Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).
BACKGROUND OF THE INVENTION

Field of the Invention

[0001] The present invention pertains to methods of preparing (R)- or (S)-tetrahydrofuranyl ketones. More specifically, the present invention is directed to a method of preparing an industrially applicable (R)- or (S)-tetrahydrofuranyl ketone having high optical purity by dehydration of (R)- or (S)-2-tetrahydrofuran amide in the presence of a dehydrating agent and an amine base, to obtain (R)- or (S)-2-tetrahydrofuran nitrile, after which nucleophilic addition-reaction with a nucleophile and hydrolysis are carried out in order.

Description of the Prior Art

[0002] Generally, (R)- or (S)-tetrahydrofuranyl ketone compounds are widely employed for preparation of antibiotics which are used as antiviral medicines and of optically active chemicals, and also employed as important medicinal intermediates of optically active medicines and veterinary medicines.

[0003] However, most of the conventional techniques are directed to the production of racemic tetrahydrofuranyl ketones, rather than of optically pure (R)- or (S)-tetrahydrofuranyl ketones.

[0004] Meanwhile, WO 92/01696 discloses a method for preparation of (R)-2-acetyl-tetrahydrofuran bromide, in which a carboxylic acid moiety in (R)-2-tetrahydrofuroic acid used as a starting material is activated by oxalic acid chloride, and reacted with excessive diazomethane and then further with 48 % aqueous hydrogen bromide solution, producing (R)-2-acetyl-tetrahydrofuran bromide. Also, a preparation method of 2-acetyl-tetrahydrofuran chlorides comprising reacting racemic 2-tetrahydrofuroic acid used as a starting material with diazomethane according to the same manner as in the above patent and further with hydrochloric acid, is described in J. Antibiot. 1994, 47(2), 253. But, the above methods cannot be applied on an industrial scale due to use of diazomethane being highly explosive.

[0005] In J. Heterocycl. Chem. 1995, 32(1), 109, a preparation method of tetrahydrofuranyl ketone is disclosed by reaction of racemic 2-tetrahydrofuroic acid and phenylmagnesium bromide or phenyllithium. However, this method is disadvantageous since even though (R)- or (S)-2-tetrahydrofuroic acid is employed as a starting material, the optical purity of the resultant tetrahydrofuranyl ketone is lowered due to racemization in the application on the industrial scale. Additionally, tertiary alcohols are produced in large amounts as by-products, thus making it difficult to apply the above method to production on the large scale.

[0006] Further, it is well known in the art that since ketones, resulting from a nucleophilic addition reaction of carboxylic acids, have higher activity for the nucleophilic addition than carboxylic acids used as a starting material, tertiary alcohols are produced in large amounts through additional nucleophilic addition reaction of said ketones, thus decreasing a reaction yield. Hence, diverse attempts have been conducted to overcome such problems.

[0007] For example, it is known that carboxylic acid and lithium hydride are reacted at a molar ratio of 1:1, to produce lithium carboxylate, which is then reacted with an organic lithium compound or a Grignard reagent, to prepare ketone. But, when this method is applied to preparation of an optically pure tetrahydrofuranyl ketone on an industrial scale, racemization occurs. So, the resultant ketone is low in optical purity.

[0008] Under these circumstances, there is proposed a preparation method in which carboxylic acid is converted, by use of N,O-dimethylhydroxyamine hydrochloride, to N,O-dimethyl hydroxiamide, followed by reacting with an organic lithium compound or a Grignard reagent to yield ketone. This method is advantageous in terms of suppression of tertiary alcohols produced as a by-product, but is disadvantageous due to use of expensive N,O-dimethylhydroxyamine hydrochloride. Therefore, it is difficult to industrially apply such a method, in terms of economic benefit. In particular, when this method is used for preparation of an optically pure tetrahydrofuranyl ketone on an industrial scale, racemization occurs, thus the produced ketone has low optical purity.

[0009] According to Tetrahedron Lett. 1984, 25(42), 4805, a method of preparing ketone is proposed, in which carboxylic acid is activated with thionyl chloride and reacted with a Grignard reagent in the presence of iron (III) catalyst to produce ketone. But, when such a method is also applied to preparation of an optically pure tetrahydrofuranyl ketone on an industrial scale, racemization is so unavoidable that the resultant ketone is low in optical purity.

SUMMARY OF THE INVENTION

[0010] Leading to the present invention, the intensive and thorough research into methods for preparation of (R)- or (S)-tetrahydrofuranyl ketone, carried out by the present inventors aiming to avoid the problems encountered in the prior arts, resulted in the finding that, when (R)- or (S)-2-tetrahydrofuran amide is used a starting material, (R)- or (S)-2-tetrahydrofuran nitrile obtained from dehydration of the above starting material is nucleophilic addition-reacted with
a nucleophile, followed by hydrolyzing to yield (R)- or (S)-tetrahydrofuranyl ketone having high optical purity.

**[0011]** Therefore, it is an object of the present invention to provide a method of preparing an industrially applicable (R)-tetrahydrofuranyl ketone having high optical purity.

**[0012]** It is another object of the present invention to provide a method of preparing an industrially applicable (S)-tetrahydrofuranyl ketone having high optical purity.

**[0013]** In accordance with an embodiment of the present invention, there is provided a method of preparing an optically pure (R)-tetrahydrofuranyl ketone, which comprises:

- dehydrating (R)-2-tetrahydrofuran amide, represented by the following chemical formula 1a, in the presence of a dehydrating agent and an amine base at 50 to 100 °C for 2 to 6 hours to obtain (R)-2-tetrahydrofuran nitrile represented by the following chemical formula 2a;
- nucleophilic addition-reacting the (R)-2-tetrahydrofuran nitrile with a nucleophile in an organic solvent at the temperature range of from -80 to 100 °C for 10 minutes to 4 hours, followed by hydrolyzing by use of aqueous acidic solution to produce (R)-tetrahydrofuranyl ketone represented by the following chemical formula 3a; and
- recovering the resulting product obtained from the previous step:

![Chemical Formula 1a](image1)

wherein, R is a straight-chained or branched, saturated or unsaturated aliphatic alkyl group having 1-30 carbon atoms; a saturated or unsaturated, substituted or unsubstituted cyclic alkyl group having 3-30 carbon atoms; or a substituted or unsubstituted aryl group having 6-30 carbon atoms.

**[0014]** In accordance with another embodiment of the present invention, there is provided a method of preparing an optically pure (S)-tetrahydrofuranyl ketone, which comprises:

- dehydrating (S)-2-tetrahydrofuran amide represented by the following chemical formula 1b, in the presence of a dehydrating agent and an amine base at 50 to 100 °C for 2 to 6 hours to obtain (S)-2-tetrahydrofuran nitrile represented by the following chemical formula 2b; and
- nucleophilic addition-reacting the (S)-2-tetrahydrofuran nitrile with a nucleophile in an organic solvent at the temperature range of from -80 to 100 °C for 10 minutes to 4 hours, followed by hydrolyzing by use of aqueous acidic solution to produce (S)-tetrahydrofuranyl ketone represented by the following chemical formula 3b; and
- recovering the resulting product obtained from the previous step:
wherein, R is a straight-chained or branched, saturated or unsaturated aliphatic alkyl group having 1-30 carbon atoms; a saturated or unsaturated, substituted or unsubstituted cyclic alkyl group having 3-30 carbon atoms; or a substituted or unsubstituted aryl group having 6-30 carbon atoms.

DETAILED DESCRIPTION OF THE INVENTION

[0015] The present invention is directed to a preparation method of an optically pure (R)- or (S)-tetrahydrofuranyl ketone. Initially, (R)- or (S)-2-tetrahydrofuran amide is dehydrated in the presence of a dehydrating agent and an amine base to produce (R)- or (S)-2-tetrahydrofuran nitrile. Thereafter, the (R)- or (S)-2-tetrahydrofuran nitrile is nucleophilic addition-reacted with a nucleophile, followed by hydrolysis. As a result, (R)- or (S)-tetrahydrofuranyl ketone is produced with high optical purity.

[0016] According to the present invention, (R)-2-tetrahydrofuran amide of chemical formula 1a or (S)-2-tetrahydrofuran amide of the following chemical formula 1b is used as a starting material:
In the present invention, the (R)- or (S)-2-tetrahydrofuran amide is preferably dehydrated in the presence of 1.0-1.5 equivalents dehydrating agent and 1.0-7.0 equivalents amine base under conditions of a reaction temperature ranging from 50 to 100 °C and a period of time required for reaction ranging from 2 to 6 hours, to produce (R)-2-tetrahydrofuran nitrile represented by the following chemical formula 2a or (S)-2-tetrahydrofuran nitrile represented by the following chemical formula 2b:

\[
\text{Chemical Formula 2a}
\]

\[
\text{Chemical Formula 2b}
\]

As such, it is noted that each using amount of the dehydrating agent and the amine base should be adjusted in proper range. For example, in case of falling out of the range as above, the dehydration may not sufficiently performed or wastes may excessively generated. Furthermore, if the period of time required for reaction is shorter than 2 hours, reaction conversion efficiency becomes low. On the other hand, if the reaction time is longer than 6 hours, economic benefit is not realized due to insufficiently long reaction time. Also, when the reaction temperature is lower than 50 °C, a period of time required to obtain the reaction conversion efficiency of 100 % is lengthened. Meanwhile, the temperature higher than 100 °C leads to generation of large amounts of by-products.

The amine base of the present invention is selected from the group consisting of primary amines, such as methylvamine, ethylamine, propylamine, butylamine, etc.; secondary amines, such as dimethylamine, diethylamine, diisopropylamine, etc.; tertiary amines, such as trimethylamine, triethylamine, diethylisopropylamine, etc.; and pyridine. Among them, pyridine is preferably used.

The dehydrating agent of the present invention is selected from the group consisting of thionyl chloride, para-toluenesulfone chloride, phosphorous pentoxide, phosphorous oxytrichloride, a mixture of dimethylsulfoxide and oxalic acid chloride, trifluoroacetic anhydride, and a mixture of formaldehyde and formic acid. Among them, para-toluenesulfone chloride is preferably used.

Then, each of (R)- and (S)-2-tetrahydrofuran nitrile, resulting from the above dehydration, is nucleophilic addition-reacted with a nucleophile. Then, hydrolysis is carried out to obtain (R)-tetrahydrofuranyl ketone represented by the following chemical formula 3a, or (S)-tetrahydrofuranyl ketone represented by the following chemical formula 3b:

\[
\text{Chemical Formula 3a}
\]
wherein, R is a straight-chained or branched, saturated or unsaturated aliphatic alkyl group having 1-30 carbon atoms; a saturated or unsaturated, substituted or unsubstituted cyclic alkyl group having 3-30 carbon atoms; or a substituted or unsubstituted aryl group having 6-30 carbon atoms.

As for the nucleophilic addition reaction, (R)- or (S)-2-tetrahydrofuran nitrile and the nucleophile are slowly introduced in the presence of an organic solvent. At this time, the (R)- or (S)-2-tetrahydrofuran nitrile and the nucleophile are introduced at an equivalent ratio of 1:1-1:3, preferably 1:1.1-1:2, and most preferably 1:1.1-1:1.3. When the ratio is less than 1:1, a part of the nucleophile is reacted with water and other impurities in the organic solvent and thus the reaction conversion efficiency is decreased. On the other hand, when the ratio exceeds 1:3, large amounts of the nucleophile remain unreacted, thus not generating economic benefit.

Examples of the nucleophile useful in the present invention include, but are not limited to, Grignard reagents, such as methylmagnesium chloride, methylmagnesium bromide, methylmagnesium iodide, ethylmagnesium chloride, ethylmagnesium bromide, ethylmagnesium iodide, n-propylmagnesium chloride, n-propylmagnesium bromide, n-propylmagnesium iodide, iso-propylmagnesium chloride, iso-propylmagnesium bromide, iso-propylmagnesium iodide, cyclopentylmagnesium chloride, cyclohexylmagnesium chloride, cyclopentylmagnesium bromide, cyclohexylmagnesium iodide, cyclopentylmagnesium iodide, cyclohexylmagnesium chloride, phenylmagnesium chloride, phenylmagnesium bromide and phenylmagnesium iodide; organic lithium compounds, such as methyllithium, ethyllithium, propyllithium, iso-propyllithium, n-butyllithium, iso-butyllithium, neobutyllithium and phenyllithium; organic zinc compounds, such as dimethylzinc and diethylzinc; and organic aluminum compounds, such as trimethylaluminum and triethylaluminum.

As the organic solvent, suitable is diethylether, di-n-butylether, methylneobutylether, isopropylether, tetrahydrofuran, 1,4-dioxane, n-hexane, n-heptane, benzene, toluene, xylene, or mixtures thereof. Preferably, the organic solvent is diethylether, dibutylether, methylneobutylether, isopropylether, tetrahydrofuran, 1,4-dioxane, or mixtures thereof. Most preferably, tetrahydrofuran is used.

The nucleophilic addition reaction is performed in the temperature range of -80 to 100 °C, preferably -20 to 50 °C, and most preferably 0 to 30 °C. The reaction temperature lower than -80 °C causes the reduction of economic benefits due to the increased reaction time. Meanwhile, the temperature higher than 100 °C results in lowered optical purity due to racemization of the product.

In addition, the nucleophilic addition is conducted for 10 minutes to 4 hours, preferably for 10 minutes to 2 hours, and most preferably for 30 minutes to 1 hour. If the time is shorter than 10 minutes, the reaction conversion efficiency is reduced. On the other hand, if the time is longer than 4 hours, economic benefit is not realized due to excessively lengthened time.

After completion of the nucleophilic addition, hydrolysis is performed using an acidic aqueous solution to effectively prepare (R)- or (S)-tetrahydrofurananyl ketone, without any change of optical purity.

As described above, the present invention is advantageous in that (R)- or (S)-tetrahydrofuran nitrile is used, instead of conventionally used (R)- or (S)-2-tetrahydrofuroic acid, whereby the amount of the nucleophile to be used can be decreased by 1 equivalent or more, thus realizing economic benefits. As well, without any decrease of optical purity, (R)- or (S)-tetrahydrofurananyl ketone can be obtained while production of tertiary alcohols as a by-product is minimized.

Having generally described this invention, a further understanding can be obtained by reference to certain specific examples which are provided herein for purposes of illustration only and are not intended to be limiting unless otherwise specified.

**EXAMPLE 1**

195 g of pyridine was introduced into a 1 L reactor and stirred, to which 40.5 g of (S)-2-tetrahydrofuran amide having an optical purity of 99.1 % ee was added together with 73.8 g of para-toluene sulfone chloride, and the reaction was conducted at 50 °C for 2 hours with stirring. Thereafter, most of the pyridine was removed through concentration under reduced pressure. The reactor was placed into a water bath filled with ice water, and added with dilute hydro-
chloric acid and stirred. Then, dichloromethane was added thereto for extraction, followed by removing an aqueous layer. Dichloromethane in the extracted organic layer was removed under reduced pressure and the dichloromethane-removed organic layer was distilled off under vacuum, yielding 25 g of (S)-2-tetrahydrofuran nitrile.

**0031** A 0.5 L reactor at a temperature of 0 °C was added with 0.1 L of 3 M methylmagnesium chloride in tetrahydrofuran, to which 25 g of (S)-2-tetrahydrofuran nitrile as previously obtained, in 0.07 L of tetrahydrofuran was slowly added dropwise. As such, the reaction was carried out for 0.5 hours with stirring, while the temperature within the reactor was controlled below 15 °C. Next, the resulting solution was added dropwise to 32 g of concentrated hydrochloric acid in 0.2 L of water, while the temperature of the reaction was controlled below 25 °C. Thereafter, the extraction was conducted by use of ethylacetate, followed by removing the solvent therein under reduced pressure, and the remainder was vacuum distilled off to produce 17.7 g of (S)-2-acetyl-tetrahydrofuran having an optical purity of 99.1 % ee.

**EXAMPLE 2**

**0032** A 0.5 L reactor was added with 70 g of pyridine and stirred, and then added with 20 g of (R)-2-tetrahydrofuran amide having an optical purity of 98.5 % ee and 37 g of para-toluenesulfone chloride, and stirred at 50 °C for 2 hours. Thereafter, most of the pyridine was removed through concentration under reduced pressure.

**0033** Then, the reactor was placed into a water bath filled with ice water, and added with dilute hydrochloric acid and stirred. Then, dichloromethane was added thereto for extraction, followed by removing an aqueous layer. Dichloromethane in the extracted organic layer was removed under reduced pressure and the dichloromethane-removed organic layer was vacuum distilled off, yielding 13.5 g of (R)-2-tetrahydrofuran nitrile.

**0034** A 1 L reactor at a temperature of 0 °C was added with 0.4 L of 1.6 M n-butyllithium in n-hexane, to which 13.5 g of (R)-2-tetrahydrofuran nitrile as previously obtained, in 0.07 L of tetrahydrofuran was slowly added dropwise. As such, the reaction was carried out for 1 hour with stirring, while the temperature within the reactor was controlled below 15 °C. Next, the resulting solution was added dropwise to 65 g of concentrated hydrochloric acid in 0.4 L of water, while the temperature of the reaction was controlled below 25 °C. Thereafter, the extraction was conducted by use of ethylacetate, followed by removing the solvent therein under reduced pressure, and the remainder was vacuum distilled off to produce 19.6 g of (R)-1-(2-tetrahydrofuranyl)-1-pentanone having an optical purity of 98.5 % ee.

**0035** The present invention has been described in an illustrative manner, and it is to be understood that the terminology used is intended to be in the nature of description rather than of limitation. Many modifications and variations of the present invention are possible in light of the above teachings. Therefore, it is to be understood that within the scope of the appended claims, the invention may be practiced otherwise than as specifically described.

**Claims**

1. A method of preparing an optically pure (R)-tetrahydrofuranyl ketone, which comprises the following steps of:

   - dehydrating (R)-2-tetrahydrofuran amide, represented by the following chemical formula 1a, in the presence of a dehydrating agent and an amine base at 50 to 100 °C for 2 to 6 hours to obtain (R)-2-tetrahydrofuran nitrile represented by the following chemical formula 2a;
   - nucleophilic addition-reacting the (R)-2-tetrahydrofuran nitrile with a nucleophile in an organic solvent at the temperature range of -80 to 100 °C for 10 minutes to 4 hours, followed by hydrolyzing by use of aqueous acidic solution to produce (R)-tetrahydrofuranyl ketone represented by the following chemical formula 3a; and
   - recovering the resulting product obtained from the previous step.

![Chemical Formula 1a](image)
wherein, R is a straight-chained or branched, saturated or unsaturated aliphatic alkyl group having 1-30 carbon atoms; a saturated or unsaturated, substituted or unsubstituted cyclic alkyl group having 3-30 carbon atoms; or a substituted or unsubstituted aryl group having 6-30 carbon atoms.

2. The method as defined in claim 1, wherein said dehydrating agent is selected from the group consisting of thionyl chloride, para-toluenesulfone chloride, phosphorous pentoxide, phosphorous oxytrichloride, a mixture of dimethylsulfoxide and oxalic acid chloride, trifluoroacetic anhydride, and a mixture of formaldehyde and formic acid.

3. The method as defined in claim 1, wherein said amine base is selected from the group consisting of methylamine, ethylamine, propylamine, butylamine, dimethylamine, diethylamine, diisopropylamine, trimethylamine, triethylamine, diethylisopropylamine, and pyridine.

4. The method as defined in claim 1, wherein said nucleophile is selected from the group consisting of Grignard reagent, organic lithium compound, organic zinc compound and organic aluminum compound.

5. The method as defined in claim 4, wherein said Grignard reagent is methylmagnesium chloride, methylmagnesium bromide, methylmagnesium iodide, ethylmagnesium chloride, ethylmagnesium bromide, ethylmagnesium iodide, n-propylmagnesium chloride, n-propylmagnesium bromide, n-propylmagnesium iodide, iso-propylmagnesium chloride, iso-propylmagnesium bromide, iso-propylmagnesium iodide, cyclopentylmagnesium chloride, cyclopentylmagnesium bromide, cyclopentylmagnesium iodide, cyclohexylmagnesium chloride, cyclohexylmagnesium bromide, cyclohexylmagnesium iodide, propargylmagnesium bromide, vinylmagnesium chloride, vinylmagnesium bromide, phenylmagnesium chloride, phenylmagnesium bromide or phenylmagnesium iodide; said organic lithium compound is methyl lithium, ethyl lithium, propyl lithium, iso-propyl lithium, n-butyl lithium, iso-butyl lithium, neobutyl lithium or phenyl lithium; said organic zinc compound is dimethylzinc or diethylzinc; and said organic aluminum compound is trimethylaluminum or triethylaluminum.

6. The method as defined in claim 1, wherein said organic solvent is selected from the group consisting of diethylether, di-n-butylether, methylneobutylether, isopropylether, tetrahydrofuran, 1,4-dioxane, n-hexane, n-heptane, benzene, toluene, xylene and mixtures thereof.

7. The method as defined in claim 1, wherein a molar ratio of the (R)-2-tetrahydrofuran nitrile and the nucleophile ranges from 1:1 to 1:3.

8. A method of preparing an optically pure (S)-tetrahydrofuranyl ketone, which comprises the following steps of:

   dehydrating (S)-2-tetrahydrofuran amide represented by the following chemical formula 1b, in the presence of a dehydrating agent and an amine base at 50 to 100 °C for 2 to 6 hours to obtain (S)-2-tetrahydrofuran nitrile represented by the following chemical formula 2b; and

   nucelophilic addition-reacting the (S)-2-tetrahydrofuran nitrile with a nucleophile in an organic solvent at the temperature range of from -80 to 100 °C for 10 minutes to 4 hours, followed by hydrolyzing by use of aqueous acidic solution to produce (S)-tetrahydrofuranyl ketone represented by the following chemical formula 3b; and
recovering the resulting product obtained from the previous step:

wherein, \( R \) is a straight-chained or branched, saturated or unsaturated aliphatic alkyl group having 1-30 carbon atoms; a saturated or unsaturated, substituted or unsubstituted cyclic alkyl group having 3-30 carbon atoms; or a substituted or unsubstituted aryl group having 6-30 carbon atoms.

9. The method as defined in claim 8, wherein said dehydrating agent is selected from the group consisting of thionyl chloride, para-toluenesulfone chloride, phosphorous pentoxide, phosphorous oxytrichloride, a mixture of dimethylsulfoxide and oxalic acid chloride, trifluoroacetic anhydride, and a mixture of formaldehyde and formic acid.

10. The method as defined in claim 8, wherein said amine base is selected from the group consisting of methylamine, ethylamine, propylamine, butylamine, dimethylamine, diethylamine, disopropylamine, trimethylamine, triethylamine, diethylisopropylamine, and pyridine.

11. The method as defined in claim 8, wherein said nucleophile is selected from the group consisting of Grignard reagent, organic lithium compound, organic zinc compound and organic aluminum compound.

12. The method as defined in claim 11, wherein said Grignard reagent is methylmagnesium chloride, methylmagnesium bromide, methylmagnesium iodide, ethylmagnesium chloride, ethylmagnesium bromide, ethylmagnesium iodide, n-propylmagnesium chloride, n-propylmagnesium bromide, n-propylmagnesium iodide, iso-propylmagnesium chloride, iso-propylmagnesium bromide, iso-propylmagnesium iodide, cyclopentylmagnesium chloride, cyclopentylmagnesium bromide, cyclopentylmagnesium iodide, cyclohexylmagnesium chloride, cyclohexylmagnesium bromide, cyclohexylmagnesium iodide, propargylmagnesium bromide, vinylmagnesium chloride, vinylmagnesium bromide, phenylmagnesium chloride, phenylmagnesium bromide or phenylmagnesium iodide; said organic lithium compound is methyl lithium, ethyllithium, propyllithium, iso-propyllithium, n-butyllithium, iso-butyllithium, neobutyllithium, neobutyllithum or phenyllithium; said organic zinc compound is dimethylzinc or diethylzinc; and said organic aluminum compound is trimethylaluminum or triethylaluminum.

13. The method as defined in claim 8, wherein said organic solvent is selected from the group consisting of diethylether,
di-n-butylether, methylneobutylether, isopropylether, tetrahydrofuran, 1,4-dioxane, n-hexane, n-heptane, benzene, toluene, xylene and mixtures thereof.

14. The method as defined in claim 8, wherein a molar ratio of the (S)-2-tetrahydrofuran nitrile and the nucleophile ranges from 1:1 to 1:3.

Patentansprüche

1. Verfahren zum Herstellen eines optisch reinen (R)-Tetrahydrofuranylketons, das die folgenden Schritte enthält:

Dehydrieren von (R)-2-Tetrahydrofuranamid, das durch die folgende chemische Formel 1a dargestellt ist, in Gegenwart eines Dehydrierungsmittel und einer Aminbase bei 50 bis 100 °C über 2 bis 6 Stunden, um (R)-2-Tetrahydrofuranitril zu erhalten, das durch die folgende chemische Formel 2a dargestellt ist;

nukleophile Additionsreaktion des (R)-2-Tetrahydrofuranitrils mit einem Nukleophil in einem organischen Lösungsmittel bei einer Temperatur im Bereich von -80 bis 100 °C über 10 Minuten bis 4 Stunden, gefolgt von Hydrolysieren unter Verwendung einer wässrigen sauren Lösung, um (R)-Tetrahydrofuranylketon herzustellen, das durch die folgende chemische Formel 3a dargestellt ist; und

Gewinnen des resultierenden Produkts, das aus dem vorhergehenden Schritt erhalten wurde:

wobei \( R \) eine geradkettige oder verzweigte, gesättigte oder ungesättigte aliphatische Alkylgruppe mit 1-30 Kohlenstoffatomen ist; eine gesättigte oder ungesättigte, substituierte oder nicht-substituierte zyklische Alkylgruppe mit 3-30 Kohlenstoffatomen; oder eine substituierte oder nicht-substituierte Arylgruppe mit 6-30 Kohlenstoffatomen.

2. Verfahren nach Anspruch 1, wobei das Dehydrierungsmittel ausgewählt ist aus der Gruppe bestehend aus Thionylichlorid, para-Toluolsulfonchlorid, Phosphorpentoxid, Phosphoroxytrichlorid, einer Mischung aus Dimethylsulfioxid und Oxalsäurechlorid, Trifluoressigsäureanhydrid, und einer Mischung aus Formaldehyd und Ameisensäure.
3. Verfahren nach Anspruch 1, wobei die Aminbase ausgewählt ist aus der Gruppe bestehend aus Methylamin, Ethylamini, Propylamin, Butylamin, Dimethylamin, Diethylamin, Diisopropylamin, Trimethylamin, Triethylamin, Diethilsopropylamin und Pyridin.

4. Verfahren nach Anspruch 1, wobei das Nukleophil ausgewählt ist aus der Gruppe bestehend aus Grignard-Reagens, organischer Lithiumverbindung, organischer Zinkverbindung und organischer Aluminiumverbindung.

5. Verfahren nach Anspruch 4, wobei das Grignard-Reagens Methylmagnesiumchlorid, Methylmagnesiumbromid, Methylmagnesiumiodid, Ethylmagnesiumchlorid, Ethylmagnesiumbromid, Ethylmagnesiumiodid, n-Propylmagnesiumchlorid, n-Propylmagnesiumbromid, n-Propylmagnesiumiodid, Isopropylmagnesiumchlorid, Isopropylmagnesiumbromid, Isopropylmagnesiumiodid, Cyclopentylmagnesiumchlorid, Cyclopentylmagnesiumbromid, Cyclopentylmagnesiumiodid, Cyclohexylmagnesiumchlorid, Cyclohexylmagnesiumbromid, Cyclohexylmagnesiumiodid, Propargylmagnesiumchlorid, Vinylmagnesiumchlorid, Vinylmagnesiumbromid, Phenylmagnesiumchlorid, Phenylmagnesiumbromid oder Phenylmagnesiumiodid ist; wobei die organische Lithiumverbindung Methyllithium, Ethyllithium, Propyllithium, Isopropyllithium, n-Butyllithium, Isobutyllithium, Neobutyllithium oder Phenyllithium ist; wobei die organische Zinkverbindung Dimethylzink oder Diethylzink ist; und wobei die organische Aluminiumverbindung Trimethylaluminium oder Triethylaluminium ist.

6. Verfahren nach Anspruch 1, wobei das organische Lösungsmittel ausgewählt ist aus der Gruppe bestehend aus Diethylether, Di-n-butyether, Methylneobutylether, Isopropylether, Tetrahydrofuran, 1,4-Dioxan, n-Hexan, n-Hexan, n-Hexan, Benzol, Toluol, Xylol und Mischungen davon.

7. Verfahren nach Anspruch 1, wobei ein Molverhältnis von dem (R)-2-Tetrahydrofurannitril und dem Nukleophil von 1:1 bis 1:3 reicht.

8. Verfahren zum Herstellen eines optisch reinen (S)-Tetrahydrofuranylketons, das die folgenden Schritte enthält:

   Dehydrieren von (S)-2-Tetrahydrofurananid, das durch die folgende chemische Formel 1b dargestellt ist, in Gegenwart eines Dehydrierungsmittel und einer Aminbase bei 50 bis 100 °C über 2 bis 6 Stunden, um (S)-2-Tetrahydrofurannitril zu erhalten, das durch die folgende chemische Formel 2b dargestellt ist; und

   nukleophile Additionsreaktion des (S)-2-Tetrahydrofurannitrils mit einem Nukleophil in einem organischen Lösungsmittel bei einer Temperatur im Bereich von -80 bis 100 °C über 10 Minuten bis 4 Stunden, gefolgt von Hydrolyseren unter Verwendung einer wässrigen sauren Lösung, um (S)-Tetrahydrofuranylketon herzustellen, das durch die folgende chemische Formel 3b dargestellt ist; und

   Gewinnen des resultierenden Produkts, das aus dem vorhergehenden Schritt erhalten wurde:

![Chemische Formel 1b](image1)

![Chemische Formel 2b](image2)
wobei R eine geradkettige oder verzweigte, gesättigte oder ungesättigte aliphatische Alkylgruppe mit 1-30 Kohlenstoffatomen ist; eine gesättigte oder ungesättigte, substituierte oder nicht-substituierte zyklische Alkylgruppe mit 3-30 Kohlenstoffatomen; oder eine substituierte oder nicht-substituierte Arylgruppe mit 6-30 Kohlenstoffatomen.

10. Verfahren nach Anspruch 8, wobei die Aminbase ausgewählt ist aus der Gruppe bestehend aus Methylamin, Ethylamin, Propylamin, Butylamin, Dimethylamin, Diethylamin, Disopropylamin, Trimethylamin, Triethyamin, Diethylisopropylamin und Pyridin.

13. Verfahren nach Anspruch 8, wobei das organische Lösungsmittel ausgewählt ist aus der Gruppe bestehend aus Diethylether, Di-n-butylether, Methylneobutylether, Isopropylether, Tetrahydrofuran, 1,4-Dioxan, n-Hexan, n-Hexan, n-Hexan, Benzol, Toluol, Xylol und Mischungen davon.

Revendications

1. Un procédé de préparation de cétone (R)-tétrahydrofuranyl optiquement pure, qui comprend les étapes suivantes de :

   déshydratation de l'amide de (R)-2-tétrahydrofuranne, représenté par la formule chimique suivante la, en présence d'un agent déshydratant et d'une base amine à 50 à 100° C pendant 2 à 6 heures pour obtenir du nitrile de (R)-2-tétrahydrofuranne représenté par la formule chimique suivante 2a ;

   réaction-addition nucléophile du nitrile de (R)-2-tétrahydrofuranne avec un nucléophile dans un solvant organique, dans une gamme de température de -80 à 100° C pendant 10 minutes à 4 heures, suivie par une hydrolyse par utilisation d'une solution aqueuse pour produire de la cétone (R)-tétrahydrofuranyl-représentée par la formule chimique suivante 3a ; et

   récupération du produit resultant obtenu à partir de l'étape précédente ;
dans laquelle R est un groupe alkyle aliphatique, saturé ou insaturé, à chaîne droite ou ramifiée, ayant de 1 à 30 atomes de carbone; un groupe alkyle cycloïque substitué ou non substitué, saturé ou insaturé, ayant de 3 à 30 atomes de carbone; ou un groupe aryle substitué ou non substitué ayant de 6 à 30 atomes de carbone.

2. Procédé selon la revendication 1, dans lequel ledit agent déshydratant est choisi dans le groupe consistant en chlorure de thionyle, chlorure de para-toluènesulfone, pentoxyde phosphoreux, oxirchlorure phosphoreux, un mélange de diméthylsulfoxide et de chlorure d'acide oxalique, anhydride trifluoroacétique et un mélange de formaldéhyde et d'acide formique.

3. Procédé selon la revendication 1, dans lequel ladite base amine est choisie dans le groupe consistant en méthylamine, éthylamine, propylamine, butylamine, diméthylamine, diéthylamine, disopropylamine, triméthylamine, triéthylamine, diéthylisopropylamine et pyridine.

4. Procédé selon la revendication 1, dans lequel ledit nucléophile est choisi dans le groupe consistant en réactif de Grignard, composé de lithium organique, composé de zinc organique et composé d'aluminium organique.

5. Procédé selon la revendication 4, dans lequel ledit réactif de Grignard est le chlorure de méthylmagnésium, le bromure de méthylmagnésium, l'iodyde de méthylmagnésium, le chlorure d'éthylmagnésium, le bromure d'éthylmagnésium, l'iodyde d'éthylmagnésium, le chlorure de n-propylimagnésium, le bromure de n-propylimagnésium, l'iodyde de n-propylimagnésium, le chlorure d'isopropylmagnésium, le bromure d'isopropylmagnésium, l'iodyde d'isopropylmagnésium, le chlorure de cyclopentylmagnésium, le chlorure de cyclohexylmagnésium, le bromure de cyclopentylmagnésium, l'iodyde de cyclopentylmagnésium, le chlorure de cyclohexylmagnésium, le bromure de propargylmagnésium, le chlorure de vinylmagnésium, le bromure de vinylmagnésium, le chlorure de phénylmagnésium, le bromure de phénylmagnésium ou l'iodyde de phénylmagnésium; ledit composé de lithium organique est le méthyllithium, l'éthyllithium, le propyllithium, l'isopropyllithium, le n-butyllithium, l'iso-butyllithium, le néobutyllithium ou le phényllithium; ledit composé de zinc organique est le diméthylzinc ou le diéthylzinc; et ledit composé d'aluminium organique est le triméthylaluminium ou le triéthylaluminium.

6. Procédé selon la revendication 1, dans lequel ledit solvant organique est choisi dans le groupe consistant en diéthyléther, di-n-butyléther, méthylénobutyléther, isopropyléther, le tétrahydrofuranne, 1,4-dioxane, n-hexane, n-heptane, benzène, toluène, xylène et leurs mélanges.
7. Procédé selon la revendication 1, dans lequel le rapport molaire du nitrile de (R)-2-tétrahydrofuranne et du nucléophile se situe de 1:1 à 1:3.

8. Procédé de préparation d'une cétone (S)-tétrahydrofuranyl optiquement pure, qui comprend les étapes suivantes de :

- déshydratation de l'amide de (S)-2-tétrahydrofuranne, représenté par la formule chimique suivante 1b, en présence d'un agent déshydratant et d'une base amine à 50 à 100°C pendant 2 à 6 heures pour obtenir du nitrile de (S)-2-tétrahydrofuranne représenté par la formule chimique suivante 2b ;
- réaction-addition nucléophile du nitrile de (S)-2-tétrahydrofuranne avec un nucléophile dans un solvant organique dans une gamme de température de -80 à 100°C pendant 10 minutes à 4 heures, suivie par l'hydrolyse par utilisation d'une solution acide aqueuse pour produire de la cétone (S)-tétrahydrofuranyl représentée par la formule chimique suivante 3b ;

9. Procédé selon la revendication 8, dans lequel ledit agent déshydratant est choisi dans le groupe consistant en chlorure de thionyle, chlorure de para-toluenesulfone, pentoxide phosphoreux, l'oxytrichlorure phosphoreux, mélange de diméthylsulfoxyde et de chlorure d'acide oxalique, anhydride trifluoroacétique et un mélange de formal-dehyde et d'acide formique.

10. Procédé selon la revendication 8, dans lequel ladite base amine est choisie dans le groupe consistant en méthyamine, éthylamine, propylamine, butylamine, diméthylamine, diéthylamine, disopropylamine, triméthylamine, triéthylamine, diéthylisopropylamine, et pyridine.

11. Procédé selon la revendication 8, dans lequel ledit nucléophile est choisi dans le groupe consistant en réactif de Grignard, composé de lithium organique, composé de zinc organique et composé d'aluminium organique.

12. Procédé selon la revendication 11, dans lequel ledit réactif de Grignard est le chlorure de méthylmagnésium, le
bromure de méthylmagnésium, l'iodyure de méthylmagnésium, le chlorure de méthylmagnésium, le bromure d'éthylmagnésium, l'iodyure d'éthylmagnésium, le chlorure d'éthylmagnésium, le bromure de n-propylmagnésium, l'iodyure de n-propylmagnésium, le chlorure d'isopropylmagnésium, le bromure d'isopropylmagnésium, l'iodyure d'isopropylmagnésium, le chlorure de cyclopentylmagnésium, le chlorure de cyclohexylmagnésium, le bromure de cyclopentylmagnésium, le bromure de cyclohexylmagnésium, l'iodyure de cyclopentylmagnésium, l'iodyure de cyclohexylmagnésium, le chlorure de propargylmagnésium, le chlorure de vinylmagnésium, le chlorure de phénylmagnésium, le bromure de phénylmagnésium, l'iodyure de phénylmagnésium; ledit composé de lithium organique est le méthyllithium, l'éthyllithium, le propyllithium, l'isopropyllithium, le n-butyllithium, l'isobutyllithium, le néobutyllithium ou le phényllithium; ledit composé de zinc organique est le diméthylzinc ou le diéthylzinc; et ledit composé d'aluminium organique est le triméthylaluminium ou le triéthylaluminium.

13. Procédé selon la revendication 8, dans lequel ledit solvant organique est choisi dans le groupe consistant en diéthyléther, di-n-butyléther, méthylnéobutyléther, isopropyléther, tétrahydrofuranne, 1,4-dioxane, n-hexane, n-heptane, benzène, toluène, xylène et leurs mélanges.

14. Le procédé selon la revendication 8, dans lequel le rapport molaire du nitrile de (S)-2-tétrahydrofuranne et du nucléophile se situe de 1:1 à 1:3.
