Description

[0001] The present invention relates to a pant diaper or a sanitary panty which includes a front part, a rear part, an intermediate crotch part, an absorbent body enclosed between an inner and an outer casing sheet, and a piece of flexible material extending over the front part and also being joined to the rear part, wherein the front part is detachably joined to the rear part by means of a first fastening.

[0002] So-called all-in-one diapers are being replaced in an ever greater extent with pant diapers, sometimes called training pants, for slightly older diaper-wearing children. Pant diapers, and which can be opened easily with a few maneuvers, eliminates the drawbacks of conventional pant diapers, and which can be stretched so as to enable the pant diaper to be easily pulled over the wearer's hips when putting on and taking-off the pant diaper, and which has an elasticity such as to ensure that when worn the pant diaper will conform to the anatomy of the child as the child moves, in a comfortable fashion. Pant diapers also resemble conventional underpants and it is easy to understand how the pant diaper shall be used, thereby in many instances enabling somewhat older diaper-wearing children to perform themselves the simple operations required when putting on the pant diaper. Pant diapers, however, also have certain drawbacks. They are difficult to change with the user lying on his/her back and when changing the pant diaper it is necessary to remove completely any article of clothing that is worn on top of the diaper. Neither can a used pant diaper be rolled-up and sealed in a bag in the same way that an all-in-one diaper can. In addition, a soiled pant diaper that contains feces is liable to soil the wearer when removing the pant diaper.

[0003] GB-A-2 267 024 teaches a pant diaper of the aforesaid kind which is intended to eliminate these drawbacks. The first releasable fastening is comprised of weakening lines in the front part, close to respective side edges thereof, and the refastenable fastening is comprised of fasteners of the hook and loop type attached to flaps which extend from respective side-edge connections between the front and rear part, slightly inwardly over the front part. Many hand maneuvers are required to open such a pant diaper, while opening of the pant diaper is made difficult by the fact that the weakening lines are relatively inaccessible. Moreover, the join formed by the weakening lines complicates manufacture of the pant diaper.

[0004] An object of the present invention is to provide a pant diaper which, similar to the aforesaid known pant diapers, eliminates the drawbacks of conventional pant diapers, and which can be opened easily with a few hand movements and which can be readily manufactured.

[0005] This object is achieved in accordance with the invention with a pant diaper or sanitary panty of the kind defined in the introduction which is characterized in that said piece of flexible material extends transversely across the front part between its edges and is joined thereto over at least 50% of its surface by a first releasable fastening which extends on both sides of a centrally located region of the piece of material, from the side edges of the central region to respective side edges of the front part in that the first fastening is comprised of a sparsely configured weld or glue pattern, and in that the piece of material includes means in said central region for separating said piece of material into two parts which extend from the central region to a respective side edge of the pant diaper. Because the first fastening extends over a large surface, it is possible to dimension this fastening with a high degree of safety so that the forces that are generated when the pant diaper is in use, particularly when putting-on the pant diaper, will be taken-up by the first fastening with a good margin, while, at the same time, enabling the fastening to be readily released by successively removing the piece of flexible material from said front part.

[0006] In one preferred embodiment of the invention said piece of material is connected refastenably with the front part by means of a second fastening and the first fastening means is destroyed when releasing the fastening. The piece of material is elastic and mounted in a stretched state, so as to function as waist elastic. A second refastenable fastening is provided between the piece of material and said front part, on both sides of a longitudinal symmetry line of the pant diaper, within said central region, said fastening joining each of the two parts of the piece of material to the front part of the pant diaper.

[0007] The invention will now be described with reference to the accompanying drawings, in which

Figure 1 is a schematic front view of one embodiment of an inventive pant diaper.
Figure 2 is a front view of the pant diaper of Figure 1 and shows the diaper in an opened-out state, and Figure 3 is a view similar to Figure 1 of a second embodiment of an inventive pant diaper.

[0008] Figures 1 and 2 illustrate a pant diaper according to a first embodiment of the invention. A pant diaper is intended to be put on in the same way as a pair of underpants, and is characterized by an elastic waist part which can be stretched so as to enable the pant diaper to be easily pulled over the wearer's hips when putting on and taking-off the pant diaper, and which has an elasticity such as to ensure that when worn the pant diaper will be held securely in place by the contraction forces exerted by the elasticization in the waist part of the pant diaper. In order to fulfill these functional requirements while, at the same time, limiting the number of product sizes, the pant diaper will preferably have a stretch which is greater than 80%, i.e. it shall be possible to stretch the waist part to an extent which corresponds to 1,8 times the circumference of the waist part of a pant diaper in a relaxed or non-stretched state. When the diaper is worn, the combined contraction force in the waist
part, i.e. the sum of the forces exerted by the elastic provided in the front part, the rear part and the side parts will preferably exceed 3 N.

The pant diaper illustrated in Figure 1 and 2 is suitably constructed in the same way as the pant diaper described in Swedish Patent Application No. 9200663-4, and will include an absorbent body 1 enclosed between an inner and an outer casing sheet 2 and 3 respectively. The inner casing sheet 2 is liquid-permeable and is comprised, for instance, of nonwoven material compiled from fibres of polyethylene, polypropylene, polyester or mixtures thereof. Viscose fibres may also be used. It is also conceivable to form the inner casing sheet from a perforated plastic sheet, for instance a perforated polyethylene sheet. The outer casing sheet 3 is liquid-impermeable or at least hydrophobic and may, for instance, comprise a sheet of polyethylene or nonwoven material which has been coated with or laminated with polyolefins so as to become liquid-impermeable or at least hydrophobic. For aesthetic and psychological reasons, the outer casing sheet 3 may be comprised of two layers, an inner, liquid impermeable layer and a layer of textile-like material placed outside the inner layer. The wearer will then see and feel the pant diaper as being less of a plastic garment. When the outer casing sheet has this latter construction, it is not necessary for the liquid-impermeable sheet to have the same extension as the textile or fabric-like sheet, but may be smaller than said sheet, for instance liquid-impermeable casing material can be omitted from the side parts of the pant diaper.

The absorbent body 1 may, for instance, contain cellulose fluff pulp with or without an admixture of particles of so-called superabsorbent material and/or thermoplastic melt fibres, and may be comprised of one or more layers.

Similar to a pair of underpants, the pant diaper illustrated in Figure 1 and 2 has a waist opening and two leg openings, which are provided conventionally with leg elastic 4, 5. The pant diaper is put on by inserting the legs of the wearer through the leg openings and then drawing the pant diaper up over the wearer's hips. The contraction forces exerted by the elastic elements in the waist opening, i.e. in the uppermost part of the waist part, are preferably greater than the contraction forces exerted in the remainder of the waist part. This will ensure that the pant diaper remains seated in its intended position, even when the absorbent body is saturated with absorbed urine.

The pant diaper includes a front part 6, a rear part 7 and an intermediate crotch part 8. A piece of material 9, which is made of fibrous nonwoven material or of plastic material and which is elastic or has been made elastic in some suitable manner, extends transversely across the front part 6 between its side edges, and is joined to the rear part at those portions thereof which lie laterally outside the front part of the pant diaper. The piece 9 is joined to the outer casing sheet 3 of the front part of the pant diaper by a sparsely configured pattern of welding or gluing points 10, this pattern extending over essentially the whole of said piece of material with the exception of a region 11 which is central in relation to the longitudinal symmetry line of the pant diaper. The piece of material 9 is divided into two parts 13, 14, by a separation line 12 which extends along the longitudinal symmetry line of the pant diaper. Refastenable fastener means are mounted within the central region 11 on both sides of the separation line 12. These refastenable fastener means may, for instance, have the form of hook and loop means, for instance of the Velcro-type with the outwardly projecting hook means containing male parts 15, 16 provided on the piece of material 9. In the illustrated embodiment, the looped female parts 17 of the fastener devices are integrated to form a band or strip mounted on the casing sheet 3.

As will be seen from Figures 1 and 2, the aforesaid two parts 13, 14 form flaps which projects out from the casing sheet of the rear part of the pant diaper and are thus integral with said rear part. It will be understood, however, that the two parts 13, 14 may instead be comprised of pieces that are separate from the rear part of the pant diaper and which have been attached to the side edges thereof in some suitable manner, for instance welded thereto.

The described pant diaper can be removed and changed without needing to remove trousers or a like garment worn on top of the pant diaper, simply by gripping the loose flaps formed by the separating line 12 in the central region 11, and pulling the two parts 13, 14 of the piece 9 loose from the front part 6. This is easily done, since only a few of the fastening points 10 between the outer casing sheet 3 and the piece of material 9 need be broken simultaneously when pulling the parts 13, 14 from the front part of the pant diaper. When the parts 13, 14 have been loosened completely from the front part, the pant diaper will have the configuration shown in Figure 2 in which the front part is no longer connected to the rear part. The rear part or the front part of the pant diaper can then be inserted between the legs of the wearer. A replacement pant diaper can then be placed on the wearer, by loosening the front part of the pant diaper in the aforesaid manner and then inserting the front or the rear part of the replacement diaper between the wearer's legs. The side parts are then fastened together, by refastening the pant diaper with the aid of the fastener means 15-17, whereby the pant diaper can be pulled up to its correct final position in the same way as a pair of underpants, unless, of course, this has already been done in conjunction with refastening the pant diaper.

The removed pant diaper is rolled-up with the parts 13, 14 positioned as shown in Figure 2, and the thus rolled-up pant diaper is secured in package form, by tying together the pants diaper parts 13, 14 or by
Claims

1. A pant diaper or a sanitary panty which includes a front part (6; 106), a rear part (7; 107), an intermediate crotch part (8; 108), an absorbent body (1; 101) enclosed between an inner and an outer casing sheet (2 and 3 respectively; 102 and 103 respectively), and a piece (9; 109) of flexible material extending over the front part (6) and also being joined to the rear part (7; 107), wherein the front part is detachably joined to the rear part by means of a first fastening (10; 110), characterized in that said piece (9; 109) of flexible material extends transversely across the front part (6) between its side edges and is joined thereto over at least 50% of its surface by means of a first releasable fastening (10; 110) which extends on both sides of a centrally located region (11; 111) of said piece of material (9; 109) from the side edges of said central region (11; 111) to respective side edges of said front part (6; 106), that the first fastening (10; 110) is comprised of a sparsely configured weld or glue pattern, and that the piece of material (9; 109) includes means (12; 112) in said central region (11; 111) for separating said piece of material into two parts (13, 14; 113, 114) which extend from the central region to a respective side edge of the pant diaper.

2. A pant diaper according to Claim 1, characterized in that the piece of material (9; 109) is refastenably fastened to the front part (6; 106) by means of a second fastening (15-17; 115, 116).

3. A pant diaper according to Claim 2, characterized in that the first fastening (10; 110) is destroyed when loosening said first fastening.

4. A pant diaper according to Claim 3, characterized in that the fastening pattern is interrupted on both sides of the central region (111) so that the piece of material (109) is unattached to the front part (106) in areas located between the respective side edge parts of the front part (106) and the central region.

5. A pant diaper according to Claim 3 or 4, characterized in that the fastening pattern is denser in the side-edge parts of the front part (6; 106) and the upper corner parts of said front part than elsewhere.

6. A pant diaper according to any one of Claims 1-5, characterized in that the piece of material (9; 109) is elastic and is mounted in a stretched state and functions as waist elastic.

7. A pant diaper according to Claim 2, characterized in that the second refastenable fastening (15-17; 115, 116) between the piece of material (9; 109) and the front part (6; 106) is located on both sides of a longitudinal symmetry line of the diaper within said central region (11; 111), wherein said fastenings (15, 17 and 16, 17 respectively; 115, 116) fasten the parts (13, 14; 113, 114) of the piece of material (9; 109) to the front part of the pant diaper.

8. A pant diaper according to Claim 1, characterized in that the first releasable fastening is a refastenable fastening.

Patentansprüche

1. Höschenwindel oder Hygiene-Unterhose, die ein Vorderteil (6; 106), ein Rückteil (7; 107), ein zwischenliegendes Mittelschritteil (8; 108), einen zwischen einer inneren und einer äußeren Decklage (2 bzw. 3; 102 bzw. 103) liegenden Absorptionskörper (1; 101) und ein sich über das Vorderteil (6) erstreckendes und auch mit dem Rückteil (7; 107) verbundenes Stück (9; 109) aus flexiblen Material enthält, wobei das Vorderteil mit dem Rückteil mittels eines ersten Befestigungsmittels (10; 110) lösbar verbunden ist, dadurch gekennzeichnet, dass das Stück (9; 109) aus flexiblen Material sich quer über das Vorderteil (6) zwischen dessen Seitenrändern erstreckt und hiermit über wenigstens 50% seiner Fläche mittels eines ersten lösaren Befestigungsmittels (10; 110) verbunden ist, das sich auf beiden Seiten eines mittig liegenden Bereichs (11; 111) des Materialstücks (9; 109) von den Seitenrändern des Mittelbereichs (11; 111) zu jeweiligen Seitenrändern des Vorderteils (6; 106) erstreckt, dass das erste Befestigungsmittel (10; 110) aus einem dünn ausgebildeten Schweiß- oder Klebermuster besteht und dass das Materialstück (9; 109) in dem Mittelbereich (11; 111) Mittel (12; 112) zum Auftrennen des Materialstücks in zwei Teile (13, 14; 113, 114) enthält, die sich von dem Mittelbereich zu einem jeweiligen Seitenrand der Höschenwindel erstrecken.

2. Höschenwindel nach Anspruch 1, dadurch gekennzeichnet, dass das Materialstück (9; 109) an dem Vorderteil (6; 106) mittels eines zweiten Befestigungsmittels (15-17; 115, 116) wiederanbringbar befestigt ist.

3. Höschenwindel nach Anspruch 2, dadurch gekennzeichnet, dass das erste Befestigungsmittel (10; 110) beim Lösen des ersten Befestigungsmittels zerstört wird.

4. Höschenwindel nach Anspruch 3, dadurch gekennzeichnet, dass das Befestigungsmuster auf beiden Seiten des Mittelbereichs (111) unterbrochen ist, so dass das Material (109) an dem Vorderteil (106) in Bereichen, die zwischen den jeweiligen

6. Höschenwindel nach irgendeinem der Ansprüche 1 - 5, dadurch gekennzeichnet, dass das Materialstück (9; 109) elastisch ist und in gedehntem Zustand angebracht ist und als elastische Taillenausbildung funktioniert.

7. Höschenwindel nach Anspruch 2, dadurch gekennzeichnet, dass das zweite wiederanbringbare Befestigungsmittel (15-17; 115, 116) zwischen dem Materialstück (9; 109) und dem Vorderteil (6; 106) auf beiden Seiten einer Symmetrielängslinie der Windel innerhalb des Mittelbereichs (11; 111) plaziert ist, wobei das Befestigungsmittel (15, 17 bzw. 16, 17; 115, 116) die Teile (13, 14; 113, 114) des Materialstücks (9; 109) an dem Vorderteil der Höschenwindel hält.

8. Höschenwindel nach Anspruch 1, dadurch gekennzeichnet, dass das erste lösbare Befestigungsmittel ein wiederanbringbares Befestigungsmittel ist.

Revendications

1. Culotte d'apprentissage de la propreté ou culotte hygiénique comprenant une partie antérieure (6; 106), une partie postérieure (7; 107), une partie intermédiaire d'entre-jambes (8; 108), un corps absorbant (1; 101) enfermé entre une feuille d'enveloppe intérieure et une feuille d'enveloppe extérieure (2 et 3 respectivement; 102 et 103 respectivement) et une pièce (9; 109) en matériau souple comprend des moyens (12; 112) dans ladite région centrale (11; 111) servent à séparer ladite pièce en deux parties (13; 14; 113, 114) qui s'étendent de la région centrale à un bord latéral respectif de la culotte.

2. Culotte d'apprentissage de la propreté selon la revendication 1, caractérisée en ce que la pièce (9; 109) en matériau souple est attachée de manière refermable à la partie antérieure (6; 106) au moyen d'une seconde fixation (15-17; 115, 116).

3. Culotte d'apprentissage de la propreté selon la revendication 2, caractérisée en ce que la première fixation (10; 110) est détruite lorsqu'on défait ladite première fixation.

4. Culotte d'apprentissage de la propreté selon la revendication 3, caractérisée en ce que le motif de fixation est interrompu sur les deux côtés de la région centrale (111) de façon que la pièce (109) en matériau souple ne soit pas attachée à la partie antérieure (106) dans des zones situées entre la partie latérale respective de la partie antérieure (106) et la région centrale.

5. Culotte d'apprentissage de la propreté selon la revendication 3 ou 4, caractérisée en ce que le motif de fixation est plus dense dans les parties latérales de la partie antérieure (6; 106) et les parties supérieures en coin de ladite partie antérieure.

6. Culotte d'apprentissage de la propreté selon l'une quelconque des revendications 1 à 5, caractérisée en ce que la pièce (9; 109) en matériau souple est élastique et est montée en un état étié et fait fonction d'élastique de taille.

7. Culotte d'apprentissage de la propreté selon la revendication 2, caractérisée en ce que la seconde fixation refermable (15-17; 115, 116) entre la pièce (9; 109) et la partie antérieure (6; 106) est située de part et d'autre d'une ligne de symétrie longitudinale de la culotte dans ladite région centrale (11; 111), dans laquelle lesdites fixations (15, 17 et 16, 17 respectivement; 115, 116) fixent les parties (13, 14; 113, 114) de la pièce (9; 109) en matériau souple à la partie antérieure de la culotte d'apprentissage de la propreté.

8. Culotte d'apprentissage de la propreté selon la revendication 1, caractérisée en ce que la première fixation détachable est une attache refermable.
