Note: Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).
Description

[0001] This invention relates to charging criteria used in a mobile telephone network for determining a price for a call between two subscribers.

[0002] In a fixed telephone network, a calling subscriber is aware of the charging criteria for the call already upon dialling the number of a subscriber B, as charging depends on whether it is a question of a local call, a long-distance call or an international call. In PBX exchanges (Private Branch Exchange) connected to a fixed telephone network, or in PABX networks internal calls are free of charge. In cordless PBX’s, part of the subscriber lines are replaced with a radio connection. In cordless PBX’s, there are both fixed and cordless extensions. Cordless PBX’s thus allow the users of cordless telephones mobility, which depends on the coverage area of cordless base stations. A coverage area typically covers the indoor premises of an office building.

[0003] In mobile telephone networks, which enable a high degree of mobility, the charging criteria used in a fixed network cannot be used as such owing to the structure and the mode of operation of the network. In the following, the structure and the operation of a mobile telephone network will be illustrated by means of a prior art GSM mobile telephone network shown in Figure 1. Communication between a mobile station MS located within a cell, and the network takes place over the radio path via a base transceiver station (BTS). Base transceiver stations are connected to a base station controller (BSC), whose tasks include e.g. management of radio channels, as well as changeover procedures. One base station controller BSC thus controls a number of base stations BTS. The location of a mobile station is known with the accuracy of a so-called location area (LA) composed of a few cells. A mobile station may move within the location area without a need to update the location information related to it. A plurality of base station controllers are connected to one mobile switching centre MSC, which performs the main switching functions of the mobile telephone network. The area of the cells controlled by the mobile switching centre is termed as an MSC area, and all the calls originating or terminating within this area are switched via this MSC. Furthermore, the MSC connects the mobile telephone network to external networks.

[0004] The mobile telephone network also contains data bases of different kinds. In a Home Location Register (HLR), subscriber data is permanently stored regardless of the current location of the subscriber. The HLR contains the MSISDN number of the subscriber, the International Mobile Subscriber Identity code IMSI to be used inside the network, the subscriber service data, and routing information on a Visitor Location Register VLR. The Visitor Location Register VLR is integrated to all present MSC’s, and it is used for recording the subscriber data obtained from the HLR for the duration of the visit of the subscriber to the area of the VLR. The VLR contains the subscriber’s IMSI, MSISDN, subscriber service data, and the location area identification LAI that has been used by the subscriber for updating the location information. The location of the subscriber is thus known with the accuracy of a location area.

[0005] In the following, call establishment in a mobile telephone network will be disclosed for understanding the charging criteria: When a subscriber switches on his mobile station MS e.g. in cell A (Figure 1), it signals an updating request to a base station, which request is directed to a mobile switching centre MSC1, and further to a visitor location register VLR. The request searches an IMSI from a home location register HLR. Thereafter, once it has been made sure in the signalling between the VLR and the mobile station that the IMSI is correct, the VLR sends an update request to the HLR, which will send the subscriber data to the VLR. Now the location of the subscriber is updated, i.e. the HLR knows the address of the VLR, and the VLR knows in which location area LAI the subscriber is located.

[0006] When a subscriber A calls a subscriber B located in a location area 22 of a second mobile switching centre MSC2, he dials the MSISDN number of subscriber B into his mobile station. Signalling phases taking place after this are indicated with ringed numbers in Figure 1, followed by the number to be switched in the phase in question. Indication MAP, TUP/ISUP represents the protocol to be used in the signalling in question. Next, mobile station MS-A sends base station 1 a message containing the dialled number, phase 1. When MSC1 receives the message, it analyses it and checks whether the request may be accepted. As a part of the check, the subscriber data of subscriber A is searched from the VLR of the MSC1, said data being recorded in connection of the above-mentioned location updating. If the request is accepted, MSC1 will send an interrogation message to the HLR, said message containing the MSISDN number of the mobile station of subscriber B, phase 2. On the basis of this number, the HLR searches the data on subscriber B, the data containing the address of the current VLR of subscriber B. Next the HLR asks the VLR to provide a roaming number by sending information IMSI to it, phase 3, whereafter the VLR sends the roaming number MSR to the HLR, phase 4. The roaming number MSR is sent from the HLR to MSC1, phase 5. Thereafter, it is possible to route the call from MSC1 to MSC2 on the basis of the roaming number MSR received from the VLR, phase 6. The mobile switching centre MSC2 of subscriber B asks the VLR incorporated into it for the subscriber data on subscriber B. The subscriber data indicates the location area LAI of subscriber B, so that MSC2 is able to send a paging message via the base station controller 2 in question (phase 7) to cells f, g, and h in the location area. Once the mobile station MS-B of subscriber B has answered the paging, a call will be established all the way to subscriber B. It must be noted that only after the mobile station of subscriber B has answered the paging
message, mobile switching centre MSC2 knows the location of subscriber 2 on the accuracy of one cell.

In the mobile telephone network described above, all the cells are of an equal value as far as the price of the call is concerned. In mobile telephone networks, the price of a call is based on whether it is a question of a call between a mobile station and a terminal equipment of a fixed network, or a mobile-to-mobile call. Owing to the mobility of mobile stations, the main criterion for charging is to charge subscriber A for the connection between him and the home network of subscriber B, and to charge subscriber B for the connection between his current location and his home network. This is considered fair as in accordance with the call establishment described above, neither the calling subscriber nor the first mobile switching centre knows the location of subscriber B, i.e. in which cell subscriber B is located when the call establishment is started.

For increasing the flexibility of the charging criteria, it is possible to set a special charging parameter, which will make it possible to apply a lower tariff to the calls made from the number related to the parameters during off-peak times, and correspondingly, a higher tariff than normally during the peak times. This parameter will make the charging criterion time-dependent, but, in other respects, the charging will follow the above-mentioned principles.

When the charging criterion of mobile telephone networks described above are compared with those of the fixed network, a few problems arise. Since all the cells are equal from the point of view of the mobile telephone network, no other charging criteria may be offered to different groups of users but the flexibility based on the time of the day. The distance between the calling and the called subscriber, or the location of the called subscriber cannot be taken into account in real time when determining the charging criteria. Special charging criteria are not available for certain intra-cell calls or for certain inter-cell calls.

GB 2272607 discloses a cellular radio system wherein the charging tariff applied for a mobile station depends on the area within which the mobile station is located. US 5295180 discloses a cellular radio system wherein each subscriber can select between a primary zone and one or more secondary zones having different call tariffs.

An object of this invention is to provide a method for improving the charging criteria, and to solve the above-mentioned problems. The object is achieved in accordance with the method claimed in claim 1.

In the method of the invention, one cell or a group consisting of several cells is chosen as a group of special cells. Upon establishing a call, the MSC of the calling subscriber analyses whether the location cell of the calling subscriber and/or that of the called subscriber are members of the group of special cells. If that is the case, the charging criteria determined for the group will be applied. In addition, private branch exchanges (PBX) may also be connected to a mobile switching centre. PBX subscribers may be taken into account for the digit analysis of the MSC e.g. by determining a separate numbering block for PBX subscribers in the numbering space of the MSC.

In accordance with a preferred embodiment, when the location cell of the calling subscriber and that of the called subscriber are not situated within the area of the same MSC, the information on the location cell of the called subscriber will be transmitted to the MSC of the calling subscriber.

In accordance with a preferred embodiment, such a group of subscribers is also defined, which consists of subscriber numbers between which calls are charged on the basis of the special criteria, taking into account the number and the location cell of the calling subscriber and/or the called subscriber.

In the following, the invention will be disclosed in greater detail with reference to the attached drawings, in which

Figure 1 shows the structure of a prior art mobile telephone network, and Figure 2 shows a signalling message in accordance with the ISUP standard.

Reference is still made to Figure 1. In accordance with the invention, cells a, c, d and e are chosen as the group of special cells. Separate charging criteria may be determined for intracell and inter-cell calls within this group.

Cells a and c are located within the same location area, and cells d and e are both located within separate location areas. The base station controllers of the base stations of the cells, however, are connected to the same mobile switching centre MSC1, to which the information has been recorded on which cells form the group of special cells. Suppose that a calling subscriber is located in cell a, and the called subscriber in cell d. In accordance with call establishment set out above, MSC1 receives the information on the number and the location cell of subscriber A once the mobile station of the subscriber has sent a call setup message. MSC1 checks whether the location cell a of subscriber A is a member of the group of special cells, and detects this is the case. The MSC receives the information on the location cell of subscriber B once the mobile station of subscriber B has answered the paging message sent to its location area, whereafter the MSC will check whether the location cell d of subscriber B is a member of the group of special cells. If it is detected that the location cell of either of the subscribers or the location cells of both subscribers belong to the group of special cells, the charging criteria determined for the group of special cells will be applied.

When it is desirable to limit the subscriber numbers to which the charging criteria of the group of special cells may be applied, a restricted group of subscribers
is determined. It is a list of subscriber numbers. When a call is being established, the mobile switching centre MSC1 of subscriber A will find out by means of a charging criteria analysis during the call establishment disclosed above what is the relation of the numbers of subscribers A and B to the restricted group of subscribers, and what is the relation of the location cell of the subscribers to the group of special cells. An individual charging criterion may be determined for each possible combination. The number of combinations may be limited in such a way that if both the number of either of the subscribers or both the subscribers belongs to the restricted group of subscribers and the location cell of either of the subscribers or both the subscribers belongs to the group of special cells, individual charging criteria will be applied. The numbers of the group of subscribers may also be chosen on the basis of the Private Numbering Plan (PNP).

The cells belonging to the group of special cells may be distributed in the areas of several MSC’s. Let us define, in addition to the above-mentioned cells a, c, d and e, cell f in location area 22 of MSC2 to the group of special cells, Figure 1. In both MSC’s, information is recorded on which cells form the group of special cells. Assume that the calling subscriber is located in cell a and the called subscriber is located in cell f of MSC2. In accordance with call establishment set out above, MSC1 receives the information on the number and the location cell of subscriber A once the mobile station of the subscriber has sent a call setup message. MSC1 checks whether the location cell c of subscriber A is a member of the group of special cells and detects this is the case. In accordance with call establishment set out above, MSC2 receives the information on the location cell of subscriber B once the mobile station MS-B of subscriber B has answered the paging message sent in its location area 22. In order that the mobile switching centre MSC1 of the calling subscriber could take into account upon determining the charging criterion whether the location cell f of subscriber B is a member of the group of special cells, MSC1 must know the location cell of subscriber B before a call is connected between the subscribers. Thus, special charging criteria may be applied in real-time to internal calls of the group of special cells, to calls originating from the group and to calls terminating in the group already from the beginning of the call. The information on the location cell is transmitted in an appropriate message in a manner disclosed hereinafter, said message being used for signalling of the network between mobile switching centres.

The information to be transmitted from MSC2 to the MSC1 of the calling subscriber on the location cell of subscriber B may be just an information on the location cell which has been found out after the mobile station MS-B of subscriber B has answered the paging message sent within its location area. In such a case, MSC1 first analyses on the basis of the information received on the location cell whether the location cell of subscriber B is a member of the group of special cells, and thereafter determines the charging criterion.

Alternatively, it is possible to carry out an analysis for finding out whether the location cell of subscriber B belongs to the group of special cells or not. This may be carried out already in MSC2. In that case, the information on the location cell to be transmitted to the mobile switching centre MSC1 of the calling subscriber is the result of said analysis, and MSC1 may immediately utilize the received result for determining the charging criterion.

In a case where the calling or the called subscriber is a PBX subscriber, it is possible to determine the PBX subscriber a virtual cell to be used when it is necessary to take a PBX subscriber into account when determining the charging criteria. This virtual cell information, or information related to charging is of no importance to the radio system. Virtual cell information may also be applied to a PSTN subscriber. When it is a question of a subscriber in a PABX or a PSTN network, the virtual cell information may be stored in the mobile switching centre to which these networks are connected.

Everything that has been said about the case where a group of special cells is located within the area of one MSC is also applicable as such to a case in which the cells of the special group are distributed in the areas of several MSC’s. It is thus possible to form a restricted group of subscribers, to use a private number etc.

In the following, ways of transmitting information on the location cell from one MSC to another will be disclosed. Information may be transmitted in a prior-art message in accordance with signalling employed between mobile switching centres, or a separate message may be created for it.

Information on the location cell of subscriber B may be added to an Address Complete message, which is sent by the MSC of subscriber B to the MSC of the calling subscriber after a successful paging of subscriber B. Alternatively, information on the location cell of subscriber B may be added to an Answer message, which is sent by the mobile switching centre of subscriber B to the mobile switching centre of the calling subscriber in response to that subscriber B has answered the call. The location cell information attached to the answer message may also be used to confirm or cancel a previous information on the location cell, obtained in an Address Complete message.

When a PABX or a PSTN subscriber/subscribers are participating in a call, the above-mentioned messages or other prior art signalling messages are used for transmitting the cell information from the MSC of the called subscriber to the MSC of the calling subscriber. It is also possible to create a separate message for that purpose if necessary.

In addition, by utilizing the call setup message sent by the MSC of the calling subscriber to the MSC of subscriber B at the beginning of the call setup, the MSC
of the calling subscriber may express to the MSC of the called subscriber its wish to receive the information on the location cell of subscriber B. This is an alternative for sending the information on the location cell every time.

[0028] In ISUP signalling, the Initial Address Message is IAM, Address Complete Message is ACM and Answer Message is ANM. In TUP signalling, the abbreviation for the answer message is ANU (Answer signal, unqualified), ANC (Answer signal, charge), or ANN (Answer signal, no charge).

[0029] The format of the messages used in ISUP signalling is shown in Figure 2. The information on the location cell of subscriber B may be added to the data field which is to be added to Address Complete Message ACM, e.g. “Location-number”. If, again, the information on the location cell is added to the Answer Message ANM, it may be placed in the above-mentioned data field “Location-number” to be added. Depending on the application, other messages may alternatively also be used, such as messages “Call progress” or “Connect”.

[0030] When TUP signalling is employed, both Address Complete Message ACM and Answer Message ANM should also be modified. This is due to the fact that the standard messages contain no suitable data field for transmitting information on the location cell of subscriber B.

[0031] An alternative way to transmit information on the location cell of subscriber B is to create a separate new message suitable for the signalling system used, and to send the message at an appropriate moment of time between Address Complete Message and Answer Message.

[0032] Regardless of the way to transmit information on the location cell, the information must arrive at the mobile switching centre of the calling subscriber along with the answer message at the latest, so that charging would have sufficient time for utilizing the information on the location cell of subscriber B.

[0033] With the method of the invention, it is possible to implement a “wireless office” system, where the location cells of various geographically distant units of a community, company, etc. form a group of special cells.

[0034] The above explanation and the figures associated therewith are only intended to illustrate the present invention. Different variations and modifications of the invention will be obvious to a person skilled in the art without deviating from the scope of the invention set forth in the attached claims.

**Claims**

1. A method for improving charging criteria in a cellular mobile telephone network, comprising steps of forming a group from special cells (a,c,d,e) comprising at least one cell of cells of the mobile telephone network, applying specifically determined charging criteria to calls in which the location cell of at least one of the subscribers (MS-A,MS-B) is a member of the group of special cells (a,c,d,e), characterized by transmitting information on a location cell of a called subscriber (MS-B) from a mobile switching centre (MSC) of the called subscriber (MS-B) to a mobile switching centre (MSC) of a calling subscriber (MS-A) when the location cell of the calling subscriber (MS-A) and the location cell of the called subscriber (MS-B) are situated within separate mobile switching centre areas, determining at a call setup whether a location cell of at least one of subscribers (MS-A,MS-B) participating a call belongs to said group of cells (a,c,d,e),

2. A method according to claim 1, characterized by forming a restricted subscriber group from subscriber numbers, and applying specifically determined charging criteria to calls in which the location cell of at least one of the subscribers (MS-A,MS-B) is a member of the group of special cells (a,c,d,e) and the subscriber number of at least one of the subscribers belongs to the restricted subscriber group.

3. A method as claimed in claim 1, characterized in that when the location cell of the calling subscriber (MS-A) and that of the called subscriber (MS-B) are situated within separate MSC areas, information on the location cell of the called subscriber will be transmitted from the mobile switching centre (MSC) of the called subscriber to the mobile switching centre (MSC) of the calling subscriber in response to a request sent by the calling subscriber along with the call setup message during the call setup.

4. A method as claimed in claim 2 or 3, characterized in that the information on the location cell of the called subscriber (MS-B) will be added to a message sent by the mobile switching centre (MSC) of the called subscriber after the mobile station of the called subscriber has answered the paging message.

5. A method as claimed in claim 2 or 3, characterized in that the information on the location cell of the called subscriber (MS-B) will be added to a message sent by the mobile switching centre (MSC) of the called subscriber after the called subscriber has answered the call.
6. A method as claimed in claim 2 or 3, characterized in that a new message will be formed for transmitting the information on the location cell of the called subscriber (MS-B).

7. A method as claimed in claim 2 or 3, characterized in that the information on the location cell of the called subscriber (MS-B) indicates the cell in which the called subscriber is located, whereby the mobile switching centre (MSC1) of the calling subscriber will find out by means of an analysis whether said cell belongs to the group of special cells (a, c, d, e).

8. A method as claimed in claim 2 or 3, characterized in that the information on the location cell of the called subscriber (MS-B) indicates the result of an analysis made for finding out whether the location cell of the called subscriber (MS-B) belongs to the group of special cells (a, c, d, e), whereby the mobile switching centre (MSC2) of the called subscriber will carry out said analysis.

9. A method as claimed in claim 1, characterized in that the numbers in the restricted subscriber group are private numbers, whereby the private number of the called subscriber will be converted into a telephone number at the beginning of call setup.

10. A method as claimed in claim 1, characterized in that an exchange (PBX) or part of a PSTN/ISDN network is set as a virtual cell, and, when the subscriber number analysis of at least one of the subscribers indicates that the subscriber is a subscriber of the exchange or the part of said PSTN/ISDN network, the specifically determined charging criteria will be applied.

Patentansprüche

1. Verfahren zur Verbesserung von Gebührenermittlungsmerkmalen in einem zellularen Mobiltelefonnetzwerk, mit den Schritten:

Bilden einer Gruppe von speziellen Zellen (a, c, d, e) mit zumindest einer Zelle von Zellen des Mobiltelefonnetzwerks,

Anwenden speziell bestimmter Gebührenermittlungsmerkmale auf Rufe, bei denen die Aufenthaltszelle von zumindest einem der Teilnehmer (MS-A, MS-B) ein Mitglied der Gruppe von speziellen Zellen (a, c, d, e) ist, gekennzeichnet durch

Übertragen von Informationen über die Aufenthaltszelle eines gerufenen Teilnehmers (MS-B) von einer Mobilvermittlungsstelle (MSC2) des gerufenen Teilnehmers (MS-B) zu einer Mobilvermittlungsstelle (MSC1) eines rufenden Teilnehmers (MS-A), wenn sich die Aufenthaltszelle des rufenden Teilnehmers (MS-A) und die Aufenthaltszelle des gerufenen Teilnehmers (MS-B) in separaten Mobilvermittlungsstellen-Bereichen befinden.

2. Verfahren gemäß Anspruch 1, gekennzeichnet durch die Schritte:

Bilden einer begrenzten Teilnehmergruppe aus Teilnehmernummern, und

Anwenden speziell bestimmter Gebührenermittlungsmerkmale auf Rufe, bei denen die Aufenthaltszelle von zumindest einem der Teilnehmer (MS-A, MS-B) ein Mitglied der Gruppe von speziellen Zellen (a, c, d, e) ist und die Teilnehmernummer von zumindest einem der Teilnehmer der begrenzten Teilnehmergruppe angehört.

3. Verfahren gemäß Anspruch 1, dadurch gekennzeichnet, dass als Reaktion auf eine vom rufenden Teilnehmer während dem Rufaufbau zusammen mit der Rufaufbaunachricht gesendete Anforderung Informationen über die Aufenthaltszelle des gerufenen Teilnehmers von der Mobilvermittlungsstelle (MSC2) des gerufenen Teilnehmers zu der Mobilvermittlungsstelle (MSC1) des rufenden Teilnehmers übertragen werden, wenn sich die Aufenthaltszelle des rufenden Teilnehmers (MS-A) und die des gerufenen Teilnehmers (MS-B) in separaten MSC-Bereichen befinden.

4. Verfahren gemäß Anspruch 2 oder 3, dadurch gekennzeichnet, dass die Informationen über die Aufenthaltszelle des gerufenen Teilnehmers (MS-B) zu einer von der Mobilvermittlungsstelle (MSC2) des gerufenen Teilnehmers gesendeten Nachricht hinzugefügt werden, nachdem die Mobilstation des gerufenen Teilnehmers die Paging-Nachricht beantwortet hat.

5. Verfahren gemäß Anspruch 2 oder 3, dadurch gekennzeichnet, dass die Informationen über die Aufenthaltszelle des gerufenen Teilnehmers (MS-B) zu einer von der Mobilvermittlungsstelle (MSC2) des gerufenen Teilnehmers gesendeten Nachricht hinzugefügt werden, nachdem der geru-
fenden Teilnehmer den Ruf beantwortet hat.

6. Verfahren gemäß Anspruch 2 oder 3, **dadurch gekennzeichnet, dass** zum Übertragen der Informationen über die Aufenthaltszelle des gerufenen Teilnehmers (MS-B) eine neue Nachricht gebildet wird.

7. Verfahren gemäß Anspruch 2 oder 3, **dadurch gekennzeichnet, dass** die Informationen über die Aufenthaltszelle des gerufenen Teilnehmers (MS-B) die Zelle angibt, in der sich der gerufene Teilnehmer befindet, wobei die Mobilvermittlungsstelle (MSC1) des rufenden Teilnehmers anhand einer Analyse herausfindet, ob die Zelle der Gruppe von speziellen Zellen (a, c, d, e) angehört.

8. Verfahren gemäß Anspruch 2 oder 3, **dadurch gekennzeichnet, dass** die Informationen über die Aufenthaltszelle des gerufenen Teilnehmers (MS-B) die Zelle angibt, in der sich der gerufene Teilnehmer befindet, wobei die Mobilvermittlungsstelle (MSC1) des rufenden Teilnehmers anhand einer Analyse herausfindet, ob die Zelle der Gruppe von speziellen Zellen (a, c, d, e) angehört, wobei die Mobilvermittlungsstelle (MSC2) des gerufenen Teilnehmers die Analyse durchführt.

9. Verfahren gemäß Anspruch 1, **dadurch gekennzeichnet, dass** die Nummern in der begrenzten Teilnehmergruppe Privatnummern sind, wobei die Privatnummer des gerufenen Teilnehmers zu Beginn eines Rufaufbaus in eine Telefonnummer umgewandelt wird.

10. Verfahren gemäß Anspruch 1, **dadurch gekennzeichnet, dass** eine Vermittlung (PBX) oder ein Teil eines PSTN/ISDN-Netzwerks als eine virtuelle Zelle festgelegt wird, und die speziell bestimmten Gebührenbegünstigungsmarkierungen angewandt werden, wenn die Teilnehmernummernanalyse von zumindest einem der Teilnehmer angibt, dass der Teilnehmer ein Teilnehmer der Vermittlung oder des Teils des PSTN/ISDN-Netzwerks ist.

**Revendications**

1. Procédé pour améliorer des critères de tarification dans un réseau téléphonique mobile cellulaire, comprenant les étapes consistant à :

   - former un groupe à partir de cellules particulières (a, c, d, e) comprenant au moins une cellule des cellules du réseau téléphonique mobile, appliquer des critères de tarification déterminés spécifiquement aux appels dans lesquels la cellule d'emplacement d'au moins l'un des abonnés (MS-A, MS-B) est un membre du groupe de cellules particulières (a, c, d, e), **caractérisé par :**

   - la transmission d'informations concernant une cellule d'emplacement d'un abonné appelé (MS-B) d'un centre de commutation du service mobile (MSC2) de l'abonné appelé (MS-B) à un centre de commutation du service mobile (MSC1) d'un abonné appelant (MS-A) lorsque la cellule d'emplacement de l'abonné appelant (MS-A) et la cellule d'emplacement de l'abonné appelé (MS-B) sont situées dans des zones de centre de commutation du service mobile distinctes, la détermination, lors de l'établissement d'un appel, si une cellule d'emplacement d'au moins l'un des abonnés (MS-A, MS-B) participant à un appel appartient audit groupe de cellules (a, c, d, e), l'application desdits critères de tarification particuliers en temps réel pendant l'appel lorsque la cellule d'emplacement d'au moins l'un des abonnés (MS-A, MS-B) participant à l'appel est un membre dudit groupe de cellules spéciales (a, c, d, e).

2. Procédé selon la revendication 1, **caractérisé par :**

   - la formation d'un groupe d'abonnés restreint à partir de numéros d'abonnés, et l'application de critères de tarification déterminés spécifiquement aux appels dans lesquels la cellule d'emplacement d'au moins l'un des abonnés (MS-A, MS-B) est un membre du groupe de cellules particulières (a, c, d, e) et le numéro d'abonné d'au moins l'un des abonnés appartient au groupe d'abonnés restreint.

3. Procédé selon la revendication 1, **caractérisé en ce que,** lorsque la cellule d'emplacement de l'abonné appelant (MS-A) et celle de l'abonné appelé (MS-B) sont situées dans des zones de centre de commutation du service mobile distinctes, des informations concernant la cellule d'emplacement de l'abonné appelé seront transmises par le centre de commutation du service mobile (MSC2) de l'abonné appelé au centre de commutation du service mobile (MSC1) de l'abonné appelant en réponse à une requête envoyée par l'abonné appelant avec le message d'établissement d'appel pendant l'établissement d'appel.

4. Procédé selon la revendication 2 ou 3, **caractérisé en ce que** les informations concernant la cellule d'emplacement de l'abonné appelé (MS-B) seront ajoutées à un message envoyé par le centre de commutation du service mobile (MSC2) de l'abonné appelé une fois que la station mobile de l'abonné
5. Procédé selon la revendication 2 ou 3, caractérisé en ce que les informations concernant la cellule d'emplacement de l'abonné appelé (MS-B) seront ajoutées à un message envoyé par le centre de commutation du service mobile (MSC2) de l'abonné appelé une fois que l'abonné appelé aura répondu à l'appel.

6. Procédé selon la revendication 2 ou 3, caractérisé en ce qu'un nouveau message sera formé pour transmettre les informations concernant la cellule d'emplacement de l'abonné appelé (MS-B).

7. Procédé selon la revendication 2 ou 3, caractérisé en ce que les informations concernant la cellule d'emplacement de l'abonné appelé (MS-B) indiquent la cellule dans laquelle l'abonné appelé est situé, moyennant quoi le centre de commutation du service mobile (MSC1) de l'abonné appelant trouvera, au moyen d'une analyse, si ladite cellule appartient au groupe de cellules spéciales (a, c, d, e).

8. Procédé selon la revendication 2 ou 3, caractérisé en ce que les informations concernant la cellule d'emplacement de l'abonné appelé (MS-B) indiquent le résultat d'une analyse effectuée pour trouver si la cellule d'emplacement de l'abonné appelé (MS-B) appartient au groupe de cellules spéciales (a, c, d, e), moyennant quoi le centre de commutation du service mobile (MSC2) de l'abonné appelé effectuera ladite analyse.

9. Procédé selon la revendication 1, caractérisé en ce que les numéros dans le groupe d'abonnés restreint sont des numéros privés, moyennant quoi le numéro privé de l'abonné appelé sera converti en un numéro de téléphone au début de l'établissement d'appel.

10. Procédé selon la revendication 1, caractérisé en ce qu'un central téléphonique (PBX) ou une partie d'un réseau PSTN/ISDN est défini en tant que cellule virtuelle, et, lorsque l'analyse de numéro d'abonné d'au moins l'un des abonnés indique que l'abonné est un abonné du central téléphonique ou de la partie dudit réseau PSTN/ISDN, les critères de tarification déterminés spécifiquement seront appliqués.
