Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).
FIELD OF THE INVENTION

[0001] The present invention relates to an optical compensatory sheet comprising an optically anisotropic layer formed of discotic liquid crystal molecules provided on a transparent substrate. The invention also relates to a liquid crystal display using the optical compensatory sheet.

BACKGROUND OF THE INVENTION

[0002] A liquid crystal display comprises a liquid crystal cell, two polarizing elements arranged on each side of the liquid crystal cell, and one or two optical compensatory sheets (phase retarders) arranged between the liquid crystal cell and the polarizing element.

[0003] The liquid crystal cell comprises a pair of substrates, rod-like liquid crystal molecules and an electrode layer. The rod-like liquid crystal molecules are provided between the substrates. The electrode layer has a function of applying a voltage to the rod-like liquid crystal molecule. Each of the substrates has an orientation layer, which has a function of aligning the rod-like liquid crystal molecule.

[0004] The optical compensatory sheet is used to remove color from an image displayed on the liquid crystal cell. The optical compensatory sheet can also be used to enlarge a viewing angle of a liquid crystal cell. A stretched birefringent film has usually been used as the optical compensatory sheet.

[0005] An optical compensatory sheet comprising an optically anisotropic layer on a transparent substrate has been proposed to be used in place of the stretched birefringent film. The optically anisotropic layer is formed by fixing aligned discotic liquid crystal molecules. The discotic liquid crystal molecules have various alignment forms.

[0007] German Patent Publication No. 4,010,503A1 which is the closest prior art to the subject-matter of claim 1 discloses a negative uniaxial optical compensator for liquid crystal displays comprising a liquid crystalline polymer material comprising discotic groups, which are substantially horizontally aligned and fixed in this orientation.

SUMMARY OF THE INVENTION

[0009] Japanese Patent Provisional Publication No. 2(1990)-176625 discloses a liquid crystal display using a liquid crystal cell of a vertical alignment (VA) mode, in which rod-like liquid crystal molecules are essentially vertically aligned while not applying voltage to the cell, and are essentially horizontally aligned while applying voltage to the cell. The vertical alignment mode is characterized in a wide viewing angle and a fast response, compared with the conventional liquid crystal modes. A prototype of the liquid crystal display of a vertical alignment mode has been exhibited (Nikkei Microdevice (written in Japanese), No. 136, page 147, 1996).

[0010] U.S. Patent Nos. 4,583,825 and 5,410,422 disclose a liquid crystal display of a bend alignment mode having a liquid crystal cell in which rod-like liquid crystal compounds are aligned symmetrically. The alignment of an upper liquid crystal compound is essentially antiparallel to the alignment of a lower liquid crystal compound. The liquid crystal cell of the bend alignment mode has a self-optical compensatory function because of the symmetrical alignment. Therefore, the bend alignment mode is also referred to as an optical compensatory bend (OCB) mode. The liquid crystal display of the bend alignment mode has an advantage of a rapid response.

[0011] The liquid crystal display of a vertical alignment mode or a bend alignment mode is characterized in a wide viewing angle and a rapid response compared with the conventional liquid crystal modes (TN mode, STN mode). However, a further improvement is necessary to be comparable with CRT.

[0012] It might be considered that an optical compensatory sheet is used to improve the liquid crystal display of a vertical alignment mode or a bend alignment mode in the same manner as in the conventional liquid crystal displays. However, the known optical compensatory sheets used in the conventional liquid crystal displays are not effective in the liquid crystal display of the vertical alignment mode or the bend alignment mode.

[0013] In the liquid crystal cell of the vertical alignment mode or the bend alignment mode, most of rod-like liquid crystal molecules are essentially vertically aligned. An optical compensatory sheet should have a specific optical ani-
The present inventors have tried to prepare an optical compensatory sheet having the required specific large negative optical anisotropy by using discotic liquid crystal molecules. However, it is very difficult to prepare a specific optically anisotropic layer in which an optical axis is essentially not inclined (less than 5°) where the layer is prepared according to prior art.

An object of the present invention is to provide an optical compensatory sheet having a large negative optical anisotropy in which an optical axis is essentially not inclined.

Another object of the invention is to provide an optical compensatory sheet suitable for a liquid crystal display of a vertical alignment mode or a bend alignment mode.

A further object of the invention is to further improve a viewing angle of a liquid crystal display of a vertical alignment mode or a bend alignment mode.

The present invention provides an optical compensatory sheet comprising an optically anisotropic layer formed of discotic liquid crystal molecules provided on a transparent substrate, wherein the discotic liquid crystal molecules are horizontally aligned in the optically anisotropic layer, an average inclined angle between discotic planes of said discotic liquid crystal molecules and a surface of said transparent substrate being less than 5°, and said discotic liquid crystal molecules being fixed in the optically anisotropic layer while keeping the horizontal alignment.

The invention also provides a liquid crystal display comprising a liquid crystal cell of a vertical alignment mode, two polarizing elements and one or two optical compensatory sheets, each of said polarizing elements being arranged on each side of the liquid crystal cell, each of said optical compensatory sheets being arranged between the liquid crystal cell and each polarizing element, wherein the optical compensatory sheet comprises an optically anisotropic layer formed of discotic liquid crystal molecules provided on a transparent substrate, said discotic liquid crystal molecules being horizontally aligned in the optically anisotropic layer, wherein an average inclined angle between discotic planes of the discotic liquid crystal molecules and a surface of the transparent substrate is less than 5°, said discotic liquid crystal molecules being fixed in the optically anisotropic layer while keeping the horizontal alignment.

The invention further provides a liquid crystal display comprising a liquid crystal cell of a bend alignment mode, two polarizing elements and one or two optical compensatory sheets, each of said polarizing elements being arranged on each side of the liquid crystal cell, each of said optical compensatory sheets being arranged between the liquid crystal cell and each polarizing element, wherein the optical compensatory sheet comprises an optically anisotropic layer formed of discotic liquid crystal molecules provided on a transparent substrate, said discotic liquid crystal molecules being horizontally aligned in the optically anisotropic layer, wherein an average inclined angle between discotic planes of the discotic liquid crystal molecules and a surface of the transparent substrate is less than 5°, said discotic liquid crystal molecules being fixed in the optically anisotropic layer while keeping the horizontal alignment.

The present inventors have found that an optical compensatory sheet having a large negative optical anisotropy in which an optical axis is essentially not inclined can be obtained by adjusting an average inclined angle between discotic planes of discotic liquid crystal molecules and a surface of the transparent substrate to be less than 5°. However, it is difficult according prior art to align discotic liquid crystal molecules in such manner (homeotropic alignment). The present inventors have further studied the alignment of the discotic liquid crystal molecules, and have finally succeeded in aligning the discotic liquid crystal molecules having an average inclined angle of less than 5°. The homeotropic alignment of the discotic liquid crystal molecule is obtained by using a specific amount (based on the discotic liquid crystal molecule) of a 1,3,5-triazine compound.

Therefore, the optical compensatory sheet of the present invention has a large negative optical anisotropy in which an optical axis is essentially not inclined. The optical compensatory sheet of the invention is particularly effective in a liquid crystal display of a vertical alignment mode or a bend alignment mode, in which most of rod-like liquid crystal molecules are essentially vertically aligned.

For the reasons mentioned above, the excellent characteristics (a wide viewing angle and a rapid response) of a liquid crystal display of a vertical alignment mode or a bend alignment mode are further improved by using optical compensatory sheet of the present invention.

Fig. 1 is a sectional view schematically illustrating alignment of rod-like liquid crystal molecules in a liquid...
crystal cell of a vertical alignment mode and discotic liquid crystal molecules in an optically anisotropic layer when voltage is not applied (off) or is applied (on) to the cell.

**0026**  Fig. 2 is a sectional view schematically illustrating alignment of rod-like liquid crystal molecules in a liquid crystal cell of a bend alignment mode and discotic liquid crystal molecules in an optically anisotropic layer when voltage is not applied (off) or is applied (on) to the cell.

**DETAILED DESCRIPTION OF THE INVENTION**

**0027**  A liquid crystal display is described by referring to the drawings.

**0028**  Fig. 1 is a sectional view schematically illustrating alignment of rod-like liquid crystal molecules in a liquid crystal cell of a vertical alignment mode and discotic liquid crystal molecules in an optically anisotropic layer when voltage is not applied (off) or is applied (on) to the cell.

**0029**  As is shown in Fig. 1, a liquid crystal cell (11 to 13) comprises an upper substrate (11), a lower substrate (13) and liquid crystal (12) comprising rod-like liquid crystal molecules (12a to 12d) sealed between the substrates.

**0030**  Each of the upper substrate (11) and the lower substrate (13) has an orientation layer and an electrode (not shown in Fig. 1). The orientation layer has a function of aligning the rod-like liquid crystal molecules (12a to 12d). The electrode has a function of applying voltage to the rod-like liquid crystal molecules (12a to 12d).

**0031**  When voltage is not applied to the liquid crystal cell of a vertical alignment mode, the rod-like liquid crystal molecules (12a to 12d) are essentially vertically aligned as is shown in (off) of Fig. 1. The rod-like liquid crystal molecules (12a to 12d) are slightly slanted (pretilted) to a direction (rightward in Fig. 1). The slanted molecules can be aligned to the pretilted direction when voltage is applied to the cell, as is shown in (on) of Fig. 2.

**0032**  An optical compensatory sheet (14 to 16) is provided under the liquid crystal cell (11 to 13). The optical compensatory sheet shown in Fig. 1 comprises a transparent substrate (16), an orientation layer (15) and an optically anisotropic layer (14) in this order. The optically anisotropic layer (14) is formed by aligning discotic liquid crystal molecules (14a) and fixing the molecules while keeping the alignment.

**0033**  According to the present invention, an average inclined angle (θ) between discotic planes of the discotic liquid crystal molecules (14a) and a surface of the transparent substrate (16) is less than 5°. The average inclined angle (θ) preferably is less than 4°, more preferably is less than 3°, further preferably is less than 2°, and most preferably is less than 1°. The average inclined angle (θ) can be 0° (completely not inclined).

**0034**  When voltage is applied to the liquid crystal cell of a vertical alignment mode, the rod-like liquid crystal molecules (12b, 12c) placed in the middle of the cell are essentially horizontally aligned. On the other hand, the rod-like liquid crystal molecules (12a, 12d) neighboring the substrates (11, 13) are obliquely aligned along the pretilted direction.

**0035**  Fig. 2 is a sectional view schematically illustrating alignment of rod-like liquid crystal molecules in a liquid crystal cell of a bend alignment mode and discotic liquid crystal molecules in an optically anisotropic layer and a second optically anisotropic layer when voltage is not applied (off) or is applied (on) to the cell.

**0036**  As is shown in Fig. 2, a liquid crystal cell (21 to 23) comprises an upper substrate (21), a lower substrate (23) and liquid crystal (22) comprising rod-like liquid crystal molecules (22a to 22d) sealed between the substrates.

**0037**  Each of the upper substrate (21) and the lower substrate (23) has an orientation layer and an electrode (not shown in Fig. 2). The orientation layer has a function of aligning the rod-like liquid crystal molecules (22a to 22d). The electrode has a function of applying voltage to the rod-like liquid crystal molecules (22a to 22d).

**0038**  When voltage is not applied to the liquid crystal cell of a bend alignment mode, the alignment of the rod-like liquid crystal molecules (22a, 22b) near the upper substrate (21) is essentially antiparallel (symmetrical) to the alignment of the molecules (22c, 22d) near the lower substrate (23), as is shown in (off) of Fig. 2. The rod-like liquid crystal molecules (22a, 22d) neighboring the substrates (21, 23) are essentially horizontally aligned. On the other hand, the rod-like liquid crystal molecules (22a, 22c) placed in the middle of the cell are obliquely aligned.

**0039**  An optical compensatory sheet (24 to 27) is provided under the liquid crystal cell (21 to 23). The optical compensatory sheet shown in Fig. 2 comprises a transparent substrate (27), an orientation layer (26), a second optically anisotropic layer (25) and an optically anisotropic layer (24) in this order. The second optically anisotropic layer (25) and the optically anisotropic layer (24) are formed by aligning discotic liquid crystal molecules (25a to 25d and 24a) and fixing the molecules while keeping the alignment.

**0040**  In the second optically anisotropic layer (25), an average inclined angle between discotic planes of the discotic liquid crystal molecules (25a to 25c) and a surface of the transparent substrate (27) is not less than 5°. The inclined angle increases or decreases with increase of a distance from the surface of the transparent substrate to the discotic plane of the discotic liquid crystal molecules. In the optical compensatory sheet shown in Fig. 2, the inclined angle (θa to θc) increases with increase of a distance from the surface of the transparent substrate (27) to the discotic plane of the discotic liquid crystal molecules (25a to 25c).

**0041**  The average inclined angle (θ) between discotic planes of the discotic liquid crystal molecules (24a) and a surface of the transparent substrate (27) is the same as the angle described in Fig. 1.
[0042] When voltage is applied to the liquid crystal cell of a bend alignment mode, the alignment of the rod-like liquid crystal molecules (22a to 22d) is rather weak compared before applying voltage (off), as is shown in (on) of Fig. 2. However, the alignment of the rod-like liquid crystal molecules (22a, 22b) near the upper substrate (21) is still essentially antiparallel (symmetrical) to the alignment of the molecules (22c, 22d) near the lower substrate (23). The rod-like liquid crystal molecules (22a, 22d) neighboring the substrates (21, 23) are essentially horizontally aligned. On the other hand, the rod-like liquid crystal molecules (22b, 22c) placed in the middle of the cell are obliquely aligned.

[0043] As is described above, most of rod-like liquid crystal molecules are essentially vertically aligned in a liquid crystal cell of a vertical alignment mode (Fig. 1) or a bend alignment mode (Fig. 2). The optical anisotropy of the essentially vertically aligned rod-like liquid crystal molecules can be optically compensated by discotic liquid crystal molecules having an inclined angle (θ) of less than 5°.

[0044] In the present specification, the term "essentially vertically (or horizontally)" and the term "essentially parallel (or perpendicular)" mean that a margin for error based on the exactly vertical, horizontal, parallel or perpendicular angle is in the range of ±20°. The margin for error is preferably in the range of ±15°, more preferably in the range of ±10°, and most preferably in the range of ±5°.

[0045] In the specification, alignment of liquid crystal molecules means that the average aligned angle of the compounds is included in the above-mentioned range, even if aligned angles of some molecules are outside the range. In practice, all the liquid crystal molecules are not always aligned along a single direction.

[Optically anisotropic layer]

[0046] The optically anisotropic layer is formed by aligning discotic liquid crystal molecules and fixing the molecules while keeping the alignment. The discotic liquid crystal molecules are preferably fixed by a polymerization reaction, though the molecules can be fixed with a binder.

[0048] A polymerizable group should be bound to a discotic core of the discotic liquid crystal molecule to cause the polymerization reaction of the compound. However, if the polymerizable group is directly bound to the discotic core, it is difficult to keep the alignment at the polymerization reaction. Therefore, a linking group is introduced between the discotic core and the polymerizable group. Accordingly, the discotic liquid crystal molecule having a polymerizable group preferably is a compound represented by the following formula (I).

\[(I) \quad D(-L-P)_n\]

in which D is a discotic core; L is a divalent linking group; P is a polymerizable group; and n is an integer of 4 to 12.

[0049] Examples of the discotic cores (D) are shown below. In the examples, LP (or PL) means the combination of the divalent linking group (L) and the polymerizable group (P).
In the formula (I), the divalent linking group (L) preferably is selected from the group consisting of an alkylene group, an alkenylene group, an arylene group, -CO, -NH-, -O-, -S- and combinations thereof. L more preferably is a divalent linking group comprising at least two divalent groups selected from the group consisting of an alkylene group, an arylene group, -CO-, -NH-, -O- and -S-. L more preferably is a divalent linking group comprising at least two divalent groups selected from the group consisting of an alkylene group, an arylene group, -CO- and -O-. The alkylene group preferably has 1 to 12 carbon atoms.

The alkenylene group preferably has 2 to 12 carbon atoms. The arylene group preferably has 6 to 10 carbon atoms.

Examples of the divalent linking groups (L) are shown below. In the examples, the left side is attached to the discotic core (D), and the right side is attached to the polymerizable group (P). The AL means an alkylene group or an alkenylene group. The AR means an arylene group. The alkylene group, the alkenylene group and the arylene group may have a substituent group (e.g., an alkyl group).

L24: -S-AL-S-AL-
L25: -S-AR-AL-

The polymerizable group (P) is determined by the polymerization reaction. Examples of the polymerizable groups (P) are shown below.
The polymerizable group (P) preferably is an unsaturated polymerizable group (P1, P2, P3, P7, P8, P15, P16, P17) or an epoxy group (P6, P18), more preferably is an unsaturated polymerizable group, and most preferably is an ethylenically unsaturated group (P1, P7, P8, P15, P16, P17).

In the formula (I), n is an integer of 4 to 12, which is determined by the chemical structure of the discotic core (D). The 4 to 12 combinations of L and P can be different from each other. However, the combinations are preferably identical.

In the present invention, the discotic liquid crystal molecules are so aligned that an average inclined angle between discotic planes of the discotic liquid crystal molecules and a surface of the transparent substrate is less than 5°. To obtain the above-mentioned alignment of the discotic liquid crystal molecules, a specific amount of a specific compound is preferably used to cause a phase separation between the compound and the discotic liquid crystal molecules. Examples of the compounds causing the phase separation include a 1,3,5-triazine compound.

The 1,3,5-triazine compound is preferably represented by the following formula (III).

\[
\text{III}
\]

in which each of \(X^1, X^2\) and \(X^3\) independently is a single bond, -NR- (wherein R is hydrogen or an alkyl group having 1 to 30 carbon atoms), -O- or -S-; and each of \(R^31, R^32\) and \(R^33\) independently is an alkyl group, an alkenyl group, an aryl group or a heterocyclic group.

The compound represented by the formula (III) preferably is a melamine compound. The melamine compound means that each of \(X^1, X^2\) and \(X^3\) is -NR- or that each of \(X^1, X^2\) and \(X^3\) is a single bond and each of \(R^31, R^32\) and \(R^33\) independently is a heterocyclic group having a free valence at nitrogen atom. The melamine compound is described below by referring to the formula (IV).
R of -NR- preferably is hydrogen.

Each of $R^{31}$, $R^{32}$ and $R^{33}$ preferably is an aryl group.

The alkyl group preferably has a chain structure rather than a cyclic structure. An alkyl group of a straight chain structure is preferred to an alkyl group of a branched chain structure. The alkyl group preferably has 1 to 30 carbon atom, more preferably has 2 to 30 carbon atoms, further preferably has 4 to 30 carbon atoms, and most preferably has 6 to 30 carbon atoms. The alkyl group may have a substituent group. Examples of the substituent groups include a halogen atom, an alkoxy group (e.g., methoxy, ethoxy, epoxyethyloxy) and an acyloxy group (e.g., acryloyloxy, methacryloyloxy).

The alkenyl group preferably has a chain structure rather than a cyclic structure. An alkenyl group of a straight chain structure is preferred to an alkenyl group of a branched chain structure. The alkenyl group preferably has 2 to 30 carbon atom, more preferably has 3 to 30 carbon atoms, further preferably has 4 to 30 carbon atoms, and most preferably has 6 to 30 carbon atoms. The alkenyl group may have a substituent group. Examples of the substituent groups include a halogen atom, an alkoxy group (e.g., methoxy, ethoxy, epoxyethyloxy) and an acyloxy group (e.g., acryloyloxy, methacryloyloxy).

The aryl group preferably is phenyl or naphthyl, and more preferably is phenyl. The aryl group may have a substituent group. Examples of the substituent groups include a halogen atom, hydroxy, cyano; nitro, carboxyl, an alkyl group, an alkenyl group, an aryl group, an alkoxy group, an amido group, an acyloxy group, an arylamine group, a sulfamoyl group, an anilino substituted sulfamoyl group, an aryl substituted sulfamoyl group, a sulfonamido group, a carbamoyl group, a carboxyamido group, a carbamoylamido group, a carbamoylamido group, a carbamoylamido group, an acyl group.

The alkyl group has the same meanings as is described above. The alkyl moieties of the alkoxy group, the acyloxy group, the alkoxycarbonyl group, the alkenyl substituted sulfamoyl group, the sulfonamido group, the alkyl substituted carbamoyl group, the amido group, the alkylthio group and the acyl group also have the same meanings as is described above.

The alkenyl group has the same meanings as is described above. The alkenyl moieties of the alkenyloxy group, the acyloxy group, the alkenyloxycarbonyl group, the alkenyl substituted sulfamoyl group, the sulfonamido group, the alkyl substituted carbamoyl group, the amido group, the alkylthio group and the acyl group also have the same meanings as is described above.

Examples of the aryl groups include phenyl, a-naphthyl, b-naphthyl, 4-methoxyphenyl, 3,4-diethoxyphenyl, 4-octyloxyphenyl and 4-dodecyloxyphenyl. Examples of the phenyl moieties of the aryloxy group, the acyloxy group, the aryloxycarbonyl group, the aryl substituted sulfamoyl group, the sulfonamido group, the aryl substituted carbamoyl group, the amido group, the arylthio group and the acyl group are the same as the examples of the phenyl group.

Where $X^1$, $X^2$ or $X^3$ is -NR-, -O- or -S-, the heterocyclic group preferably has aromaticity. An aromatic heterocyclic ring generally is an unsaturated heterocyclic ring, and preferably is a heterocyclic ring having the maximum number of double bonds. The heterocyclic ring preferably is a five-membered, six-membered or seven-membered ring, more preferably is a five-membered or six-membered ring, and most preferably is a six-membered ring. The hetero atom of the ring preferably is N, S or O, and more preferably is N. The aromatic heterocyclic ring most preferably is pyridine ring. The heterocyclic group preferably is 2-pyridyl or 4-pyridyl. The heterocyclic group may have a substituent group. Examples of the substituent groups are the same as those of the aryl group.

Where $X^1$, $X^2$ or $X^3$ is a single bond, the heterocyclic group preferably has a free valence at nitrogen atom. The heterocyclic ring preferably is a five-membered, six-membered or seven-membered ring, more preferably is a five-membered or six-membered ring, and most preferably is a five-membered ring. The heterocyclic ring may contain two or more nitrogen atoms. The heterocyclic ring may contain another hetero atom (e.g., O, S). The heterocyclic ring may have a substituent group. Examples of the substituent groups are the same as those of the substituent groups of the aryl group.

Examples of the heterocyclic groups having a free valence at nitrogen atom are shown below.
At least one of $R_{31}$, $R_{32}$ and $R_{33}$ preferably contains an alkylene moiety having 9 to 30 carbon atoms or an alkenylene moiety having 9 to 30 carbon atoms. The alkylene moiety or the alkenylene moiety preferably has a straight chain structure. The alkylene moiety or the alkenylene moiety is preferably contained in a substituent group of an aryl group.

At least one of $R_{31}$, $R_{32}$ and $R_{33}$ preferably contains a polymerizable group as a substituent group. The 1,3,5-triazine compound preferably has at least two polymerizable groups. The polymerizable group is preferably positioned at the end of $R_{31}$, $R_{32}$ or $R_{33}$.

Where the polymerizable group is introduced into the 1,3,5-triazine compound, the discotic liquid crystal molecules and the 1,3,5-triazine compound can be polymerized in the optical anisotropic layer.

Examples of $R_{31}$, $R_{32}$ or $R_{33}$ having a polymerizable group as a substituent group are represented by the formula $(Rp)$.

$$(Rp) \quad -L^5(-P)n$$
in which $L^5$ is a $(n+1)$ valent linking group; $P$ is a polymerizable group; and $n$ is an integer of 1 to 5.

[0072] In the formula (Rp), $L^5$ preferably is a linking group consisting of at least two of an alkyne group, an alkenylene group, a $(n+1)$ valent aromatic group, a divalent heterocyclic group, -CO-, -NR- (wherein $R$ is hydrogen or an alkyl group having 1 to 30 carbon atoms), -O-, -S- and -SO_2-. The alkyne group preferably has 1 to 12 carbon atoms. The alkenylene group preferably has 2 to 12 carbon atoms. The aromatic group preferably has 6 to 10 carbon atoms.

[0073] Examples of $L^5$ of the formula (Rp) are shown below. The left side is attached to $X^1$, $X^2$ or $X^3$ (or directly attached to 1,3,5-triazine ring where $X^1$, $X^2$ or $X^3$ is a single bond) in the formula (III). The right side is attached to a polymerizable group (P). AL means an alkyne group or alkenylene group, Hc means a divalent heterocyclic group, and AR means an aromatic group. The alkyne group, the alkenylene group, the heterocyclic group and the aromatic group may have a substituent group (e.g., an alkyl group, a halogen atom).

\[

\end{align*}
\]

[0074] Examples of the polymerizable groups (P) in the formula (Rp) are the same as those of the polymerizable groups (P1 to P18) of the discotic liquid crystal molecule. The polymerizable group is used to polymerize the 1,3,5-triazine compound and the discotic liquid crystal molecule. Accordingly, the polymerizable group of the 1,3,5-triazine compound is preferably similar to the polymerizable group of the discotic liquid crystal molecule. Therefore, the polymerizable group (P) of the 1,3,5-triazine compound preferably is an unsaturated polymerizable group (P1, P2, P3, P7, P8, P15, P16, P17) or an epoxy group (P6, P18), more preferably is an unsaturated polymerizable group, and most preferably is an ethylenically unsaturated group (P1, P7, P8, P15, P16, P17) in the same manner as in the discotic liquid crystal compound.

[0075] Where $n$ is an integer of 2 to 5, the linking group ($L^5$) preferably contains a $(n+1)$ valent aromatic group. In other words, the formula (Rp) is preferably branched at the $(n+1)$ valent aromatic group. In the formula (Rp), $n$ preferably is an integer of 1 to 3.

[0076] Examples of the 1,3,5-triazine compounds (except for melamine compounds) are shown below.

[0079] The 1,3,5-triazine compound preferably is a melamine compound represented by the formula (IV).

![IV](image)

in which each of R⁴¹, R⁴³ and R⁴⁵ independently is hydrogen or an alkyl group having 1 to 30 carbon atoms; and each of R⁴², R⁴⁴ and R⁴⁶ independently is an alkyl group, an alkenyl group, an aryl group or a heterocyclic group; or R⁴¹ and R⁴², R⁴³ and R⁴⁴ or R⁴⁵ and R⁴⁶ are combined to form a heterocyclic ring.

[0080] Each of R⁴¹, R⁴³ and R⁴⁵ preferably is hydrogen or an alkyl group having 1 to 20 carbon atoms, more preferably is hydrogen or an alkyl group having 1 to 10 carbon atoms, further preferably is hydrogen or an alkyl group having 1 to 6 carbon atoms, and most preferably is hydrogen.

[0081] Each of R⁴², R⁴⁴ and R⁴⁶ preferably is an aryl group.

[0082] The definitions and the substituent groups of the alkyl group, the alkenyl group, the aryl group and the heterocyclic group are the same as those described in the formula (III).

[0083] The heterocyclic ring formed by R⁴¹ and R⁴², R⁴³ and R⁴⁴ or R⁴⁵ and R⁴⁶ is the same as the heterocyclic group having a free valence at nitrogen atom described in the formula (III).

[0084] At least one of R⁴², R⁴⁴ and R⁴⁶ preferably contains an alkylen moiety having 9 to 30 carbon atoms or an alkenylen moiety having 9 to 30 carbon atoms. The alkylen moiety or the alkenylen moiety preferably has a straight chain structure. The alkylen moiety or the alkenylen moiety is preferably contained in a substituent group of an aryl.
At least one of $R_{42}$, $R_{43}$ and $R_{44}$ preferably contains a polymerizable group as a substituent group. The melamine compound preferably has at least two polymerizable groups. The polymerizable group is preferably positioned at the end of $R_{42}$, $R_{44}$ or $R_{46}$.

Where the polymerizable group is introduced into the melamine compound, the discotic liquid crystal molecules and the melamine compound can be polymerized in the optical anisotropic layer.

Examples of $R_{42}$, $R_{44}$ or $R_{46}$ having a polymerizable group as a substituent group are the same as the groups represented by the formula (Rp).

Examples of the melamine compounds are shown below.

(MM-96)

A melamine polymer can be used as the melamine compound. The melamine polymer is preferably synthesized from a melamine compound and a carbonyl compound by a reaction represented by the formula (V).
in which each of $R_{71}$, $R_{72}$, $R_{73}$, $R_{74}$, $R_{75}$ and $R_{76}$ independently is hydrogen, an alkyl group, an alkenyl group, an aryl group or a heterocyclic group.

[0097] The definitions and the substituent groups of the alkyl group, the alkenyl group, the aryl group and the heterocyclic group are the same as those described in the formula (III).

[0098] The polymerization reaction of the melamine compound and the carbonyl compound is the same as the synthesizing reaction of a conventional melamine resin (e.g., melamine formaldehyde resin). A commercially available melamine polymer (melamine resin) can be used in the present invention.

[0099] The melamine polymer has a molecular weight preferably in the range of 2,000 to 400,000.

[0100] At least one of $R_{71}$, $R_{72}$, $R_{73}$, $R_{74}$, $R_{75}$ and $R_{76}$ preferably contains an alkylene moiety having 9 to 30 carbon atoms or an alkenylene moiety having 9 to 30 carbon atoms. The alkylene moiety or the alkenylene moiety preferably has a straight chain structure. The alkylene moiety or the alkenylene moiety is preferably contained in a substituent group of an aryl group.

[0101] At least one of $R_{71}$, $R_{72}$, $R_{73}$, $R_{74}$, $R_{75}$ and $R_{76}$ preferably contains a polymerizable group as a substituent group. The polymerizable group is preferably positioned at the end of $R_{71}$, $R_{72}$, $R_{73}$, $R_{74}$, $R_{75}$ or $R_{76}$.

[0102] Where the polymerizable group is introduced into the melamine polymer, the discotic liquid crystal molecules and the melamine polymer can be polymerized in the optical anisotropic layer.

[0103] Examples of $R_{71}$, $R_{72}$, $R_{73}$, $R_{74}$, $R_{75}$ and $R_{76}$ having a polymerizable group as a substituent group are the same as the groups represented by the formula (Rp).

[0104] Examples of the carbonyl compounds having polymerizable groups are shown below.

Not defined R: Hydrogen
Ph: Phenyl

Two or more 1,3,5-triazine compounds (including melamine compounds and melamine polymers) can be used in combination.

The 1,3,5-triazine compound is used in an amount of 0.01 to 20 wt.% based on the amount of the discotic liquid crystal molecules. The amount is preferably in the range of 0.1 to 15 wt.%, and more preferably in the range of 0.5 to 10 wt.%.

An optically anisotropic layer can be formed by coating a solution containing the discotic liquid crystal molecule, the above-mentioned additive (a 1,3,5-triazine compound), a polymerization initiator and other optional components on a transparent substrate or an orientation layer.

A solvent for the preparation of the solution preferably is an organic solvent. Examples of the organic solvents include amides (e.g., dimethylformamide), sulfoxides (e.g., dimethylsulfoxide), heterocyclic compounds (e.g., pyridine), hydrocarbons (e.g., benzene, hexane), alkyl halides (e.g., chloroform, dichloromethane), esters (e.g., methyl acetate,
butyl acetate, ketones (e.g., acetone, methyl ethyl ketone), ethers (e.g., tetrahydrofuran, 1,2-dimethoxyethane). Alkyl halides and ketones are preferred. Two or more organic solvents can be used in combination.

[0115] The solution can be coated according to a conventional coating method such as a curtain coating method, an extrusion coating method, a roll coating method, a spin coating method, a dip coating method, a print coating method, a spray coating method, a slide coating method. The optically anisotropic layer is preferably coated continuously. The layer can be continuously coated according to the curtain coating method, the roll coating method or the slide coating method.

[0116] The aligned discotic liquid crystal molecules are preferably fixed while keeping the alignment. The discotic liquid crystal molecules are fixed preferably by a polymerization reaction. The polymerization reaction can be classified as a thermal reaction using a thermal polymerization initiator and a photo reaction using a photo polymerization initiator. A photo polymerization reaction is preferred.

[0118] The amount of the photo polymerization initiator is preferably in the range of 0.01 to 20 wt.%, and more preferably in the range of 0.5 to 5 wt. % based on the solid content of the coating solution of the layer.

[0119] The light irradiation for the photo polymerization is preferably conducted by an ultraviolet ray. The exposure energy is preferably in the range of 20 to 5,000 mJ per cm², and more preferably in the range of 100 to 800 mJ per cm². The light irradiation can be conducted while heating the layer to accelerate the photo polymerization reaction.

[0120] The optically anisotropic layer has a thickness preferably in the range of 0.5 to 10 μm, more preferably 0.5 to 5 μm, and most preferably in the range of 1 to 5 μm.

[Second optically anisotropic layer]

[0121] The optical compensatory sheet may have a second optically anisotropic layer. The second optically anisotropic layer is also preferably formed from discotic liquid crystal molecules. The discotic liquid crystal molecules are preferably so aligned in the second optically anisotropic layer that an average inclined angle between discotic planes of the discotic liquid crystal molecules and a surface of the transparent substrate is not less than 5°. The inclined angle preferably increases or decreases with increase of a distance from the surface of the transparent substrate to the discotic plane of the discotic liquid crystal molecule.

[0122] Japanese Patent Provisional Publication No. 7(1995)-287120 discloses an optical compensatory sheet having an optically anisotropic layer in which discotic liquid crystal molecules are aligned as described above (hybrid alignment). The optical compensatory sheet disclosed in the publication comprises a transparent substrate of planar alignment and the an optically anisotropic layer. The optical compensatory sheet is used to improve a viewing angle of a liquid crystal display of a TN mode. The transparent substrate of planar alignment is also effective in a liquid crystal display of a bend alignment mode or a vertical alignment mode (particularly a bend alignment mode). A polycarbonate film is usually used as the transparent substrate of planar alignment. However, the polycarbonate film has a problem with dimensional stability. Further, a polymer film needs a thickness of about 100 μm. Furthermore, it is difficult to control the planar alignment of a polymer film.

[0123] The effect of the optical compensatory sheet disclosed in Japanese Patent Provisional Publication No. 7(1995)-287120 can also be obtained according the present invention by using the above-described (first) optically anisotropic layer in combination with the second optically anisotropic layer. The (first) optically anisotropic layer can function as a transparent substrate of planar alignment. The dimensional stability of the (first) optically anisotropic layer is superior to the stability of a polymer film. The (first) optically anisotropic layer can be formed as a thin layer (preferably 0.5 to 10 μm as is described above). Further, the planar alignment of about 1,000 nm can be controlled by some nm by adjusting a coating amount of discotic liquid crystal molecules contained in the optically anisotropic layer.

[0124] The details of the second optically anisotropic layer are the same as those of the (first) optically anisotropic layer, except that the additive decreasing the inclined angle of the discotic planes (a 1,3,5-triazine compound) is not used.

[0125] There is no specific limitation about the arrangement of the (first) optically anisotropic layer and the second optically anisotropic layer. The second optically anisotropic layer rather than the (first) optically anisotropic layer requires an orientation layer (described below). Accordingly, if only one orientation layer is used, the second optically anisotropic layer rather than the (first) optically anisotropic layer is preferably arranged on the orientation layer.
The orientation layer has a function of aligning discotic liquid crystal molecules. The orientation layer can be formed by rubbing treatment of an organic compound (preferably a polymer), oblique evaporation of an inorganic compound, formation of a micro groove layer, or stimulation of an organic compound (e.g., ω-tricosanoic acid, dioctadecylmethylammonium chloride, methyl stearate) according to a Langmuir-Blodgett method. Further, the aligning function of the orientation layer can be activated by applying an electric or magnetic field to the layer or irradiating the layer with light. A denatured polyvinyl alcohol having a hydrophobic group is particularly preferred. The discotic compound can uniformly be aligned by introducing the hydrophobic group into polyvinyl alcohol because the hydrophobic group has an affinity with the discotic compound. The hydrophobic group is attached to the side chain or the end of the main chain of polyvinyl alcohol.

The hydrophobic group preferably is an aliphatic group (more preferably an alkyl group or an alkenyl group) having 6 or more carbon atoms or an aromatic group. The rubbing treatment can be conducted by rubbing the layer with a paper or cloth several times along a certain direction.

After aligning discotic liquid crystal compounds of the optically anisotropic layer by the orientation layer, the alignment of the discotic compounds can be kept even if the orientation layer is removed. Therefore, the orientation layer is not essential in a prepared optical compensatory sheet, while the orientation layer is essential in the preparation of the optical compensatory sheet.

If the (first) optically anisotropic layer does not require a small (0° to 5°) inclined angle, the rubbing treatment or the orientation layer itself is not necessary. Even if the orientation layer is not necessary, an adhesive orientation layer may be provided between a transparent substrate and the (first) optically anisotropic layer. The adhesive orientation layer (described in Japanese Patent Provisional Publication No. 9(1997)-152509) has a function of forming a chemical bond with discotic liquid crystal molecule to improve the adhesion. If the orientation layer is used to improve the adhesion, the rubbing treatment is not necessary.

A transparent substrate is made of a polymer film or a glass plate, and preferably is a polymer film. The transparent substrate means that light transmittance is not less than 80%.

Examples of the polymers include polycarbonate, polyarylate, polysulfone, polyethersulfone and cellulose ester (e.g., diacetyl cellulose, triacetyl cellulose).

Polycarbonate and cellulose ester are preferred. The polymer film is formed preferably according to a solvent casting method.

The optical characteristics of the transparent substrate can be controlled by adjusting stretching (preferably biaxially stretching) conditions or shrinkage ratios in length and width.

The transparent substrate can be subjected to a surface treatment (e.g., glow discharge treatment, corona discharge treatment, ultraviolet (UV) treatment, flame treatment) to improve adhesion to a layer formed on the substrate (e.g., adhesive layer, orientation layer, optically anisotropic layer). A glow discharge treatment or a corona discharge treatment is preferred. Two or more surface treatments can be used in combination.

The transparent substrate has a thickness preferably in the range of 20 to 500 µm, and more preferably in the range of 50 to 200 µm.

An adhesive layer (undercoating layer) can be provided on the transparent substrate. The adhesive layer is preferably formed by coating a hydrophilic polymer (e.g., gelatin) on the transparent substrate. The adhesive layer has a thickness preferably in the range of 0.1 to 2 µm, and more preferably in the range of 0.2 to 1 µm.

The optical compensatory sheet of the present invention is particularly effective in a liquid crystal display of a vertical alignment mode or a bend alignment mode. In a liquid crystal cell of a vertical alignment mode, rod-like liquid crystal molecules are essentially vertically aligned while not applying voltage to the cell, and are essentially horizontally aligned while applying voltage to the cell, as is shown in Fig. 1. In a liquid crystal cell of a bend alignment mode, rod-like liquid crystal molecules are essentially symmetrically aligned, as is shown in Fig. 2.
A liquid crystal display comprises a liquid crystal cell, a pair of optical compensatory sheets arranged on both sides of the cell, or one optical compensatory sheet arranged on one side of the cell, and a pair of polarizing elements arranged on the liquid crystal cell or the optical compensatory sheet.

The liquid crystal displays include a direct looking type, a projection type and a modulation type. The present invention is also effective in a liquid crystal display having an active matrix such as TFT, MIM having three or two terminals.

*Reference EXAMPLE 1

A triacetyl cellulose film (thickness: 100 µm, size: 270 mm × 100 mm, Fuji Tac, Fuji Photo Film Co., Ltd.) was used as a transparent substrate.

An alkyl denatured polyvinyl alcohol (MP-203, Kuraray Co., Ltd.) was coated on the transparent substrate, and dried to form an orientation layer (thickness: 0.5 µm). The surface of the orientation layer was subjected to a rubbing treatment.

The following coating solution was coated on the orientation layer by using a wire bar coater.

Discotic liquid crystal compound (1)

The coated layer was heated at 106°C to align the discotic liquid crystal compound. The layer was irradiated with an ultraviolet ray of 2 J to polymerize the liquid crystal compound and to fix the alignment. Thus an optical compensatory sheet was prepared.

COMPARISON EXAMPLE 1

An optical compensatory sheet was prepared in the same manner as in Example 1, except that 0.3 weight part of polyvinyl butyral (#3000-1, Denki Kagaku Kogyo K.K.) was used in place of cellulose acetate butyrate (CAB-531-1).

COMPARISON EXAMPLE 2

An optical compensatory sheet was prepared in the same manner as in Example 1, except that cellulose *not part of the invention
acetate butyrate (CAB-531-1) was not used.

**COMPARISON EXAMPLE 3**

[0152] An optical compensatory sheet was prepared in the same manner as in Example 1, except that the amount of cellulose acetate butyrate (CAB-531-1) was 3.0 weight parts.

*Reference EXAMPLE 2*

[0153] An optical compensatory sheet was prepared in the same manner as in Reference Example 1, except that 0.3 weight part of cellulose acetate butyrate (acetic acid content: 17.5%, butyric acid content: 32.5%, CAB-321-0.1, Eastman Chemical) was used in place of cellulose acetate butyrate (CAB-531-1), and the heating temperature for the layer was 123°C.

**COMPARISON EXAMPLE 4**

[0154] An optical compensatory sheet was prepared in the same manner as in Reference Example 2, except that cellulose acetate butyrate (CAB-321-0.1) was not used.

*Reference EXAMPLE 3*

[0155] An optical compensatory sheet was prepared in the same manner as in Reference Example 1, except that 0.3 weight part of cellulose acetate butyrate (acetic acid content: 2.0%, butyric acid content: 52.0%, CAB-551-0.2, Eastman Chemical) was used in place of cellulose acetate butyrate (CAB-531-1), the heating temperature for the layer was 112°C, and the exposure of the ultraviolet ray was 1J.

**COMPARISON EXAMPLE 5**

[0156] An optical compensatory sheet was prepared in the same manner as in Reference Example 3, except that cellulose acetate butyrate (CAB-551-0.2) was not used.

*Reference EXAMPLE 4*

[0157] An optical compensatory sheet was prepared in the same manner as in Reference Example 1, except that 0.5 weight part of cellulose acetate butyrate (acetic acid content: 2.5%, butyric acid content: 45.0%, CAB-482-0.5, Eastman Chemical) was used in place of cellulose acetate butyrate (CAB-531-1), the heating temperature for the layer was 145°C, and the exposure of the ultraviolet ray was 3J.

**COMPARISON EXAMPLE 6**

[0158] An optical compensatory sheet was prepared in the same manner as in Reference Example 4, except that 0.5 weight part of polyvinyl butyral (#3000-1, Denki Kagaku Kogyo K.K.) was used in place of cellulose acetate butyrate (CAB-482-0.5).

**COMPARISON EXAMPLE 7**

[0159] An optical compensatory sheet was prepared in the same manner as in Reference Example 4, except that cellulose acetate butyrate (CAB-482-0.5) was not used.

*Reference EXAMPLE 5*

[0160] An optical compensatory sheet was prepared in the same manner as in Reference Example 1, except that 100 weight parts of the following discotic liquid crystal compound (2) were used in place of the discotic liquid crystal compound (1), and the heating temperature for the layer was 85°C.

*not part of the invention*
A glass plate (thickness: 0.85 mm) was used as a transparent substrate.

An aqueous solution of polyvinyl alcohol denatured with methacryloyloxyethyl isocyanate (Polymer No. 1 of Japanese Patent Provisional Publication No. 8(1996)-48197) was coated on the transparent substrate by using a bar coater, and dried to form an orientation layer (thickness: 0.63 µm). The surface of the orientation layer was subjected to a rubbing treatment.

The following coating solution was coated on the orientation layer by using a spin coater of 1,000 rpm, and dried at the room temperature. The thickness of the formed layer was 1.9 µm.

* Reference EXAMPLE 20
Discotic liquid crystal compound (5)

[0179]

![Chemical structure](image)

[0180] The coated layer was heated at 180°C to align the discotic liquid crystal compound. The layer was irradiated with an ultraviolet ray of 600 mJ per cm² to polymerize the liquid crystal compound and to fix the alignment. Thus an optical compensatory sheet was prepared.

* Reference EXAMPLES 21 to 31 and COMPARISON EXAMPLES 16 to 18

[0181] Optical compensatory sheets were prepared in the same manner as in Reference Example 20, except that the kind of the discotic liquid crystal compound, the kind or amount of the fluorine containing surface active agent or the heating temperature for the layer was changed as is shown in Table 3.

(Evaluation of optical compensatory sheets)

[0182] The optical characteristics of the optical compensatory sheets were measured at the wavelength of 632.8 nm by using an ellipsometer (AEP-100, Shimazu Seisakusho, Ltd.). The results are set forth in Table 3.

A triacetyl cellulose film (thickness: 100 µm, size: 270 mm × 100 mm, Fuji Tac, Fuji Photo Film Co., Ltd.) was used as a transparent substrate.

An alkyl denatured polyvinyl alcohol (MP-203, Kuraray Co., Ltd.) was coated on the transparent substrate, and dried (without conducting a rubbing treatment) to form an orientation layer (thickness: 0.5 µm).

The coating solution used in Reference Example 1 was coated on the orientation layer by using a wire bar coater.

The coated layer was heated at 106°C to align the discotic liquid crystal compound. The layer was irradiated with an ultraviolet ray of 2 J to polymerize the liquid crystal compound and to fix the alignment. Thus an optical compensatory sheet was prepared.

(Remark)

- Angle: Inclined angle of an optical axis (a direction having the minimum retardation value) corresponding to average inclined angle between discotic planes and a surface of the transparent substrate
- Δnd: Rth retardation value.
PRELIMINARY EXPERIMENT 1

[0228] A glass plate was used as a transparent substrate.
[0229] An alkyl denatured polyvinyl alcohol (MP-203, Kuraray Co., Ltd.) was coated on the transparent substrate, and dried to form an orientation layer.
[0230] The following coating solution was coated on the orientation layer by using a spin coater, and dried at the room temperature.

<table>
<thead>
<tr>
<th>Coating solution</th>
<th>1 weight part</th>
</tr>
</thead>
<tbody>
<tr>
<td>Melamine polymer (MP-5)</td>
<td></td>
</tr>
</tbody>
</table>
The coated sample was gradually heated, and the change of the liquid crystal phase was observed with a polarizing microscope. As a result, a liquid crystal phase was observed in the range of 116 to 180°C.

The sample was quickly cooled to the room temperature. The inclined angle of the optic axis was measured by using an ellipsometer (AEP-100, Shimazu Seisakusho, Ltd.). The angle was 2.9±0.4°.

PRELIMINARY EXPERIMENT 2

The experiment was conducted in the same manner as in Preliminary Experiment 1, except that 10 weight parts of the melamine polymer (MP-5) were used.

As a result, a liquid crystal phase was observed in the range of 111 to 151°C, and the inclined angle of the optic axis was 2.9±0.7°.

PRELIMINARY EXPERIMENT 3

The experiment was conducted in the same manner as in Preliminary Experiment 1, except that the melamine polymer (MP-5) was not used.

As a result, a liquid crystal phase was observed in the range of 126 to 183°C. However, a schlieren texture was observed in the liquid crystal phase. Accordingly, the liquid crystal molecules were not uniformly aligned.

EXAMPLE 86

A triacetyl cellulose film (thickness: 100 µm, Fuji Tac, Fuji Photo Film Co., Ltd.) was used as a transparent substrate.

An aqueous solution of an alkyl denatured polyvinyl alcohol (MP-203, Kuraray Co., Ltd.) was coated on the transparent substrate, and dried to form an orientation layer.

The following coating solution was coated on the orientation layer by using a wire bar coater, and dried at the room temperature.

Coating solution for optically anisotropic layer

</tr>
</tbody>
</table>

The coated layer was heated at 130°C to align the discotic liquid crystal compound. The layer was irradiated with an ultraviolet ray of 600 mJ per cm² to polymerize the liquid crystal compound and to fix the alignment. Thus an optical compensatory sheet was prepared.
The alignment of the optically anisotropic layer was kept after polymerizing the discotic liquid crystal compound and cooling the layer. After heating the layer at 130°C, the optically anisotropic layer was not changed to the liquid crystal state. The inclined angle of the optic axis was measured by using an ellipsometer (AEP-100, Shimazu Seisakusho, Ltd.). As a result, the angle was less than 5°.

EXAMPLE 87

An optical compensatory sheet was prepared in the same manner as in Example 86, except that 1 weight part of the following melamine polymer (MP-7) was used in place of the melamine polymer (MP-5).

![Chemical structure of MP-7]

The alignment of the optically anisotropic layer was kept after polymerizing the discotic liquid crystal compound and cooling the layer. After heating the layer at 130°C, the optically anisotropic layer was not changed to the liquid crystal state. The inclined angle of the optic axis was measured by using an ellipsometer (AEP-100, Shimazu Seisakusho, Ltd.). As a result, the angle was less than 5°.

Claims

1. An optical compensatory sheet (14-16) comprising an optically anisotropic layer (14) formed of discotic liquid crystal molecules (14a) provided on a transparent substrate (16), wherein the discotic liquid crystal molecules are horizontally aligned in the optically anisotropic layer, an average inclined angle between discotic planes of said discotic liquid crystal molecules and a surface of said transparent substrate being less than 5°, and said discotic liquid crystal molecules being fixed in the optically anisotropic layer while keeping the horizontal alignment, characterised in that the optically anisotropic layer further contains a 1,3,5-triazine compound in an amount of 0.01 to 20 wt.% based on the amount of the discotic liquid crystal molecules.

2. The optical compensatory sheet (14-16) as defined in claim 1, wherein the discotic liquid crystal molecules (14a) are polymerised.

3. The optical compensatory sheet (14-16) as defined in claim 1, wherein the 1,3,5-triazine compound is a melamine compound.

4. The optical compensatory sheet (14-16) as defined in claim 3, wherein the 1,3,5-triazine compound is a melamine polymer.

5. The optical compensatory sheet (14-16) as defined in claim 2, wherein the discotic liquid crystal molecules (14a) and the 1,3,5-triazine compound are polymerised in the optical anisotropic layer (14).

6. The optical compensatory sheet (24-27) as defined in claim 1, wherein the optical compensatory sheet further comprises a second optically anisotropic layer (25) formed of discotic liquid crystal molecules (25a-25c), said discotic liquid crystal molecules being aligned in the second optically anisotropic layer, and wherein an average inclined angle between discotic planes of the discotic liquid crystal molecules and a surface of the transparent substrate (27) is not less than 5°, said inclined angle increasing or decreasing with increase of a distance from the surface of the transparent substrate to the discotic plane of the discotic liquid crystal molecule.

7. A liquid crystal display comprising a liquid crystal cell of a vertical alignment mode (11-13), two polarising elements
and one or two optical compensatory sheets (14-16), each of said polarising elements being arranged on each side of the liquid crystal cell, each of said optical compensatory sheets being arranged between the liquid crystal cell and each polarising element, wherein the optical compensatory sheet is an optical compensatory sheet according to any one of claims 1 to 5.

8. A liquid crystal display comprising a liquid crystal cell of a bend alignment mode (21-23), two polarising elements, and one or two optical compensatory sheets (24-27), each of said polarising elements being arranged on each side of the liquid crystal cell, each of said optical compensatory sheets being arranged between the liquid crystal cell and each polarising element, wherein the optical compensatory sheet is an optical compensatory sheet according to any one of claims 1 to 6.

Patentansprüche

1. Optisches Kompensationsblatt (14-16), das eine optisch anisotrope Schicht (14) umfaßt, die von diskotischen Flüssigkristallmolekülen (14a) gebildet wird, die auf einem transparenten Substrat (16) vorgesehen sind, wobei die diskotischen Flüssigkristallmoleküle in der optisch anisotropen Schicht horizontal ausgerichtet sind, ein mittlerer Neigungswinkel zwischen diskotischen Ebenen der diskotischen Flüssigkristallmoleküle und einer Oberfläche des transparenten Substrats weniger als 5° beträgt und die diskotischen Flüssigkristallmoleküle in der optisch anisotropen Schicht fixiert sind, wobei die horizontale Ausrichtung beibehalten wird, dadurch gekennzeichnet, daß die optisch anisotrope Schicht weiterhin eine 1,3,5-Triazinverbindung in einer Menge von 0,01 bis 20 Gew. %, bezogen auf die Menge der diskotischen Flüssigkristallmoleküle, enthält.

2. Optisches Kompensationsblatt (14-16) gemäß Anspruch 1, worin die diskotischen Flüssigkristallmoleküle (14a) polymerisiert sind.

3. Optisches Kompensationsblatt (14-16) gemäß Anspruch 1, worin die 1,3,5-Triazinverbindung eine Melaminverbindung ist.

4. Optisches Kompensationsblatt (14-16) gemäß Anspruch 3, worin die 1,3,5-Triazinverbindung ein Melaminpolymer ist.

5. Optisches Kompensationsblatt (14-16) gemäß Anspruch 1, worin die diskotischen Flüssigkristallmoleküle (14a) und die 1,3,5-Triazinverbindung in der optisch anisotropen Schicht (14) polymerisiert sind.

6. Optisches Kompensationsblatt (24-27) gemäß Anspruch 1, worin das optische Kompensationsblatt weiterhin eine zweite optisch anisotrope Schicht (25) umfaßt, die von diskotischen Flüssigkristallmolekülen (25a-25c) gebildet wird, die diskotischen Flüssigkristallmoleküle in der zweiten optisch anisotropen Schicht ausgerichtet sind und wobei ein mittlerer Neigungswinkel zwischen diskotischen Ebenen der diskotischen Flüssigkristallmoleküle und einer Oberfläche des transparenten Substrats (27) nicht weniger als 5° beträgt und sich der Neigungswinkel mit steigendem Abstand von der Oberfläche des transparenten Substrats zu der diskotischen Ebene des diskotischen Flüssigkristallmoleküls vergrößert oder verkleinert.

7. Flüssigkristallanzeige, die eine Flüssigkristallzelle vom vertikalen Ausrichtungsmodus ("vertical alignment mode") (11-13), zwei polarisierende Elemente und ein oder zwei optische Kompensationsblätter (14-16) umfaßt, worin jedes der polarisierenden Elemente auf jeder Seite der Flüssigkristallzelle angeordnet ist, jedes der optischen Kompensationsblätter zwischen der Flüssigkristallzelle und jedem polarisierenden Element angeordnet ist, wobei das optische Kompensationsblatt ein optisches Kompensationsblatt gemäß irgendeinem der Ansprüche 1 bis 5 ist.

8. Flüssigkristallanzeige, die eine Flüssigkristallzelle vom gebogenen Ausrichtungsmodus ("bend alignment mode") (21-23), zwei polarisierende Elemente und ein oder zwei optische Kompensationsblätter (24-27) umfaßt, worin jedes der polarisierenden Elemente auf jeder Seite der Flüssigkristallzelle angeordnet ist, jedes der optischen Kompensationsblätter zwischen der Flüssigkristallzelle und jedem polarisierenden Element angeordnet ist, wobei das optische Kompensationsblatt ein optisches Kompensationsblatt gemäß irgendeinem der Ansprüche 1 bis 6 ist.
Revendications

1. Feuille de compensation optique (14 - 16) comprenant une couche optiquement anisotrope (14) formée de molécules de cristaux liquides discotiques (14a) disposées sur un substrat transparent (16), dans laquelle les molécules de cristaux liquides discotiques sont alignées horizontalement dans la couche optiquement anisotrope, l'angle moyen d'inclinaison entre les plans discotiques desdites molécules de cristaux liquides discotiques et une surface dudit substrat transparent étant inférieur à 5°, et lesdites molécules de cristaux liquides discotiques étant fixées dans la couche optiquement anisotrope tout en gardant l'alignement horizontal, caractérisée en ce que la couche optiquement anisotrope contient, en outre, un composé 1,3,5-triazine en une quantité comprise entre 0,01 et 20% en poids, sur la base de la quantité de molécules de cristaux liquides discotiques.

2. Feuille de compensation optique (14 - 16) telle que définie dans la revendication 1, dans laquelle les molécules de cristaux liquides discotiques (14a) sont polymérisées.

3. Feuille de compensation optique (14-16) telle que définie dans la revendication 1, dans laquelle le composé 1,3,5-triazine est un composé de mélamine.

4. Feuille de compensation optique (14 -16) telle que définie dans la revendication 3, dans laquelle le composé 1,3,5-triazine est un polymère de mélamine.

5. Feuille de compensation optique (14 -16) telle que définie dans la revendication 2, dans laquelle les molécules de cristaux liquides discotiques (14a) et le composé 1,3,5-triazine sont polymérisés dans la couche optiquement anisotrope (14).

6. Feuille de compensation optique (24-27) telle que définie dans la revendication 1, ladite feuille de compensation optique comprenant, en outre, une deuxième couche optiquement anisotrope (25) formée de molécules de cristaux liquides discotiques (25a - 25c), lesdites molécules de cristaux liquides discotiques étant alignées dans la deuxième couche optiquement anisotrope, et dans laquelle un angle moyen d'inclinaison entre des plans discotiques des molécules de cristaux liquides discotiques et une surface du substrat transparent (27) n'est pas inférieur à 5°, ledit angle incliné augmentant ou diminuant avec l'accroissement d'une distance de la surface du substrat transparent au plan discotique de la molécule de cristaux liquides discotiques.

7. Dispositif d'affichage à cristaux liquides comprenant une cellule de cristaux liquides à mode d'alignement vertical (11 -13), deux éléments polarisants et une ou deux feuilles de compensation optique (14 -96), chacun desdits éléments polarisants étant disposé de chaque côté de la cellule de cristaux liquides, chacune desdites feuilles de compensation optique étant disposée entre la cellule de cristaux liquides et chaque élément polarisant, dans lequel la feuille de compensation optique est une feuille de compensation optique selon l'une quelconque des revendications 1 à 5.

8. Dispositif d'affichage à cristaux liquides comprenant une cellule de cristaux liquides à mode d'alignement incurvé (21 - 23), deux éléments polarisants, et une ou deux feuilles de compensation optique (24 - 27), chacun desdits éléments polarisants étant disposé de chaque côté de la cellule de cristaux liquides, chacune desdites feuilles de compensation optique étant disposée entre la cellule de cristaux liquides et chaque élément polarisant, dans lequel la feuille de compensation optique est une feuille de compensation optique selon l'une quelconque des revendications 1 à 6.
