Sprayer comprising a container with changeable volume

There is disclosed a sprayer with a changeable volume. The sprayer includes a container (10), a pump (20), a first pipe (21), a second pipe (22) and a nozzle (221). The container (10) includes an upper wall (12) and a lower wall (11). The upper wall (12) can be compressed while not containing water and is extensible for containing water. The lower wall (11) is connected to the upper wall (12). The pump (20) is positioned in a space (111) defined in the lower wall (11). The first pipe (21) is directed to the pump (20) from a space (121) defined in the upper wall (12). The second pipe (22) is directed to the exterior of the container (10) from the pump (20). The nozzle (221) is connected to the second pipe (22).
Description

Background of Invention

1. Field of Invention

[0001] The present invention relates to a sprayer and, more particularly, to a sprayer with a changeable volume.

2. Related Prior Art

[0002] Referring to Figs. 12 and 13, a conventional sprayer includes a container 60 formed with a handle 63. The container 60 includes a first space 61, a second space 62 in communication with the first space 61, and a port 621 in communication with the second space 62. Water can be filled in and poured from the second space 62 through the port 621. The port 621 can be closed by means of a cap 90. A pump 70 is positioned in the first space 61. A pipe is directed into the second space 62 from the pump 70. An outlet device 80 includes a pipe 81 connected to the pump 70, a nozzle 83 connected to the pipe 81 and a handle 82 operatively connected to the nozzle 83. In use, water is filled in the container 60 and then sprayed from the nozzle 83. After use, water is poured from the container 60. As made of a thermosetting plastic, the container 60 occupies a large space even when the second space 62 is empty. This causes inconvenience for storage and shipment. This entails a high cost in shipment.

[0003] The present invention is therefore intended to obviate or at least alleviate the problems encountered in prior art.

Summary of Invention

[0004] According to the present invention, there is disclosed a sprayer with a changeable volume. The sprayer includes a container, a pump, a first pipe, a second pipe and a nozzle. The container includes an upper wall and a lower wall. The upper wall can be compressed while not containing water and extensible for containing water. The lower wall is connected to the upper wall. The pump is positioned in a space defined in the lower wall. The first pipe is directed to the pump from a space defined in the upper wall. The second pipe is directed to the exterior of the container from the pump. The nozzle is connected to the second pipe.

[0005] An advantage of the sprayer according to the present invention is the convenience in shipment and storage of the sprayer because of the upper wall can be compressed and occupy a small space.

[0006] Other advantages and novel features of the invention will become more apparent from the following detailed description in conjunction with the drawings.

Detailed Description of Embodiments

[0007] The present invention will be described through detailed description of three embodiments referring to the drawings.

Fig. 1 is a perspective view of a sprayer with a changeable volume according to the first embodiment of the present invention.

Fig. 2 is another perspective view of the sprayer of Fig. 1, showing the sprayer extended.

Fig. 3 is a cross-sectional view taken along a line 3-3 in Fig. 1.

Fig. 4 is a cross-sectional view taken along a line 4-4 in Fig. 2.

Fig. 5 is a side view of the sprayer shown in Fig. 1, showing the sprayer in use.

Fig. 6 is a perspective view of a sprayer with a changeable volume according to the second embodiment of the present invention.

Fig. 7 is a cross-sectional view taken along a line 7-7 in Fig. 6.

Fig. 8 is similar to Fig. 7 but shows the sprayer extended.

Fig. 9 is a perspective view of a sprayer with a changeable volume according to the third embodiment of the present invention.

Fig. 10 is a cross-sectional view taken along a line 10-10 in Fig. 9.

Fig. 11 is similar to Fig. 10 but shows the sprayer containing the maximum volume of water.

Fig. 12 is a perspective view of a conventional sprayer.

Fig. 13 is an exploded view of the sprayer shown in Fig. 12.
[0013] Water can be filled in and poured from the space 121 through a port 123 defined in the top portion. The port 123 can be closed by means of a cover 30.

[0014] A first pipe 21 is directed to the pump 20 from the space 121 through the aperture 124. A second pipe 22 is directed to the exterior of the container 10 from the pump 20. A nozzle 221 is connected to the second pipe 22.

[0015] The second pipe 22 is directed through the lower wall 11. A socket and a switch are installed on the lower wall 11. The socket can receive a plug at an end of a cable connected to a power supply in order to energize the pump 20. The switch is operable to turn on and off the pump 20.

[0016] Referring to Fig. 3, with the pleated structure, the upper wall 12 is compressed and occupies a small space while not containing any water. This saves space and causes convenience for shipment and storage. This involves a low cost in shipment. The second pipe 22 is withdrawn.

[0017] Referring to Fig. 4, with the pleated structure, the upper wall 12 is extended and provides a large space for containing water. The second pipe 22 is extended.

[0018] Referring to Fig. 5, the sprayer can be used in washing cars.

[0019] Figs. 6 through 8, there is shown a sprayer according to a second embodiment of the present invention. The second embodiment is similar to the first embodiment except that the upper wall 12 includes an inflatable structure instead of the pleated structure. To this end, the upper wall 12 can be made of any proper material such as that of a tube of a tire.

[0020] Referring to Fig. 7, with the inflatable structure, the upper wall 12 is compressed and occupies a small space while not containing any water. The upper wall 12 is thick.

[0021] Referring to Fig. 8, with the inflatable structure, the upper wall 12 is extended and provides a large space for containing water. The upper wall 12 becomes thin.

[0022] Referring to Figs. 9 through 11, there is shown a sprayer according to a third embodiment of the present invention. The first embodiment is identical to the first embodiment except a few things. Firstly, the third embodiment does not include the partition 13 so that the spaces 111 and 121 are in direct communication with each other, i.e., they become one. Secondly, the second pipe 22 is directed through the top portion of the container 10. Thirdly, the socket and the switch are installed on the top portion of the container 10. The socket and the switch are moved based on sealing concerns.

[0023] The present invention has been described through the detailed description of the embodiments. Those skilled in the art can derive variations from the embodiments without departing from the scope of the present invention. Therefore, the embodiments shall not limit the scope of the present invention defined in the claims.

Claims

1. A sprayer with a changeable volume comprising:

   a container (10) comprising a lower wall (11) defining a space (111) and an upper wall (12) defining a space (121) and being extensible for containing water and compressible while not containing water;
   a pump (20) positioned in the space (111) defined in the lower wall (11);
   a first pipe (21) directed to the pump (20) from the space (121) defined in the upper wall (12);
   a second pipe (22) directed to the exterior of the container (10) from the pump (20); and
   a nozzle (23) connected to the second pipe (22).

2. The sprayer according to claim 1 wherein the upper wall (12) comprises a pleated structure.

3. The sprayer according to claim 1 wherein the upper wall (12) comprises an inflatable structure.

4. The sprayer according to claim 1 wherein the container (10) comprises a handle (122) formed on the upper wall (12).

5. The sprayer according to claim 1 wherein the container (10) comprises a port (123) for water.

6. The sprayer according to claim 5 comprising a cover (30) for closing the port (123).

7. The sprayer according to claim 1 comprising a strap (112) for restraining the upper wall (12).

8. The sprayer according to claim 1 wherein the container (10) comprises a partition (13) between the lower and upper walls (11; 12).

9. The sprayer according to claim 1 wherein the container (10) wherein the partition (13) defines an aperture (124) through which the first pipe (21) is directed.

10. A sprayer with a changeable volume comprising:

    a container (10) defining a space (111; 121) and being extensible for containing water and compressible while not containing water;
    a pump (20) positioned in the space (111; 121) defined in the container (10);
    a pipe (22) directed to the exterior of the container (10) from the
pump (20); and
a nozzle (23) connected to the pipe (22).

11. The sprayer according to claim 10 wherein the container (10) comprises a pleated structure.

12. The sprayer according to claim 10 wherein the container (10) comprises an inflatable structure.

13. The sprayer according to claim 10 wherein the container (10) comprises a handle (122) formed thereon.

14. The sprayer according to claim 10 wherein the container (10) comprises a port (123) for water.

15. The sprayer according to claim 14 comprising a cover (30) for closing the port (123).

16. The sprayer according to claim 14 comprising a strap (112) for restraining the container (12).

Amended claims in accordance with Rule 86(2) EPC.

1. A sprayer with a changeable volume, comprising:

   a container (10) comprising:
   
   a lower circumferential wall (11) having a rigid structure and defining a lower space (111); and
   an upper circumferential wall (12) circumferentially connected to the upper circumferential end section of the lower circumferential wall (11) and extending therefrom to define an upper space (121) for containing water, and being extensible and compressible so that the volume of the upper space (121) is changeable;
   
   a pump (20) positioned in the lower space (111);
   a first pipe (21) connected to the pump (20) to supply the water thereto;
   a second pipe (22) directed to the exterior of the container (10) from the pump (20); and
   a nozzle (23) connected to the second pipe (22).

2. The sprayer according to claim 1, wherein the upper circumferential wall (12) comprises a pleated structure.

3. The sprayer according to claim 1, wherein the upper circumferential wall (12) comprises an inflatable structure.

4. The sprayer according to claim 1, wherein the container (10) comprises a handle (122) formed on the upper circumferential wall (12).
