Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).
Description

Field of the Invention

[0001] The present invention relates to information processing of computer networks, more specifically, to a method for indicating the location of video hot links.

Background of the Invention

[0002] Hypermedia is a term used to describe the fusion of two other new technologies: multimedia and hypertext. Multimedia refers to forms of information containing text, images, graphics, audio and video. A hypertext document is one which is linked to other documents via hyperlinks. A hyperlink often appears in a hypertext document as a piece of highlighted text. The text is usually a word or phrase describing something of which a user might want further information. When the user activates the hyperlink, typically by clicking on it using a mouse, the user view is changed so as to show the linked document, which typically contains more information on the highlighted word or phrase concerned. Hyperlinks make it easy to follow cross-references between documents. Hypermedia documents are hypertext documents with multimedia capabilities. The regions on the screen which are active hyperlinks are called hot-links.

[0003] Nowadays, most people are familiar with the application of hypertext by using a mouse to click on hot-links on computer displays of homepages from the world Wide web (the Web) on the Internet. Data on the Web is located via URLs. URL stands for Uniform Resource Locator. It is a draft standard for specifying as object on the Internet. It specifies access methods and the location of the files. Documents on the Web are written in a simple markup language called HTML, which stands for Hypertext Markup Language. File formats of data on the Web are specified as MIME formats; MIME stands for "Multipurpose Internet Mail Extensions". (Reference: http://www.oac.uci.edu/indiv/ehood/MIME/ MIME.html). Examples of file formats on the Web are .au (probably the most common audio format), .html (HTML files), .jpg (JPEG encoded images), .mid (Midi music format), .mpg (MPEG encoded video), and .ps (postscript files).

[0004] While presently hypertext technology is most common in text and image media, it is beginning to also appear in animation and video. HyperVideo is the name for video augmented with hyperlinks. NEC corporation has demonstrated to Newsbytes such a system, named video hypermedia system, that will bring the point and click capabilities of hypertext to full motion video (NEC's video HyperText System, Newsbytes News Network, July 31, 1995.).

[0005] HyperCafe is an experimental hypermedia prototype, developed as an illustration of a general hypervideo system (Nitin "Nick" Sawhney, David Balcom and Ian Smith, HyperCafe: Narrative and Aesthetic Properties of Hypervideo, Hypertext 96: Seventh ACM Conference on Hypertext (Recipient of the first Engelbart Best Paper Award at Hypertext ’96, March 20, 1996), http://silver.skiles.gatech.edu/gallery/hypercafe/ HT96_Talk/). This program places the user in a virtual cafe, composed primarily of digital video clips of actors involved in fictional conversations in the cafe. HyperCafe allows the user to follow different conversations, and offers dynamic opportunities of interaction via temporal, spatio-temporal and textual links to present alternative narratives.

[0006] VideoActive is an authoring tool for the creation of interactive movies (Hypervideo Authoring Tool (User Notes), http://ephyx.com/, PreRelease version, Feb. 1996). It uses the Hypervideo technology to include hot-links in digital video files. The tool allows one to prepare video clips with the hot-link information and then to link them with other types of media.

[0007] Hot links in hypertext files are highlighted presently by way of color variation. When normal hypertexts are black, for instance, the hypertexts containing hot links are of another color (e.g. blue). In this way, the users can learn whether there exists a hot link in the hypertexts through changes of the colors. However, color is important information in other hypermedia (image and video) files, hence the user might get a distorted image and video if the same method as mentioned above were still used to indicate whether there exist hot links in the image and video files. In the case where there is a red flower in a certain frame of a video, for instance, the information contained in the video itself will evidently be distorted if the hot link on the red flower is indicated directly by way of color variation. Therefore, it is undesirable to directly adopt the method of color variation in hypermedia (such as video) files. In the current hypervideo demo systems, the mouse cursor is often moved into a video display window and is moved around continuously within the window to find out whether there exist hot links in the video. For instance, when the cursor shape changes, it shows that there is a hot link. The method for seeking hot links contained in the video by way of a mouse cursor's roaming within the video window is very inconvenient.

[0008] IBM Technical Disclosure Bulletin, vol.37, no. 4A, pp.95-96, "Multimedia Hypervideo Links for Full Motion Videos", April 1994, discloses the use of multimedia hypervideo links. A user identifies these links by means of hot spots on the screen. When the user invokes the hypervideo marker, the video stops and the link will be invoked.

[0009] IBM Technical Disclosure Bulletin, vol.36, no. 9B, pp.163-164, "User-Controlled Display of Hypermedia Links", September 1993, discloses a user interface which provides an end user with the ability to control the visibility of hypermedia links, including the ability to turn off the hyperlinks.

Links via Mouse Location*, August 1993, discloses a user interface in which if a mouse pointer is within a window of interest, then hypermedia links are displayed and if a mouse pointer is not within a window of interest, then hypermedia links are not displayed.

[0011] The objective of the invention is to provide a method for indicating the location of time dependent video hot links to a user, including a method for indicating the presence and the location of a hot link.

Disclosure of the Invention

[0012] Accordingly, the present invention provides a method for indicating the location of time dependent video hot links to a user, comprising the steps of displaying a motion video presentation on a display device, the video presentation including a hot link region which is dynamically displayed for selection by a user to link to different content; displaying an indication of the presence of the hot link region in the video presentation. The present invention is characterised in that: the motion video presentation is displayed on a first portion of the display device; and the indication is displayed in a non-intrusive manner on a second portion of the display device, said second portion including vertical and horizontal indicators adjacent said first portion of said display device for cooperatively indicating a location and size of one or more hot link regions present in said video presentation.

[0013] The method of the invention may comprise the further step of altering a visual attribute of at least a portion of the hot link region when a user manipulable cursor is within the first portion.

[0014] The method of the invention may comprise the further step of displaying an indication of the presence of the hot link region in the video presentation on a second portion of the display screen.

[0015] With the method of the present invention, it is possible to indicate the presence and location of a hot link without the mouse cursor roaming or intrusion into the active video window. That is to say, a user can view in a non-intrusive mode, while he obtains the information about the presence and the corresponding location (if present) of a hot link.

Brief Description of the Drawings

[0016] The invention will now be described, by way of example only, with reference to the accompanying drawing, in which:

Fig. 1 shows schematically an embodiment of the present invention.

Detailed Description of the Invention

[0017] Fig. 1 shows schematically an embodiment of the invention. In this embodiment, video is being displayed on a computer monitor 2000. This monitor displays data (text, video) which is generated by a computer 2001, to which are also attached a keyboard 2002 and a mouse 2003 in standard configuration. Speakers are attached to the computer. The video is accompanied by audio, as is typical in motion pictures. The computer is also connected in standard fashion to a network connecting device 2004 such as ethernet, token ring or telephone modem, which allows access to the World Wide Web.

[0018] The video is contained inside a video display window 2010. The window is bordered in standard fashion, to allow for moving it or resizing it by utilizing the mouse in standard fashion. The top border is a standard panel bar 2020 with an active file button 2021 which, when activated by pointing the cursor at it and clicking with the mouse, displays a menu for initiating actions such as exiting the video program; an active button 2022 which, when activated, displays an options menu; and active buttons 2023 for miniaturizing the display window to an icon on the screen or on a control bar (as in Windows 95), for fast resizing between normal size to full screen size, and for fast termination of the video program. Such button configurations are standard. Underneath the window is a panel bar 2030 which contains active regions (buttons) 2040 for controlling typical video functions as play and stop/pause, and an active slider 2050 for controlling random access to temporal locations in the video. Such configurations are standard in the art.

[0019] The displayed video has been encoded with embedded hyperlinks. These are certain regions 2080 within the video display window for which at certain time intervals special information has been encoded in the video data stream that point to html files in various URLs which are connected to the computer network. Such region 2080 during such time period is called a hot-link.

[0020] If a user clicks the left button of the mouse while the cursor 2070 is inside the hot-link, a signal is transmitted from the computer to the encoded URL requesting the delivery of the linked html file back to the computer. The contents of the html file contain instructions which the computer executes. Typically these will be to display text or multimedia data on the monitor; the multimedia data may also include audio played out of the speakers. While this new data is being displayed, the video is paused. This is achieved either by a pause command on the video player if the video data has already been downloaded to a local file, or (more typically) by emitting a pause request to the URL from which the hot video is being streamed, and having that location issue a pause command to stop the streaming. If the originating URL does not support a pause command, then the video continues. The user has an option to miniaturize the video display window while he is viewing the newly displayed information. At some later time, the user may resume the hot video by pointing to the play button in 2040 with the cursor and clicking a button on the
mouse.

[0021] At any time period, more than one hot-link may be present in the video, and they are simultaneously visible if the cursor is inside the video display window.

[0022] Object 2009 is a horizontal indicator bar and object 2100 is a vertical indicator bar. When a hot-link is present in the displayed video, the X-coordinate of the center of the hot-link is indicated on the horizontal indicator bar directly below it by a bright dot, and the Y-coordinate of the center of the hot-link is indicated on the vertical indicator bar directly to its right by a bright dot. If the cursor is inside the display window while there is a hot-link in the video, that region is highlighted by either a color change of an easily observed border; the option is offered in the options menu. The user accesses the HTML file corresponding to the hot region.

[0023] Since the indicators of the present invention pinpoint the center of the hot-link, there is an option also accessible via the option menu for eliminating the hot-link highlighters inside the video display window. The user can still quickly move the cursor to the appropriate X-Y coordinate position within the video display window and click on the hot-link. Since hot regions typically correspond to recognizable image segments, such as people, faces, animals, objects, the user need not position the cursor exactly at the X-Y coordinates to be within the hot-link region. Another option within the options menu is that the cursor itself is changed when it is inside the hot-link. This may be a color change or an addition of a question mark next to the typical cursor, or other change.

[0024] Another option accessible via the options menu is that the horizontal and vertical indicator bars exhibit via lighted horizontal and vertical line segments the corresponding support intervals of hot-link. Thus, if the hot-link is a rectangle, then the horizontal bar is lighted along the entire interval directly below the hot-link, and the vertical bar is lighted along the entire interval directly to the right of the hot region. If the hot-link is an ellipse, the lighted intervals on the indicator bars may correspond to either the largest rectangle whose sides are parallel to the indicator bars and which lies either completely inside the ellipse of the smallest rectangle whose sides are parallel to the indicator bars and which contains completely the ellipse. Multiple hot-links in a single frame may have regions whose x-coordinates or y-coordinates overlap. Various options for user interfaces to convey this information on the indicator bars are envisioned, and follow directly from the invention herein.

[0025] It will be observed that the invention provides the user the ability to view a hot video without intrusion of hot-link indications inside the video window as well as the ability to view the video with indicators inside the video window visible. The choice can be dynamically invoked by simply moving the cursor out of or into the video display window. When the user is viewing in a non-intrusive mode, the light indicator provides information as to the presence of a hot region, alerting the viewer that if he so chooses, he can quickly determine the location of the hot-link by moving the cursor inside the display window.

[0026] Creation of hot video content is achieved in the following way. An MPEG encoded video source is used for this particular embodiment (D. LeGall, MOEG: A video Compression Standard for Multimedia Applications, Communications of the ACM, Vol. 34, No. 4, April 1994). The MPEG system layer contains packets of video, audio, and user specified data (International Organization for Standardization, ISO/IEC JTC1/SC29/WG11, Coding of Motion Pictures and Associated Audio, N0272, June 10, 1994). The user specified data will contain the hot-link information. Hot-link information for a given frame in the video will be encoded in a packet which immediately preceeds the packet which contains the beginnings of the video data for that frame. A hot video editing system comprising an MPEG playback system is used. It can play back the MPEG video in real-time mode, slow mode, or single-frame-at-a-time mode. It also has editing tools for inserting the hot link information.

At any desired frame, the user freezes the playback at that frame. Using the editing tools, the user indicates the desired region which is to be hot. After the region is indicated, the user labels the region with a pointer to a URL. A list of URLs for the particular video sequence is maintained, and displayed along the frozen single frame. If the desired URL is already in the list, the user simply has to click on it with a mouse to achieve the labeling. If this URL is new, the user has to enter it into the list and then point the hot-link to it. The editing system inserts this information into the user data packet, as discussed above.

[0027] An alternate embodiment for the creation of hot MPEG video, which is extensible to other video formats, is the following. A hot video editing system is used, as above. This time, instead of embedding the hot-link information into the MPEG system layer data stream, a new type of data stream is created, which mixes the MPEG system layer with the hot-link information. This will form a new MIME type, consisting of a sequence of hot video information for a particular frame, followed by the video data of that particular frame. Special start code symbols are used to indicate the start of a hot video data segment; and other special start code symbols are used to indicate the start of a MPEG video data segment.

[0028] Both hot video creation systems described above can be automated for faster creation of hot video. For example, motion estimation techniques as in MPEG encoding may be used to predict the location of a hot-link in a frame from a previous frame. The interactive editing system allows the user to view the automatically created hot-link regions, and the user can make modifications if necessary.

[0029] A hot video decoder is utilized by a browser whenever it identifies the incoming data as hot video data; this identification is via the suffix of the data name. If the data is encoded using the first embodiment, with hot-
A method for indicating the location of time dependent video hot links to a user, comprising the steps of: 

1. A method as claimed in claim 1, characterized in that the motion video presentation is displayed on a first portion (2010) of the display device; and the indication is displayed in a non-intrusive manner on a second portion of the display device, said second portion including vertical and horizontal indicators adjacent said first portion of said display device for cooperatively indicating a location and size of one or more hot link regions present in said video presentation.

2. A method as claimed in claim 1, characterized in that the mentioned step of displaying an indication of the presence of the hot link region (2080) in the video presentation comprises the further step of altering a visual attribute of at least a portion of the hot link region when a user manipulable cursor is within the first portion (2010).

3. A method as claimed in claim 2, characterized in that the mentioned step of altering a visual attribute of at least a portion of the hot link region (2080) can be extended to the method of direct displaying the hot link region in the first portion (2010).

4. A method as claimed in claim 1, characterized in that the mentioned step of displaying an indication of the presence of the hot link region (2080) in the video presentation comprises the further step of displaying an indication (2009, 2100) of the presence of the hot link region in the video presentation on a second portion (2030) of the display screen.

5. A method as claimed in claim 4, characterized in that the method further comprises the step of altering a visual attribute of at least a portion of the hot link region (2080) when a user manipulable cursor is within the first portion (2010).

6. A method as claimed in claim 4, characterized in that the method further comprises the step of displaying on the second portion (2030) an indicator (2009, 2100) of the location of the hot link region (2080).

7. A method as claimed in claim 4, characterized in that the method further comprises the step of displaying on the second portion (1030, 2030) an indicator (2009, 2100) of the location and size of the hot link region (1080, 2080).

Claims

1. A method for indicating the location of time dependent video hot links to a user, comprising the steps of: 

1.1. playing an indication (2009, 2100) of the presence of the hot link region in the video presentation; and

1.2. characterised in that:

2. A method as claimed in claim 1, characterized in that the motion video presentation is displayed on a first portion (2010) of the display device; and the indication is displayed in a non-intrusive manner on a second portion of the display device, said second portion including vertical and horizontal indicators adjacent said first portion of said display device for cooperatively indicating a location and size of one or more hot link regions present in said video presentation.

3. A method as claimed in claim 2, characterized in that the mentioned step of altering a visual attribute of at least a portion of the hot link region (2080) can be extended to the method of direct displaying the hot link region in the first portion (2010).

4. A method as claimed in claim 1, characterized in that the mentioned step of displaying an indication of the presence of the hot link region (2080) in the video presentation comprises the further step of displaying an indication (2009, 2100) of the presence of the hot link region in the video presentation on a second portion (2030) of the display screen.

5. A method as claimed in claim 4, characterized in that the method further comprises the step of altering a visual attribute of at least a portion of the hot link region (2080) when a user manipulable cursor is within the first portion (2010).

6. A method as claimed in claim 4, characterized in that the method further comprises the step of displaying on the second portion (2030) an indicator (2009, 2100) of the location of the hot link region (2080).

7. A method as claimed in claim 4, characterized in that the method further comprises the step of displaying on the second portion (1030, 2030) an indicator (2009, 2100) of the location and size of the hot link region (1080, 2080).
Patentansprüche

1. Verfahren, um einem Benutzer die Position von zeitabhängigen aktiven Videoverbindungen anzuzeigen, das die folgenden Schritte umfasst:
   Anzeigen einer Bewegtbildvideopräsentation auf einer Anzeigeeinheit (2000), wobei die Videopräsentation einen Bereich aktiver Videoverbindungen (2080) enthält, der zur Auswahl durch einen Benutzer dynamisch angezeigt wird, um eine Verknüpfung zu einem anderen Inhalt herzustellen;
   Anzeigen eines Hinweises (2009, 2100) auf das Vorhandensein des Bereichs der aktiven Videoverbindungen in der Videopräsentation; und
dadurch gekennzeichnet, dass:
   die Bewegtbildvideopräsentation in einem ersten Teil (2010) der Anzeigeeinheit angezeigt wird; und
der Hinweis unaufringlich in einem zweiten Teil der Anzeigeeinheit angezeigt wird, wobei der zweite Teil senkrechte und waagerechte Anzeiger enthält, die sich direkt neben dem ersten Teil der Anzeigeeinheit befinden, um die Position und die Größe von einem oder mehreren Bereichen aktiver Videoverbindungen, die in der Videopräsentation vorhanden sind, gemeinsam anzuzeigen.

Revendications

1. Procédé destiné à indiquer l'emplacement de liens dynamiques vidéo dépendant du temps à un utilisateur, comprenant les étapes consistant à :

   afficher une présentation vidéo animée sur un dispositif d'affichage (2000), la présentation vidéo comprenant une région de lien dynamique (2080) qui est dynamiquement affichée en vue d'une sélection par un utilisateur pour se connecter à un contenu différent,

   afficher une indication (2009, 2100) de la présence de la région de lien dynamique dans la présentation vidéo, et
caractérisé en ce que :

   la présentation vidéo animée est affichée sur une première partie (2010) du dispositif d'affichage, et

   l'indication est affichée de manière non importante sur une seconde partie du dispositif d'affichage ladite seconde partie comprenant des indicateurs vertical et horizontal adjacents à la première partie dudit dispositif d'affichage afin d'indiquer en coopération un emplacement et une taille d'une ou de plusieurs régions de
liens dynamiques présentes dans ladite présentation vidéo.

2. Procédé selon la revendication 1, caractérisé en ce que l'étape mentionnée consistant à afficher une indication de la présence de la région de lien dynamique (2080) dans la présentation vidéo comprend l'étape supplémentaire consistant à modifier un attribut visuel d'au moins une partie de la région de lien dynamique lorsqu'un curseur manipulable par un utilisateur est à l'intérieur de la première partie (2010).

3. Procédé selon la revendication 2, caractérisé en ce que l'étape mentionnée consistant à afficher une indication de la présence de la région de lien dynamique (2080) peut être étendue au procédé consistant à afficher directement la région de lien dynamique dans la première partie (2010).

4. Procédé selon la revendication 1, caractérisé en ce que l'étape mentionnée consistant à afficher une indication de la présence de la région de lien dynamique (2080) dans la présentation vidéo comprend l'étape supplémentaire consistant à afficher une indication (2009, 2100) de la présence de la région de lien dynamique dans la présentation vidéo sur une seconde partie (2030) de l'écran d'affichage.

5. Procédé selon la revendication 4, caractérisé en ce que le procédé comprend en outre l'étape consistant à modifier un attribut visuel d'au moins une partie de la région de lien dynamique (2080) lorsqu'un curseur manipulable par un utilisateur est à l'intérieur de la première partie (2010).

6. Procédé selon la revendication 4, caractérisé en ce que le procédé comprend en outre l'étape consistant à afficher sur la seconde partie (2030) un indicateur (2009, 2100) de l'emplacement de la région de lien dynamique (2080).

7. Procédé selon la revendication 4, caractérisé en ce que le procédé comprend en outre l'étape consentant à afficher sur la seconde partie (1030, 2030) un indicateur (2009, 2100) de l'emplacement et de la taille de la région de lien dynamique (1080, 2080).
