B) pour obtenir un composé (4) représenté par la formule (4)

(dans laquelle R a la même signification que celle donnée ci-dessus) ;
(D) traitement du composé (4) obtenu dans l'étape (C) avec un acide pour hydrolyser la partie céital du composé (4) pour obtenir un composé (5) représenté par la formule (5)
(dans laquelle R a la même signification que celle donnée ci-dessus) :

(E) soumission du composé (5) obtenu dans l'étape (D) à une réaction de réduction et une réaction d'élimination des groupes hydroxyle en positions 2 et 3 pour obtenir un composé (7) représenté par la formule (7)

(F) réduction de la double liaison entre les positions 2 et 3 du composé (7) obtenu dans l'étape (E) pour obtenir un composé (8) représenté par la formule (8)

(dans laquelle R a la même signification que celle donnée ci-dessus).

2. Procédé de fabrication d'une γ-lactone 4-substituée selon la revendication 1, caractérisé en ce que dans l'étape (E), on soumet le composé (5) à une réaction de réduction pour obtenir un composé (6) représenté par la formule (6), et qu'on élimine les groupes hydroxyle en positions 2 et 3 du composé (6) pour obtenir le composé (7) :

(dans laquelle R représente un groupe alkyle ayant de 4 à 14 atomes de carbone).

3. Procédé de fabrication d'une γ-lactone 4-substituée selon la revendication 1, caractérisé en ce que dans l'étape (E), on élimine les groupes hydroxyle en positions 2 et 3 du composé (5) pour obtenir le composé (6') représenté par la formule (6') et qu'on soumet le composé (6') à une réaction de réduction pour obtenir le composé (7)
4. Composé représenté par la formule (5):

5. Composé représenté par la formule (7):

6. Procédé de fabrication d'un (R,Z)-5-tétradécène-4-olide représenté par la formule (18)

(A) introduction d'un groupe 1-décynyle en position 1 du 2,3-O-isopropylidène-D-ribofuranose (1) pour obtenir le (2R, 3R, 4R,5R)-2,5-dihydroxy-3,4-isopropylidényxypentadéca-6-yn-1-ol (12)
(dans laquelle $R_1$ a la même signification que celle donnée ci-dessus) ;

(B) réalisation de fermeture par oxydation de la partie 1,2-diol du (2R, 3R, 4R, 5R)-2,5-dihydroxy-3,4-isopropylidénedioxypentadéca-6-yn-1-ol (12) obtenu pour obtenir le (3S, 4R, 5R)-5-(1-décylnyl)-2-hydroxy-3,4-isopropylidénedioxytétrahydrofuran (13)
EP 0 528 044 B1

5

(15)  (17)

(dans laquelle $R_1$ a la même signification que celle donnée ci-dessus) ; et
(F) réduction de la double liaison entre les positions 2 et 3 du (4S, 5Z)-tétradéc-2,5-dièn-4-olide (17) pour
obtenir le (R,Z)-5-tétradécène-4-olide (18)

15

(17)  (18)

(dans laquelle $R_1$ a la même signification que celle donnée ci-dessus).

20

7. Procédé de fabrication d'un (R,Z)-5-dodécène-4-olide représenté par la formule (28)

25

(28)

(dans laquelle $R_2$ représente un groupe C$_8$H$_{13}$), caractérisé en ce qu'il comprend les étapes de :

30

(A) introduction d'un groupe 1-octynyle en position 1 du 2,3-O-isopropyldène-D-ribofuranose (1) pour obtenir
le (2R, 3R, 4R, 5R)-2,5-dihydroxy-3,4-isopropyldénydixytriédéca-6-yn-1-ol (22)

35

(1)  (22)

(dans laquelle $R_2$ la même signification que celle donnée ci-dessus) :
(B) réalisation de fermeture par oxydation de la partie 1,2-diol du (2R, 3R, 4R, 5R)-2,5-dihydroxy-3,4-isopropyl-
dénydixytriédéca-6-yn-1-ol (22) obtenu pour obtenir le (3S, 4R, 5R)-5-(1-octynyle)-2-hydroxy-3,4-isopropy-
dénydixytréthahydrofurane (23)
(dans laquelle \( R_2 \) a la même signification que celle donnée ci-dessus);

(C) oxydation du \((3S, 4R, 5R)-5-(1-octynyl)-2-hydroxy-3,4-isopropyldénedioxotétrahydrofurane\) (23) pour obtenir le \((2S, 3S, 4R)-2,3-isopropyldénedioxo-5-dodécyn-4-olide\) (24)

(D) traitement du \((2S, 3S, 4R)-2,3-isopropyldénedioxo-5-dodécyn-4-olide\) (24) obtenu avec un acide pour hydrolyser la partie cétoïde du composé (24) pour obtenir le \((2S, 3S, 4R)-2,3-di-hydroxy-5-dodécyn-4-olide\) (25)

(E) soumission du \((2S, 3S, 4R)-2,3-di-hydroxy-5-dodécyn-4-olide\) (25) obtenu à une réaction de réduction et une réaction d'élimination des groupes hydroxyle en positions 2 et 3 pour obtenir le \((4S, 5Z)-dodéca-2,5-dièn-4-olide\) (17)

(F) réduction de la double liaison entre les positions 2 et 3 du \((4S, 5Z)-tétradéca-2,5-dièn-4-olide\) (27) pour
obtenir le (R,Z)-5-dodécèn-4-olide (28)

(dans laquelle $R_2$ a la même signification que celle donnée ci-dessus).
