Note: Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).
DESCRIPTION

BACKGROUND OF THE INVENTION

1. Field of the Invention

[0001] The present invention relates to a removable film for the windows of motor vehicles. The film can be adhered to a glass window of motor vehicles having a smooth surface, sufficiently held on the glass window after being adhered thereto, and easily peeled therefrom without damaging the window film or staining the glass window. If desired, the film can reduce transmittance of ultraviolet light and/or visible light.

2. Description of Related Art

[0002] In recent years, the same films that have been used for fashion, design, and privacy have been used as window films for motor vehicles. These films comprise a base film having applied thereto the same pressure sensitive adhesive that is used in films for building materials to prevent glass-splashing, and a silicone type polyester release film that is adhered to the pressure sensitive adhesive layer.

[0003] Difficulties arise, however, in using the strong pressure sensitive adhesives of the prior art to adhere films to the windows of motor vehicles. For example, there are many failings attributed to the adhesion of the surfaces of the pressure sensitive adhesive layers to each other during the process of adhering the films to the windows. Further, because the window films are adhered with the strong pressure sensitive adhesives, once they have been adhered, it is difficult to remove them from the windows without damaging the film and/or leaving residues of the adhesives on the window. Thinners or solvents have been used to remove such residues, but this procedure carries with it the danger of damaging polyurethane leathers or polyvinyl chloride leathers used as interior materials for the motor vehicles.

[0004] Clinging sheets according to the preamble of claim 1 are described in EP-A-0 688 844. These clinging sheets are prepared from a two-component polyurethane system using as a cross-linking agent an aromatic polyisocyanate.

SUMMARY OF THE INVENTION

[0005] One object of the present invention is to provide removable window films for motor vehicles that can be separated and used even if their pressure sensitive adhesive layers become adhered to each other prior to their application to the motor vehicle windows.

[0006] Another object of the present invention is to provide removable window films that can be easily adhered to motor vehicle windows, can maintain sufficient adhesion to the windows for practical use after being adhered thereto, and can be easily peeled therefrom without being damaged or staining the glass windows.

[0007] Still another object of the present invention is to provide a method for easily adhering a window film to motor vehicle windows.

[0008] Extensive investigations undertaken by the present inventors directed to the object described above have led to the discovery that such objects can be achieved by the formation of a window film having an adhesive layer comprising a low adhesive strength type adhesive on one surface of the base film.

[0009] The present invention is directed to a removable window film with superior weathering resistance for motor vehicles which comprises a base film and a removable adhesive layer having low adhesive strength formed on one surface of the base film, said adhesive layer comprising an adhesive having a low adhesive strength.

[0010] In another aspect, the present invention is directed to a removable window film for motor vehicles, as described above, wherein a vapor deposited metal layer is further provided between the base film and the adhesive layer.

[0011] In still another aspect, the present invention is directed to a removable window film for motor vehicles, as described above, wherein the adhesive further comprises a colorant.

[0012] In yet another aspect, the present invention is directed a removable window film for motor vehicles, as described above, wherein the adhesive further comprises an ultraviolet absorbent.

[0013] Further, the present invention is directed to a method for attaching a film to a motor vehicle window which comprises adhering the removable window film for motor vehicles as described above to said window.

BRIEF DESCRIPTION OF THE DRAWINGS

[0014] Figure 1 shows a sectional view of one embodiment of the removable window film for motor vehicles of the present invention;
DESCRIPTION OF PREFERRED EMBODIMENTS

[0015] As described above, the adhesive layer of the removable window films for motor vehicles of the present invention comprises an adhesive having a low adhesive strength.

[0016] The adhesive having a low adhesive strength includes a polyurethane adhesive having a low adhesive strength. The polyurethane adhesive having a low adhesive strength includes, for example, a polyurethane elastomer comprising (1) a soft segment containing a long chain polyl as a main component and (2) a hard segment containing a diisocyanate compound and a chain extension agent. It is preferred that the long chain polyl be a polyester polyl or a polyether polyl.

[0017] The diisocyanate compound includes tolylene diisocyanate (TDI), diphenylmethane diisocyanate (pure MDI), hexamethylene diisocyanate (HDI), and the like. The chain extension agent includes a low molecular weight polyl, an aromatic diamine, and the like.

[0018] The polyurethane elastomer is a two component type, in which a curing reaction is carried out by adding a crosslinking agent, such as, a polyisocyanate, to a polyurethane elastomer or a prepolymer thereof. Preferably, a crosslinking accelerator is also added.

[0019] The polyisocyanate which is used in the invention as the crosslinking agent is an aliphatic or alicyclic polyisocyanate, as the use of such a crosslinking agent will result in improved weathering resistance.

[0020] Further, the polyurethane elastomer includes a moisture curing type, in which an isocyanate is reacted with moisture in air, or the thermomelting extrusion type, i.e., hot melt.

[0021] In addition, other polyurethane adhesives having a low adhesive strength include, for example, a polyurethane produced by reacting a prepolymer - having an end isocyanate group and produced by reacting a mixture of one or more polyols having an average functional group number of 2 to 2.6 with an excess of organic diisocyanate - with a mixture of one or more polyols having an average functional group number of 2 or more in an equivalent ratio of NCO to OH of about 0.65 to about 1.15, wherein the total of the average functional group number of the polyol mixture and the average functional group number of the polyl mixture as the prepolymer component is more than 4 and less than 5.

[0022] In the polyurethane, the polyols of the polyol mixture include propylene glycol, ethylene glycol, polymers produced by the additional polymerization of propylene oxide and/or ethylene oxide to propylene glycol or ethylene glycol; polyether diols, such as, polytetramethylene ether glycol; polyester glycols produced by the dehydration condensation of low molecular weight glycols, such as, ethylene glycol, propylene glycol, and 1, 4-butanediol, and organic acids, such as, adipic acid and phthalic acid; glycerol, trimethyl propane, pentaerythritol, arabitol, sorbitol, and polymers produced by the additional polymerization of propylene oxide and/or ethylene oxide to one or more of these as an initial agent. It is also possible to use polymer polyols produced by polymerizing vinyl monomers, such as, acrylonitrile and styrene, in the polyols described above.

[0023] In the polyurethane, the organic diisocyanates include: aliphatic or alicyclic diisocyanates, such as, hexamethylenediisocyanate, lysinediisocyanate, isophoronediisocyanate, 4, 4’ - dicyclohexylmethanediisocyanate, isoproplidene bis (cyclohexylisocyanate), and xylidenediisocyanate; and dimers, trimers, and carbodiimide modified compounds thereof. The aliphatic and alicyclic diisocyanate display an excellent action in view of their weathering resistance.

[0024] The polyurethane adhesives having a low adhesive strength are a polyurethane comprising essentially a polyisocyanate compound and a low molecular weight olefin type polyl that has no polar groups in its molecular skeleton, and has end hydroxyl groups, a number average molecular weight of from about 500 to about 5,000, and from about 1.5 to about 8 hydroxyl groups per molecule. The polyisocyanate compounds that can be used include the same as the polyisocyanate compounds described above.

[0025] The polyurethane adhesives having a low adhesive strength can be used alone or in combination of two or more.

[0026] The adhesive having a low adhesive strength can be used singly or in a combination of two or more members.

[0027] As used in the present invention, the term “low adhesive strength” means a peel strength of preferably from about 1 g/25mm to about 50 g/25mm.

[0028] A colorant can be incorporated in the above described low adhesive strength type adhesives.

[0029] The colorant includes conventional colorants, such as, dyes and pigments. Examples of the colorant include: organic pigments or dyes, such as, phthalocyanine type, azo type, condensed azo type, azo lake type, Hansa type, benzimidazolone type, anthraquinone type, diallyltype type, perylene type, perylene type, indigo type, thioidigo type, isoindolinone type, azomethineazo type dioxazine type quinacridone type, aniline black type, triphenylmethane type, carbon black type, methine type, quinophthalone type and anthrapyridone type pigments or dyes; and inorganic pigments, such as, oxides, sulfides or sulfates of zinc, lead, titanium, antimony, cadmium, iron, arsenic, magnesium,
aluminum, cobalt or chromium, and metal powders. Examples of the inorganic pigments are titanium oxide type, iron oxide type, iron hydroxide type, chromium oxide type, spinel baked type, chromic acid type, chromium vermilion type, Prussian blue type, aluminum powder type and bronze powder type pigments.

[0030] When vivid color tone or high transparency is specifically required, dyes or pigments of anthraquinone type, indigo type, and diazo type are preferably used. When weathering resistance is required, oxides, sulfides, or sulfates of zinc, lead, titanium, antimony, cadmium, iron, arsenic, magnesium, aluminum, cobalt, chromium, or the like are used.

[0031] Colorants that can transmit only arbitrary color are preferred, and the colorants that can transmit only blue, brown, or gold are specifically preferred.

[0032] A suitable amount of the colorant will be dependent upon the coloration degree required in a given case, and can readily be selected accordingly by those skilled in the art.

[0033] An ultraviolet absorbing agent can be incorporated in the above described low adhesive strength type adhesives.

[0034] The ultraviolet absorbing agents include : for example, benzophenone ultraviolet absorbing agents, such as, 2-hydroxy-4-methoxybenzophenone, 2 - hydroxy - 4 - octoxybenzophenone, 2,2'-dihydroxy-4-methoxybenzophenone, 2, 4-dihydroxybenzophenone, 2-hydroxy - 4 - dodecylbenzophenone, 2, 2' - dihydroxy - 4, 4' - dimethoxybenzophenone, 2 - hydroxy - 4 - methoxy - 5 - sulfobenzophenone, and bis (2-methoxy-4-hydroxy-5-benzoylphenyl) methane; salicylic acid ultraviolet absorbing agents, such as, phenylsalicylate, p-tert-butylphenylsalicylate, and p-ocetylphenylsalicylate; benzo triazole ultraviolet absorbing agents, such as, 2-(2'-hydroxy-5'-methylphenyl) benzotriazole, 2-(2'-hydroxy-5'-tert-butylphenyl) benzotriazole, 2-(2'-hydroxy-3', 5'-di - tert-butylphenyl) benzotriazole, 2-(2-hydroxy-3-tet-butyl-5'-methylphenyl)-5-chlorobenzotriazole, 2-(2'-hydroxy-3', 5'-di - tert-butyphenyl) - 5 - chlorobenzotriazole, 2 - (2'-hydroxy - 3', 5'-di - tert-amylphenyl) benzotriazole, 2-(2-hydroxy-3''-3', 4'', 5'', 6''-tert-hydrophthalimidomethyl)- 5'-methylphenyl benzotriazole, and 2, 2-methylenebis [4-(1, 1, 3, 3-tetramethylbutyl)-6-(2H-benzotriazole-2-il) phenol] ; cyanacrylate ultraviolet absorbing agents, such as, 2-ethylhexyl-2-cyano-3, 3'- diphenylacrylate, and ethyl-2-cyano-3, 3'-diphenylacrylate.

[0035] The amount of the ultraviolet absorbing agent is preferably in a range of from about 0.2 to about 5 parts by weight based on 100 parts by weight of the adhesive having a low adhesive strength.

[0036] The thickness of the adhesive layer is not critical, but is normally in a range of from about 5 to about 100 micrometers, preferably in a range of from about 10 to about 50 micrometers.

[0037] In the removable window film for motor vehicles of the present invention, a vapor deposited metal layer can be provided between the base film and the adhesive layer. Examples of metals that can be used in such vapor deposited metal layers include aluminum, gold, silver, copper, nickel, cobalt, chromium, tin and indium, of which aluminum, gold, silver, and tin are more preferred and aluminum is most preferred.

[0038] The thickness of the vapor deposited metal layer is preferably in a range of from about 50 to about 300 angstroms.

[0039] The base film of the present invention is preferably transparent.

[0040] Examples of the base films include films or laminated films of various resins, including polyolefin resins, such as, polyethylene and polypropylene, vinyl chloride resins, styrene resins, acrylonitrile-butadiene-styrene resins, polyvinyl alcohol resins, acrylic resins, acrylonitrile - styrene resins, vinyl chloride resins, acetate resins, polyvinyl chloride resins, vinylidene chloride resins, fluorocarbon resins, polyethylene resins, polyethylene terephthalate, polystyrene resins, polyester resins, polyvinyl alcohol resins, polyvinylidene fluoride resins, fluorinated resins, polycarbonate resins, polyamide resins, polycarbonate resins, polynonylene oxide resins, polyester resins, polystyrene resins, polybutylene terephthalate and polyethylene terephthalate, polyethylene sulfide resins, polyimide resins, polysulfone resins, polyether sulfone resins, aromatic polyester resins, and polyallylate resins. Among these films, polyester resin films, vinyl chloride resin films, and polyolefin resin films are preferred, and polyester resin films are most preferred. The base films can be uniaxially or biaxially oriented.

[0041] A suitable thickness of the base film can readily be selected by those skilled in the art, and normally is in a range of from about 5 to about 200 micrometers, preferably in a range of from about 10 to about 100 micrometers.

[0042] In the removable window film for motor vehicles of the present invention, a release film layer can be provided for protecting the surface of the adhesive layer. The release film layer is preferably transparent.

[0043] The release film layer is preferably a non-silicone type of polyester release film.

[0044] The adhesive layer can be applied to the base film by various methods, including, for example, a method in which it is dissolved in a suitable solvent and applied to the base film; a method in which it is applied to the base film by hot melt extrusion; a method in which it is dispersed or emulsified in a suitable medium and applied to the base film; a method in which, without using solvent, it is applied to the base film; a method in which it is applied by casting or with calender rolls or knives; a method in which an adhesive layer formed on a release liner is transferred to the base film and a method in which a double-sided adhesive tape is applied with a normal adhesive and the adhesive having a low adhesive strength on each sides is overlaid on the base film to contact the normal adhesive and the base film.
If the anchoring force between the base film and the adhesive layer is insufficient, the surface of the base film to be coated with the adhesive can be treated with corona discharge or can be preferably provided with a primer layer by applying a primer mainly composed of a polyester resin, a urethane resin, or a chlorinated polyolefin resin and containing a filler, as required. Various fillers can be used for this purpose, including silica, calcium carbonate, magnesium carbonate, kaolin, sintered clay, bentonite, zeolite, talc, and diatomaceous earth.

Owing to the use of the removable adhesive having a low adhesive strength in the removable window films for motor vehicles of the present invention, the removable window films for motor vehicles can be adhered to a glass window having a smooth surface, sufficiently held on the glass window after being adhered thereto, and then easily peeled from the glass window without damage to the window film or staining of the glass window in a case of peeling the removable window film for motor vehicles. Further, when the colorant or the ultraviolet absorbing agent is incorporated in the adhesive having a low adhesive strength, the removable window films for motor vehicles can efficiently reduce transmittance of ultraviolet light and/or visible light, as required. Furthermore, when the vapor deposited metal layer is provided between the base film and the adhesive layer in the removable window films for motor vehicles, the removable window films for motor vehicles can reflect ultraviolet light and reduce visible light.

The present invention also provides an adhering method which comprises adhering the removable window films for motor vehicles of the present invention to a glass window of a motor vehicle. The preferable embodiments of the adhering method of the present invention can reduce transmittance of ultraviolet light and/or visible light.

Example 1

Figure 1 shows a sectional view of one embodiment of the removable window films for motor vehicles according to the present invention.

On one surface of a transparent base-film 1 (a polyester resin film, having a thickness of 25 micrometers), a homogeneous mixture of 100 parts by weight of a polyether-type polyurethane elastomer (a product of DAINIPPON INK & CHEMICALS, INC., trade name: CRISVON NT - 165EL, concentration: 65 percent by weight), 20 parts by weight of an aliphatic diisocyanate crosslinking agent (a product of DAINIPPON INK & CHEMICALS, INC., trade name: BARNOCK DN - 950, concentration: 75 percent by weight) and 3 parts by weight of a crosslinking accelerator (a product of DAINIPPON INK & CHEMICALS, INC., trade name: CRISVON AccelT) was applied by casting and heat at 100 °C for 12 minutes to form an adhesive layer 2 comprising the polyurethane elastomer and having a thickness of 20 micrometers. And then, a transparent nonsilicone-type polyester release film 3 (thickness: 25 micrometer) was provided on the surface of the adhesive layer 2 to obtain a removable window film for motor vehicles.

Example 2

A removable window film for motor vehicles was obtained by the same method as in Example 1, except that 10 parts by weight of a blue dye (a product of CHUO GOSEI CHEMICAL CO., trade name: Neo Super Liquid Blue C531-L, 1:2 type metal complex dye) based on 100 parts by weight of the polyurethane elastomer was mixed into the polyurethane elastomer of Example 1.

Example 3

A removable window film for motor vehicles was obtained by the same method as in Example 1, except that 1.5 parts by weight of a benzophenone type ultraviolet absorbing agent, "2, 4-dihydroxybenzophenone", (a product of KYODO CHEMICALS CO., trade name: BIOSORB 100) based on 100 parts by weight of the polyurethane elastomer was mixed into the polyurethane elastomer of Example 1.

Example 4

As shown in Figure 2, a vapor deposited metal layer 4 (a thickness of the vapor deposited aluminum layer: 100 angstroms) was formed by the vapor deposition of aluminum on one surface of a transparent base film 1 (a polyester resin film, having a thickness of 25 micrometers). A polyurethane elastomer (a product of DAINIPPON INK & CHEMICALS, INC., trade name: CRISVON 5516S, concentration: 30 percent by weight) was applied on the surface of the vapor deposited metal layer 4 by casting and heated at 100 °C for 12 minutes to form an adhesive layer 2 comprising the polyurethane elastomer and having a thickness of 20 micrometers. And then, a transparent nonsilicone type polyester release film 3 (thickness: 25 micrometer) was provided on the surface of the adhesive layer 2 to obtain a removable window film for motor vehicles.

The removable window films for motor vehicles obtained in Examples 1 through 4 were adhered to a transparent glass window of a motor vehicle. The removable window films for motor vehicles were sufficiently held on the
transparent glass window of a motor vehicle after adhering. And then, the removable window films for motor vehicles were peeled from the transparent glass window of the motor vehicle. The removable window films for motor vehicles were easily peeled without damage. The glass window was not damaged and did not have a residue of the adhesive having a low adhesive strength.

[0054] Test pieces prepared with the removable window films for motor vehicles obtained in Examples 1 through 4 were adhered to a transparent glass plate having a smooth surface. The peel strength of the test pieces were measured. The results were shown in Table 1.

[0055] In measuring the holding power of Table 1, no dislocation of the test pieces of Examples 1 through 4 was observed.

[0056] The peel strength, the holding power and the ball tack were measured by the following methods.

(1) peel strength

[0057] The peel strength was measured according to a peeling method at 180 degrees, which was provided in Japanese Industrial Standard Z 0237 (1991) 8.3.1.

(2) ball tack

[0058] The ball tack was measured by using a inclined plate having an inclination of 30 degrees according to an incline ball tack test method at 180 degrees, which was provided in Japanese Industrial Standard Z 0237 (1991) 12.

(3) holding power

[0059] The holding power was measured according to a holding power test method, which was provided in Japanese Industrial Standard Z 0237 (1991) 11.

[0060] The holding power relates to cohesive power or shear resistance. The longer the falling time, the larger is the shear resistance.

Claims

1. A removable window film for motor vehicles which comprises a base film (1) and a removable adhesive layer having low adhesive strength (2) formed on one surface of the base film (1), said adhesive layer (2) comprising a two-component type polyurethane adhesive having a low adhesive strength, characterized in that the adhesive layer is obtained by adding a crosslinking agent of an aliphatic or alicyclic polyisocyanate to a polyurethane elastomer or a prepolymer thereof and by reacting them to be cured.

2. The removable window film for motor vehicles as claimed in claim 1, wherein a vapor deposited metal layer (4) is further provided between the base film (1) and the adhesive layer (2).

3. The removable window film for motor vehicles as claimed in claim 1 or 2, wherein the adhesive further comprises a colorant.

4. The removable window film for motor vehicles as claimed in any one of claims 1 to 3, wherein the adhesive further comprises an ultraviolet absorbent.
5. The removable window film for motor vehicles as claimed in any one of claims 1 to 4, wherein a transparent release film (3) is adhered on a surface of the adhesive layer (2).

6. An adhering method which comprises adhering the removable window film for motor vehicles as claimed in any one of claims 1 to 5 to a motor vehicle window.

Patentansprüche

1. Entfernbare Fensterfolie für Kraftfahrzeuge, umfassend eine Basisfolie (1) und eine entfembare Klebeschicht mit einer geringen Haftfestigkeit (2), gebildet auf einer Oberfläche der Basisfolie (1), wobei die Klebeschicht (2) einen Polyurethan-Klebstoff vom Zweikomponenten-Typ mit einer geringen Haftfestigkeit umfasst, dadurch gekennzeichnet, dass die Klebeschicht durch Zusetzen eines Vernetzungsmittels eines aliphatischen oder alicyclischen Polyisocyanats zu einem Polyurethanelastomer oder einem Prepolymer davon und durch Umsetzen von diesen zum Härten erhalten wird.

2. Entfernbare Fensterfolie für Kraftfahrzeuge nach Anspruch 1, wobei eine aufgedampfte Metallschicht (4) weiter zwischen der Basisfolie (1) und der Haftschicht (2) vorgesehen ist.

3. Entfernbare Fensterfolie für Kraftfahrzeuge nach Anspruch 1 oder 2, wobei der Klebstoff weiter ein Farbmittel umfasst.

4. Entfernbare Fensterfolie für Kraftfahrzeuge nach mindestens einem der Ansprüche 1 bis 3, wobei der Klebstoff weiter ein UV-Absorptionsmittel umfasst.

5. Entfernbare Fensterfolie für Kraftfahrzeuge nach mindestens einem der Ansprüche 1 bis 4, wobei eine transparente Trennfolie (3) auf einer Oberfläche der Haftschicht (2) anhaftet.

6. Verhaftungsverfahren, umfassend das Verhaften der entfernbaren Fensterfolie für Kraftfahrzeuge nach mindestens einem der Ansprüche 1 bis 5 mit einem Kraftfahrzeugfenster.

Revendications

1. Film amovible pour fenêtres destiné aux véhicules à moteur qui comprend un film de base (1) et une couche amovible adhésive possédant un faible pouvoir adhésif (2) formée sur une surface du film de base (1) ladite couche adhésive (2) comportant un adhésif polyuréthane du type à deux composants possédant un faible pouvoir adhésif, caractérisé en ce que la couche d’adhérence est obtenue en ajoutant un agent de réticulation d’un polyisocyanate aliphatique ou alicyclique à un élastomère polyuréthane ou à l’un de ses prépolymères et en les faisant réagir jusqu’à la vulcanisation.

2. Film amovible pour fenêtres destiné aux véhicules à moteur selon la revendication 1, dans lequel une couche métallique 4 déposée en phase vapeur est, en outre, formée entre le film de base (1) et la couche adhésive (2).

3. Film amovible pour fenêtres destiné aux véhicules à moteur selon la revendication 1 ou 2, dans lequel l’adhésif comprend, en outre, un colorant.

4. Film amovible pour fenêtres destiné aux véhicules à moteur selon l’une quelconque des revendications 1 à 3, dans lequel l’adhésif comprend, en outre, un absorbant dans l’ultraviolet.

5. Film amovible pour fenêtres destiné aux véhicules à moteur selon l’une quelconque des revendications 1 à 4, dans lequel un film de séparation transparent 3 est mis à adhérer sur une surface de la couche adhésive (2).

6. Procédé de mise en adhérence qui comprend la mise en adhérence du film amovible pour fenêtres destiné aux véhicules à moteur selon l’une quelconque des revendications 1 à 5 sur une fenêtre d’un véhicule à moteur.
