The present invention relates to compounds of formula I, to pharmaceutical compositions containing them and their use in the treatment of neurological and neuropsychiatric disorders.

It has surprisingly been found that the compounds of general formula I are good inhibitors of the glycine transporter 1 (GlyT-1), and that they have a good selectivity to glycine transporter 2 (GlyT-2) inhibitors.

Schizophrenia is a progressive and devastating neurological disease characterized by episodic positive symptoms such as delusions, hallucinations, thought disorders and psychosis and persistent negative symptoms such as flattened affect, impaired attention and social withdrawal, and cognitive impairments (Lewis DA and Lieberman JA, Neuron, 2000, 28:325-33). For decades research has focused on the "dopaminergic hyperactivity" hypothesis which has led to therapeutic interventions involving blockade of the dopaminergic system (Vandenberg RJ and Aubrey KR., Exp. Opin. Ther. Targets, 2001, 5(4): 507-518; Nakazato A and Okuyama S, et al., 2000, Exp. Opin. Ther. Patents, 10 (1): 75-98). This pharmacological approach poorly address negative and cognitive symptoms which are the best predictors of functional outcome (Sharma T., Br. J. Psychiatry, 1999, 174(suppl. 28): 44-51).

A complementary model of schizophrenia was proposed in the mid-1960’ based upon the psychotomimetic action caused by the blockade of the glutamate system by compounds like phencyclidine (PCP) and related agents (ketamine) which are non-competitive NMDA receptor antagonists. Interestingly in healthy volunteers, PCP-induced psychotomimetic action incorporates positive and negative symptoms as well as cognitive dysfunction, thus closely resembling schizophrenia in patients (Javitt DC et al., 1999, Biol. Psychiatry, 45: 668-679 and refs. herein). Furthermore transgenic mice expressing reduced levels of the NMDAR1 subunit displays behavioral abnormalities similar to those observed in pharmacologically induced models of schizophrenia, supporting a model in which reduced NMDA receptor activity results in schizophrenia-like behavior (Mohn AR et al., 1999, Cell, 98: 427-236).

Glutamate neurotransmission, in particular NMDA receptor activity, plays a critical role in synaptic plasticity, learning and memory, such as the NMDA receptors appears to serve as a graded switch for gating the threshold of

Thus, increasing activation of NMDA receptors via GlyT-1 inhibition may lead to agents that treat psychosis, schizophrenia, dementia and other diseases in which cognitive processes are impaired, such as attention deficit disorders or Alzheimer's disease.

US 6,645,973 discloses spiro(2H-1-benzopyran-2,4-piperidine) derivatives and their use for the treatment of CNS disorders based on their glycine inhibitory activity, however, these compounds are different in structure.

Objects of the present invention are the compounds of formula I per se, the use of compounds of formula I and their pharmaceutically acceptable salts for the manufacture of medicaments for the treatment of diseases related to activation of NMDA receptors via Glyt-1 inhibition, their manufacture, medicaments based on a compound in accordance with the invention and their production as well as the use of compounds of formula I in the control or prevention of illnesses such as psychoses, disfunction in memory and learning, schizophrenia, dementia and other diseases in which cognitive processes are impaired, such as attention deficit disorders or Alzheimer's disease.

The preferred indications using the compounds of the present invention are schizophrenia, cognitive impairment and Alzheimer's disease.

with a compound of formula

in the presence of AcOH and TMS CN and then with a corresponding Grignard reagent of formula

to a compound of formula

![Chemical Structure](image)

wherein the substituents are as described above and hal is Cl, Br or I, and

b) if desired, separating the obtained racemic forms into corresponding enantiomers, and if desired, converting the compounds obtained into pharmaceutically acceptable acid addition salts.

[0029] The acid addition salts of the basic compounds of formula I may be converted to the corresponding free bases by treatment with at least a stoichiometric equivalent of a suitable base such as sodium or potassium hydroxide, potassium carbonate, sodium bicarbonate, ammonia, and the like.

[0030] The compounds of formula I may be prepared in accordance with process variants a) and b) and with the following schemes 1 and 2.

[0031] The starting material is commercially available or may be prepared in accordance with known methods.

[0032] The following abbreviations have been used:

- LDA = lithiumdiisopropylamide
- TMS CN = trimethylthiocyanat
- DCM = dichloromethane
- TFA = trifluoroacetic acid
- THF = tetrahydrofuran

[0033] Starting from an appropriately 1-protected-piperidine-4-ethylcarboxylate 1, treatment with an appropriate base, usually LDA, followed by treatment with an appropriately substituted nitro alkene 2 results in formation of the nitro alkane
Reduction to the amino group facilitated by Raney-Ni and hydrogen, usually at 60 bar pressure and at 55 °C in EtOH as solvent results in the formation of 4. Subsequent cyclisation by heating in toluene under reflux affords the amide 5. Removal of the protecting group under standard conditions (TFA treatment in DCM for R = Boc; or hydrogenolysis with Pd/C in DCM, MeOH for R = Bn) affords the diazaspiropiperidines 6 (Scheme 1).

wherein R is a N-protecting group, such as BOC or benzyl, and the other substituents are as described above.

Compounds of formula 6 are treated, under Strecker reaction conditions, with a compound of formula 7 in the presence of AcOH and a cyanide source (preferably TMSCN) to give a compound of formula 8, which are then treated, under Bruylant reaction conditions, with a corresponding Grignard reagent 9 to give compounds of formula 1 (Scheme 2). Strecker synthesis can also be carried out using suitable cyanating reagents (KCN, acetone cyanohydrin) according to known procedures at temperature ranges from 0 to 100 °C with reaction times between 30 min and 7 days. Bruylant reactions can be carried out using Grignard reagents prepared from Mg(0) or from i-PrMgCl or other known reagents in a suitable solvent such as tetrahydrofuran (THF). Suitable Grignard reagents are represented by formula R1-MgZ 9.
All compounds of formulas I, 3, 4, 5, 6 and 8 can be prepared in racemic form following the procedures described below and separated into chiral non-racemic enantiomers by preparative HPLC using either a Chiralpak OD or AD column (5 x 50 cm) at room temperature using an ethanol: heptane mobile phase with UV detection at 220 nM.

The compounds of formula I and their pharmaceutically usable addition salts possess valuable pharmacological properties. Specifically, it has been found that the compounds of the present invention are good inhibitors of the glycine transporter I (GlyT-1).

The compounds were investigated in accordance with the test given hereinafter.

Uptake buffer (UB): 150 mM NaCl, 10 mM Hepes-Tris, pH 7.4, 1 mM CaCl₂, 2.5 mM KCl, 2.5 mM MgSO₄, 10 mM (+) D-glucose.

Flip-in™-CHO (Invitrogen Cat n˚ R758-07)cells stably transfected with mGlyT1b cDNA.

Glycine uptake inhibition assay (mGlyT-1b)

On day 1 mammalian cells, (Flip-in™-CHO), transfected with mGlyT-lb cDNA, were plated at the density of 40,000 cells/well in complete F-12 medium, without hygromycin in 96-well culture plates. On day 2, the medium was aspirated and the cells were washed twice with uptake buffer (UB). The cells were then incubated for 20 min at 22°C with either (i) no potential competitor, (ii) 10 mM non-radioactive glycine, (iii) a concentration of a potential inhibitor. A range of concentrations of the potential inhibitor was used to generate data for calculating the concentration of inhibitor resulting in 50 % of the effect (e.g. IC₅₀, the concentration of the competitor inhibiting glycine uptake of 50 %). A solution was then immediately added containing [³H]-glycine 60 nM (11-16 Ci/mmol) and 25 μM non-radioactive glycine. The plates were incubated with gentle shaking and the reaction was stopped by aspiration of the mixture and washing (three times) with ice-cold UB. The cells were lysed with scintillation liquid, shaken 3 hours and the radioactivity in the cells was counted using a scintillation counter.

The following activity can be shown in mouse and human:
The compounds of formula I and the pharmaceutically acceptable salts of the compounds of formula I can be used as medicaments, e.g., in the form of pharmaceutical preparations. The pharmaceutical preparations can be administered orally, e.g., in the form of tablets, coated tablets, dragées, hard and soft gelatine capsules, solutions, emulsions or suspensions. The administration can, however, also be effected rectally, e.g., in the form of suppositories, parenterally, e.g., in the form of injection solutions.

The compounds of formula I can be processed with pharmaceutically inert, inorganic or organic carriers for the production of pharmaceutical preparations. Lactose, corn starch or derivatives thereof, talc, stearic acids or its salts and the like can be used, for example, as such carriers for tablets, coated tablets, dragées and hard gelatine capsules. Suitable carriers for soft gelatine capsules are, for example, vegetable oils, waxes, fats, semi-solid and liquid polyols and the like. Depending on the nature of the active substance no carriers are however usually required in the case of soft gelatine capsules. Suitable carriers for the production of solutions and syrups are, for example, water, polyols, glycerol, vegetable oil and the like. Suitable carriers for suppositories are, for example, natural or hardened oils, waxes, fats, semi-liquid or liquid polyols and the like.

The pharmaceutical preparations can, moreover, contain preservatives, solubilizers, stabilizers, wetting agents, emulsifiers, sweeteners, colorants, flavorants, salts for varying the osmotic pressure, buffers, masking agents or antioxidants. They can also contain still other therapeutically valuable substances.

Medicaments containing a compound of formula I or a pharmaceutically acceptable salt thereof and a therapeutically inert carrier are also an object of the present invention, as is a process for their production, which comprises bringing one or more compounds of formula I and/or pharmaceutically acceptable acid addition salts and, if desired, one or more other therapeutically valuable substances into a galenical administration form together with one or more therapeutically inert carriers.

The most preferred indications in accordance with the present invention are those, which include disorders of the central nervous system, for example the treatment or prevention of schizophrenia, cognitive impairment and Alzheimer’s disease.

The dosage can vary within wide limits and will, of course, have to be adjusted to the individual requirements in each particular case. In the case of oral administration the dosage for adults can vary from about 0.01 mg to about 1000 mg per day of a compound of general formula I or of the corresponding amount of a pharmaceutically acceptable salt thereof. The daily dosage may be administered as single dose or in divided doses and, in addition, the upper limit can also be exceeded when this is found to be indicated.

The following examples illustrate the present invention without limiting it. All temperatures are given in degree Celsius.

[0066] To a solution of 3-iodotoluene (388 mg, 1.8 mmol) in dry THF (6 mL) under argon at - 60 °C was added isopropylmagnesium chloride (2 M solution in THF, 977 uL, 2.0 mmol) and the resulting solution allowed to warm up to 0 °C over 1 h and then to room temperature over 10 min. The resulting solution was then added dropwise to a solution of rac-1-(1-oxo-4-phenyl-2,8-diaza-spiro[4.5]dec-8-yl)-cyclohexanecarbonitrile (200 mg, 0.6 mmol) in dry THF (3 mL) and the solution stirred overnight at room temperature. The reaction was quenched by the addition of ammonium chloride solution (sat., 10 mL) and the product extracted with ethyl acetate (2 x 20 mL). The combined organic extracts were then washed with brine (20 mL), dried over sodium sulfate, filtered and evaporated. The residue was purified by chromatography on silica gel eluting with DCM : MeOH : NH₂OH (95 : 4.5: 0.5) to afford the title compound (170 mg, 71 %) as a white solid. MS : m/e = 403.6 (M+H).
