Description

TECHNICAL FIELD

[0001] The present invention relates to disposable pants having a fit gather laminate in which an elastic member is provided between a pair of upper and lower non-woven fabric sheets, and a method of manufacturing the same.

BACKGROUND ART

[0002] As described in Japanese Laid-Open Patent Publication No. 6-197920, for example, a method known in the prior art of manufacturing a briefs type body fluid absorbing article, including the steps of: transferring a back sheet having waist gathers in the longitudinal direction while folding the back sheet downward at a predetermined interval, supplying a waist side elastic body in the longitudinal direction on the upper surface of the back sheet being transferred, supplying a holding non-woven fabric in the longitudinal direction on the upper surface thereof, and bonding the waist side elastic body and the holding non-woven fabric on the back sheet except for the downward folded portions; cutting off the waist side elastic body and the holding non-woven fabric integrated with the back sheet along the top edge of each downward folded portion of the back sheet, and then unfolding the downward folded portions to make the back sheet back into a sheet form, thereby forming a back sheet having the waist side elastic bodies at a predetermined interval; bonding a body fluid absorbent to areas of the non-woven fabric sheets except for a widthwise center area thereof, and bonding the waist side elastic body and the holding non-woven fabric on the upper surface of the back sheet, thereby complicating the structure of the manufacturing apparatus.

[0005] The present invention has been made in view of the above, and has an object to realize a high-speed manufacture of disposable pants having a fit gather laminate in which an elastic member is provided between a pair of upper and lower non-woven fabric sheets, without complicating the structure of the manufacturing apparatus.

DISCLOSURE OF THE INVENTION

[0006] Disposable pants of the present invention include: a fit gather laminate in which an elastic member is provided between a pair of upper and lower non-woven fabric sheets in a widthwise direction thereof, with the elastic member being secured on areas of the non-woven fabric sheets except for a widthwise center area thereof and being cut off along the widthwise center area of the non-woven fabric sheets; a reinforcement sheet secured on a lower surface side of the fit gather laminate in the widthwise center area thereof; an absorbent provided on an upper surface side of the fit gather laminate; and a back sheet provided on a lower surface side of the reinforcement sheet.

[0007] With the structure described above, the elastic members are provided in areas of the non-woven fabric sheets forming the fit gather laminate except for the widthwise center area thereof and the elastic members are allowed to shrink/stretch, whereby they can be securely worn, while the shrinking/stretching force of the elastic members is prevented from acting upon the widthwise center area of the fit gather laminate, where the absorbent is provided, thereby forming the area where the absorbent is provided in a flat shape. Moreover, the reinforcement sheet is secured on the lower surface side of the fit gather laminate in the widthwise center area thereof, whereby areas where the elastic members are cut off are reinforced by the reinforcement sheet.

[0008] A method of manufacturing disposable pants of the present invention includes: transferring continuous materials of a pair of non-woven fabric sheets forming a fit gather laminate and a continuous material of an elastic member provided therebetween in a longitudinal direction thereof while intermittently securing the continuous material of the elastic member on the non-woven fabric at a predetermined interval and supplying a waist side elastic body and a holding non-woven fabric on the upper surface of the back sheet, the operation of bonding the waist side elastic body and the holding non-woven fabric on the back sheet except for the downward folded portions, and the operation of cutting off the waist side elastic body and the holding non-woven fabric integrated with the back sheet along the top edge of each downward folded portion of the back sheet, are performed, the operation speed needs to be reduced since these operations are difficult to perform, and it is necessary to provide a folding mechanism for folding the back sheet downward, thereby complicating the structure of the manufacturing apparatus.
sheets; cutting off the elastic member along with the non-woven fabric sheets along a non-secured area thereof; securing a reinforcement sheet on a lower surface side of the fit gather laminate at a position corresponding to the non-secured area of the elastic member while providing an absorbent on an upper surface side of the fit gather laminate; and providing a back sheet on a lower surface side of the reinforcement sheet.

**[0009]** With the structure described above, the elastic members are provided in areas except for the widthwise center area and the areas are allowed to shrink/stretch, while the shrinking/stretching force of the elastic members is prevented from acting upon the widthwise center area, where the absorbent is provided. Moreover, the reinforcement sheet is secured on the lower surface side in the widthwise center area. Therefore, disposable pants having the fit gather laminate in which areas where the elastic members are cut off are reinforced by the reinforcement sheet can be manufactured at a high speed using a manufacturing apparatus having a simple structure.

**BRIEF DESCRIPTION OF THE DRAWINGS**

**[0010]** FIG. 1 is a diagram illustrating disposable pants according to an embodiment of the present invention in an unfolded state; FIG. 2 is a cross-sectional view taken along line A-A of FIG. 1; FIG. 3 is a diagram illustrating an embodiment of disposable pants according to the present invention; FIG. 4 is a diagram illustrating a specific example of a disposable pants manufacturing apparatus; FIG. 5 is a diagram illustrating elastic members being secured on a non-woven sheet intermittently; FIG. 6 is a diagram illustrating the elastic members being broken off; FIG. 7 is a diagram illustrating the elastic members being broken off, as viewed in a plan view; FIG. 8 is a diagram illustrating a fit gather laminate with a reinforcement tape being secured thereon; and FIG. 9 is a diagram illustrating the structure of a continuous material of disposable pants.

**BEST MODE FOR CARRYING OUT THE INVENTION**

**[0011]** FIG. 1 and FIG. 2 illustrate a disposable pants material obtained by unfolding disposable pants according to an embodiment of the present invention. The disposable pants material includes: a fit gather laminate 2 having a plurality of elastic members 1 extending in the widthwise direction in areas of the fit gather laminate 2 except for the widthwise center area; a pair of front and back reinforcement sheets 3 secured on the lower surface side of the fit gather laminate 2, i.e., the outer surface side of the disposable pants, in the widthwise center area of the fit gather laminate 2; an absorbent 4 provided on the upper surface side of the fit gather laminate 2, i.e., the inner surface side of the disposable pants located on the body contact surface side; and a back sheet 5 provided on the lower surface side of the reinforcement sheets 3.

**[0012]** The elastic member 1 is made of a linear or band-like rubber material, a material under the trade name "Operon" from Du Pont-Toray Co., Ltd., or the like, and is provided, while being stretched, between the pair of upper and lower non-woven sheets 6 and 7 to be secured on areas of the non-woven sheets 6 and 7 except for the widthwise center area thereof. The elastic member 1 is cut off in the widthwise center area of the non-woven sheets 6 and 7 so that a shrinking/stretching force of the elastic members 1 does not act upon the widthwise center area.

**[0013]** The non-woven sheets 6 and 7 are each formed in an hourglass shape using a flexible material such as a polypropylene, a polyethylene, a polyester or a rayon. The upper non-woven sheet 6 and the lower non-woven sheet 7 are bonded together by an adhesive such as a hot melt in the area where the elastic members 1 are provided, with the elastic members 1 being provided in areas except for the widthwise center area, thus forming the fit gather laminate 2.

**[0014]** The reinforcement sheet 3 is made of a plastic film material, or the like, having an appropriate rigidity, and is secured on the lower surface side of the fit gather laminate 2 in the widthwise center area thereof. On the lower surface side of the reinforcement sheet 3, i.e., on the outer surface side of the disposable pants, a character design or a character, etc., is printed as necessary (see FIG. 3).

**[0015]** As illustrated in FIG. 2, the absorbent 4 includes an upper liquid-permeable sheet 8 made of a non-woven fabric, a plastic film material having holes therein, or the like, a lower liquid-impermeable sheet 9 made of a plastic film material, or the like, and an absorption mat 10 provided between the sheets 8 and 9 and made of crushed pulp, a highly water-absorbing resin, a shape-retaining thermoplastic resin, or the like. It is preferred to provide, on the upper surface of the liquid-permeable sheet 8 along the left and right edges thereof, a pair of left and right raised gathers 11 having an elastic member made of a linear rubber material, or the like, attached in the longitudinal direction of the disposable pants.

**[0016]** The back sheet 5 is made of a flexible material such as a polypropylene, a polyethylene, a polyester or a rayon, is provided so as to cover the entire lower surface of the fit gather laminate 2 on the lower surface side of the reinforcement sheet 3, and is bonded on the lower surface of the fit gather laminate 2 by an adhesive such as a hot melt.

**[0017]** Then, the disposable pants material having the fit gather laminate 2 and the back sheet 5 is folded in two along the longitudinal center area thereof, and the left and right edges of the fit gather laminate 2 are attached together by means of welding using an ultrasonic sealer or a heat sealer, or bonding using an adhesive, or the like, so as to form the material into a pants shape as illustrated in FIG. 3.

**[0018]** FIG. 4 illustrates the disposable pants manu-
facturing apparatus. The manufacturing apparatus includes a fit gather forming section 12 for forming a continuous material of the fit gather laminate 2, a reinforcement sheet bonding section 13 for bonding the reinforcement sheet 3 to the continuous material of the fit gather laminate 2, a back sheet bonding section 14 for bonding the back sheet 5 to the continuous material of the fit gather laminate 2, and an absorbent supply section 15 for supplying the absorbent 4 on the continuous material of the fit gather laminate 2.

[0019] The fit gather forming section 12 includes a pair of non-woven fabric rolls 16 and 17 for feeding the pair of non-woven sheets 6 and 7, respectively, an elastic member roll 18 for feeding the elastic members 1, a first hot melt applicator 19 for intermittently applying a hot melt on the non-woven sheet 6, a pressing roller 20 for pressing together the non-woven sheets 6 and 7, and a cutting roller 21 for cutting off the elastic members 1 along with the non-woven sheets 6 and 7 in areas where the hot melt is not applied.

[0020] The cutting roller 21 includes a plurality of cutting blades arranged at a predetermined interval so as to avoid unnecessarily cutting off areas as much as possible while reliably cutting off the plurality of elastic members 1 between the non-woven sheets 6 and 7, and the cutting roller 21 is configured so as to intermittently cut off the non-woven sheets 6 and 7 having the elastic member 1.

[0021] The reinforcement sheet bonding section 13 includes a reinforcement sheet roll 22 for feeding a continuous material of the reinforcement sheet 3, a second hot melt applicator 23 for applying a hot melt on the continuous material of the reinforcement sheet 3 being fed from the reinforcement sheet roll 22, a cutting roller 24 for cutting off the continuous material of the reinforcement sheet 3 into pieces of a predetermined length, and a pressing roller 25 for pressing and bonding the reinforcement sheet 3, obtained by cutting off the continuous material, onto the lower surface side of the fit gather laminate 2.

[0022] The back sheet bonding section 14 includes a back sheet roll 26 for feeding a continuous material of the back sheet 5, a third hot melt applicator 27 for applying a hot melt on the continuous material of the back sheet 5 being fed from the back sheet roll 26, and a pressing roller 28 for pressing and bonding the continuous material of the back sheet 5 onto the lower surface side of the fit gather laminate 2.

[0023] The absorbent supply section 15 is configured so as to place the absorbent 4, produced in a separate step, on the fit gather laminate 2 while it is positioned at a predetermined position, and to secure the absorbent 4 on the upper surface side of the fit gather laminate 2 by means of welding using an ultrasonic sealer or a heat sealer, or bonding using an adhesive, or the like.

[0024] Disposable pants are manufactured as follows by using the manufacturing apparatus described above. The continuous materials of the pair of non-woven sheets 6 and 7 being fed from the non-woven fabric rolls 16 and 17 are transferred in the longitudinal direction thereof while the elastic members 1 being fed from the elastic member roll 18 are placed therebetween. Then, after a hot melt is applied by the first hot melt applicator 19 intermittently at a predetermined interval on the non-woven sheet 6, the non-woven sheets 6 and 7 are sandwiched and pressed together by the pressing roller 20, thereby bonding together the non-woven sheets 6 and 7 and the elastic members 1 in areas where the hot melt H1 is applied, as illustrated in FIG. 5.

[0025] Then, by using the cutting roller 21, the continuous materials of the elastic members 1, along with the continuous materials of the non-woven sheets 6 and 7, are cut off along a cut-off line C1 in non-adhesive areas as illustrated in FIG. 6 and FIG. 7, thereby forming a continuous material of the fit gather laminate 2 in which the elastic members 1 having a predetermined length are placed between the non-woven sheets 6 and 7 being stretched, while secured on the non-woven sheets 6 and 7.

[0026] Then, the reinforcement sheet 3 (obtained by applying a hot melt by the second hot melt applicator 23 on the upper surface side of the continuous material of the reinforcement sheet 3 being fed from the reinforcement sheet roll 22 and cutting off the continuous material of the reinforcement sheet 3 by the cutting roller 24 into pieces of a predetermined length) and the continuous material of the fit gather laminate 2 are sandwiched and pressed together by the pressing roller 25, whereby the reinforcement sheet 3 is bonded by a hot melt H2 on the lower surface side of the continuous material of the fit gather laminate 2 at positions corresponding to areas where the elastic members 1 are not provided, as illustrated in FIG. 8.

[0027] Then, after a hot melt is applied by the third hot melt applicator 27 on the upper surface side of the continuous material of the back sheet 5 being fed from the back sheet roll 26, the continuous material of the back sheet 5 and the continuous material of the fit gather laminate 2 are sandwiched by the pressing roller 28 so as to bond the continuous material of the back sheet 5 on the lower surface side of the reinforcement sheet 3.

[0028] Then, after the absorbent 4 supplied from the absorbent supply section 15 is placed on the upper surface side of the fit gather laminate 2, the absorbent 4 is bonded, for example, on the upper surface side of the continuous material of the fit gather laminate 2 while it is positioned at positions corresponding to areas where the elastic members 1 are not bonded, thereby forming a continuous material of a disposable pants material as illustrated in FIG. 9.

[0029] The disposable pants material illustrated in FIG. 1 is obtained by cutting off the thus formed continuous material of the disposable pants material along a cut-off line C2 into pieces having a predetermined size, and disposable pants illustrated in FIG. 3 can be manufactured by folding in two the disposable pants material along the
longitudinal center area thereof and by attaching together the left and right edges of the fit gather laminate 2 by means of welding, bonding, or the like.

[0030] As described above, the disposable pants according to the present invention include the fit gather laminate 2 (in which the elastic members 1 are provided between the non-woven sheets 6 and 7 and secured on areas of the non-woven sheets 6 and 7 except for the widthwise center area thereof, and the elastic members 1 are cut off in the widthwise center area of the non-woven sheets 6 and 7), the reinforcement sheet 3 secured on the lower surface side of the fit gather laminate 2 in the widthwise center area thereof, the absorbent 4 provided on the upper surface side of the fit gather laminate 2, and the back sheet 5 provided on the lower surface side of the reinforcement sheet 3. Therefore, the elastic members 1 provided in areas of the non-woven sheets 6 and 7 except for the widthwise center area thereof are allowed to shrink/stretch, whereby they can be securely worn while effectively preventing the occurrence of leakage of fluid, etc.

[0031] Moreover, since the elastic members 1 are not provided in the widthwise center area of the fit gather laminate 2 where the absorbent 4 is provided, it is possible to prevent the area where the absorbent 4 is provided from being deformed due to the influence of the shrinking/stretching force of the elastic members 1. Therefore, it is possible to realize a good appearance and a stable wearing feeling, while preventing wrinkles from being formed in the widthwise center area of the disposable pants where the absorbent 4 is provided.

[0032] The reinforcement sheet 3 is secured on the lower surface side of the fit gather laminate 2 in the widthwise center area thereof, whereby even when the elastic members 1 are cut off along with the non-woven sheets 6 and 7, the area where the elastic members 1 are cut off can be reinforced by the reinforcement sheet 3. Therefore, it is not required to perform complicated operations (such as placing and securing the elastic members 1, which have been cut off in advance into pieces having a predetermined length, between the non-woven sheets 6 and 7, or as illustrated in the conventional example, transferring a back sheet having waist gatherers while folding the back sheet downward and cutting off the waist side elastic body and the holding non-woven fabric integrated with the back sheet along the top edge of each downward folded portion of the back sheet), and it is possible to manufacture, at a high speed and continuously, disposable pants in which the elastic members 1 are secured on areas of the non-woven sheets 6 and 7 except for the widthwise center area thereof.

[0033] Thus, as described above, the disposable pants can be produced at a high speed and continuously using a manufacturing apparatus having a simple structure by transferring the continuous materials of the pair of non-woven sheets 6 and 7 forming the fit gather laminate 2 and the continuous materials of the elastic members 1 therebetween in the longitudinal direction thereof while intermittently bonding the continuous materials of the elastic members 1 on the non-woven sheets 6 and 7, cutting off the elastic members 1 along with the non-woven sheets 6 and 7 along areas where the elastic members 1 are not secured, securing the reinforcement sheet 3 on the lower surface side of the fit gather laminate 2 at positions corresponding to areas where the elastic members 1 are not secured, providing the absorbent 4 on the upper surface side thereof, and providing the back sheet 5 on the lower surface side of the reinforcement sheet 3.

[0034] Moreover, in the case where the back sheet 5 is provided on the lower surface side of the reinforcement sheet 3, as described above, so that substantially the entirety of the outer surface of the disposable pants is covered by the back sheet 5, it is possible to avoid the awkwardness due to the coexistence of a plurality of materials on the outer surface side of the disposable pants, thereby effectively improving the appearance.

[0035] Moreover, in the case where a character design or a character, etc., is printed on the lower surface side of the reinforcement sheet 3, as illustrated in the embodiment described above, the character design, etc., can be seen through the semitransparent back sheet 5 made of a non-woven fabric sheet, or the like, whereby it is possible to effectively improve the decorativeness of the disposable pants.

[0036] In order to further improve the close fitting property of the disposable pants onto the body, it is desirable to provide each of a leg hole section B1 located along each widthwise edge of the fit gather laminate 2 and a waist section B2 located along each longitudinal edge thereof with an elastic member made of a linear rubber material, or the like, as shown in phantom lines in FIG. 1.

[0037] Instead of the embodiment described above where the disposable pants material is folded in two along the longitudinal center area thereof and the left and right edges of the fit gather laminate 2 are attached together, the left and right edges may be detachably attached together with a holding member made of an adhesive tape, a mechanical planar fastener, or the like.

INDUSTRIAL APPLICABILITY

[0038] As described above, the present invention provides an advantage that it is possible with a manufacturing apparatus having a simple structure to manufacture, at a high speed and continuously, disposable pants, in which the elastic members provided in areas of non-woven fabric sheets forming a fit gather laminate except for the widthwise center area thereof are allowed to shrink/stretch, whereby they can be securely worn while preventing the shrinking/stretching force of the elastic members from acting upon the widthwise center area of the fit gather laminate, where the absorbent is provided, thereby preventing the deformation of the area where the absorbent is provided.
Claims

1. Disposable pants, comprising: a fit gather laminate (2) in which an elastic member (1) is provided between a pair of upper and lower sheets in a widthwise direction thereof, with the elastic member (1) being secured on areas of the sheets except for a widthwise center area thereof and being cut off along the widthwise center area of the sheets; wherein an absorbent (4) is provided on an upper surface side of the fit gather laminate (2), characterized in that the elastic member (1) is provided between the pair of upper and lower non-woven sheets (6, 7), wherein the disposable pants further comprising a reinforcement sheet (3) secured on a lower surface side of the fit gather laminate (2) in the widthwise center area thereof; and a back sheet (5) provided on a lower surface side of the reinforcement sheet (3), wherein the back sheet (5) is provided so as to cover the entire lower surface of the fit gather laminate (2) on the lower surface side of the reinforcement sheet (3).

2. A method of manufacturing the disposable pants of claim 1, comprising: transferring continuous materials of a pair of sheets forming a fit gather laminate (2) and a continuous material of an elastic member (1) provided therebetween in a longitudinal direction thereof while intermittently securing the continuous material of the elastic member (1) on the sheets; cutting off the elastic member (1) along with the sheets (6, 7) along a non-secured area thereof; providing an absorbent (4) on an upper surface side of the fit gather laminate (2), characterized in that the elastic member (1) is provided between the pair of upper and lower non-woven sheets (6, 7), wherein the method comprises the following steps: securing a reinforcement sheet (3) on a lower surface side of the fit gather laminate (2) at a position corresponding to the non-secured area of the elastic member (1) while providing the absorbent (4) on an upper surface side of the fit gather laminate (2); and providing a back sheet (5) on a lower surface side of the reinforcement sheet (3), wherein the back sheet (5) is provided so as to cover the entire lower surface of the fit gather laminate (2) on the lower surface side of the reinforced sheet (3).

Patentansprüche

1. Wegwerfbare Unterhose, die umfasst: ein Einsetz- 

sammellaminat (2), in dem ein elastisches Element (1) zwischen einer oberen und einer unteren Lage in Breitenrichtung hiervon vorgesehen ist, wobei das elastische Element (1) an Bereichen der Lagen mit Ausnahme eines in Breitenrichtung mittleren Bereichs hiervon befestigt ist und längs des in Breiten-

richtung mittleren Bereichs der Lagen abgeschnitten ist; wobei auf einer oberen Oberfläche des Einsetz- 

sammellaminats (2) ein Absorptionsmittel (4) vorge- 

sehen ist, dadurch gekennzeichnet, dass das ela-

stische Element (1) zwischen dem Paar oberer und 

unterer Vlieslagen (6, 7) vorgesehen ist, wobei die 

wegwerfbare Unterhose ferner eine Verstärkungs-

lage (3) umfasst, die an einer unteren Oberfläche 

des Einsetzammellaminats (2) in dem in Breiten-

richtung mittleren Bereich hiervon befestigt ist; und 

eine rückseitige Lage (5) an einer unteren Oberflä-

che der Verstärkungslose (3) vorgesehen ist, wobei 

die rückseitige Lage (5) so vorgesehen ist, dass sie 

die gesamte untere Oberfläche des Einsetzammel-

laminats (2) auf der unteren Oberfläche der Verstärkungs-

lage (3) abdeckt.

2. Verfahren zum Herstellen der wegwerfbaren Un-

terhose nach Anspruch 1, das umfasst: Befestigen ko-

ntinuierlicher Materialien eines Paars Lagen, die ein 

Einsetzammellaminat (2) bilden, und eines konti-

nuierlichen Materials eines elastischen Elements 

(1), das dazwischen vorgesehen ist, in einer Längs-

richtung hiervon, wobei das kontinuierliche Material 

des elastischen Elements (1) auf den Lagen inter-

mittierend befestigt wird; Abschneiden des elasti-

schen Elements (1) zusammen mit den Lagen (6, 7) 

längs eines nicht befestigten Bereichs hiervon; Vor-

sehen eines Absorptionsmittels (4) auf einer oberen 

Oberfläche des Einsetzammellaminats (2), da-

durch gekennzeichnet, dass das elastische Ele-

ment (1) zwischen dem Paar oberer und unterer 

Vlieslagen (6, 7) vorgesehen ist, wobei das Verfah-

ren die folgenden Schritte umfasst: Befestigen einer 

Verstärkungslose (3) an einer unteren Oberfläche 

des Einsetzammellaminats (2) an einer Position, 

die dem nicht befestigten Bereich des elastischen 

Elements (1) entspricht, wobei das Absorptionsmit-

tel (4) auf einer oberen Oberfläche des Einsetzammel-

laminats (2) vorgesehen wird; und Vorsehen ei-

ner rückseitigen Lage (5) an einer unteren Oberflä-

che der Verstärkungslose (3), wobei die rückseitige 

Lage (5) so vorgesehen ist, dass sie die gesamte 

untere Oberfläche des Einsetzammellaminats (2) 

auf der unteren Oberfläche der Verstärkungslose (3) 

abdeckt.

Reivendications

1. Couche-culotte jetable, comprenant: un matériau 

stratifié ajusté par des fronces (2) dans lequel un élé-

ment élastique (1) est prévu entre une paire de 

feuilles supérieure et inférieure dans une direction 

transversale de celui-ci, l'élément élastique (1) étant 

fixé dans des zones des feuilles sauf pour une zone 

centrée en largeur de celles-ci et découpé le long de 

la zone centrée en largeur des feuilles; dans laquelle
un matériau absorbant (4) est prévu sur une surface supérieure du matériau stratifié ajusté par des fronces (2), caractérisée en ce que l'élément élastique (1) est prévu entre la paire de feuilles supérieure et inférieure non tissées (6, 7), la couche-culotte jetable comprenant en outre une feuille de renforcement (3) fixée sur une surface inférieure du matériau stratifié ajusté par des fronces (2) dans la partie centrée en largeur de celui-ci; et une feuille arrière (5) prévue sur une surface inférieure de la feuille de renforcement (3), la feuille arrière (5) étant prévue de façon à couvrir l'entièreté de la surface inférieure du matériau stratifié ajusté par des fronces (2) sur la surface inférieure de la feuille de renforcement (3).

2. Procédé de fabrication de la couche-culotte jetable selon la revendication 1, comprenant: le transfert de matériau continu d'une paire de feuilles pour former un matériau stratifié ajusté par des fronces (2) et d'un matériau continu d'un élément élastique (1) prévu entre les deux dans une direction longitudinale de celui-ci tout en fixant par intermittence le matériau continu de l'élément élastique (1) sur les feuilles; la découpe de l'élément élastique (1) le long des feuilles (6, 7) le long d'une zone non fixée de celui-ci; la fourniture d'un matériau absorbant (4) sur une surface supérieure du matériau stratifié ajusté par des fronces (2), caractérisé en ce que l'élément élastique (1) est prévu entre la paire de feuilles supérieure et inférieure non tissées (6, 7), le procédé comprenant les étapes suivantes: la fixation d'une feuille de renforcement (3) sur une surface inférieure du matériau stratifié ajusté par des fronces (2) à une position correspondant à la zone non fixée de l'élément élastique (1) tout en procurant l'absorbant (4) sur une surface supérieure du matériau stratifié ajusté par des fronces (2); et la fourniture d'une feuille arrière (5) sur une surface inférieure de la feuille de renforcement (3), la feuille arrière (5) étant prévue de façon à couvrir l'entièreté de la surface inférieure du matériau stratifié ajusté par des fronces (2) sur la surface inférieure de la feuille renforcée (3).
