specification

Note: Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).
The present invention concerns benzisoxazoles and phenones having central $\alpha_2$-adrenoceptor antagonist activity. It further relates to their preparation, compositions comprising them and their use as a medicine.

Central $\alpha_2$-adrenoceptor antagonists are known to increase noradrenaline release by blocking presynaptic $\alpha_2$-receptors which exert an inhibiting control over the release of the neurotransmitter. By increasing the noradrenaline concentrations, $\alpha_2$-antagonists can be used clinically for the treatment or prophylaxis of depression, cognitive disturbances, Parkinson's disease, diabetes mellitus, sexual dysfunction and impotence, elevated intraocular pressure, and diseases related to disturbed enterokinesia, since all these conditions are associated with a deficiency of noradrenaline in the central or peripheral nervous system.

WO98/45297, published on 15 October 1998, discloses 1,2,3,4-tetrahydro-benzofuro-[3,2-c]pyridine derivatives having central $\alpha_2$-adrenoceptor antagonist activity. Said compounds differ from the compounds according to the present invention in the selection of the Alk-radical, being 1,5-pentanediyl and the introduction of radicals (a) and (b). In addition, WO 98/45297 is completely silent on the dopamine-affinity of our compounds.

4-(3,4-dihydrobenzofuro[3,2-c]pyridin-2(1$H$)-yl)-1-(4-fluorophenyl)-1-butanone derivatives are disclosed in Aksanova et al. [Khim. Farm. Zh. (1975), 9(1), 7-9] as central nervous system blocking agents.

The compounds of the present invention are novel and have a specific and selective binding affinity for the different known subtypes of the $\alpha_2$-adrenoceptors, i.e. the $\alpha_{2A}$, $\alpha_{2B}$ and $\alpha_{2C}$-adrenoceptor. When compared to the closest art compounds, the present compounds unexpectedly show an improvement in dissociation between binding affinity for the $\alpha_{2A}$-adrenoceptor and the dopamine D$_2$ receptor which is particularly useful when treating depression.

The present invention concerns the compounds of formula

\[
\text{(I)}
\]

the N-oxide forms, the pharmaceutically acceptable addition salts and the stereochemically isomeric forms thereof, wherein:

- Alk is 1-5-pentanediyl;
- n is 1 or 2;
- p is 1 and q is 2; or
- p is 2 and q is 1;
- X is -O-, -S- or NH;
- each R$_1$ is independently hydrogen, halogen, C$_1$-alkyl, nitro, hydroxy or C$_1$-alkyloxy;
- D is a radical of formula

\[
\text{(a)}
\]
\[
\text{(b)}
\]

wherein

- m is 1 or 2;
- each R$_3$ independently is hydrogen, C$_1$-alkyl, C$_1$-alkyloxy.
or halo.

[0008] As used in the foregoing definitions the term halogen is generic to fluoro, chloro, bromo and iodo. The term C_{1-4}alkyl as a group or part of a group defines straight and branched saturated hydro-carbons, having from 1 to 4 carbon atoms such as, for example, methyl, ethyl, propyl, butyl, 1-methylethyl, 1,1-dimethylethyl, 2-methylpropyl and the like. The term C_{1-6}alkyl is meant to include C_{1-4}alkyl radicals and the higher homologues thereof having 5 or 6 carbon atoms such as, for example, pentyl, hexyl and the like.

[0009] The addition salts as mentioned herein are meant to comprise the therapeutically active addition salt forms which the compounds of formula (I) are able to form with appropriate acids, such as, for example, inorganic acids such as hydrohalic acids, e.g. hydrochloric or hydrobromic acid; sulfuric; nitric; phosphoric and the like acids; or organic acids such as, for example, acetic, propanoic, hydroxyacetic, lactic, pyruvic, oxalic, malonic, succinic, maleic, fumaric, malic, tartaric, citric, methanesulfonic, ethanesulfonic, benzenesulfonic, p-toluenesulfonic, cyclamic, salicylic, p-aminosalicylic, pamoic and the like acids.

[0010] The pharmaceutically acceptable addition salts as mentioned hereinabove are also meant to comprise the therapeutically active non-toxic base, in particular, a metal or amine addition salt forms which the compounds of formula (I) are able to form. Said salts can conveniently be obtained by treating the compounds of formula (I) containing acidic hydrogen atoms with appropriate organic and inorganic bases such as, for example, the ammonium salts, the alkali and earth alkaline metal salts, e.g. the lithium, sodium, potassium, magnesium, calcium salts and the like, salts with organic bases, e.g. the benzathine, N-methyl-D-glucamine, hydrabamine salts, and salts with amino acids such as, for example, arginine, lysine and the like. Conversely said salt forms can be converted by treatment with an appropriate base or acid into the free acid or base form.

[0011] The term addition salt as used hereinabove also comprises the solvates which the compounds of formula (I) are able to form and said solvates are meant to be included within the scope of the present invention. Examples of such solvates are, e.g. the hydrates, alcoholates and the like.

[0012] The N-oxide forms of the compounds of formula (I) are meant to comprise those compounds of formula (I) wherein one or several nitrogen atoms are oxidized to the so-called N-oxide.

[0013] The term stereochemically isomeric forms as used herein defines all the possible isomeric forms in which the compounds of formula (I) may occur. Unless otherwise mentioned or indicated, the chemical designation of compounds denotes the mixture of all possible stereochemically isomeric forms, said mixtures containing all diastereomers and enantiomers of the basic molecular structure.

[0014] Some of the compounds of formula (I) may also exist in their tautomeric forms. Such forms although not explicitly indicated in the above formula are intended to be included within the scope of the present invention.

[0015] Whenever used hereinafter, the term compounds of formula (I) is meant to include also the N-oxide forms, the pharmaceutically acceptable addition salts and all stereoisomeric forms.

[0016] As used hereinafter, when the position of the R\textsuperscript{1} substituent is referred to, the following numbering is used:

![Diagram]

[0017] An interesting group of compounds are those compounds of formula (I) wherein n is 1 and R\textsuperscript{1} is hydrogen, chloro, fluoro, methyl, methoxy or nitro, in particular R\textsuperscript{1} is hydrogen, chloro or methoxy.

[0018] In case R\textsuperscript{1} is other than hydrogen, then R\textsuperscript{2} is suitably connected to the tricyclic ring system in the 6 or 7 position.

[0019] Still another interesting group of compounds are those compounds of formula (I) wherein D is a radical of formula (a) and R\textsuperscript{3} is fluoro, bromo, methoxy, methyl or hydrogen, in particular, fluoro.

[0020] Compounds of formula (I) wherein D is a radical of formula (b) are also of particular interest.

[0021] The compounds of formula (I) can generally be prepared by N-alkylating an intermediate of formula (II) with an alkylating reagent of formula (III) following the procedure described in EP-A-0,037,265, EP-A-0,070,053, EP-A-0,196,132 and in EP-A-0,378,255. In particular, the N-alkylation may be performed in a reaction-inert solvent such as, for example, methyl isobutyl ketone, N,N-dimethylformamide or N,N-dimethylacetamide, in the presence of a base such as, for example, triethylamine, sodium carbonate or sodium bicarbonate, and optionally in the presence of a catalyst such as, for example, potassium iodide.
In intermediate (III), \( W^1 \) represents an appropriate reactive leaving group such as, for example, halo, e.g. chloro, bromo or iodo; sulfonyloxy, e.g. methanesulfonyloxy, 4-methylbenzenesulfonyloxy.

In this and the following reactions, the reaction products may be isolated from the reaction medium and, if necessary, further purified according to methodologies generally known in the art such as extraction, crystallization, trituration and chromatography.

The compounds of formula (I) may be converted into each other following art-known functional group transformation reactions.

The compounds of formula (I) may also be converted to the corresponding N-oxide forms following art-known procedures for converting a trivalent nitrogen into its N-oxide form. Said N-oxidation reaction may generally be carried out by reacting the starting material of formula (I) with an appropriate organic or inorganic peroxide. Appropriate inorganic peroxides comprise, for example, hydrogen peroxide, alkali metal or earth alkaline metal peroxides, e.g. sodium peroxide, potassium peroxide; appropriate organic peroxides may comprise peroxy acids such as, for example, benzencarboxylic acid or halo substituted benzencarboxylic acid, e.g. 3-chlorobenzencarboxylic acid, peroxoalkanoic acids, e.g. peroxyacetic acid, alkylhydroperoxides, e.g. tert-butyl hydroperoxide. Suitable solvents are, for example, water, lower alkanols, e.g. ethanol and the like, hydrocarbons, e.g. toluene, ketones, e.g. 2-butanone, halogenated hydrocarbons, e.g. dichloromethane, and mixtures of such solvents.

A number of intermediates and starting materials are commercially available or are known compounds which may be prepared according to art-known methodologies.

Intermediates of formula (II) wherein \( X = O \) can be prepared analogous to the procedures described in Cattanach C. et al. (J. Chem. Soc (C), 1971, p53-60); Kartashova T. (Khim. Geterotsikl. Soedin., 1979 (9), p 1178-1180) and Zakusov. V. Et al. (Izobreteniya, 1992 (15), p 247). Intermediates of formula (II) wherein \( X = S \) can be prepared analogous to the procedure described in Capps et al. (J. Am. Chem. Soc., 1953, p. 697) or US-3,752,820.

A particular synthesis route for the preparation of intermediates of formula (II) wherein \( p = 1 \) and \( q = 2 \), said intermediates being represented by formula (II-1), is depicted in scheme 1.
[0030] Step a can be performed analogous to the procedure described in Tetrahedron (1981), 37, p 979-982. Benzofurans resulting from step c have been used as intermediates in US 4,210,655. The further reaction steps are analogous to the reaction procedures described in US 3,752,820.

[0031] Alternatively, intermediates of formula (II-1) can be prepared using the reaction steps depicted in scheme 2.

![Scheme 2](image)

[0032] Step a can be performed analogous to the procedure described in Heterocycles (1994), 39(1), p. 371-380. Step b can be performed analogous to the procedure described in J. Med. Chem. (1986), 29(9), p. 1643-1650. Further reaction steps can be performed analogous to the ones described in J. Heterocycl. Chem. (1979), 16, p. 1321.

[0033] Intermediates of formula (II) wherein p is 2 and q is 1, said intermediates being represented by formula (II-2), can be prepared according to Synth. Comm., 1995, p3883-3900 and using methods known in the art. A general procedure is depicted in scheme 3.

![Scheme 3](image)

Intermediates of formula (II-2) wherein $X$ is $-$S$-$, said intermediates being represented by formula (II-2-b), can be prepared according to J. Med. Chem., 1992, 35(7), p1176-1182 and using methods known in the art. A general procedure is depicted in scheme 5.

Some of the compounds of formula (I) and some of the intermediates in the present invention contain at least one asymmetric carbon atom. Pure stereochemically isomeric forms of said compounds and said intermediates can be obtained by the application of art-known procedures. For example, diastereoisomers can be separated by physical methods such as selective crystallization or chromatographic techniques, e.g. counter current distribution, liquid chro-
matrimony and the like methods. Enantiomers can be obtained from racemic mixtures by first converting said racemic mixtures with suitable resolving agents such as, for example, chiral acids, to mixtures of diastereomeric salts or compounds; then physically separating said mixtures of diastereomeric salts or compounds by, for example, selective crystallization or chromatographic techniques, e.g. liquid chromatography and the like methods; and finally converting said separated diastereomeric salts or compounds into the corresponding enantiomers.

[0037] Pure stereochemically isomeric forms of the compounds of formula (I) may also be obtained from the pure stereochemically isomeric forms of the appropriate intermediates and starting materials, provided that the intervening reactions occur stereospecifically. The pure and mixed stereochemically isomeric forms of the compounds of formula (I) are intended to be embraced within the scope of the present invention.

[0038] The compounds of formula (I), the N-oxides, the pharmaceutically acceptable addition salts and stereochemically isomeric forms thereof, block the presynaptic α2-receptors on central noradrenergic neurons thus increasing the noradrenaline release. Blocking said receptors will suppress or relieve a variety of symptoms associated with a deficiency of noradrenaline in the central or peripheral nervous system. Therapeutic indications for using the present compounds are depression, cognitive disturbances, Parkinson's disease, diabetes mellitus, sexual dysfunction and impotence and elevated intraocular pressure.

[0039] In particular, the present compounds show a larger dissociation between binding affinity for α2-receptors and that for dopamine receptors, especially between α2A-receptors and dopamine D2 receptors. This larger dissociation reduces the risk of extrapyramidal side effects (EPS) that might arise from dopamine receptor blockade and that should be avoided in the treatment of depression.

[0040] Blocking α2 receptors in the central nervous system has also been shown to enhance the release of serotonin which may add to the therapeutic action in depression (Maura et al., 1992, Naunyn-Schmiedeberg's Arch. Pharmacol., 345: 410-416).

[0041] It has also been shown that blocking α2 receptors may induce an increase of extracellular DOPAC (3,4-dihydro-phenylacetic acid) which is a metabolite of dopamine and noradrenaline.

[0042] In view of the usefulness of the subject compounds in the treatment of diseases associated with a deficiency of noradrenaline in the central nervous system, in particular depression and Parkinson's disease, the present invention provides a method of treating warm-blooded animals suffering from such diseases, in particular depression and Parkinson's disease, said method comprising the systemic administration of an therapeutically effective amount of a compound of formula (I) or a pharmaceutically acceptable addition salt thereof.

[0043] The present compounds are also potentially useful in the treatment of Alzheimer's disease and dementia as it is known that α2-antagonists promote the release of acetylcholine (Tellez et al. 1997, J. Neurochem. 68:778-785).

[0044] In general it is contemplated that an effective therapeutic daily amount would be from about 0.01 mg/kg to about 4 mg/kg body weight.

[0045] The present invention thus also relates to compounds of formula (I) as defined hereinabove for use as a medicament for treating depression or Parkinson's disease.

[0046] Ex vivo as well as in vitro receptor signal-transduction and receptor binding studies can be used to evaluate the α2 adrenoceptor antagonism of the present compounds. As indices of central α2-adrenoceptor blockade in vivo, the reversal of the loss of righting reflex observed in rats after intravenous injection of xylazine and inhibition of the tremors induced by reserpine in rats can be used.

[0047] The compounds of the present invention also have the ability to rapidly penetrate into the central nervous system.

[0048] For administration purposes, the subject compounds may be formulated into various pharmaceutical compositions comprising a pharmaceutically acceptable carrier and, as active ingredient, a therapeutically effective amount of a compound of formula (I). To prepare the pharmaceutical compositions of this invention, an effective amount of the particular compound, in addition salt or in free acid or base form, as the active ingredient is combined in intimate admixture with a pharmaceutically acceptable carrier, which may take a wide variety of forms depending on the form of preparation desired for administration. These pharmaceutical compositions are desirably in unitary dosage form suitable, preferably, for administration orally, percutaneously, or by parenteral injection. For example, in preparing the compositions in oral dosage form, any of the usual pharmaceutical media may be employed, such as, for example, water, glycols, oils, alcohols and the like in the case of oral liquid preparations such as suspensions, syrups, elixirs and solutions; or solid carriers such as starches, sugars, kaolin, lubricants, binders, disintegrating agents and the like in the case of powders, pills, capsules and tablets. Because of their ease in administration, tablets and capsules represent the most advantageous oral dosage form unit, in which case solid pharmaceutical carriers are obviously employed. For parenteral compositions, the carrier will usually comprise sterile water, at least in large part, though other ingredients, for example, to aid solubility, may be included. Injectable solutions, for example, may be prepared in which the carrier comprises saline solution, glucose solution or a mixture of saline and glucose solution. Injectable solutions containing compounds of formula (I) may be formulated in an oil for prolonged action. Appropriate oils for this purpose
are, for example, peanut oil, sesame oil, cottonseed oil, corn oil, soybean oil, synthetic glycerol esters of long chain fatty acids and mixtures of these and other oils. Injectable suspensions may also be prepared in which case appropriate liquid carriers, suspending agents and the like may be employed. In the compositions suitable for percutaneous administration, the carrier optionally comprises a penetration enhancing agent and/or a suitable wettable agent, optionally combined with suitable additives of any nature in minor proportions, which additives do not cause any significant deleterious effects on the skin. Said additives may facilitate the administration to the skin and/or may be helpful for preparing the desired compositions. These compositions may be administered in various ways, e.g., as a transdermal patch, as a spot-on or as an ointment. Addition salts of (I) due to their increased water solubility over the corresponding free base or free acid form, are obviously more suitable in the preparation of aqueous compositions.

[0049] It is especially advantageous to formulate the aforementioned pharmaceutical compositions in dosage unit form for ease of administration and uniformity of dosage. Dosage unit form as used in the specification and claims herein refers to physically discrete units suitable as unitary dosages, each unit containing a predetermined quantity of active ingredient calculated to produce the desired therapeutic effect, in association with the required pharmaceutical carrier. Examples of such dosage unit forms are tablets (including scored or coated tablets), capsules, pills, powder packets, wafers, injectable solutions or suspensions, teaspoonfuls, tablespoonfuls and the like, and segregated multiples thereof.

[0050] The following examples are intended to illustrate the present invention.

Experimental part

A. Preparation of the intermediates

Example A1

[0051] A mixture of O-phenylhydroxylamine hydrochloride (1:1) (0.625 mol) and 4,4-piperidinediol hydrochloride (1:1) (0.682 mol) in 2-propanol (615 ml) was stirred at 20°C. HCl (353 ml) was added dropwise at 20°C. The reaction mixture was gently heated to reflux temperature. The reaction mixture was stirred and refluxed for 3 hours, then cooled to room temperature. The precipitate was filtered off, washed with diisopropyl ether, and dried. This fraction was crystallized from water (1600 ml). The desired compound was allowed to crystallize out while stirring. The precipitate was filtered off, washed with 2-propanol and diisopropyl ether, then dried, yielding 84 g (64%) of 1,2,3,4-tetrahydrobenzofuro[3,2-c]pyridine hydrochloride (1:1) (interm. 1).

Example A2

[0052] a) Reaction under N2 atmosphere. NaH 60% (0.17 mol) was stirred in tetrahydrofuran (350 ml). A solution of diethyl (cyanomethyl)phosphonate (0.17 mol) in tetrahydrofuran (150 ml) was added dropwise over ±20 minutes. (exo-thermic temperature rise to 30°C). The mixture was stirred for 20 minutes at room temperature, then cooled to 0°C. A solution of 5-methyl-3(2H)-benzofuranone (0.15 mol) in tetrahydrofuran (350 ml) was added dropwise over 30 minutes at 0°C. The reaction mixture was stirred overnight at room temperature, then poured out into water (1500 ml) and stirred. The mixture was filtered off, washed with diisopropyl ether, and dried. This fraction was crystallized from water (1600 ml). The desired compound was allowed to crystallize out while stirring. The precipitate was filtered off, washed with 2-propanol and diisopropyl ether, then dried, yielding 21.2 g (82%) of 5-methyl-3-benzofuranacetonitrile[3,2-c]pyridine hydrochloride (1:1) (interm. 1).

b) A mixture of intermediate (2) (0.12 mol) in NH3/CH3OH (400 ml) was hydrogenated with Raney Nickel (3 g) as a catalyst. After uptake of H2 (2 equiv), the catalyst was filtered off and the filtrate was evaporated. The residue was purified by column chromatography over silica gel (eluent: CH2Cl2/hexane 50:50). The desired fractions were collected and the solvent was evaporated, yielding 21.2 g (82%) of 5-methyl-3-benzofuranacetonitrile (interm. 2).

c) A mixture of intermediate (3) (0.0024 mol) in H2O (2 ml), acetic acid (2 ml) and formol 37% (2 ml) was stirred for one hour at 100°C. The reaction mixture was cooled and poured out into 1 M NaOH (50 ml). The precipitate was filtered off, washed with water, then dissolved in 1 N HCl (100 ml). The mixture was stirred for 15 minutes on a warm-water-bath (80°C). The solvent was evaporated. 2-Propanol was added. The solution was evaporated. The residue was stirred in boiling 2-propanone, then allowed to cool to room temperature while stirring. The precipitate was filtered off and dried, yielding 0.40 g of 1,2,3,4-tetrahydro-6-methylbenzofuro[2,3-c]pyridine monohydrochlo-
Example A3

[0053]

a) Butyl lithium (0.27 mol of a 2.5 M solution) was added dropwise to 6-methoxybenzo[b]thiophene [prepared analogous to the procedure described in J. Med. Chem. 1989, 32(12), 2548-2554] (0.25 mol) in tetrahydrofuran (1000 ml), stirred at -30°C. The mixture was stirred for 10 minutes at -30°C. Ethylene oxide (0.38 mol in 100 ml tetrahydrofuran) was added dropwise at -30°C. The mixture was allowed to warm to room temperature and stirred for 3 hours. The mixture was acidified with dilute HCl solution. The solvent was evaporated. The residue was diluted with water and this mixture was extracted with CH$_2$Cl$_2$. The separated organic layer was dried, filtered, and the solvent evaporated. The residue was stirred in hexane, filtered off and dried, yielding 41.3 g 6-methoxybenzo[b]thiophene-2-ethanol (interm. 5).

b) Methanesulfonylchloride (0.21 mol) was added to a mixture of intermediate 5 (0.19 mol) and triethylamine (0.21 mol) in CH$_2$Cl$_2$ (1000 ml), stirred at 0°C. The reaction mixture was stirred for 4 hours at room temperature, then poured out into water. The separated organic layer was dried, filtered and the solvent evaporated. The residue was triturated under diisopropylether, filtered off and dried, yielding 50.5 g (94%) of 6-methoxybenzo[b]thiophene-2-ethanol methanesulfonate (ester) (interm. 6).

c) A mixture of intermediate 6 (0.18 mol) and NaI (0.45 mol) in 2-propanone (1000 ml) was stirred and refluxed for 9 hours, then cooled to room temperature and the solvent was evaporated. The residue was washed with water and extracted with CH$_2$Cl$_2$. The separated organic layer was dried, filtered and the solvent evaporated, yielding 57 g of 2-(2-iodoethyl)-6-methoxybenzo[b]thiophene (interm. 7).

d) Intermediate 7 (0.18 mol) was added portionwise to a mixture of 1,3,5,7-tetra-azatricyclo[5.1.1.1$_{5,7}$]decanecyclo[5.1.1.1$_{5,7}$]decane (600 ml). The reaction mixture was stirred and refluxed overnight, then cooled to room temperature. The precipitate was filtered off and dried, yielding 54.2 g of 1-[2-(6-methoxybenzo[b]thiophen-2-yl)ethyl]-1,3,5,7-tetra-azatricyclo[5.1.1.1$_{5,7}$]decane iodide (interm. 8).

e) A mixture of intermediate 8 (0.12 mol) and HCl (0.50 mol) in ethanol (171 ml) was stirred for 2 days at room temperature. More HCl (10 ml) and ethanol (40 ml) were added and the reaction mixture was stirred and refluxed for one hour, then cooled to room temperature. The solvent was evaporated. The residue was stirred in 2-propanol and converted into the hydrochloric acid salt (1:1) with HCl/2-propanol. The precipitate was filtered off and dried, yielding 13.1 g (50%) of 1,2,3,4-tetrahydro-7-methoxy-[1]benzothieno[3,2-c]pyridine (interm. 9).

Analogously, 1,2,3,4-tetrahydro-8-methyl-[1]benzothieno[3,2-c]pyridine hydrochloride (interm. 10) was prepared.

Example A4

[0054]

a) A mixture of formol (37 %; 31 g) and ZnCl$_2$ (10 g) in ethyl acetate (90 ml) and HCl (12 N; 190 ml) was stirred at -10°C. HCl (gas) was allowed to bubble through the mixture until saturation (at -10°C). 5-Fluoro-benzo[b]thiophene (0.35 mol) was added dropwise at <0°C. The reaction mixture was stirred overnight at room temperature. Toluene (200 ml) was added and the mixture was stirred vigorously. The organic layer was separated, washed with an aqueous NaHCO$_3$ solution and with water, dried, filtered and the solvent evaporated. The residue was triturated under hexane, filtered off and dried, yielding 58 g (82.6%) of 3-(chloromethyl)-5-fluorobenzo[b]-thiophene (interm 11).

b) A mixture of NaCN (0.33 mol) and dibenzo-18-crown ether (0.050 g) in dimethyl sulfoxide (110 ml) was stirred at 30°C. Intermediate 11 (0.29 mol) was added slowly. The mixture was allowed to cool to room temperature while stirring. Then, the reaction mixture was stirred in ice-water. The precipitate was filtered off, washed with water, then dissolved in CH$_2$Cl$_2$. The organic solution was dried, filtered and the solvent evaporated, yielding 5-fluorobenzo[b]thiophene-3-acetonitrile (interm 12).

c) A mixture of intermediate 12 (0.29 mol) in a mixture of NH$_3$ and CH$_3$OH (700 ml) was hydrogenated at 14°C with Raney Nickel (5 g) as a catalyst in the presence of a thiophene solution (10 ml). After uptake of H$_2$ (2 equiv), the catalyst was filtered off over dicalite and the filtrate was evaporated. The residue was purified by column chromatography over silica gel (eluent: CH$_2$Cl$_2$/CH$_3$OH/NH$_3$ 96/4). The desired fractions were collected and the solvent was evaporated. The residue was dissolved in diisopropyl ether and converted into the hydrochloric acid salt (1:1) with HCl/2-propanol. The precipitate was filtered off, washed with diisopropyl ether, and dried, yielding
A mixture of intermediate 13 (0.21 mol) in water (190 ml), acetic acid (190 ml) and formol (37 %; 190 ml) was stirred and refluxed for one hour. The mixture was allowed to cool to room temperature, then poured out in NaOH (4 M; 1200 ml), while stirring. The precipitate was filtered off and triturated under CH₃CN, filtered off, washed with diisopropyl ether and dried, yielding 21 g 1,1'-methylenebis[6-fluoro-1,2,3,4-tetra-hydro-[1]benzothieno[2,3-c]pyridine (interm. 14).

e) A mixture of intermediate 14 (0.049 mol) in water (1700 ml) and HCl (12 N; 285 ml) was stirred and refluxed for one hour. The precipitate was filtered off, washed with CH₃CN and diisopropyl ether, and dried, yielding 17.7 g 6-fluoro-1,2,3,4-tetrahydro-[1]benzothieno[2,3-c]pyridine hydrochloride (interm. 15).

Example A5

[0055] A mixture of AlCl₃ (32 g) in methoxybenzene (250 ml) was stirred at 0° C. 5-Chloropentanoyl chloride (0.24 mol) was added dropwise at 0° C. The reaction mixture was stirred for 3 hours at 0 to 5° C and then allowed to rise to 15° C. The mixture was poured out onto ice water (400 g) and HCl 12N (100 ml), and extracted with CH₂Cl₂. The organic layer was separated, dried, filtered and the solvent evaporated. The residue was stirred in petroleum ether and diisopropyl ether, and the resulting oil was separated, yielding 50.4 g 6-chloro-1-(4-methoxyphenyl)-1-hexanone (interm. 16).

Example A6

[0056] a) Reaction under N₂ atmosphere. BF₃ in diethylether (215 ml) was cooled to 0° C. 3-Fluoro-phenol (0.25 mol) was added. 6-Chloro-hexanoyl chloride (0.51 mol) added and the resulting reaction mixture was stirred for 15 min at 0° C, then allowed to warm to room temperature. The reaction mixture was then stirred overnight at 130° C. The mixture was cooled room temperature. Water was added while cooling. This mixture was extracted twice with diisopropyl ether. The separated organic layer was dried, filtered and the solvent evaporated. The residue was by column chromatography over silica gel (elucent: CH₂Cl₂/hexane 50/50), then by HPLC (elucent: CH₂Cl₂/hexane 50/50). The fractions were collected and the solvent was evaporated, yielding 52.2 g of 6-chloro-1-(4-fluoro-2-hydroxyphenyl)-1-hexanone (interm. 17).

b) A mixture of intermediate 17 (0.21 mol) and hydroxylamine hydrochloride (0.25 mol) in pyridine (100 ml) was stirred for 2 days at room temperature, then poured out into 1 N HCl (450 ml). This mixture was stirred for 10 min, then extracted with ethylacetate (2 x). The separated organic layer was dried, filtered and the solvent evaporated. The residue was purified by column chromatography over silica gel (elucent: CH₂Cl₂/hexane 99/1). The desired fractions were collected and the solvent was evaporated, yielding 22 g 6-chloro-1-(4-fluoro-2-hydroxyphenyl)-1-hexanone, oxime (interm. 18).

c) Intermediate 18 (0.017 mol) in tetrahydrofuran (50 ml) was warmed to 60° C. A solution of 1,1'-carbonylbis-1H-imidazole (0.035 mol) in tetrahydrofuran (200 ml) was added dropwise and the resulting reaction mixture was stirred and refluxed for 2 hours. The reaction mixture was cooled to room temperature and the solvent was evaporated. The residue was washed with water, then acidified with HCl. This mixture was extracted with CH₂Cl₂. The separated organic layer was dried, filtered and the solvent evaporated. The residue was purified by column chromatography over silica gel (elucent: CH₂Cl₂ 100%). The desired fractions were collected and the solvent was, yielding 3-(5-chloropentyl)-6-fluoro-1,2-benzisoxazole (interm. 19).

B. Preparation of the compounds of formula (I)

Example B1

[0057] A mixture of 6-chloro-1-(4-fluorophenyl)-1-hexanone (0.018 mol), intermediate 1 (0.015 mol), Na₂CO₃ (4 g) and potassium iodide (catalytic quantity) in methyl isobutyl ketone (200 ml) was stirred and refluxed overnight and then cooled to room temperature. The solvent was evaporated. The residue was washed with H₂O and the mixture was extracted with CH₂Cl₂. The organic layer was separated, dried, filtered and the solvent evaporated. The residue was purified by column chromatography over silica gel (elucent: CH₂Cl₂/CH₃OH 95/5). The pure fractions were collected and the solvent was evaporated. The residue was converted into the (E)-2-butenedioic acid salt (1:1). The precipitate was filtered off and dried, yielding 5.1 g 1-(4-fluorophenyl)-6-(1,2,3,4-tetrahydrobenzofuro[3,2-c]pyridin-2-yl)-1-hexanone (E)-2-butenedioate (1:1) (71%).

[0058] Tables 1, 2 and 3 list compounds of formula (I) which were prepared analogously to example B1.

### Table 2

...
C. Pharmacological examples

Example C.1: *In vitro* binding affinity for $\alpha_2$ receptors

The interaction of the compounds of formula (I) with $\alpha_2$ receptors was assessed in *in vitro* radioligand binding experiments. In general, a low concentration of a radioligand with a high binding affinity for a particular receptor is incubated with a sample of a tissue preparation enriched in a particular receptor or with a preparation of cells expressing cloned human receptors in a buffered medium. During the incubation, the radioligand binds to the receptor. When equilibrium of binding is reached, the receptor bound radioactivity is separated from the non-bound radioactivity, and the receptor bound activity is counted. The interaction of the test compounds with the receptor is assessed in competition binding experiments. Various concentrations of the test compound are added to the incubation mixture containing the receptor preparation and the radioligand. Binding of the radioligand will be inhibited by the test compound in proportion to its binding affinity and its concentration.
The radioligand used for $\alpha_{2A}$, $\alpha_{2B}$ and $\alpha_{2C}$ receptor binding is $^3$H-rauwolscine and the receptor preparation used is the Chinese Hamster Ovary (CHO) cell expressing cloned human $\alpha_{2A}$, $\alpha_{2B}$ and $\alpha_{2C}$ receptors.

The IC$_{50}$ value (concentration whereby 50 % of the receptors is inhibited) for the compounds exemplified in the experimental part above for each of the three receptors ranged between $10^{-6}$ M and $10^{-10}$ M.

Example C.2: Dissociation in receptor binding affinity for $\alpha_{2A}$ and dopamine D$_2$

As already mentioned above, dopamine D2 antagonism may lead to an increased risk of EPS. Thus, the larger the dissociation between $\alpha_{2A}$ and D$_2$, the better. In Table 4 the columns headed "dissociation" show the IC$_{50}$ value in molar (M) for the $\alpha_{2A}$ receptor and the D$_2$ receptor. By "Ratio" is meant the ratio D$_2$/$\alpha_{2A}$ and this is an indication for the dissociation between said two receptors.

D. Composition examples

"Active ingredient" (A.I.) as used throughout these examples relates to a compound of formula (I), a pharmaceutically acceptable addition salt or a stereochemically isomeric form thereof.

Example D.1: Capsules

20 g of the A.I., 6 g sodium lauryl sulfate, 56 g starch, 56 g lactose, 0.8 g colloidal silicon dioxide, and 1.2 g magnesium stearate are vigorously stirred together. The resulting mixture is subsequently filled into 1000 suitable hardened gelatin capsules, each comprising 20 mg of the A.I.

Example D.2: Film-coated tablets

Preparation of tablet core

A mixture of 100 g of the A.I., 570 g lactose and 200 g starch is mixed well and thereafter humidified with a solution of 5 g sodium dodecyl sulfate and 10 g polyvinylpyrrolidone in about 200 ml of water. The wet powder mixture is sieved, dried and sieved again. Then there are added 100 g microcrystalline cellulose and 15 g hydrogenated vegetable oil. The whole is mixed well and compressed into tablets, giving 10,000 tablets, each comprising 10 mg of the active ingredient.

Coating

To a solution of 10 g methyl cellulose in 75 ml of denaturated ethanol there is added a solution of 5 g of ethyl cellulose in 150 ml of dichloromethane. Then there are added 75 ml of dichloromethane and 2.5 ml 1,2,3-propanetriol. 10 g of polyethylene glycol is molten and dissolved in 75 ml of dichloromethane. The latter solution is added to the
former and then there are added 2.5 g of magnesium octadecanoate, 5 g of polyvinylpyrrolidone and 30 ml of concentrated colour suspension and the whole is homogenated. The tablet cores are coated with the thus obtained mixture in a coating apparatus.

Claims

1. A compound having the formula

![Chemical Structure]

a N-oxide form, a pharmaceutically acceptable addition salt or a stereochemically isomeric form thereof, wherein:

- Alk is 1,5-pentanediyl;
- n is 1 or 2;
- p is 1 and q is 2; or
- p is 2 and q is 1; 1;
- X is -O-, -S- or NH;
- each R1 is independently hydrogen, halogen, C1-6 alkyl, nitro, hydroxy or C1-4 alkyloxy;
- D is a radical of formula

![Chemical Structures]

wherein

- m is 1 or 2;
- each R3 independently is hydrogen, C1-4 alkyl, C1-4 alkyloxy or halo.

2. A compound according to claim 1 wherein n is 1 and R1 is hydrogen, chloro, fluoro, methyl, methoxy or nitro.

3. A compound according to any one of claims 1 to 2 for use as a medicine.

4. The use of a compound as claimed in any one of claims 1 to 2 in the manufacture of a medicament for treating depression or Parkinson's disease.

5. A composition comprising a pharmaceutically acceptable carrier and, as active ingredient, a therapeutically effective amount of a compound as claimed in any one of claims 1 to 2.

6. A process for preparing a composition according to claim 5 by combining a compound as defined in any one of claims 1 to 2 as the active ingredient in intimate admixture with a pharmaceutically acceptable carrier.

7. A process for preparing a compound according to claim 1, characterized by:

a) N-alkylating an intermediate of formula (II) with an alkylating reagent of formula (III)
wherein W is a suitable leaving group and D, Alk, X, n and R are as defined in claim 1, in a reaction-inert solvent, in the presence of a base and optionally in the presence of a catalyst;
b) and if desired, converting compounds of formula (I) into each other following art-known transformations, and further, if desired, converting the compounds of formula (I), into a therapeutically active non-toxic acid addition salt by treatment with an acid, or into a therapeutically active non-toxic base addition salt by treatment with a base, or conversely, converting the acid addition salt form into the free base by treatment with alkali, or converting the base addition salt into the free acid by treatment with acid; and, if desired, preparing stereochimically isomeric forms or N-oxides thereof.

Patentansprüche

1. Verbindungen der Formel

...
3. Verbindungen nach Anspruch 1 oder 2 zur Verwendung als Medizin.

4. Verwendung einer Verbindung nach Anspruch 1 oder 2 zur Herstellung eines Medikaments zur Behandlung von Depression oder Morbus Parkinson.

5. Zusammensetzung, enthaltend einen pharmazeutisch unbedenklichen Träger und, als Wirkstoff, eine therapeutisch wirksame Menge einer Verbindung nach Anspruch 1 oder 2.

7. Verfahren zur Herstellung einer Verbindung nach Anspruch 1, dadurch gekennzeichnet, daß man

   a) ein Zwischenprodukt der Formel (II) mit einem Alkylierungsmittel der Formel (III)

   b) und, falls gewünscht, Verbindungen der Formel (I) nach im Stand der Technik bekannten Transformationen ineinander umwandelt und weiterhin, falls gewünscht, die Verbindungen der Formel (I) durch Behandlung mit einer Säure in ein therapeutisch wirksames, nicht toxisches Säureadditionssalz umwandelt oder durch Behandlung mit einer Base in ein therapeutisch wirksames, nicht toxisches Basenadditionssalz umwandelt oder umgekehrt die Säureadditionssalzform durch Behandeln mit Alkali in die freie Base umwandelt oder das Basenadditionssalz durch Behandeln mit Säure in die freie Säure umwandelt; und, falls gewünscht, stereochemisch isomere Formen oder N-Oxide davon herstellt.

**Revendications**

1. Composé de formule

une forme N-oxyde, un sel d'addition pharmaceutiquement acceptable ou une forme stéréochimiquement isomère de celui-ci, dans laquelle :

   Alk est 1,5-pentanediyle ;
   n est 1 ou 2 ;
   p est 1 et q est 2 ; ou
   p est 2 et q est 1 ;
   X est -O-, -S- ou NH ;
chaque $R^1$ est indépendamment hydrogène, halogène, alkyle en C$_{1-6}$, nitro, hydroxy ou alkyloxy en C$_{1-4}$ ;

D est un radical de formule

$$\text{(a)}$$

$$\text{(b)}$$

dans laquelle

- $m$ est 1 ou 2 ;
- chaque $R^3$ indépendamment est hydrogène, alkyle en C$_{1-4}$, alkyloxy en C$_{1-4}$ ou halogéno.

2. Composé selon la revendication 1, **caractérisé en ce que** $n$ est 1 et $R^1$ est hydrogène, chloro, fluoro, méthyle, méthoxy ou nitro.

3. Composé selon l'une quelconque des revendications 1 à 2, destiné à être utilisé comme médicament.

4. Utilisation d'un composé selon l'une quelconque des revendications 1 à 2, dans la fabrication d'un médicament destiné au traitement de la dépression ou de la maladie de Parkinson.

5. Composition comprenant un support pharmaceutiquement acceptable et, à titre de principe actif, une quantité thérapeutiquement efficace d'un composé selon l'une quelconque des revendications 1 à 2.

6. Procédé de préparation d'une composition selon la revendication 5, en combinant un composé tel que défini dans l'une quelconque des revendications 1 à 2 à titre de principe actif en mélange intime avec un support pharmaceutiquement acceptable.

7. Procédé de préparation d'un composé selon la revendication 1, **caractérisé par**

   a) la $N$-alkylation d'un intermédiaire de formule (II) avec un réactif alkylant de formule (III)

   $$\text{(III)}$$

   $$\text{(II)}$$

   dans lesquelles $W^1$ est un groupement partant convenable et D, Alk, X, $n$ et $R^1$ sont tels que définis dans la revendication 1, dans un solvant inerte vis-à-vis de la réaction, en présence d'une base et éventuellement en présence d'un catalyseur ;

b) et si on le souhaite, la transformation des composés de formule (I) les uns en les autres selon les transformations connues dans la technique, et en outre, si on le souhaite, la transformation des composés de formule (I) en un sel d'addition d'acide non toxique thérapeutiquement actif par traitement avec un acide, ou en un sel d'addition de base non toxique thérapeutiquement actif par traitement avec une base, ou inversement, la transformation de la forme de sel d'addition d'acide en la base libre par traitement avec un alcali, ou la transformation du sel d'addition de base en l'acide libre par traitement avec de l'acide ; et, si on le souhaite, la préparation de formes stéréochimiquement isomères ou des $N$-oxydes de celui-ci.
