A limb support (216, 218) coupled to a patient-support apparatus (210) includes a multi-axis pivot mount having a first joint (232) mounted to the patient-support apparatus (210), an arm (234) coupled to the first joint (232) on a first end for pivotable movement thereabout, and a second joint (236) coupled to a second end of the arm (234) for pivotable movement thereabout. A cushion assembly (238) is mounted to the second joint (236) for pivotable movement of the cushion assembly (238) in relation to the second joint (236).
Description

[0001] The present disclosure relates to accessories that attach to birthing beds to support the body of a patient during obstetric labor and delivery. More particularly, the present disclosure relates to patient support accessories that attach to birthing beds or birthing bed accessory frames and that are configured to engage and support limbs of the body of a patient during labor and delivery.

[0002] During obstetric delivery in which a patient is in a reclining position, it is desirable for the legs of a patient to be positioned by a caregiver so as not to be supported by an underlying table surface. In many situations it is important to have a limb-support apparatus permitting flexure of the knee joints of a patient by a sufficient amount to place the patient in a desired position for delivery of a child.

[0003] The present disclosure comprises one or more of the following features alone or in any combination: A limb support may be configured to be secured to a patient-support apparatus having two generally parallel longitudinal members spaced apart such as a birthing bed for obstetric delivery. The limb support, embodied as a foot support, comprises a foot-receiving portion which is configured to be adjustable to support the foot of a patient thereon, especially, for example, a patient in labor for obstetric delivery. The foot support may be shaped to engage a foot of a patient.

[0004] The foot support may further comprise a frame configured to pivot about both a vertical axis and a horizontal axis in relation to the patient support apparatus. A pair of locks configured to block pivoting movement of the frame about an associated axis is coupled to the frame. The frame includes a U-shaped bracket having a pair of walls positioned in a parallel spaced-apart relation to one another. Each wall is formed to include a blind slot having a termination and arranged to open away from the horizontal axis of rotation.

[0005] A lock release actuator is coupled to the frame to receive an actuation force from a caregiver to simultaneously unlock both the vertical rotation-blocking lock and the horizontal rotation-blocking lock to allow the caregiver to move the foot support to a desired position. In some embodiments, the lock release actuator may be embodied as a grip. The grip is coupled to a crossmember positioned such that portions of the crossmember are received by both slots for slidable movement therein. The crossmember is coupled to the locks via a pair of cables, each cable being coupled to an associated rotation-blocking lock.

[0006] The grip is generally J-shaped and arranged to receive a hand of a caregiver for application of the actuation force. The grip is configured to transmit the actuation force to the locks regardless of where the actuation force is applied along the length of the grip.

[0007] When an actuation force is applied to the grip along a generally longitudinal axis of the foot support frame, the crossmember will move toward the opening of both slots in a generally symmetric motion. However, the arrangement of the slot terminations allows the crossmember to form a pivot axis about the termination if an oblique actuation force is applied to the grip. Thus, while one end of the crossmember pivots about the slot termination, the other end is free to move toward the slot opening allowing the crossmember to sufficiently displace the cables so that the associated locks are released.

[0008] The limb support may further comprise a leg support mounted on the foot support and movable from a stowed position below the foot support to one of a number of use positions. The leg support may be pivotally coupled to the foot support through a pivot-coupler that is coupled to the foot support. The leg support comprises an arm, a ball-lock assembly coupled to the arm, and a cushion assembly coupled to the ball-lock assembly to receive and support a portion of a leg of an obstetric patient. The cushion may be configured to conform to the contours of the body of the patient. In some embodiments, the leg support may have an upwardly facing surface which is convex in shape.

[0009] The limb support may comprise a multi-axis pivot mount coupled to the foot support, the pivot mount including a first joint mounted to the foot support, an arm coupled to the first joint on a first end for pivotable movement thereabout, and a second joint coupled to a second end of the arm for pivotable movement thereabout, and a cushion assembly coupled to the second joint for pivotable movement of the cushion assembly in relation to the second joint.

[0010] The pivot-coupler has a body and a spring-loaded release handle. The pivot-coupler also has an internal pivot shaft about which the arm pivots.

[0011] The arm comprises a pivot collar and an offset shaft. The pivot collar is formed to include two slots which receive a lock-rod coupled to the spring-loaded release handle to maintain the arm in a position in either a stowed position or a use position. The arm, and therefore the leg support, are able to pivot about an axis to move the leg support from the stowed position to the use position to receive the leg of the patient.

[0012] The ball-lock mechanism includes a housing, a release handle, a ball mount, and a spring bias assembly. The ball-lock mechanism is movable between an unlocked position wherein the ball mount is free to pivot relative to the housing and a locked position wherein the ball mount is inhibited from moving relative to the housing. The ball mount comprises a spherical portion and a shaft configured to engage with a mount coupled to the cushion assembly. The release handle is used to engage the ball-lock mechanism.

[0013] The release handle includes a bent shaft and a grip. The release handle is rotated by the caregiver to move the ball-lock mechanism between the locked and unlocked positions. A cam supports a flange of the spring bias assembly. The flange supports a plurality of spring washers that in turn support a cradle that receives the
spherical portion of the ball mount. The cam is four sided with two opposing sides having a thickness smaller than the other two opposing sides. Thus, rotation of the cam ninety degrees in a prescribed direction changes the displacement of the flange and therefore the deflection of the spring washers.

When the force exerted by spring washers on the cradle, and therefore the ball mount, is minimal, the ball mount is pivotable in a plurality of directions about the center of the spherical portion. When the cam is rotated in an opposite direction, the cradle is urged against the spherical portion which urges the spherical portion against an annular surface of the housing to cause the ball mount to be restrained from moving.

The invention will now be described by way of example with reference to the accompanying drawings in which:

Fig. 1 is a perspective view from a foot end corner of a patient-support apparatus of the present disclosure showing a pair of limb supports coupled to an articulable yoke and a left limb support being shown in an articulated position in phantom;

Fig. 2 is an exploded perspective view of illustrative components included in a limb support lock release mechanism of the patient-support apparatus of Fig. 1;

Fig. 3 is a plan view of a limb support embodied as a foot support (with a cover removed) showing (from left to right) an outer grip, a lock release grip, a frame, and horizontal and vertical pivot mounts;

Fig. 4 is a bottom view of the foot support of Fig. 3 showing the foot support with portions removed;

26 to pivot about axis 28 and the direction of arrow 30. The main portion 22 of a patient's foot is supported on foot support 14. Main portion 22 comprises a bracket 40 coupled to frame 34, mount 36 coupled to frame 34 and positioned to support a locking mechanism 42 at one end of release cable 46 as shown in Fig. 3. Flange 44 supports two release cable assemblies 46 and 48. Release cable 46 is coupled to locking mechanism 42 at one end of release cable 46 and is actuable to release locking mechanism 42 to permit main portion 22 to move about axis 24 relative to mount portion 26. Release cable 48 is coupled to a locking mechanism 50 (best seen in Fig. 5) and is actuable to release locking mechanism 50 to permit mount portion 26 to pivot about axis 28 and the direction of arrow 30. Foot support 14 is shown with covers omitted to show the mechanical structure of the foot support 14, as suggested in Fig. 3. Foot support 14 is pivotable about axis 28 in a plurality of directions as depicted by arrow 30 as shown, for example, in Fig. 1. Referring once again to Fig. 3, main portion 22 is pivotably coupled to the mount portion 26 and pivotable about axis 24 as depicted by arrow 32. The main portion 22 comprises a lock release handle 66 comprising a grip portion 72 that is U-shaped and is coupled to the outer surfaces of walls 54 and 56 of frame 34 as shown in Fig. 3. The outer grip 52 is accessible by a user to grip and thereby actuate release cables 46 and 48 simultaneously to allow adjustment of foot support 14 about axes 24 and/or 28. Grip 52 is U-shaped and is coupled to the outer surfaces of walls 54 and 56 of frame 34 as shown in Fig. 3. The outer grip 52 is accessible by a user to grip and thereby actuate release cables 46 and 48 simultaneously to allow adjustment of foot support 14 about axes 24 and/or 28.
direction perpendicular to the longitudinal length of slots 60 and 62. Thus, inner cables 76 move relative to outer sheaths 74 of release cable 46 and 48 thereby releasing locking mechanisms 42 and 50. Therefore, a user may grip release handle 66 at any point along the length of grip release handle 66 to apply an actuation force in any of a number of directions to simultaneously release locking mechanisms 42 and 50.

[0025] Once again referring again to Fig. 3, locking mechanism 42 is pinned to bracket 40 by a retaining pin 88 and hairpin fastener 90 that retains pin 88 on bracket 40. As suggested in Fig. 5, locking mechanism 42 is also pinned to two flanges 92 and 94 coupled to a frame portion 96 of main portion 330 retaining pin 88 and hairpin fastener 90 couple the locking mechanism 42 to the flanges 92 and 94. When in the locked position, the locking mechanism 42 maintains the distance between the pins 88 and prevents rotation of main portion 22 about axis 24. By changing the distance between pin 88 and bracket 40 and pin 88 in flanges 92 and 94, main portion 22 pivots about axis 24 to change the position of foot support 14.

[0026] Locking mechanism 50 is coupled to a frame 96 of mount portion 26 through a pin 98, as shown in Fig. 9. Locking mechanism 50 is also coupled to a cam plate 100 of a cam assembly 110 through a pin 102. Pins 98 and 102 are retained on locking mechanism 50 by a pair of e-rings 104 and 106 respectively. Cam assembly 110 further comprises a keyed collar 112 that is configured to engage a shaft to on yoke 22 of patient-support apparatus 10. The collar 112 comprises a keyed slot 114 that engages with a key (not shown) on the shaft (not shown) of the yoke 22. The shaft is fixed to the yoke 22 and keyed collar 112 is restrained from rotation about the shaft by the engagement of the keyed slot 114 with the key of the shaft.

[0027] Cam assembly 110 is pivotable relative to frame 96 of mount portion 26 about axis 28. The locking mechanism 50 prevents rotation of the cam assembly 110 relative to frame 96 when the locking mechanism is engaged. When the locking mechanism is released an outer housing 116 of locking mechanism 50 is free to move along a shaft 118 that thereby permits frame 96 of mount portion 26 to rotate relative to cam assembly 110 to a new orientation. The cam assembly 110 stays in the same or relative position as it relates to the yoke 22, but the mount portion 26 and thereby the remainder of the foot support 14 pivots relative to the yoke 22.

[0028] The locking mechanisms 42 and 50 operate in a similar fashion as will be discussed in reference to locking mechanism 42 shown in Fig. 8. The locking mechanism 42 is a wrap spring mechanism in which a wrap spring (not shown) engages the shaft 118 when the wrap spring is in a relaxed positioned. The inner diameter of the wrap spring is slightly smaller than the outer diameter of the shaft 118 such that when the wrap spring engages shaft 118 the spring is precluded from movement along the longitudinal length of the shaft 118 thereby securing the spring to the shaft 118. Locking mechanism 42 further comprises an outer housing 116 that is engaged with the spring.

[0029] The housing 116 comprises a cylindrical main portion 128 and two flanges 124 and 126 with each flange coupled to opposing sides of the cylindrical main portion 128. The housing 116 also comprises a connecting flange 130 that is used to connect to the housing 116 to an external member (not shown). The flanges 124 and 126 are coupled to a terminal end of cable 46 to transmit the actuation force to the flanges. When the flanges 124 and 126 are brought together as depicted by arrow 132 in response to the actuation force transmitted by cable 46, the wrap spring, internal to the housing, is configured such that the inner diameter of the spring body is enlarged so that the spring is free to move along shaft 118. When the flanges 124 and 126 are released, the inner diameter of the spring contracts and the spring is secured to the shaft 118 and thus prevents the housing 116 from moving relative to the shaft 118.

[0030] The shaft 118 includes a flange 120 positioned at one end which prevents the spring and therefore the housing 116 from sliding off the end of the shaft 118. At the end of the shaft opposite to the flange 120 is an eyelet 122 coupled to the shaft 118 to connect the shaft 118 to another external member. In use, a release cable 48 is coupled to the locking mechanisms such that the inner cable 76 is connected to flange 124 and the outer sheath 74 is connected to flange 126 so that movement of the release handle 66 as discussed above causes the flanges 124 and 126 to contract in the direction of arrow 132 thereby releasing the locking mechanism 42. This permits the adjustment of the foot support 14 relative to yoke 22 to a plurality of positions about axis 24. The release of locking mechanism 50 occurs in a similar fashion and allows foot support 14 to be adjusted about axis 28.

[0031] For example, the foot supports 12 and 14 are each shown in a home position in Fig. 1 and shown articulated about both the generally vertical and generally horizontal axes to an upright out-of-the-way position as shown in Fig. 10. The foot supports 12 and 14 are adjustable to a plurality of positions about the generally horizontal and generally vertical axes so that the foot support 12 and 14 may be positioned to a plurality of positions and orientations as desired by the caregiver.

[0032] In the illustrative embodiment of Fig. 10, two leg supports 150 and 152 are coupled to foot supports 12 and 14 respectively. In addition, the foot support 12 comprises a foot receiving cover 140, a bellows cover 142 covering a horizontal pivoting mechanism, and a mount cover 138. The foot support 14 comprises a foot-receiving cover 144, a bellows 148, and a mount cover 146.

[0033] In a second illustrative embodiment of a patient-support apparatus 210 of Fig. 12, two limb supports 216 and 218 are coupled to foot supports 12 and 14, respectively. As suggested in Figs. 12-14, the leg support 216 is moveable between a stowed position below foot sup-
port 16 as shown in Fig. 12 and any of a number of use positions as shown in Fig. 14. The leg support 216 and leg support 218 are similar in structure with the leg support 216 being configured as a right-hand version and the leg support 218 being configured as a left-hand version. The structure of leg support 216 will be discussed in detail below. It should be understood that the description of leg support 216 is applicable to the general structure of leg support 218 with the only difference being the handedness of the two leg supports 216 and 218.

[0034] As shown in Figs. 13 and 14, leg support 216 is pivotably coupled to foot support 12 through a pivot-coupler 232 that is coupled to foot support 16. The leg support 216 comprises an arm 234, a ball-lock assembly 236 coupled to the arm 234, and a cushion assembly 238 coupled to the ball-lock assembly 236. Referring now to Fig. 20, the pivot-coupler 232 includes a body 240 having a first knuckle 235, a second knuckle 237, and a spring-loaded release handle 242 coupled to the first knuckle 235. The pivot-coupler 232 also has an internal pivot shaft 233 about which arm 234 pivots.

[0035] The arm 234 is shown in Fig. 17 and comprises a pivot collar 244, an offset shaft 246, a first end 243, and a second end 245. The pivot collar 244 comprises two slots 248 and 250 which receive a lock-rod (not shown) coupled to the spring-loaded release handle 242 to maintain the arm 234 in a position in either a stowed position or a use position. The arm 234 and therefore leg support 216 pivots about an axis 252 shown in Fig. 15.

[0036] Details of the ball-lock mechanism 236 are shown in Figs. 18 and 19 and the ball-lock mechanism 236 comprises a housing 254, an handle assembly 256, a ball mount 258, and a spring bias assembly 260. The ball-lock mechanism 236 is moveable between a position wherein the ball mount 258 is free to pivot relative to the housing 254 and position wherein the ball mount 258 is constrained from moving relative to the housing 254. The ball mount 258 comprises a spherical portion 262 and a shaft 264 configured to engage with a mount 266 (best seen in Fig. 21) of the cushion assembly 238. The handle assembly 256 is used to engage the ball-lock mechanism 236.

[0037] The handle assembly 256 comprises a bent shaft 268 and a grip 270. The handle assembly 256 is actuated such that the shaft 268 is rotated in the direction of arrow 272 to thereby move the ball-lock mechanism 236 between locked and unlocked positions. Referring now to Fig. 19, shaft 268 is coupled to a cam 274 that supports a flange 276 of the spring bias assembly 260. The flange 276 supports four spring washers 278 that in turn support a cradle 280 that supports the spherical portion 262 of ball mount 258. The cam 274 is four sided with two opposing sides having a thickness smaller than the other two opposing sides. Thus, rotation of the cam 274 ninety degrees in the direction of arrow 272 changes the displacement of flange 276 and therefore the deflection of spring washers 278. As shown in Fig. 19, the displacement of spring washers 278 is at a minimum. In the position of Fig. 19, the force exerted by spring washers 278 on cradle 280 and therefore ball mount 258 is minimal such that the ball mount 258 is pivotable in a plurality of directions about the center of the spherical portion 262. When the cam 274 is rotated ninety degrees, the cradle 280 is urged against the spherical portion 262 which is thereby urged against an annular surface 282 of the housing 254 such that the ball mount 258 is restrained from moving.

[0038] Referring now to Fig. 23, a portion of housing 254 is removed to define a slot 292 that is configured to receive the shaft 264 of ball mount 258 when the leg support 216 is in a stowed position. The shaft 264 has two sides 288 and 290 that define a tapered cross-section of shaft 264. The tapering assists the shaft in nesting in the slot 292 to prevent the cushion assembly 238 from moving while the leg support 216 is stowed.

[0039] The structure of leg support 216 permits the leg assembly to be rotated about an axis 294 shown in Fig. 20 in the direction of arrow 296. Once the leg support is rotated about axis 294, the cushion assembly 238 is positionable relative to the ball-lock mechanism 236 to a plurality of positions such as, for example, in direction 286 toward the use position shown in Fig. 16.

[0040] Referring now to Figs. 21-24, the cushion assembly 238 comprises a molded foam covering 298 coupled to a support structure 300. The mount 266 is coupled to structure 300 through two fasteners 302. Mount 266 includes a through-hole 304 that is positioned such that when shaft 264 of ball mount 258 is positioned in a blind hole 306 in a lower surface 308 of mount 266, the cushion assembly 238 is coupled to the ball mount 258 and secured with a fastener 305.

[0041] The covering 298 is molded to form two ridges 310 and 312 in a surface 532 of covering 298. The ridges 310 and 312 are spaced apart such that a strap 314 is positionable between the ridges 310 and 312. Strap 314 is used as a securing strap to assist a patient in maintaining their legs positioned in the cushion assembly 238 during labor. The ridges 310 and 312 assist in maintaining the strap 314 positioned without sliding along the longitudinal length of the cushion assembly 238. Cushion assembly 238 further includes a molded ridge 316 that extends about the perimeter of the cushion assembly 238 to eliminate sharp edges. The covering 298 comprises an over-molded foam.

[0042] The covering 298 covers structure 300 that is a unitary metal sheet. In some embodiments, the metal sheet may be replaced with a rigid plastic material such as ABS. Structure 300 includes a main portion 318 that has several through-holes 320 that are configured to allow the over-molding to adhere between an upper portion and lower portion. Structure 300 also includes two flanges 324 and 326 extending longitudinally along a length of main portion 318. An additional flange 322 is coupled to main portion 318 to provide support for a lower leg hanging over the edge of cushion assembly 238.
Claims

1. A limb support 216, 218 for use with a patient-support apparatus 210 comprising:
   a frame 12, 14 coupled to the patient-support apparatus 210,
   a multi-axis pivot mount coupled to the frame 12, 14, the pivot mount including a pivot coupler 232 mounted to the frame 12, 14, an arm 246 coupled to the pivot coupler 232 on a first end for pivotable movement thereabout, and a ball joint 236 coupled to a second end of the arm 246, and
   a cushion assembly 238 configured to receive and support a portion of a leg of a patient, the cushion assembly 238 being coupled to the ball joint 236 for pivotable movement of the cushion assembly 238 in relation to the ball joint 236.

2. The limb support 216, 218 of claim 1, wherein the frame 12, 14 is configured to pivot about a first axis and a second axis in relation to the patient support apparatus.

3. The limb support 216, 218 of either claim 1 or claim 2, wherein the frame 12, 14 is a foot support.

4. A limb support 216, 218 for use with a birthing bed comprising:
   a foot support coupled to the birthing bed, the foot support pivotable relative to the birthing bed about a first and a second axis,
   a multi-axis pivot mount coupled to the foot support, the pivot mount including a first joint mounted to the foot support, an arm 246 coupled to the first joint on a first end for pivotable movement thereabout, and a second joint coupled to a second end of the arm 246 for pivotable movement thereabout, and
   a cushion assembly 238 coupled to the second joint for pivotable movement of the cushion assembly 238 in relation to the second joint.

5. The limb support 216, 218 of claim 4, wherein the first joint includes a body coupled to the frame 12, 14, the body having a first and a second knuckle positioned in a spaced-apart relation and configured to receive a pivot pin therethrough and a spring-biased lock pin pivotably coupled to the first knuckle.

6. A limb support 216, 218 for use with a patient-support apparatus 210 comprising:
   a foot support coupled to the patient-support apparatus 210 and configured to pivot about a first axis and a second axis in relation to the patient support apparatus,
   a multi-axis pivot mount coupled to the frame 12, 14, the pivot mount including a pivot coupler 232 mounted to the foot support, an arm 246 coupled to the pivot coupler 232 on a first end for pivotable movement thereabout, and a ball joint 236 coupled to a second end of the arm 246, a cushion assembly 238 configured to receive and support a portion of a leg of a labor patient, the cushion assembly 238 coupled to the ball joint 236 for pivotable movement of the cushion assembly 238 in relation to the ball joint 236.

7. The limb support 216, 218 of any one of claims 1 to 3 or 6, wherein the pivot coupler 232 includes a body 240 coupled to the frame 12, 14, the body 240 having a first and a second knuckle 235, 237 positioned in a spaced-apart relation and configured to receive a pivot pin 233 therethrough and a spring-biased lock pin 242 pivotably coupled to the first knuckle 235.

8. The limb support 216, 218 of either claim 5 or claim 7, wherein the arm 246 first end 243 is coupled to a pivot collar 244 configured to be received by the base 240 and positioned between the first and second knuckles 235, 237 to receive a portion of the pivot pin 233 therethrough.

9. The limb support 216, 218 of claim 8, wherein a portion of the spring-biased lock pin 242 is configured to extend into the first knuckle 235 to confront the rim of the pivot collar 244.

10. The limb support 216, 218 of either claim 8 or claim 9, wherein the pivot collar 244 is formed to include a pair of slots 248, 250 in a rim of the pivot collar and configured to receive a portion of the spring-biased lock pin 242 to block pivoting movement of the pivot collar 244.

11. The limb support 216, 218 of claim 10, wherein the pair of slots 248, 250 formed in the rim of the pivot collar 244 to receive a portion of the lock pin 242 correspond to a use position and a stowed position of the cushion assembly 238.

12. The limb support of any one of Claims 4, 5 and 8 to 11 as dependent on Claim 5 wherein the second joint is a ball joint 236.

13. The limb support 216, 218 of any one of claims 1 to 3, 6, 7, 8 to 10 as dependent on claim 7, and 12, wherein the ball joint 236 includes a housing 254 formed to include a frustoconical open end 282 and arranged to be coupled to the second end 245 of the arm 246, a handle 270 coupled to the housing 254, a spring-bias assembly 260 positioned within the housing, and a ball mount 258 configured to be re-
ceived between the housing 254 and the spring-bias assembly 260.

14. The limb support 216, 218 of claim 13, wherein the ball mount 258 includes a spherical portion 262 and a shaft 264 extending outwardly from the spherical portion 262 and configured to engage with a mount 266 coupled to the cushion assembly 238.

15. The limb support 216, 218 of claim 14, wherein the spring-bias assembly 260 includes a cradle 280 configured to receive a portion of the ball mount 258, a flange 276 positioned in a spaced-apart relation to the cradle 280, and a plurality of spring washers 278 positioned in a registered relationship extending therebetween.

16. The limb support 216, 218 of either claim 14 or claim 15, wherein a portion of the handle 270 extends into the housing 254 and is coupled to a cam 274, the cam 274 is positioned to confront a surface portion of the flange 276 opposite from the spring washers 278 and configured to urge the flange 276 toward the cradle 280 to deflect the spring washers 278 in response to rotation of the cam 274 to urge the ball mount 258 against the frustoconical open end 282.

17. The limb support 216, 218 of any preceding claim, further comprising a strap 314 coupled to the cushion assembly 238 and configured to secure a limb of a patient received in the cushion assembly 238.

18. The limb support 216, 218 of any preceding claim, wherein the pivot mount is configured for pivotable movement of the cushion assembly 238 between a stowed position where the cushion assembly 238 is positioned generally underneath the foot support and a use position adjacent to the foot support and accessible to a limb of a patient reclining on the patient-support apparatus 210.

19. The limb support 216, 218 of any preceding claim, wherein the arm 246 is an offset arm 246.
