Note: Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).
FIELD OF THE INVENTION

[0001] This invention relates to certain mixtures of fused pyrimidinones and dinitrophenolic compounds, their agriculturally suitable salts, and methods of their use as fungicides.

BACKGROUND OF THE INVENTION

[0002] The control of plant diseases caused by fungal plant pathogens is extremely important in achieving high crop efficiency. Plant disease damage to ornamental, vegetable, field, cereal, and fruit crops can cause significant reduction in productivity and thereby result in increased costs to the consumer. Therefore, fungicides that effectively control plant diseases are in constant demand by growers. Many products are commercially available for these purposes. However, the need continues for new products that are more effective, less costly, less toxic, environmentally safer and/or have different modes of action. Plant diseases are highly destructive, difficult to control and quickly develop resistance to commercial fungicides. Combinations of pesticides are often used to facilitate disease control, to broaden spectrum of control and to retard resistance development (see e.g., WO98/33381). It is recognized in the art that the advantages of particular pesticide combinations can often vary, depending on such factors as the particular plant and plant disease to be treated, and the treatment conditions. Accordingly, there is an ongoing search for advantageous combinations of pesticides.

SUMMARY OF THE INVENTION

[0003] This invention relates to synergistic fungicidal combinations (e.g., mixtures) comprising

(1) at least one compound selected from the fused pyrimidinones of Formula I (including all geometric and stereoisomers), N-oxides, and suitable salts thereof,

\[
\text{I}
\]

wherein

G is a fused phenyl, thiophene or pyridine ring;
R\(^1\) is C\(_1\)-C\(_6\) alkyl or C\(_2\)-C\(_7\) cycloalkylalkyl;
R\(^2\) is C\(_1\)-C\(_6\) alkyl, C\(_1\)-C\(_6\) alkoxy or C\(_1\)-C\(_6\) alkylthio;
R\(^3\) is halogen; and
R\(^4\) is hydrogen or halogen; and

(2) at least one dinitrophenolic compound selected from the group consisting of compounds of Formula II and compounds of Formula III (including all geometric and stereoisomers)
[0004] This invention provides agricultural compositions containing these combinations. This invention also provides a method for controlling plant diseases caused by fungal plant pathogens (especially powdery mildews) comprising applying to the plant or portion thereof, or to the plant seed or seedling, a fungicidally effective amount of these combinations (e.g., as a composition described herein).

DETAILS OF THE INVENTION

[0005] Pyrimidinone fungicides of Formula I are described in International Patent Application WO94/26722, U.S. Patent No. 6,066,638, U.S. Patent No. 6,245,770, U.S. Patent No. 6,262,058 and U.S. Patent No. 6,277,858. See these references for methods of preparation of compounds of component (1). The compounds of Formula I can also be referred to as 2-(R²)-3-(R¹)-pyrimidin-4(3H)-ones fused at the 5- and 6-positions to G(R³)(R⁴).

[0006] The dinitrophenolic compounds of Formula II can also be referred to as 1,3-dinitro-5-R⁵-benzenes further substituted at the 4-position with -OC(=O)J. The dinitrophenolic compounds of Formula III can also be referred to as 1,3-dinitro-5-R⁵-benzenes further substituted at the 2-position with -OC(=O)J.

[0007] Dinitrophenolic compounds of Formula II include a mixture comprising compounds of Formula II wherein J is 1-propenyl and R⁵ is octyl wherein "octyl" is a mixture of 1-methylheptyl, 1-ethylhexyl and 1-propylpentyl (Formula IIa). A compound of Formula IIa as a single compound is known as the Chemical Abstracts name (E)-2-(1-methylheptyl)-4,6-dinitrophenyl 2-butenolate (CAS Registry Number [131-72-6] and the mixture of octyl isomers with unstated stereochemistry has CAS Registry Number [39300-45-3].

[0008] Compounds of Formula IIa are commercially available in a mixture comprising 2.0-2.5 parts of Formula IIa to 1.0 parts of Formula IIIa that has the common name dinocap and the IUPAC name 2,6-dinitro-4-octylphenyl crotonates and 2,4-dinitro-6-octylphenyl crotonates in which 'octyl' is a mixture of 1-methylheptyl, 1-ethylhexyl and 1-propylpentyl groups.

[0009] Accordingly, component (2) can be provided by dinocap. Of note are compositions (e.g., mixtures comprising dinocap) that comprise a compound of Formula II and a compound of Formula III. Dinocap is disclosed in U.S. Patent No. 2,526,660 and U.S. Patent No. 2,810,767 as a fungicide and acaricide.

[0010] Dinitrophenolic compounds of Formula II also include a compound of Formula II wherein J is OCH(CH₃)₂ and
R² is CH(CH₃)CH₂CH₃ (Formula IIb). Formula IIb is also known as the Chemical Abstracts name 1-methylethyl 2-(1-methylpropyl)-4,6-dinitrophenyl carbonate (CAS Registry Number [973-21-7], the IUPAC name 2-sec-butyl-4,6-dinitrophenyl isopropyl carbonate and the common name dinobuton.

[0012] In the above recitations, the term "alkyl", used either alone or in compound words such as "alkylthio" includes straight-chain or branched alkyl, such as methyl, ethyl, n-propyl, i-propyl, or the different butyl, pentyl or hexyl isomers. "Alkenyl" includes straight-chain or branched alkenes such as ethenyl, 1-propenyl, 2-propenyl, and the different butenyl, pentenyl and hexenyl isomers. "Alkynyl" also includes polyenes such as 1,2-propadienyl and 2,4-hexadienyl. "Alkoxy" includes, for example, methoxy, ethoxy, n-propoxy, isopropoxy and the different butoxy, pentoxy and hexyloxy isomers. "Alkylthio" includes branched or straight-chain alkylthio moieties such as methylthio, ethylthio, and the different propylthio, butylthio, pentylthio and hexylthio isomers. "Cycloalkyl" includes, for example, cyclopropyl, cyclobutyl, cyclopentyl, and cyclohexyl. "Cycloalkylalkyl" includes alkyl groups substituted with cycloalkyl groups, for example, cyclopropylmethyl, cyclopropylethyl and cyclohexylmethyl.

[0013] The term "halogen" includes fluorine, chlorine, bromine or iodine.

[0014] The total number of carbon atoms in a substituent group is indicated by the "Cᵢ₋Cᵢ" prefix where i and j are numbers from 1 to 8. When a compound is substituted with a substituent bearing a subscript that indicates the number of said substituents can exceed 1, said substituents (when they exceed 1) are independently selected from the group of defined substituents. Further, when the subscript indicates a range, e.g. (R)ᵢ₋j then the number of substituents may be selected from the integers between i and j inclusive.

[0015] When a group contains a substituent which can be hydrogen, for example R⁴, then, when this substituent is taken as hydrogen, it is recognized that this is equivalent to said group being unsubstituted.

[0016] Compounds suitable for use in accordance with this invention can exist as one or more stereoisomers. The various stereoisomers include enantiomers, diastereomers, atropisomers and geometric isomers. One skilled in the art will appreciate that one stereoisomer may be more active and/or may exhibit beneficial effects when enriched relative to the other stereoisomer(s) or when separated from the other stereoisomer(s). Additionally, the skilled artisan knows how to separate, enrich, and/or to selectively prepare said stereoisomers. Accordingly, the present invention comprises compounds of Formula I, N-oxides and suitable salts thereof and Formula II. The compounds may be present as a mixture of stereoisomers, individual stereoisomers, or as optically active forms.

[0017] One skilled in the art will appreciate that not all nitrogen containing heterocycles can form N-oxides since the nitrogen requires an available lone pair for oxidation to the oxide; one skilled in the art will recognize those nitrogen containing heterocycles which can form N-oxides. One skilled in the art will also recognize that tertiary amines can form N-oxides. Synthetic methods for the preparation of N-oxides of heterocycles and tertiary amines are very well known by one skilled in the art including the oxidation of heterocycles and tertiary amines with peroxy acids such as peracetic and m-chloroperbenzoic acid (MCPBA), hydrogen peroxide, alky hydroperoxides such as 1-butyl hydroperoxide, sodium perborate, and dioxiranes such as dimethyldioxirane. These methods for the preparation of N-oxides have been extensively described and reviewed in the literature, see for example: T. L. Gilchrist in Comprehensive Organic Synthesis, vol. 7, pp 748-750, S. V. Ley, Ed., Pergamon Press; M. Tisler and B. Stanovnik in Comprehensive Heterocyclic Chemistry, vol. 3, pp 18-20, A. J. Boulton and A. McKillop, Eds., Pergamon Press; M. R. Grimmett and B. R. T. Keene in Advances in Heterocyclic Chemistry, vol. 43, pp 149-161, A. R. Katritzky, Ed., Academic Press; M. Tisler and B. Stanovnik in Advances in Heterocyclic Chemistry, vol. 9, pp 285-291, A. R. Katritzky and A. J. Boulton, Eds., Academic Press; and G. W. H. Cheeseman and E. S. G. Wersstiuk in Advances in Heterocyclic Chemistry, vol. 22, pp 390-392, A. R. Katritzky and A. J. Boulton, Eds., Academic Press.

[0018] The salts of the compounds comprising this invention include acid-addition salts with inorganic or organic acids such as hydrobromic, hydrochloric, nitric, phosphoric, sulfuric, acetic, butyric, fumaric, lactic, maleic, malonic, oxalic, propionic, salicylic, tartaric, 4-toluenesulfonic or valeric acids. The salts of the compounds comprising this invention also include those formed with organic bases (e.g., pyridine, ammonia, or triethylamine) or inorganic bases (e.g., hydrides,
hydroxides, or carbonates of sodium, potassium, lithium, calcium, magnesium or barium) when the compound contains an acidic group such as a carboxylic acid or phenol.

[0019] Preferred compositions for reasons of cost, ease of synthesis and/or biological efficacy are:

[0020] Preferred 1. Compositions comprising Formula I above as component (1), and suitable salts thereof, wherein R¹ is propyl or cyclopropylmethyl; and R² is propyloxy or propylthio.

[0021] Of note are pyrimidinone fungicides of Formula I selected from the group consisting of 6-bromo-3-propyl-2-propyloxy-4(3H)-quinazolinone, 6,8-diiodo-3-propyl-2-propyloxy-4(3H)-quinazolinone, 6-iodo-3-propyl-2-propyloxy-4(3H)-quinazolinone, 6-chloro-2-propoxy-3-propylthieno[2,3-d]pyrimidin-4(3H)-one, 6-bromo-2-propoxy-3-propylthieno[2,3-d]pyrimidin-4(3H)-one, 7-bromo-2-propoxy-3-propylthieno[3,2-d]pyrimidin-4(3H)-one, 6-bromo-2-propoxy-3-propylpyrido[2,3-d]pyrimidin-4(3H)-one, 6,7-dibromo-2-propoxy-3-propylthieno[3,2-d]pyrimidin-4(3H)-one, and 3-(cyclopropylmethyl)-6-iodo-2-(propylthio)pyrido[2,3-d]pyrimidin-4(3H)-one.

[0022] Preferred 2. Compositions of Preferred 1 wherein component (2) is provided by dinocap.

[0023] Preferred 3. Compositions of Preferred 2 wherein G is a fused phenyl or thiophene ring; R¹ is propyl; R² is propyloxy; R³ is Cl, Br or I in the 6-position; and R⁴ is hydrogen.

[0024] Preferred 4. Compositions of Preferred 2 wherein component (1) comprises 6-iodo-3-propyl-2-propyloxy-4(3H)-quinazolinone or 6-chloro-2-propoxy-3-propylthieno[2,3-d]pyrimidin-4(3H)-one.

[0025] Preferred 5. Compositions of Preferred 4 wherein component (1) comprises 6-iodo-3-propyl-2-propyloxy-4(3H)-quinazolinone or 6-chloro-2-propoxy-3-propylthieno[2,3-d]pyrimidin-4(3H)-one.

[0026] Compositions include those where component (1) and component (2) are present in a fungicidally effective amount and the weight ratio of component (1) to component (2) is from about 1:100 to 1:5000. These compositions are considered to be particularly effective for controlling powdery mildew diseases. Of note are compositions where the weight ratio of component (1) to component (2) is from about 1:125 to 1:4000.

[0027] This invention also relates to methods for controlling plant diseases caused by fungal plant pathogens comprising applying to the plant or portion thereof, or to the plant seed or seedling, fungidically effective amounts of the compositions of the invention (e.g., as a composition described herein). The preferred methods of use include those involving the above preferred compositions; and the diseases controlled with particular effectiveness include powdery mildew diseases. Combinations of fungicides used in accordance with this invention can be used to facilitate disease control and to retard resistance development.

Synergistic Effects

[0028] Fungicides that effectively control plant fungi, particularly wheat powdery mildew (Erysiphe graminis) are in constant demand by growers. Combinations of fungicides are often used to facilitate disease control and to retard resistance development. Mixtures of fungicides may provide significantly better disease control than could be predicted based on the activity of the individual components. This synergism has been described as "the cooperative action of two components of a mixture, such that the total effect is greater or more prolonged than the sum of the effects of the two (or more) taken independently" (see Tames, P. M. L., Neth. J. Plant Pathology, (1964), 70, 73-80). It has been demonstrated that compositions containing compounds exhibit synergistic effects.

\[ p = A + B - \left[ \frac{A \times B}{100} \right] \]

[0030] Using the methods of the Colby, the presence of a synergistic interaction between two active ingredients is established by first calculating the predicted activity, p, of the mixture based on activities of the two components applied alone. If p is lower than the experimentally established effect, synergism has occurred. In the equation above, A is the fungicidal activity in percentage control of one component applied alone at rate x. The B term is the fungicidal activity in percentage control of the second component applied at rate y. The equation estimates p, the fungicidal activity of the mixture of A at rate x with B at rate y if their effects are strictly additive and no interaction has occurred.
The Colby equation for a three-way mixture is

$$p = A + B + C + \frac{A \times B \times C}{10000} - \frac{(A \times B) + (A \times C) + (B \times C)}{100}$$

wherein A, B and C are the fungicidal activities of the three components respectively.

Compositions are provided in accordance with this invention that comprise proportions of component (1) and component (2) that are especially useful for controlling particular fungal diseases. These compositions are considered especially useful for controlling wheat powdery mildew (*Erysiphe graminis*).

In this application, fungicidal activities provided by compositions of component (1) (Formula I compounds) and component (2) (Formula II compounds) alone are compared with that of compositions of component (1) and component (2) together. Based on the description of synergism developed by Colby, compositions of the present invention are considered to be synergistically useful. Accordingly, this invention provides an improved method of combating powdery mildew diseases, such as wheat powdery mildew (*Erysiphe graminis*) in crops, especially cereals.

**Formulation/Utility**

This invention provides fungicidal compositions comprising fungicidally effective amounts of the combinations of the invention and at least one additional component selected from the group consisting of surfactants, solid diluents or liquid diluents and/or at least one other fungicide having a different mode of action.

The fungicidal compositions of the present invention comprise an effective amount of a mixture of the compounds (s) of component (1) (e.g., 6-iodo-3-propyl-2-propyloxy-4(3H)-quinazolinone -- Compound 1 of Index Table A below) and the compound(s) of component (2) (e.g., dinocap). The mixtures of this invention will typically be used as a formulation or composition with an agriculturally suitable carrier comprising at least one of a liquid diluent, a solid diluent or a surfactant. Accordingly, compositions are provided which comprise, in addition to a fungicidally effective amount of the active compound(s), at least one additional component selected from the group consisting surfactants, solid diluents and liquid diluents. The formulation or composition ingredients are selected to be consistent with the physical properties of the active ingredient, mode of application and environmental factors such as soil type, moisture and temperature. Useful formulations include liquids such as solutions (including emulsifiable concentrates), suspensions, emulsions (including microemulsions and/or suspesoemulsions) and the like which optionally can be thickened into gels. Useful formulations further include solids such as dusts, powders, granules, pellets, tablets, films, and the like which can be water-dispersible ("wettable") or water-soluble. Active ingredients can be (micro)encapsulated and further formed into a suspension or solid formulation; alternatively the entire formulation of the active ingredients can be encapsulated (or "overcoated"). Encapsulation can control or delay release of the active ingredients. Sprayable formulations can be extended in suitable media and used at spray volumes from about one to several hundred liters per hectare. High-strength compositions are primarily used as intermediates for further formulation.

The formulations will typically contain effective amounts of active ingredients, diluent and/or surfactant within the following approximate ranges which add up to 100 percent by weight.

corrosion, microbiological growth and the like, or thickeners to increase viscosity.

**[0038]** Surfactants include, for example, polyethoxylated alcohols, polyethoxylated alkylphenols, polyethoxylated sorbitan fatty acid esters, dialkyl sulfosuccinates, alkyl sulfates, alkylbenzene sulfonates, organosilicones, N,N-dialkyltaurates, lignin sulfonates, naphthalene sulfonate formaldehyde condensates, polycarboxylates, and polyoxyethylene/polyoxypropylene block copolymers. Solid diluents include, for example, clays such as bentonite, montmorillonite, attapulgite and kaolin, starch, sugar, silica, talc, diatomaceous earth, urea, calcium carbonate, sodium carbonate and bicarbonate, and sodium sulfate. Liquid diluents include, for example, water, N,N-dimethylformamide, dimethyl sulfoxide, N-alkylpyrrolidone, ethylene glycol, polyethylene glycol, paraffins, alkylbenzenes, alklynapthalenes, oils of olive, castor, linseed, tung, sesame, corn, peanut, cotton-seed, soybean, rape-seed and coconut (which can be methylated), fatty acid esters, ketones such as cyclohexanone, 2-heptanone, isophorone and 4-hydroxy-4-methyl-2-pentanone, and alcohols such as methanol, cyclohexanol, decanol and tetrahydrofurfuryl alcohol.

**[0039]** Solutions, including emulsifiable concentrates, can be prepared by simply mixing the ingredients. Dusts and powders can be prepared by blending and, usually, grinding as in a hammer mill or fluid-energy mill. Suspensions are usually prepared by wet-milling; see, for example, U.S. 3,060,084. Granules and pellets can be prepared by spraying the active materials upon preformed granular carriers or by agglomeration techniques. See Browning, "Agglomeration", *Chemical Engineering*, December 4, 1967, pp 147-48; *Perry’s Chemical Engineer’s Handbook* 4th Ed., McGraw-Hill, New York, 1963, pages 8-57 and following, and WO 91/13546. Pellets can be prepared as described in U.S. 4,172,714. Water-dispersible and water-soluble granules can be prepared as taught in U.S. 4,144,050, U.S. 3,920,442 and DE 3,246,493. Tablets can be prepared as taught in U.S. 5,180,587, U.S. 5,232,701 and U.S. 5,208,030. Films can be prepared as taught in GB 2,095,558 and U.S. 3,299,566.

via potent, differentiation-specific, inhibition of the infection process. Compounds of component (2) (e.g. dinocap) of this invention are considered to uncouple mitochondrial oxidative phosphorylation. In certain instances, combinations with other fungicides having a different mode of action will be particularly advantageous for resistance management (especially if the other fungicide also has a similar spectrum of control). Of particular note are compositions which in addition to component (1) and component (2) include (3) at least one other fungicide useful in controlling a powdery mildew disease but having a different mode of action from those of component (1) and component (2). Examples of other fungicides having different mode of actions include compounds acting at the $bc_1$ complex of the fungal mitochondrial respiratory electron transfer site, compounds acting at the demethylase enzyme of the sterol biosynthesis pathway and morpholine and piperidine compounds that act on the sterol biosynthesis pathway.

The $bc_1$ Complex Fungicides

[0048] Of note are combinations including component (1), component (2) and at least one strobilurin fungicide. Strobilurin fungicides such as azoxystrobin, dimoxystrobin (SSF-129), fluoxastrobin, kresoxim-methyl, metominostrobin/fenominostrobin (SSF-126), orysastrobin, picoxystrobin, pyraclostrobin and trifloxystrobin are known to have a fungicidal mode of action which inhibits the cytochrome $bc_1$ complex in the mitochondrial respiration chain (Angew. Chem. Int. Ed., 1999, 38, 1328-1349). Methyl (E)-2-[[6-(2-cyanophenox)-4-pyrimidinyl]oxy]-α-((methoxyimino)benzeneacetate (also known as azoxystrobin) is described as a $bc_1$ complex inhibitor in Biochemical Society Transactions 1993, 22, 68S. Methyl (E)-α-((methoxyimino)-2-[[2-methylphenoxymethyl]benzeneacetate (also known as kresoxim-methyl) is described as a $bc_1$ complex inhibitor in Biochemical Society Transactions 1993, 22, 64S. (E)-2-[[2,5-Dimethylphenoxymethyl]-α-((methoxyimino))-N-methylbenzeneacetic acid is described as a $bc_1$ complex inhibitor in Biochemistry and Cell Biology 1995, 85(3), 306-311.

[0049] Famoxadone and fenamidone are other compounds that inhibit the $bc_1$ complex in the mitochondrial respiration chain. Of note are combinations including component (1), component (2) and at least one strobilurin fungicide (e.g. dinocap) from the group consisting of famoxadone and fenamidone.

[0050] The $bc_1$ complex is sometimes referred to by other names in the biochemical literature, including complex III of the electron transfer chain, and ubihydroquinone:cytochrome c oxidoreductase. It is uniquely identified by the Enzyme Commission number EC 1.10.2.2. The $bc_1$ complex is described in, for example, J. Biol. Chem. 1989, 264, 14543-38; Methods Enzymol. 1986, 126, 253-71; and references cited therein. The Fungicide Resistance Action Committee (FRAC) of the Global Crop Protection Federation (GCPF) refers to compounds that inhibit the $bc_1$ complex as Qo inhibitors (QoI) since they all act at the Quinol "outer" (Qo) binding site of the cytochrome $bc_1$ complex.

The Sterol Biosynthesis Inhibitor (SBI) Fungicides

[0051] The class of sterol biosynthesis inhibitors includes DMI and non-DMI compounds, that control fungi by inhibiting enzymes in the sterol biosynthesis pathway. FRAC groups these fungicides together as SBI fungicides. DMI fungicides have a common site of action within the fungal sterol biosynthesis pathway; that is, an inhibition of demethylation at position 14 of lanosterol or 24-methylene dihydrolanosterol, which are precursors to sterols in fungi. Compounds acting at this site are often referred to as demethylase inhibitors, DMI fungicides, or DMIs. The demethylase enzyme is sometimes referred to by other names in the biochemical literature, including complex II of the electron transfer chain, and ubihydroquinone:cytochrome c oxidoreductase. It is uniquely identified by the Enzyme Commission number EC 1.10.2.2. The $bc_1$ complex is described in, for example, J. Biol. Chem. 1992, 267, 13175-79 and references cited therein. DMI fungicides fall into several classes: azoles (including triazoles and imidazoles), pyrimidines, piperazines and pyridines. The triazoles include bromuconazole, cyproconazole, difenoconazole, diniconazole, epoxiconazole, fenbuconazole, fluquinconazole, flusilazole, flutriafol, hexaconazole, ipconazole, miconazole, propiconazole, prothioconazole, tebuconazole, tetraconazole, triadimefon, triadimenol, triticonazole and uniconazole. The imidazoles include clotrimazole, econazole, flusilazole, imazalil, isocianazole, miconazole and prochloraz. Of particular note are combinations including component (1), component (2) and at least one azole fungicide. The pyrimidines include fenamidone and pyrifenox. Biochemical investigations have shown that all of the above mentioned fungicides are DMI fungicides as described by K. H. Kuck, et al. in Modern Selective Fungicides - Properties, Applications and Mechanisms of Action, Lyr, H., Ed.; Gustav Fischer Verlag: New York, 1995, 205-258.

[0052] The DMI fungicides have been grouped together to distinguish them from other sterol biosynthesis inhibitors, such as the morpholine and piperidine fungicides and spiroxamine (commonly grouped together by FRAC as the so-called "morpholine" fungicides). The morpholines include aldimorph, dodemorph, fenpropimorph, triodemorph and tri-morphamide. The piperidines include fenpropidin. Spiroxamine is a piroketalamine. The "morpholines" are also sterol biosynthesis inhibitors but have been shown to inhibit other steps in the sterol biosynthesis pathway. Biochemical investigations have shown that all of the above mentioned "morpholine" fungicides are sterol biosynthesis inhibitor fungicides as described by K. H. Kuck, et al. in Modern Selective Fungicides - Properties, Applications and Mechanisms of Action, Lyr, H., Ed.; Gustav Fischer Verlag: New York, 1995, 185-204. They inhibit to a variable degree the DDM7 complex.
Advantageous methods include those where component (1) and component (2) are added in amounts sufficient to provide a fungicidal effectiveness greater than the sum of the fungicidal effectiveness provided by those amounts of component (1), component (2) and at least one other fungicide having a different mode of action.

Preferred for better control of plant diseases caused by fungal plant pathogens (e.g., lower use rate or broader spectrum of plant pathogens controlled) or resistance management are mixtures of component (1) (e.g. Compound 1) and component (2) (e.g. dinocap) with a fungicide selected from the group consisting of azoxytrobin, kresoxim-methyl, trifloxystrobin, pyraclostrobin, picoxytrobin, dimoxytrobin (SSF-129), metominostrobin/fenominostrobin (SSF-126), quinoxyfen, metrafenon, cyflufenamid, fenpropidine, fenpropimorph, spiroxamine, bromuconazole, cyproconazole, difenoconazole, epoxiconazole, fenbucnazole, fluquinconazole, flusilazole, hexaconazole, ipconazole, metconazole, penconazole, propiconazole, tebuconazole, triticonazole, prochloraz or nicobifen.

Of note are combinations including component (1) and component (2) (e.g. Compound 1) and component (2) (e.g. dinocap) with azoxytrobin, kresoxim-methyl, trifloxystrobin, pyraclostrobin, picoxytrobin, dimoxytrobin (SSF-129), metominostrobin/fenominostrobin (SSF-126), quinoxyfen, metrafenon, cyflufenamid, fenpropidine, fenpropimorph, spiroxamine, bromuconazole, cyproconazole, difenoconazole, epoxiconazole, fenbucnazole, fluquinconazole, flusilazole, hexaconazole, ipconazole, metconazole, penconazole, propiconazole, tebuconazole, triticonazole, prochloraz or nicobifen.

For example, this invention provides methods for controlling plant diseases caused by fungal plant pathogens comprising applying to the plant or portion thereof to be protected, or to the plant seed or seedling to be protected, an effective amount of a fungicidal composition comprising component (1), component (2), and at least one “morpholine” fungicide.

This invention also provides a method for controlling plant diseases caused by fungal plant pathogens comprising applying to the plant or portion thereof, or to the plant seed or seedling to be protected, one said components taken independently.

Plant disease control is ordinarily accomplished by applying an effective amount of a composition of this invention either pre- or post-infection, to the portion of the plant to be protected such as the roots, stems, foliage, fruit,
seeds, tubers or bulbs, or to the media (soil or sand) in which the plants to be protected are growing. The compositions can also be applied to the seed to protect the seed and seedling. The compositions of this invention are particularly useful when applied pre-infection. The fungicidal compositions of this invention may also comprise (in addition to comprising fungicidally effective amounts of the combination of component (1) and component (2)) at least one additional component selected from the group consisting of surfactants, solid diluents or liquid diluents and/or at least one other fungicide having a different mode of action.

[0060] Rates of application for these compositions can be influenced by many factors of the environment and should be determined under actual use conditions. Foliage can normally be protected when treated at a rate of from less than 1 g/ha to 5,000 g/ha of active ingredients. Seed and seedlings can normally be protected when seed is treated at a rate of from 0.1 to 10 g per kilogram of seed.

[0061] See Index Table A for descriptions of selected component (1) compounds.
[0062] Component (2) compounds are available commercially, typically in a formulation. Of particular note, dinocap is commercially available as a 19.5% wettable powder formulation known as Karathane®.

[0063] Without further elaboration, it is believed that one skilled in the art using the preceding description can utilize the present invention to its fullest extent. The following Example is, therefore, to be construed as merely illustrative and not limiting of the disclosure in any way whatsoever. Percentages are by weight except where otherwise indicated.

**EXAMPLE 1**

[0064] The following TESTS demonstrate the control efficacy of compounds of this invention on a specific pathogen. The pathogen control protection afforded by the compounds is not limited, however, to this species.

[0065] Test solutions or suspensions comprising a single active ingredient are sprayed to demonstrate the control efficacy of the active ingredient individually. To demonstrate the control efficacy of a combination, (a) the active ingredients can be combined in the appropriate amounts in a single test suspension, (b) stock solutions of individual active ingredients can be prepared and then combined in the appropriate ratio, and diluted to the final desired concentration to form a test suspension or (c) test suspensions comprising single active ingredients can be sprayed sequentially in the desired ratio.

[0066] General protocol for preparing test suspensions:

[0067] The component (1) compounds can be formulated prior to application in these tests. An example formulation is Example E.
Example E

[0068] The formulation containing a compound of component (1) is dissolved in water to form a stock solution. For testing component (1) individually the stock solution is diluted to the final desired concentration to form a test solution. For example, the compositions of component (1) (e.g., Compound 1 of Index Table A), either alone or in combination, are sprayed at 0.08 or 0.4 ppm to the point of run-off on the test plants, equivalent to a rate of 0.2 or 1 g/ha, respectively.

[0070] The commercially available formulation of component (2) (e.g. the Karathane® 19.5% wettable powder formulation of dinocap) is suspended in water to form a stock suspension. For testing component (2) individually the stock suspension is diluted to the final desired concentration to form a test suspension. For example, dinocap, either alone or in combination, is sprayed at 10, 40 or 200 ppm to the point of run-off on the test plants, equivalent to a rate of 25, 100 or 500 g/ha, respectively.

[0071] For testing combinations, the stock suspensions of the individual active ingredients prepared as above are then combined in the appropriate ratio, and diluted to the final desired concentration to form a test suspension.

[0072] The resulting test suspensions are then used in the following tests. Test suspensions are sprayed to the point of run-off on the test plants at the rates of active ingredient described below. The tests were replicated three times and the results reported as the average of the three replicates.

TEST A

[0073] The test suspension was sprayed to the point of run-off on wheat seedlings. The following day the seedlings were inoculated with a spore dust of *Erysiphe graminis f. sp. tritici,* (the causal agent of wheat powdery mildew) and incubated in a growth chamber at 20 °C for 8 days, after which disease ratings were made.

[0074] Results for Test A are given in Table A. In the table, a rating of 100 indicates 100% disease control and a rating of 0 indicates no disease control (relative to the controls). Columns labeled Observed Disease Control indicate the average of three replications. Columns labeled Expected Disease Control indicate the expected value for each treatment mixture using the Colby equation. A "-" indicates that an expected value is not calculated using the Colby equation for single-compound tests. Tests demonstrating control greater than expected are indicated with *.

Based on the description of synergism developed by Colby, compositions of the present invention are considered to be synergistically useful. Accordingly, this invention provides an improved method of combating powdery mildew diseases, such as wheat powdery mildew (Erysiphe graminis) in crops, especially cereals.

Claims

1. A synergistic fungicidal composition comprising:

   (1) at least one compound selected from the fused pyrimidinones of Formula I, N-oxides, and suitable salts thereof,

   \[
   \begin{align*}
   &\text{G is a fused phenyl, thiophene or pyridine ring;} \\
   &\text{R}^1 \text{ is C}_1\text{-C}_6 \text{ alkyl or C}_4\text{-C}_7 \text{ cycloalkylalkyl;} \\
   &\text{R}^2 \text{ is C}_1\text{-C}_6 \text{ alkyl, C}_1\text{-C}_6 \text{ alkoxy or C}_1\text{-C}_6 \text{ alkylthio;} \\
   &\text{R}^3 \text{ is halogen; and} \\
   &\text{R}^4 \text{ is hydrogen or halogen; and}
   \end{align*}
   \]

   (2) at least one dinitrophenolic compound selected from the group consisting of compounds of Formula II and compounds of Formula III

   \[
   \begin{align*}
   &\text{J is C}_1\text{-C}_6 \text{ alkyl, C}_1\text{-C}_6 \text{ alkoxy or C}_2\text{-C}_6 \text{ alkenyl;} \\
   &\text{R}^5 \text{ is C}_1\text{-C}_8 \text{ alkyl.}
   \end{align*}
   \]

2. A composition of Claim 1 wherein in component (1), R\(^1\) is propyl or cyclopropylmethyl and R\(^2\) is propyloxy or propylthio.

3. A composition of Claim 1 or Claim 2 wherein component (2) is provided by dinocap.

4. A composition of Claim 2 or Claim 3 wherein component (1) comprises a compound selected from the group consisting of 6-bromo-3-propyl-2-propyloxy-4(3\(H\))-quinazolinone, 6,8-diido-3-propyl-2-propyloxy-4(3\(H\))-quinazolinone,
6-iodo-3-propyl-2-propyloxy-4(3H)-quinazolinone,
6-chloro-2-propoxy-3-propylthieno[2,3-d]pyrimidin-4(3H)-one,
6-bromo-2-propoxy-3-propylthieno[2,3-d]pyrimidin-4(3H)-one,
7-bromo-2-propoxy-3-propylthieno[3,2-d]pyrimidin-4(3H)-one,
6-bromo-2-propoxy-3-propylpyrido[2,3-d]pyrimidin-4(3H)-one,
6,7-dibromo-2-propoxy-3-propylthieno[3,2-d]pyrimidin-4(3H)-one, and
3-(cyclopropylmethyl)-6-iodo-2-(propylthio)pyrido[2,3-d]pyrimidin-4(3H)-one.

5. A composition of Claim 3 wherein G is a fused phenyl or thiophene ring; R1 is propyl; R2 is propyloxy; R3 is Cl, Br or I in the 6-position; and R4 is hydrogen.

6. A composition of Claim 3 wherein component (1) comprises
6-iodo-3-propyl-2-propyloxy-4(3H)-quinazolinone or
6-chloro-2-propoxy-3-propylthieno[2,3-d]pyrimidin-4(3H)-one.

7. A composition of Claim 6 wherein component (1) comprises
6-iodo-3-propyl-2-propyloxy-4(3H)-quinazolinone.

8. A composition of any of Claims 1 to 7 which comprises a compound of Formula II and a compound of Formula III.

9. A composition of any of Claims 1 to 8 which further comprises (3) at least one other fungicide useful in controlling a powdery mildew disease but having a different mode of action from those of component (1) and component (2).

10. A composition of Claim 9 wherein component (3) includes at least one fungicide selected from the group consisting of compounds acting at the bc1 complex of the fungal mitochondrial respiratory electron transfer site, compounds acting at the demethylase enzyme of the sterol biosynthesis pathway and morpholine and piperidine compounds that act on the sterol biosynthesis pathway.

11. A method for controlling a powdery mildew plant disease caused by a fungal plant pathogen, comprising applying to the plant or portion thereof, or to the plant seed or seedling, a fungicidally effective amount of a composition of any of Claims 1 to 10.

12. The method of Claim 11 wherein wheat powdery mildew is controlled.

13. The method of Claim 11 wherein the fungal plant pathogen *Erysiphe graminis* is controlled.

**Patentansprüche**

1. Synergistische, fungizide Zusammensetzung, aufweisend:

(1) mindestens eine Verbindung, die ausgewählt ist aus kondensierten Pyrimidonen der Formel I, N-Oxiden und geeigneten Salzen davon:

![Chemical Structure](image)

worin sind:

G ein kondensierter Phenyl-, Thiophen- oder Pyridinring;
EP 1 511 380 B1

R¹ ein C₁-C₆-Alkyl oder C₄-C₇-Cycloalkylalkyl;
R² ein C₁-C₆-Alkyl, C₁-C₆-Alkoxy oder C₁-C₆-Alkylthio;
R³ Halogen und
R⁴ Wasserstoff oder Halogen; sowie

(2) mindestens eine Dinitrophenol-Verbindung, ausgewählt aus der Gruppe, bestehend aus Verbindungen der Formel II und Verbindungen der Formel III:

![Chemical Structures](image)

worin sind:

J C₁-C₆-Alkyl, C₁-C₆-Alkoxy oder C₂-C₆-Alkenyl und
R⁵ ist C₁-C₈-Alkyl

2. Zusammensetzung nach Anspruch 1, worin in Komponente (1) R¹ Propyl oder Cyclopropylmethyl ist und R² Propyloxy oder Propylvio ist.

3. Zusammensetzung nach Anspruch 1 oder 2, worin Komponente (2) bereitgestellt wird durch Dinocap.

4. Zusammensetzung nach Anspruch 2 oder 3, worin Komponente (1) eine Verbindung aufweist, die ausgewählt ist aus der Gruppe, bestehend aus:

- 6-Brom-3-propyl-2-propyloxy-4(3H)-chinazolinon,
- 6,8-Diod-3-propyl-2-propyloxy-4(3H)-chinazolinon,
- 6-Iod-3-propyl-2-propyloxy-4(3H)-chinazolinon,
- 6-Chlor-2-propoxy-3-propylthieno[2,3-d]pyrimidin-4(3H)-on,
- 6-Brom-2-propoxy-3-propylthieno[2,3-d]pyrimidin-4(3H)-on,
- 7-Brom-2-propoxy-3-propylthieno[3,2-d]pyrimidin-4(3H)-on,
- 6-Brom-2-propoxy-3-propylpyrido[2,3-d]pyrimidin-4(3H)-on,
- 6,7-Dibrom-2-propoxy-3-propylthieno[3,2-d]pyrimidin-4(3H)-on und
- 3-(Cyclopropylmethyl)-6-Iod-2-(propylthio)pyrido[2,3-d]pyrimidin-4(3H)-one.

5. Zusammensetzung nach Anspruch 3, worin G ein kondensierter Phenyl- oder Thiophenring ist; R¹ ist Propyl; R² ist Propyloxy; R³ ist Cl, Br oder I in 6-Stellung; und R⁴ ist Wasserstoff.

6. Zusammensetzung nach Anspruch 3, worin Komponente (1) aufweist:

- 6-Iod-3-propyl-2-propyloxy-4(3H)-chinazolinon oder
- 6-Chlor-2-propoxy-3-propylthieno[2,3-d]pyrimidin-4(3H)-on.

7. Zusammensetzung nach Anspruch 6, worin Komponente (1) aufweist:

- 6-Iod-3-propyl-2-propyloxy-4(3H)-chinazolinon.

8. Zusammensetzung nach einem der Ansprüche 1 bis 7, die eine Verbindung der Formel II aufweist und eine Verbindung der Formel III aufweist.

9. Zusammensetzung nach einem der Ansprüche 1 bis 8, ferner aufweisend (3) mindestens ein anderes Fungizid, das zum Bekämpfen einer Mehltau-Erkrankung verwendbar ist, das jedoch gegenüber denen der Komponente (1)
und Komponente (2) ein anderes Wirkungsprinzip hat.

10. Zusammensetzung nach Anspruch 9, worin Komponente (3) mindestens ein Fungizid einschließt, das ausgewählt ist aus der Gruppe, bestehend aus Verbindungen, die an dem $bc_1$-Komplex der pilzlich-mitochondrischen, respiratorischen Elektronentransferstelle wirken; aus Verbindungen, die auf das Demethylase-Enzym des Sterol-Biosynthезeweges wirken; sowie aus Morpholin- und Piperidin-Verbindungen, die auf den Sterol-Biosynthезeweg wirken.

12. Verfahren nach Anspruch 11, wobei der Weizenmehltau bekämpft wird.

13. Verfahren nach Anspruch 11, wobei das pilzliche Pflanzenpathogen *Erysiphe graminis* bekämpft wird.

**Revendications**

1. Composition fongicide synergique comprenant:

   (1) au moins un composé choisi parmi les pyrimidinones condensées de formule I, les N-oxydes, et les sels appropriés de ceux-ci,

   ![Diagramme I](image1)

    dans laquelle

   G représente un cycle phényle, thiophène ou pyridine condensé;
   R¹ représente un groupe alkyle en C₁-C₆ ou cycloalkylalkyle en C₄-C₇;
   R² représente un groupe alkyle en C₁-C₆, alcoxy en C₁-C₆ ou alkylthio en C₁-C₆;
   R³ représente un atome d’halogène; et
   R⁴ représente un atome d’hydrogène ou d’halogène; et

   (2) au moins un composé dinitrophénolique choisi parmi le groupe constitué des composés de formule II et des composés de formule III

   ![Diagramme II and III](image2)

    dans lesquelles

   J représente un groupe alkyle en C₁-C₆, alcoxy en C₁-C₆ ou alcényle en C₂-C₆; et
   R⁵ représente un groupe alkyle en C₁-C₆.
2. Composition selon la revendication 1, dans laquelle dans le composant (1), R₁ représente un groupe propyle ou cyclopropylméthyle et R² représente un groupe propyloxy ou propylthio.

3. Composition selon la revendication 1 ou la revendication 2, dans laquelle le composant (2) est fourni par le dinocap.

4. Composition selon la revendication 2 ou la revendication 3, dans laquelle le composant (1) comprend un composé choisi parmi le groupe constitué de
la 6-bromo-3-propyl-2-propyloxy-4(3H)-quinazolinone,
la 6,8-diiodo-3-propyl-2-propyloxy-4(3H)-quinazolinone,
la 6-iodo-3-propyl-2-propyloxy-4(3H)-quinazolinone,
la 6-chloro-2-propoxy-3-propylthiéno[2,3-d]pyrimidin-4(3H)-one
la 6-bromo-2-propoxy-3-propylthiéno[2,3-d]pyrimidin-4(3H)-one,
la 7-bromo-2-propoxy-3-propylthiéno[3,2-d]pyrimidin-4(3H)-one,
la 6-bromo-2-propoxy-3-propylpyrido[2,3-d]pyrimidin-4(3H)-one,
la 6,7-dibromo-2-propoxy-3-propylthiéno[3,2-d]pyrimidin-4(3H)-one, et
la 3-(cyclopropylméthyl)-6-iodo-2-(propylthio)pyrido[2,3-d]pyrimidin-4(3H)-one.

5. Composition selon la revendication 3, dans laquelle G représente un cycle phényle ou thiophène condensé; R₁ représente un groupe propyle; R² représente un groupe propyloxy; R³ représente un atome de Cl, Br ou I en position 6; et R⁴ représente un atome d’hydrogène.

6. Composition selon la revendication 3, dans laquelle le composant (1) comprend de la 6-iodo-3-propyl-2-propyloxy-4(3H)-quinazolinone ou de la 6-chloro-2-propoxy-3-propylthiéno[2,3-d]pyrimidin-4(3H)-one.

7. Composition selon la revendication 6, dans laquelle le composant (1) comprend de la 6-iodo-3-propyl-2-propyloxy-4(3H)-quinazolinone.

8. Composition selon l’une quelconque des revendications 1 à 7, qui comprend un composé de formule II et un composé de formule III.

9. Composition selon l’une quelconque des revendications 1 à 8, qui comprend en outre (3) au moins un autre fongicide utile pour contrôler une maladie de mildiou pulvérulent mais ayant un mode d’action différent de ceux du composant (1) et du composant (2).

10. Composition selon la revendication 9, dans laquelle le composant (3) inclut au moins un fongicide choisi parmi le groupe constitué des composés agissant aux complexes bc, du site de transfert d’électron respiratoire mitochondrial fongique, des composés agissant au niveau de l’enzyme déméthylase de la voie de biosynthèse des stérols et des composés morpholine et pipéridine qui agissent sur la voie de biosynthèse des stérols.

11. Procédé de régulation d’une maladie végétale de mildiou pulvérulent provoquée par un pathogène végétal fongique, comprenant l’application à la plante ou à une partie de celle-ci, ou à la graine de la plante ou à la plantule, d’une quantité efficace au plan fongicide d’une composition selon l’une quelconque des revendications 1 à 10.

12. Procédé selon la revendication 11, dans lequel le mildiou pulvérulent du blé est contrôlé.

13. Procédé selon la revendication 11, dans lequel le pathogène végétal fongique Erysiphe graminis est contrôlé.
