Note: Within nine months of the publication of the mention of the grant of the European patent in the European Patent Bulletin, any person may give notice to the European Patent Office of opposition to that patent, in accordance with the Implementing Regulations. Notice of opposition shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).
Description

1. CROSS-REFERENCE

[0001] This application claims benefit under 35 U.S.C. §119(e) to provisional application Serial No. 60/645,424, filed January 19, 2005 and provisional application Serial No. 60/654,620, filed February 18, 2005.

2. FIELD

[0002] The present disclosure relates to prodrugs of biologically active 2,4-pyrimidinediamine compounds, pharmaceutical compositions comprising the prodrugs, and the prodrugs and compositions for use in a variety of contexts, such as in the treatment or prevention of various diseases.

3. BACKGROUND

[0003] Crosslinking of Fc receptors, such as the high affinity receptor for IgE (FcεRI) and/or the high affinity receptor for IgG (FcγRI) activates a signaling cascade in mast, basophil and other immune cells that results in the release of chemical mediators responsible for numerous adverse events. For example, such crosslinking leads to the release of preformed mediators of Type I (immediate) anaphylactic hypersensitivity reactions, such as histamine, from storage sites in granules via degranulation. It also leads to the synthesis and release of other mediators, including leukotrienes, prostaglandins and platelet-activating factors (PAFs), that play important roles in inflammatory reactions. Additional mediators that are synthesized and released upon crosslinking Fc receptors include cytokines and nitric oxide.

[0004] The signaling cascade(s) activated by crosslinking Fc receptors such as FcεRI and/or FcγRI comprises an array of cellular proteins. Among the most important intracellular signal propagators are the tyrosine kinases. And, an important tyrosine kinase involved in the signal transduction pathways associated with crosslinking the FcεRI and/or FcγRI receptors, as well as other signal transduction cascades, is Syk kinase (see Valent et al., 2002, Intl. J. Hematol. 75(4):257-362 for review).

[0005] The mediators released as a result of FcεRI and FcγRI receptor cross-linking are responsible for, or play important roles in, the manifestation of numerous adverse events. Recently, various classes of 2,4-pyrimidinediamine compounds have been discovered that inhibit the FcεRI and/or FcγRI signaling cascades, and that have myriad therapeutic uses. See, i.e., U.S. application Serial no. 10/355,543 filed January 31, 2003 (US 2004/0029902A1), international application Serial No. PCT/US03/03022 filed January 31, 2003 (WO 03/063794), U.S. application Serial No. 10/631,029 filed July 9, 2003 (US 2007/0060603), international application Serial No. PCT/US03/24087 (WO 2004/014382), U.S. application Serial No. 10/903,263 filed July 30,2004 (US2005/0234049), and international application Serial No. PCT/US2004/24716 (WO 2005/016893). While many of these compounds exhibit good bioavailability properties, in some instances it may be desirable to tailor their solubility or other properties such that their bioavailability via specified routes of administration is optimised.

4. SUMMARY

[0006] The present invention provides a compound which is of structural formula:

![Structural formula](image)

or a pharmaceutically acceptable salt or hydrate, solvate, or N-oxide of the compound or salt.

[0007] The present disclosure describes prodrugs of 2,4-pyrimidinediamine compounds that have myriad biological activities, and hence therapeutic uses, compositions comprising the prodrugs, methods and intermediates useful for synthesizing the prodrugs and methods of using the prodrugs in a variety of in vitro and in vivo contexts, including in the treatment and/or prevention of diseases mediated, at least in part, by the activation of Fc receptor signaling cascades.

[0008] The described prodrugs generally comprise a biologically active 2,4-pyrimidinediamine compound that is sub-
stituted at the nitrogen atom of one or more primary or secondary amine groups with a progroup R_p that metabolizes or otherwise transforms under conditions of use to yield the active 2,4-pyrimidinediamine. In some embodiments, the progroup R_p is a phosphorous-containing progroup. In some embodiments, the progroup includes a group or moiety that is metabolized under the conditions of use to yield an unstable α-hydroxymethyl, α-aminomethyl or α-thiomethyl intermediate, which then further metabolized in vivo to yield the active 2,4-pyrimidinediamine drug. In some embodiments, the progroup includes an α-hydroxylalkyl, α-aminolalkyl or α-thioalkyl moiety, for example an α-hydroxymethyl, α-aminomethyl, α-thiomethyl moiety, that metabolizes under the conditions of use to yield the active 2,4 pyrimidinediamine drug. For example, in some embodiments the progroup R_p is of the formula -CR^Rd-R^3, where each R_d is, independently of the other, selected from hydrogen, cyano, optionally substituted (C1-C20) alkyl, (C1-C20) perfluoroalkyl, optionally substituted (C7-C30) arylalkyl and optionally substituted 6-30 membered heteroarylalkyl, where each optional substituent is, independently of the others, selected from hydrogen, alkyl, aryl, arylalkyl, heteroaryl and heteroalkyl, or, alternatively, the two R_d are taken together with the carbon atom to which they are bonded to form a cycloalkyl containing from 3 to 8 carbon atoms; A is selected from O, S and NR^50, where R^50 is selected from hydrogen, alkyl, aryl, arylalkyl, heteroaryl, heteroarylalkyl and cycloheteroarylalkyl, or alternatively is combined with R^3, and, together with the nitrogen to which they are attached, form a three to seven membered ring; and R^3 represents a group that can be metabolized in vivo to yield a group of the formula -CR^Rd-AH, where R_d and A are as previously defined.

The identity of R^3 is not critical, provided that it can be metabolized under the desired conditions of use, for example under the acidic conditions found in the stomach and/or by enzymes found in vivo, to yield a group of the formula -CR^Rd-AH, where A and R_d are as previously defined. Thus, skilled artisans will appreciate that R^3 can comprise virtually any known or later-discovered hydroxyl, amine or thiol protecting group. Non-limiting examples of suitable protecting groups can be found, for example, in Protective Groups in Organic Synthesis, Greene & Wuts, 2nd Ed., John Wiley & Sons, New York, 1991 (especially pages 10-142 (alcohols, 277-308 (thiols) and 309-405 (amines)).

In a specific embodiment, R^3 includes, together with A, an ester, a thioester, an amide, a carbonate, a thiacarbonate, a carbamate, a thiocarbamate, or a urea linkage, -OCH_2SO_3R, where R is hydrogen, alkyl, arylalkyl or a metal salt (e.g., sodium, lithium, potassium); -GCH_2^z(N(R^51))_2M^-, where G is absent, -OPO_3-, OSO_3- or -CO_2-, R^51 is hydrogen, alkyl, arylalkyl, cyclohetoroalkyl or cycloheteroalkylalkyl and M^- is a counterion, usually a halide ion or the like (acetate, sulfate, phosphate, etc.). Specific exemplary embodiments include, but are not limited to, progroups in which R_d is selected from R^3, -C(O)R, -C(O)OR, -C(O)NR, and -SiR^R'R'R, where each R^d is, independently of the others, selected from hydrogen, optionally substituted lower alkyl, optionally substituted lower heteroalkyl, optionally substituted lower cycloalkyl, optionally substituted lower heterocycloalkyl, optionally substituted lower heterocycloalkyloxyalkyl, optionally substituted lower cycloalkyloxyalkyl, optionally substituted lower cycloalkylalkoxyalkyl, optionally substituted lower heterocycloalkyloxyalkyl, optionally substituted lower heterocycloalkyloxy, optionally substituted lower heterocycloalkylalkoxyalkyl and optionally substituted lower heterocycloalkylalkoxy, optionally substituted lower cycloalkylalkoxyalkyl, optionally substituted lower heterocycloalkylalkoxyalkyl

The identity of the progroup(s) R_p can be selected to tailor the water-solubility and other properties of the underlying active 2,4-pyrimidinediamine compound to be optimized for a particular mode of administration. It can also be selected to provide for removal at specified organs and/or tissues within the body, such as, for example, in the digestive tract, in blood and/or serum, or via enzymes residing in specific organs, such as the liver.

In some embodiments, progroups R_p that are phosphorous-containing progroups include phosphate moieties that can be cleaved in vitro by enzymes such as esterases, lipases and/or phosphatases. Such enzymes are prevalent throughout the body, residing in, for example, the stomach and digestive tract, blood and/or serum, and in virtually all tissues and organs. Such phosphate-containing progroups R_p will generally increase the water-solubility of the underlying active 2,4-pyrimidinediamine compound, making such phosphate-containing prodrugs ideally suited for modes of administration where water-solubility is desirable, such as, for example, oral, buccal, intravenous, intramuscular and ocular modes of administration.

In some embodiments, each phosphate-containing progroup R_p in the prodrug is of the formula -(CR^Rd-R^3)_y-O-P(O)(OH)(OH), or a salt thereof, wherein R_d is as previously defined and y is an integer ranging from 1 to 3, typically 1 or 2. In one specific embodiment, each R_d is, independently of the others, selected from hydrogen, substituted or unsubstituted lower alkyl, substituted or unsubstituted phenyl, substituted or unsubstituted methyl and substituted or unsubstituted benzyl. In another specific embodiment, each R_d is, independently of the others, selected from hydrogen and unsubstituted lower alkyl. Specific exemplary phosphate-containing progroups R_p include -CH_2-O-P(O)(OH)(OH) and/or the corresponding salts.

While not intending to be bound by any theory of operation, when y is 1 in the exemplary phosphate-containing progroups R_p, it is believed that the phosphate-containing prodrugs are converted in vivo by enzymes such as phosphatases, lipases and/or esterases to the corresponding hydroxymethyamines, which are then further metabolized in vivo by the elimination of formaldehyde to yield the active 2,4-pyrimidinediamine drug compound. The phosphate and formaldehyde metabolic by-products are innocuous.

When y is 2 in the exemplary phosphate-containing prodrugs, it is believed that the prodrugs are metabolized to the active 2,4-pyrimidinediamine drug compound in vivo by elimination of enol phosphate, which further metabolizes to acetaldehyde and phosphate. The phosphate and acetaldehyde metabolic by-products are innocuous.
Skilled artisans will appreciate that certain types of precursors can be converted in vivo to phosphate groups. Such precursors include, by way of example and not limitation, phosphate esters, phosphites and phosphite esters. For example, phosphites can be oxidized in vivo to phosphates. Phosphate esters can be hydrolyzed in vivo to phosphates. Phosphite esters can be oxidized in vivo to phosphate esters, which can in turn be hydrolyzed in vivo to phosphates. As a consequence of the ability of these phosphate precursor groups to convert to phosphates in vivo, the prodrugs can also include progroups that comprise such phosphate precursors. In some embodiments, the phosphate precursor groups may be directly metabolized to the active 2,4-pyrimidinediamine drug, without first being converted into a phosphate prodrug. In other embodiments, prodrugs comprising progroups that include such phosphate precursors are first metabolized into the corresponding phosphate prodrug, which then metabolizes to the active 2,4-pyrimidinediamine drug via a hydroxymethylamine, as discussed above.

In some embodiments, such phosphate precursor groups are phosphate esters. The phosphate esters can be acyclic or cyclic, and can be phosphate triesters or phosphate diesters. Such esters are generally less water-soluble than the corresponding phosphate acid prodrugs and the corresponding active 2,4-pyrimidinediamine compounds, and are therefore typically suitable for modes of delivering prodrugs of active 2,4-pyrimidinediamine compounds where low water-solubility is desired, including, by way of example and not limitation, administration via inhalation. The solubility of the prodrug can be specifically tailored for specific modes of administration by appropriate selection of the number and ident(ies) of the esterifying groups in the phosphate ester.

The mechanism by which the phosphate ester group metabolizes to the corresponding phosphate group can be controlled by appropriate selection of the esterifying moieties. For example, it is well-known that certain esters are acid (or base) labile, generating the corresponding phosphate under the acidic conditions found in the stomach and digestive tract. In instances where it is desirable for the phosphate ester prodrug to metabolize to the corresponding phosphate prodrug in the digestive tract (such as, for example, where the prodrugs are administered orally), phosphate ester progroups that are acid-labile can be selected. Other types of phosphate esters are acid and base stable, being converted into the corresponding phosphates via enzymes found in certain tissues and organs of the body (see, e.g., the various cyclic phosphate esters described in Erion et al., 2004, J. Am. Chem. Soc. 126:5154-5163.). In instances where it is desirable to convert a phosphate ester prodrug into the corresponding phosphate prodrug within a desired target tissue or site within the body, phosphate esters having the desired metabolic properties can be selected.

In some embodiments, each phosphate ester-containing progroup Rp in the prodrug is an acyclic phosphate ester of the formula -(CRdRd)yO-P(O)(OH)(ORc) or -(CRdRd)y-O-P(O)(ORc)(ORc), or a salt thereof, wherein each Rc is, independently of the others, selected from substituted or unsubstituted lower alkyl, substituted or unsubstituted (C6-C14) aryl (e.g., phenyl, naphthyl, 4-loweralkoxyphenyl, 4-methoxyphenyl), substituted or unsubstituted (C7-C20) arylalkyl (e.g., benzyl, 1-phenylethan-1-yl, 2-phenylethan-1-yl), -(CRdRd)y-O-C(O)Rf, -(CRdRd)y-O-C(O)ORf, -(CRdRd)y-S-C(O)Rf, -(CRdRd)y-S-C(O)ORf, -(CRdRd)y-NH-C(O)Rf, -(CRdRd)y-NH-C(O)ORf and -Si(Rd)3, wherein Rd, Rf and y are as defined above. In a specific embodiment, each R d is selected from hydrogen and unsubstituted lower alkyl and/or each Rc is an unsubstituted lower alkanyl or benzyl. Specific exemplary phosphate ester progroups include, but are not limited to, -CH2-O-P(O)(OH)(ORc), -CH2CH2-O-P(O)(OH)(ORc), -CH2-O-P(O)(ORc)(ORc) and -CH2CH2-O-P(O)(ORc)(ORc), where Rc is selected from lower alkanyl, i-propyl and t-butyl.

In other embodiments, each phosphate ester-containing progroup Rp is a cyclic phosphate ester of the formula
where \( R_d \), \( R_h \) and \( y \) are as previously defined.

[0021] The mechanism by which cyclic phosphate ester prodrugs including such cyclic phosphate ester progroups metabolize in vivo to the active drug compound depends, in part, on the identity of the \( R_h \) substituent. For example, cyclic phosphate ester progroups in which each \( R_h \) is, independently of the others, selected from hydrogen and lower alkyl are cleaved in vivo by esterases. Thus, in some embodiments, the cyclic phosphate ester progroups are selected such that they are cleavable in vivo by esterases. Specific examples of such cyclic phosphate ester progroups include, but are not limited to, progroups selected from

![Diagram showing cyclic phosphate ester progroups](image.png)

[0022] Alternatively, cyclic phosphate ester prodrugs having progroups in which the \( R_h \) substituents are substituted or unsubstituted aryl, arylalkyl and heteroaryl groups, are not typically cleaved by esterases, but are instead metabolized to the active prodrug by enzymes, such as cytochrome \( P_{450} \) enzymes, that reside in the liver. For example, a series of cyclic phosphate ester nucleotide prodrugs that undergo an oxidative cleavage reaction catalyzed by a cytochrome \( P_{450} \) enzyme (CYP) expressed predominantly in the liver are described in Erion et al., 2004, J. Am. Chem. Soc. 126:5154-5163. In some embodiments, the cyclic phosphate ester progroups are selected such that they are cleavable by CYP enzymes expressed in the liver. Specific exemplary embodiments of such cyclic phosphate ester-containing progroups \( R_p \) include, but are not limited to, progroups having the formula

![Diagram showing cyclic phosphate ester progroups with CYP expression](image.png)
where Rh is selected from phenyl, 3-chlorophenyl, 4-pyridyl and 4-methoxyphenyl.

As skilled artisans will appreciate, phosphites and phosphite esters can undergo oxidation in vivo to yield the corresponding phosphate and phosphate ester analogs. Such reactions can be carried out in vivo by, for example, oxidase enzymes, oxoreductase enzymes and other oxidative enzymes. Thus, the phosphorous-containing progroups R² can also include phosphate and phosphite ester analogs of any of the phosphate and phosphate ester progroups described above. In some embodiments the phosphorous-containing progroups R² include, but are not limited to, groups of the formula -(CRdRd)y-O-P(OH)(OH), -(CR²R²)y-O-P(OH)(OR²) and -(CR²R²)y-O-P(OR²)(R²), or salts thereof, where R², R² and y are as previously defined. Specific exemplary embodiments include groups in which each R² is, independently of the others, selected from hydrogen and unsubstituted lower alkyl and/or each R² is, independently of the others, selected from unsubstituted lower alkanyl and benzyl. Specific exemplary acyclic phosphite and phosphite ester progroups include, but are not limited to, groups of the formula -(CRdRd)y-O-P(OH)(OH), -(CR²R²)y-O-P(OH)(OR²) and -(CR²R²)y-O-P(OR²)(R²), where each R² is selected from lower alkanyl, i-propyl and t-butyl. Specific exemplary cyclic phosphite ester prodrugs include phosphite analogs of the above-described cyclic phosphate ester progroups. Conceptually, prodrug compounds including such phosphite and/or phosphite ester progroups can be thought of as prodrugs of the corresponding phosphate and phosphate ester prodrugs.

As mentioned above, it is believed that certain phosphate-containing prodrugs metabolize in vivo through the corresponding hydroxymethylamines. Although these hydroxymethylamines metabolize in vivo to the corresponding active 2,4-pyrimidinediamine compounds, they are stable at pH 7 and can be prepared and administered as hydroxalkyl-containing prodrugs. In some embodiments, each hydroxalkyl-containing progroup R³ of such prodrugs is of the formula -CR²R²-OH, where R² is as previously defined. A specific exemplary hydroxalkyl-containing progroup R³ is -CH₂OH.

Virtually any known 2,4-pyrimidinediamine compound that has biological, and hence therapeutic, activity can be protected at an available primary or secondary amine with one or more progroups R³ as described herein. Suitable active 2,4-pyrimidinediamine compounds are described, for example, in U.S. application Serial No.10/355,543 filed January 31, 2003 (US2004/0029902A1), international application Serial No. WO 03/063794, U.S. application Serial No. 10/631,029 filed July 29, 2003 (US 2007/0060603), international application Serial No. WO/2004/24716 (WO/2005/016893). In such 2,4-pyrimidinediamine compounds, the pragroup(s) R³ can be attached to any available primary or secondary amine, including, for example, the N2 nitrogen atom of the 2,4-pyrimidinediamine moiety, the N4 nitrogen atom of the 2,4-pyrimidinediamine moiety, and/or a primary or secondary nitrogen atom included in a substituent on the 2,4-pyrimidinediamine compound. The use of phosphate-containing progroups R³ is especially useful for 2,4-pyrimidinediamine compounds that exhibit poor water solubility under physiological conditions (for example, solubilities of less than about 10 mg/ml). While not intending to be bound by any theory of operation, it is believed that the phosphate-containing progroups aid the solubility of the underlying active 2,4-pyrimidinediamine compound, which in turn increases its bioavailability when administered orally. It is believed that the phosphate progroups R³ are metabolized by phosphatase enzymes found in the digestive tract, permitting uptake of the underlying active drug.

It has been discovered that the water solubility and oral bioavailability of a particular biologically active 2,4-pyrimidinediamine compound, illustrated below (Compound 1), increased dramatically when formulated to include a progroup R³ of the formula -CH₂-O-P(O)(OH)₂ at the ring nitrogen atom highlighted with the asterisk (Compound 4):

![Compound 1](image1)
![Compound 4](image2)

Significantly, whereas the water solubility of the active drug (Compound 1) is in the range of about 1-2 µg/ml in aqueous buffer under physiological conditions, the solubility of the corresponding phosphate prodrug (Compound 4) is greater than 5 mg/ml under the same conditions, or approximately 2000 times greater. This increased water-solubility allows for better dissolution in the gut, thereby facilitating oral administration. Other active 2,4-pyrimidinediamine compounds having similarly poor water solubilities are expected to exhibit similar increases in water solubility and oral bioavailability when formulated as phosphate prodrugs.

As mentioned above, phosphate ester prodrugs are generally less water-soluble than the corresponding phos-
phate prodrugs, and are therefore generally useful in applications where low water-solubility is desired, such as, for example, administration via inhalation. The same holds true for the relative water-solubility of phosphite ester and phosphite prodrugs.

In some embodiments, the prodrugs described herein are 2,4-pyrinidinediamine compounds that are substituted at the N4 nitrogen of the 2,4-pyrinidinediamine moiety with a substituted or unsubstituted nitrogen-containing bicyclic ring that includes at least one progroup R² as described herein at one or more of: the nitrogen atom(s) of the bicyclic ring, the N2 nitrogen of the 2,4-pyrinidinediamine moiety and/or the N4 nitrogen of the 2,4-pyrinidinediamine moiety. In a specific illustrative exemplary embodiment, the prodrug is a compound according to structural formula (I):

![Structural formula (I)](image)

including salts, solvates, hydrates and N-oxides thereof, wherein:

Y is selected from CH₂, NR₂⁴, O, S, S(O) and S(O)₂;
Z¹ and Z² are each, independently of one another, selected from CH and N;
R² is an optionally substituted lower alkyl, lower cycloalkyl, lower heteroalkyl, lower cycloheteroalkyl, aryl, phenyl, or heteroaryl group;
R⁵ is an electronegative group, such as, for example, a halo, fluoro, cyano, nitro, trihalomethyl or trifluoromethyl group;
R¹⁷ is selected from hydrogen, halogen, fluoro, lower alkyl and methyl or, alternatively, R¹⁷ may be taken together with R¹⁸ to form an oxo (=O) group or, together with the carbon atom to which they are attached, a spirocycle containing from 3 to 7 carbon atoms;
R¹⁸ is selected from hydrogen, halogen, fluoro, lower alkyl and methyl or, alternatively, R¹⁸ maybe taken together with R¹⁷ to form an oxo (=O) group or, together with the carbon atom to which they are attached, a spirocycle containing from 3 to 7 carbon atoms;
R¹⁹ is selected from hydrogen, lower alkyl, and methyl or, alternatively, R¹⁹ may be taken together with R²⁰ to form an oxo (=O) group or, together with the carbon atom to which they are attached, a spirocycle containing from 3 to 7 carbon atoms;
R²⁰ is selected from hydrogen, lower alkyl and methyl or, alternatively, R²⁰ may be taken together with R¹⁹ to form an oxo (=O) group or, together with the carbon atom to which they are attached, a spirocycle containing from 3 to 7 carbon atoms;
R²¹, R²² and R²³ are each, independently of one another, selected from hydrogen and a progroup R² as described herein; and
R²⁴ is selected from hydrogen, lower alkyl and a progroup R² as described herein,

with the proviso that at least one or R²¹, R²², R²³ and R²⁴ must be a progroup R². In some embodiments, each of R²¹, R²² and R²³ is one of the specific progroups exemplified above and R²⁴ is hydrogen. In some embodiments R²¹ is one of the specific progroups exemplified above and R²², R²³ and R²⁴ are each hydrogen. In some embodiments, R²¹, R²² and R²³ are each one of the specific progroups exemplified above and R²⁴ is lower alkyl.

In another aspect, the present invention provides a composition comprising a compound which is of structural formula:
or a pharmaceutically acceptable salt or hydrate, solvate, or N-oxide of the compound or salt and an appropriate carrier, excipient or diluent. The exact nature of the carrier, excipient or diluent will depend upon the desired use for the composition, and may range from being suitable or acceptable for veterinary uses to being suitable or acceptable for human use. The composition may optionally include one or more additional compounds.

[0031] The present disclosure describes intermediates useful for synthesizing the prodrugs described herein. In the case of phosphate- or phosphite-containing prodrugs, the intermediates generally comprise prodrugs in which the oxygen atoms of the phosphate- and/or phosphite-containing progroups are masked with protecting groups that are selectively removable under specified conditions. In some embodiments, the protecting groups are selectively removable under mildly acidic conditions. In some embodiments, the intermediates are phosphate or phosphite esters which are themselves prodrugs that can be metabolized into active 2,4-pyrimidinediamine compounds. In one illustrative embodiment, the intermediates include prodrugs in which each R³ progroup is, independently of the others, of the formula -(CRdRd)y-O-P(ORi)(ORi), -(CR²R³)y-O-P(OR)(OR)i, -(CR²R³)y-O-P(OR)(OR)i or -(CR²R³)y-O-P(OR)(OH), where each Ri is, independently of the others, selected from lower unsubstituted alkanyl, substituted or unsubstituted phenyl and substituted or unsubstituted benzyl, and R³ and y are as previously defined. In a specific embodiment, the intermediates include phosphate and/or phosphite esters in which each Ri is, independently of the others, selected from lower linear alkanyl, lower branched alkanyl, i-propyl, t-butyl and lower cyclic alkanyl.

[0032] In some embodiments, the intermediates comprise an active 2,4-pyrimidinediamine that is substituted at a nitrogen atom of a primary or secondary amine group with a group of the formula -CRdRd-AH, where Rd and A are as previously defined.

[0033] The present disclosure describes methods of synthesizing the intermediates and/or prodrugs described herein. Phosphate-containing prodrugs can be synthesized by reacting an active 2,4-pyrimidinediamine compound with a phosphate ester halide, for example, a phosphate ester halide of the formula X-(CRdRd)y-O-P(O)(ORi)(ORi) or X-(CR²R³)y-O-P(O)(OR)(OH), where each Ri is, independently of the others, a selectively removable protecting group; X is a halide, such as, for example, chloride; and R³ and y are as previously defined. In some embodiments, each Ri is R⁰, where as previously defined. Removal of the selectively removable protecting groups Ri yields a phosphate prodrug. In some embodiments each Ri is the same and is selected from lower linear alkyl, lower branched alkyl and lower cycloalkyl. In some embodiments, each Ri is isopropyl or t-butyl. In embodiments in which mixtures of intermediates are obtained, for example, mixtures of intermediates which contain different numbers of progroups or progroups at different positions on the 2,4-pyrimidinediamine molecule, the desired intermediate can be isolated from the mixture using standard separation and/or isolation techniques (e.g., column chromatography). Alternatively, a desired prodrug can be isolated from a mixture of different prodrugs using standard separation and/or isolation techniques.

[0034] Acyclic phosphate ester prodrugs can be obtained in an analogous manner by reacting the active 2,4-pyrimidinediamine with a phosphate ester halide, for example a phosphate ester halide of the formula X-(CR²R³)y-O-P(O)(OR)(OR) or X-(CR²R³)y-O-P(OR)(OR)(OR), where X, R³, y and R⁰ are as previously defined. In this instance, removal of the esterifying groups R³ is not necessary.

[0035] Acyclic phosphite and phosphite ester prodrugs can be prepared in an analogous manner from the corresponding phosphite ester halides, for example phosphite ester halides of the formula X-(CR²R³)y-O-P(OR)(OR), X-(CR⁴R⁵)y-O-P(OR)(OR), where X, R², y, R⁰ and R³ are as previously defined.

[0036] Cyclic phosphate ester and phosphite ester prodrugs can be prepared by reacting the active 2,4-pyrimidinediamine compound with the corresponding cyclic phosphate ester or phosphite ester halide, for example, a cyclic phosphate ester halide of the formula

\[
\text{X-(CR²R³)y-O-P(OR)(OR)}
\]

or a cyclic phosphate ester halide of the formula

\[
\text{X-(CR²R³)y-O-P(OR)(OR)}
\]
where X, R, y, z, R2 and R3 are as previously defined.

[0037] Embodiments in which Rp is -CRdRd-AR3 can be prepared from the corresponding 2,4-pyrimidinediamine drug using conventional methods. For example, when A is O, the intermediates can be synthesized by reacting an active 2,4-pyrimidinediamine compound, with an aldehyde or ketone of the formula R3-C(O)-Rd, where R3 is as previously defined, to yield a corresponding hydroxymethylamine intermediate (where Rp is -CRdRd-OH). The hydroxymethylamine intermediate can then be converted into the prodrug using standard techniques. For example, other drug substances containing secondary amines have been added to formaldehyde to afford their corresponding isolable hydroxymethylamine adducts, Bansal et al., J. Pharmaceutical Sci. 1981, 70: (8), 850-854; Bansal et al., J. Pharmaceutical Sci. 1981, 70: (8), 855-856; Khan et al., J. Pharmaceutical and Biomedical Analysis 1989, 7 (6), 685-691. Alternatively, hydroxalkyl-containing prodrugs can be prepared in two steps by first reacting the active 2,4-pyrimidinediamine with a bis-functional electrophile, such as a halide of the formula X1-CRdRd-X2, where X1 represents a first halide, X2 represents a second halide and R3 is as previously defined. In a specific exemplary embodiment, the halide is of the formula I-CRdRd-CL. The unreacted halide is then hydrolyzed to yield the hydroxalkyl-containing prodrug using standard techniques.

[0038] Prodrugs in which A is O, S or NR50 can be synthesized from corresponding N-methyl phosphate esters. According to this embodiment, the phosphate ester groups can be displaced with a group of the formula R3-AH, where R3 and A are as previously defined, to yield the prodrug, as discussed in further detail below.

[0039] Many of the prodrugs described herein, and in particular the prodrugs according to structural formula (I), metabolize to yield 2,4-pyrimidinediamine compounds that are potent inhibitors of degranulation of immune cells, such as mast, basophil, neutrophil and/or eosinophil cells. Additional 2,4-pyrimidinediamine compounds that exert similar biological activities that can be formulated as prodrugs as described herein and used in the various methods described herein are described in U.S. application Serial No. 10/355,543 filed January 31, 2003 (US2004/0029902A1), international application Serial No. PCT/US03/03022 filed January 31, 2003 (WO 03/063794), U.S. application Serial No. 10/631,029 filed July 29, 2003 (US2007/0060603), international application Serial No. PCT/US03/24087 (WO2004/014382), U.S. application Serial No. 10/903,263 filed July 30, 2004 (US2005/0234049), and international application Serial No. PCT/US2004/24716 (WO2005/016893). The present invention provides a compound which is of structural formula:

or a pharmaceutically acceptable salt or hydrate, solvate, or N-oxide of the compound or salt for use in a method of inhibiting cell degranulation in a subject. The method may be practiced in in vivo contexts as a therapeutic approach towards the treatment or prevention of diseases characterized by, caused by or associated with cellular degranulation.

[0040] While not intending to be bound by any theory of operation, biochemical data confirm that many of these active 2,4-pyrimidinediamine compounds exert their degranulation inhibitory effect, at least in part, by blocking or inhibiting the signal transduction cascade(s) initiated by crosslinking of the high affinity FcεRI receptors for IgE ("FcεRI") and/or IgG ("FcγRI") (see, e.g. U.S. application Serial No. 10/631,029 filed July 29, 2003 (US2007/0060603), international application Serial No. PCT/US03/24087 (WO2004/014382), U.S. application Serial No. 10/903,263 filed July 30, 2004 (US2005/0234049), and international application Serial No. PCT/US2004/24716 (WO2005/016893). Indeed, these active 2,4-pyrimidinediamine compounds are potent inhibitors of both FcεRI-mediated and FcγRI-mediated degranulation. As a consequence, the prodrugs described herein may be used to inhibit these Fc receptor signaling cascades in any cell type expressing such FcεRI and/or FcγRI receptors including but not limited to macrophages, mast, basophil, neutrophil and/or eosinophil cells.

[0041] The methods also permit the regulation of, and in particular the inhibition of, downstream processes that result as a consequence of activating such Fc receptor signaling cascade(s). Such downstream processes include, but are not limited to, FccRI-mediated and FcγRI-mediated degranulation, cytokine production and/or the production and/or release of lipid mediators such as leukotrienes and prostaglandins. The method generally involves contacting a cell expressing an Fc receptor, such as one of the cell types discussed above, with an amount of a prodrug described herein, or an acceptable salt, hydrate, solvent, N-oxide and/or composition thereof, effective to regulate or inhibit the Fc receptor signaling cascade and/or a downstream process exerted by the activation of this signaling cascade. The method may be practiced in in vitro contexts provided that the contacting is performed under conditions under which the progroup(s) metabolize to yield the active 2,4-pyrimidinediamine compound, or in in vivo contexts as a therapeutic approach.
towards the treatment or prevention of diseases characterized by, caused by or associated with the Fc receptor signaling cascade, such as diseases effected by the release of granule specific chemical mediators upon degranulation, the release and/or synthesis of cytokines and/or the release and/or synthesis of lipid mediators such as leukotrienes and prostaglandins.

[0042] In yet another aspect, the present invention provides a compound which is of structural formula:
or a pharmaceutically acceptable salt or hydrate, solvate, or N-oxide of the compound or salt for use in a method of inhibiting activity of a Syk kinase in a subject. The method generally involves contacting a Syk kinase or a cell comprising a Syk kinase with an amount of the compound or an acceptable salt, hydrate, solvate, N-oxide and/or composition thereof, effective to regulate or inhibit Syk kinase activity. In one embodiment, the Syk kinase is an endogenous or recombinant Syk kinase. In another embodiment, the Syk kinase is an endogenous or recombinant Syk kinase expressed by a cell, for example a mast cell or a basophil cell. The method may be practiced in in vitro contexts provided that the contacting is performed under conditions under which the progroup(s) metabolize to yield the active 2,4-pyrimidinediamine compound, or in in vivo contexts as a therapeutic approach towards the treatment or prevention of diseases characterized by, caused by or associated with Syk kinase activity.

While not intending to be bound by any particular theory of operation, it is believed that such active 2,4-pyrimidine compounds inhibit cellular degranulation and/or the release of other chemical mediators primarily by inhibiting Syk kinase that gets activated through the gamma chain homodimer of FcεRI. This gamma chain homodimer is shared by other Fc receptors, including FcγRI, FcγRIII and Fc αRI. For all of these receptors, intracellular signal transduction is mediated by the common gamma chain homodimer. Binding and aggregation of those receptors results in the recruitment and activation of tyrosine kinases such as Syk kinase. As a consequence of these common signaling activities, the prodrugs described herein that metabolize to such active 2,4-pyrimidinediamine compounds may be used to regulate, and in particular inhibit, the signaling cascades of Fc receptors having this gamma chain homodimer, such as FcεRI, FcγRI, FcγRIII and FcαRI, as well as the cellular responses elicited through these receptors.

Syk kinase is known to play a critical role in other signaling cascades. For example, Syk kinase is an effector of B-cell receptor (BCR) signaling (Turner et al., 2000, Immunology Today 21:148-154) and is an essential component of integrin beta(1), beta(2) and beta(3) signaling in neutrophils (Mocsai et al., 2002, Immunity 16:547-558). Active 2,4-pyrimidinediamine compounds that are potent inhibitors of Syk kinase can be used to regulate, and in particular inhibit, any signaling cascade where Syk plays a role, such as, for example, the Fc receptor, BCR and integrin signaling cascades, as well as the cellular responses elicited through these signaling cascades. Thus, the prodrugs described herein that metabolize to such active 2,4-pyrimidinediamine compounds can be used to regulate such activities. The particular cellular response regulated or inhibited will depend, in part, on the specific cell type and receptor signaling cascade, as is well known in the art. Non-limiting examples of cellular responses that may be regulated or inhibited with such prodrugs include a respiratory burst, cellular adhesion, cellular degranulation, cell spreading, cell migration, phagocytosis (e.g., in macrophages), calcium ion flux (e.g., in mast, basophil, neutrophil, eosinophil and B-cells), platelet aggregation, and cell maturation (e.g., in B-cells).

Methods are described of regulating, and in particular inhibiting, signal transduction cascades in which Syk plays a role. The method generally involves contacting a Syk-dependent receptor or a cell expressing a Syk-dependent receptor with an amount of a suitable prodrug described herein, or an acceptable salt, hydrate, solvate, N-oxide and/or composition thereof, effective to regulate or inhibit the signal transduction cascade. The methods may also be used to regulate, and in particular inhibit, downstream processes or cellular responses elicited by activation of the particular Syk-dependent signal transduction cascade. The methods may be practiced to regulate any signal transduction cascade where Syk is now known or later discovered to play a role. The methods may be practiced in in vitro contexts provided that the contacting is performed under conditions under which the progroup(s) metabolize to yield the active 2,4-pyrimidinediamine compound, or in in vivo contexts as a therapeutic approach towards the treatment or prevention of diseases characterized by, caused by or associated with activation of the Syk-dependent signal transduction cascade. Non-limiting examples of such diseases include those previously discussed.

Recent studies have shown that activation of platelets by collagen is mediated through the same pathway used by immune receptors, with an immunoreceptor tyrosine kinase motif on the FcγRI playing a pivotal role (Watson & Gibbons, 1998, Immunol. Today 19:260-264), and also that FcγRI plays a pivotal role in the generation of neointimal hyperplasia following balloon injury in mice, most likely through collagen-induced activation of platelets and leukocyte recruitment (Konishi et al., 2002, Circulation 105:912-916). Thus, the prodrugs described herein can also be used to inhibit collagen-induced platelet activation and to treat or prevent diseases associated with or caused by such platelet activation, such as, for example, intimal hyperplasia and restenosis following vascular injury.
Cellular and animal data also confirm that many of these active 2,4-pyrimidinediamine compounds may also be used to treat or prevent autoimmune diseases and/or symptoms of such diseases (see, e.g., U.S. application Serial No. 10/631,029 filed July 29, 2003 (US2007/0060603), international application Serial No. PCT/US03/24087 (WO2004/014382), U.S. application Serial No. 10/903,263 filed July 30, 2004 (US2005/0234049), and international application Serial No. PCT/US2004/24716 (WO/2005/016893). As a consequence, prodrugs of such active 2,4-pyrimidinediamine compounds can likewise be used to treat or prevent such autoimmune diseases and/or symptoms. Thus the present invention provides a compound which is of structural formula:

![Chemical structure]

or a pharmaceutically acceptable salt or hydrate, solvate, or N-oxide of the compound or salt for use in a method of treating or preventing an autoimmune disease in a subject. The methods generally involve administering to a subject suffering from an autoimmune disease or at risk of developing an autoimmune disease an amount of the compound, or an acceptable salt, N-oxide, hydrate, solvate or composition thereof, effective to treat or prevent the autoimmune disease and/or its associated symptoms. Autoimmune diseases that can be treated or prevented with the prodrugs include those diseases that are commonly associated with nonanaphylactic hypersensitivity reactions (Type II, Type III and/or Type IV hypersensitivity reactions) and/or those diseases that are mediated, at least in part by activation of the FcγR signaling cascade in monocyte cells. Such autoimmune disease include, but are not limited to, those autoimmune diseases that are frequently designated as single organ or single cell-type autoimmune disorders and those autoimmune disease that are frequently designated as involving systemic autoimmune disorder. Non-limiting examples of diseases frequently designated as single organ or single cell-type autoimmune disorders include: Hashimoto’s thyroiditis, autoimmune hemolytic anemia, autoimmune atrophic gastritis of pernicious anemia, autoimmune encephalomyelitis, autoimmune orchitis, Goodpasture’s disease, autoimmune thrombocytopenia, sympathetic ophthalmia, myasthenia gravis, Graves’ disease, primary biliary cirrhosis, chronic aggressive hepatitis, ulcerative colitis and membranous glomerulopathy. Non-limiting examples of diseases often designated as involving systemic autoimmune disorder include: systemic lupus erythematosus, rheumatoid arthritis, Sjogren’s syndrome, Reiter’s syndrome, polymyositis-dermatomyositis, systemic sclerosis, polyarteritis nodosa, multiple sclerosis and bullous pemphigoid. Additional autoimmune diseases, which can be β-cell (humoral) based or T-cell based, include autoimmune alopecia, Type I or juvenile onset diabetes, and thyroiditis.

5. BRIEF DESCRIPTION OF THE FIGURES

[0052] FIG. 1 provides schemes illustrating metabolic pathways of exemplary phosphorous-containing prodrugs;
[0053] FIG. 2 provides a scheme illustrating a metabolic pathway of an exemplary cyclic phosphate ester prodrug;
[0054] FIG. 3 illustrates an exemplary synthesis of exemplary cyclic phosphate prodrug; and
[0055] FIGS. 4-11 provide graphs illustrating various pharmacokinetic data for drug Compound 1 and/or prodrug Compound 4.

6. DETAILED DESCRIPTION

6.1 Definitions

[0056] As used herein, the following terms are intended to have the following meanings:

[0057] “Alkyl” by itself or as part of another substituent refers to a saturated or unsaturated branched, straight-chain or cyclic monovalent hydrocarbon radical having the stated number of carbon atoms (i.e., C1-C6 means one to six carbon atoms) that is derived by the removal of one hydrogen atom from a single carbon atom of a parent alkane, alkene or alkyne. Typical alkyl groups include, but are not limited to, methyl, ethyl, etc., ethanediol, ethanediol; propyls such as propyl-1-yl, prop-2-yl, cyclopropan-1-yl, prop-1-en-1-yl, prop-1-en-2-yl, prop-2-en-1-yl, cycloprop-1-1-yl, prop-1-en-1-yl, prop-1-en-2-yl, prop-2-en-1-yl, cycloprop-2-en-1-yl, prop-1-yn-1-yl, prop-2-yne-1-yl, etc.; butyls such as butan-1-yl, butan-2-yl, 2-methyl-propan-1-yl, 2-methyl-propan-2-yl, cyclobut-1-yl, but-1-en-1-yl, but-2-en-1-yl, but-1-yn-1-yl, but-2-yn-1-yl, but-2-en-2-yl, but-2-yn-2-yl.
Heteroalkyl," Heteroalkynyl," Heteroalkyldiyl" and "Heteroalkyleno" by themselves or as part of another substituent refer to saturated or unsaturated, branched, straight-chain or cyclic alkyl or alkynyl having at least one carbon-carbon double bond derived by the removal of one hydrogen atom from a single carbon atom of a parent alkane. Typical alkyl groups include, but are not limited to, methanyl; ethanyl; propenyls such as prop-1-en-1-yl, prop-1-en-2-yl, prop-2-en-1-yl, prop-2-en-2-yl, cycloprop-1-en-1-yl, cycloprop-2-en-1-yl; butenyls such as but-1-en-1-yl, but-1-en-2-yl, 2-methyl-prop-1-en-1-yl, 2-methyl-prop-1-en-2-yl, buta-1,3-dien-1-yl, cyclobut-1-en-1-yl, cyclobutan-1-yl, etc.; and the like. As used herein, "lower alkyl" means (C1-C8) alkyl.

[0058] "Alkenyl" by itself or as part of another substituent refers to a saturated branched, straight-chain or cyclic alkyl or alkenyl having at least one carbon-carbon double bond derived by the removal of one hydrogen atom from a single carbon atom of a parent alkane. Typical alkynyl groups include, but are not limited to, methanyl; ethanyl; propenyls such as prop-1-en-1-yl, prop-1-en-2-yl, prop-2-en-1-yl, prop-2-en-2-yl, cycloprop-1-en-1-yl, cycloprop-2-en-1-yl; butynyls such as but-1-yn-1-yl, but-1-yn-2-yl, 2-methyl-prop-1-yn-1-yl, 2-methyl-prop-1-yn-2-yl, etc.; and the like. As used herein, "lower alkynyl" means (C1-C8) alkynyl.

[0059] "Alkenyl" by itself or as part of another substituent refers to an unsaturated branched, straight-chain or cyclic alkyl having at least one carbon-carbon double bond derived by the removal of one hydrogen atom from a single carbon atom of a parent alkene. Typical alkenyl groups include, but are not limited to, methenyl; ethenyl; propenylns such as prop-1-en-1-yl, prop-1-en-2-yl, prop-2-en-1-yl, cycloprop-1-en-1-yl, cycloprop-2-en-1-yl; butenyls such as but-1-en-1-yl, but-1-en-2-yl, 2-methyl-prop-1-en-1-yl, 2-methyl-prop-1-en-2-yl, buta-1,3-dien-1-yl, buta-1,3-dien-2-yl, cyclobut-1-en-1-yl, cyclobutan-1-yl, etc.; and the like. As used herein, "lower alkenyl" means (C1-C8) alkenyl.

[0060] "Alkenyl" by itself or as part of another substituent refers to an unsaturated branched, straight-chain or cyclic alkyl having at least one carbon-carbon triple bond derived by the removal of one hydrogen atom from a single carbon atom of a parent alkene. Typical alkenyl groups include, but are not limited to, methenyl; ethenyl; propenylns such as prop-1-en-1-yl, prop-1-en-2-yl, prop-2-en-1-yl, cycloprop-1-en-1-yl, cycloprop-2-en-1-yl; butenyls such as but-1-en-1-yl, but-1-en-2-yl, 2-methyl-prop-1-en-1-yl, 2-methyl-prop-1-en-2-yl, etc.; butynyls such as but-1-yn-1-yl, but-1-yn-3-yl, etc.; and the like. As used herein, "lower alkynyl" means (C1-C8) alkynyl.

[0061] "alkyldiyi" by itself or as part of another substituent refers to a saturated or unsaturated, branched, straight-chain or cyclic divalent hydrocarbon group having the stated number of carbon atoms (i.e., C1-C6 means from one to six carbon atoms) derived by the removal of one hydrogen atom from each of two different carbon atoms of a parent alkane, alkene or alkynyl, or by the removal of two hydrogen atoms from a single carbon atom of a parent alkane, alkene or alkynyl. The two monovalent radical centers or each valency of the divalent radical center can form bonds with the same or different atoms. Typical alkyldiyi groups include, but are not limited to, methanediyl; ethanediyi such as ethan-1,2-diydi, ethan-1,3-diydi, ethan-1,4-diydi; propanediyls such as propan-1,3-diydi, propan-1,4-diydi, propan-2,3-diydi, propan-2,4-diydi, cycl propane-1,2-diydi, cycl propane-1,3-diydi, cycl propane-1,4-diydi, cycloprop-2-en-1,2-diydi, cycloprop-2-en-1,3-diydi; butanediyls such as butan-1,3-diydi, butan-1,4-diydi, butan-2,3-diydi, butan-2,4-diydi; cyclobutanediyls such as cyclobutan-1,3-diydi, cyclobutan-1,4-diydi, cyclobut-1-en-1,3-diydi, cyclobut-1-en-1,4-diydi, cyclobut-2-en-1,3-diydi, cyclobut-2-en-1,4-diydi, cyclobuta-1,3-diydi, cyclobuta-1,4-diydi, etc.; and the like. Where specific levels of saturation are intended, the nomenclature alkanediyl, alkylene, alkylidydi and/or alkyldiydi is used. Where it is specifically intended that the two valencies are on the same carbon atom, the nomenclature "alkylii" is used. In some embodiments, the alkyldiyi group is (C1-C8) alkyldiyi. Specific embodiments include saturated acyclic alkanediyl groups in which the radical centers are at the terminal carbons, e.g., methandiyl (methano); ethan-1,2-diydi (ethano); propan-1,3-diydi (propano); butan-1,4-diydi (butano); and the like (also referred to as alkyleneos, defined infra).

[0062] "Alkyleno" by itself or as part of another substituent refers to a saturated or unsaturated, branched, straight-chain or cyclic divalent hydrocarbon group having two terminal monovalent radical centers derived by the removal of one hydrogen atom from each of the two terminal carbon atoms of straight-chain parent alkane, alkene or alkynyl. The locant of a double bond or triple bond, if present, in a particular alkyleno is indicated in square brackets. Typical alkyleno groups include, but are not limited to, methano; ethano; propeno; cycloprop-1-en-1-yl, cycloprop-2-en-1-yl, cycloprop-1-en-2-1-yl, cycloprop-2-en-1,2-diydi, cycloprop-2-en-1,3-diydi; buta-1,3-dien-1-yl, buta-1,3-dien-2-yl, buta-1,3-dien-3-yl, buta-1,3-dien-4-yl, buta-1,3-dien-1,2-diydi, buta-1,3-dien-1,3-diydi, buta-1,3-dien-1,4-diydi, cyclobut-1-en-1,2-diydi, cyclobut-1-en-1,3-diydi, cyclobut-2-en-1,2-diydi, cyclobut-2-en-1,3-diydi, cyclobuta-1,3-dien-1,2-diydi, cyclobuta-1,3-dien-1,3-diydi, buta-1,3-dien-1,4-diydi, buta-1,3-dien-1,3di, etc.; and the like. Where specific levels of saturation are intended, the nomenclature alkyleno, alkyleneo, alkylendon and/or alkyleno is used. In some embodiments, the alkyleno group is (C1-C8) or (C1-C3) alkyleno. Specific embodiments include straight-chain saturated alkano groups, e.g., methano; ethano; propeno; butano; and the like (also referred to as alkelenos, defined infra).

[0063] "Heteroalkyl," Heteroalkanyl," Heteroalkyldiyl" and "Heteroalkyleno" by themselves or as part of another substituent refer to alkyl, alkenyl, alkynyl, alkyldiyi and alkyleno groups, respectively, in which one or more of the carbon atoms are each independently replaced with the same or different heteratoms or heteroatomic groups. Typical heteroatoms and/or heteroatomic groups which can replace the carbon atoms include, but are not limited to, -O-, -S-, -SO-, -NR-, -PH-, -S(O)-, -S(O)2-, -S(O)NR-, -S(O)2NR-, and the like, including combinations thereof, where each R' is independently hydrogen or (C1-C8) alkyl.

[0064] "Cycloalkyl" and "Heterocycloalkyl" by themselves or as part of another substituent refer to cyclic versions of "alkyl" and "heteroalkyl" groups, respectively. For cycloalkyl groups, a heteroatom can occupy the position that is attached to the remainder of the molecule. Typical cycloalkyl groups include, but are not limited to, cyclopropyl; cyclobutyls
such as cyclobutanyl and cyclobutenyl; cyclopentyls such as cyclopentanyl and cyclopentenyl; cyclohexyls such as cyclohexanyl and cyclohexenyl; and the like. Typical heterocycloalkyl groups include, but are not limited to, tetrahydrofuranyl (e.g., tetrahydrofurany-2-yl, tetrahydrofurany-3-yl, etc.), piperidinyl (e.g., piperidin-1-yl, piperidin-2-yl, etc.), morpholinyl (e.g., morpholin-3-yl, morpholin-4-yl, etc.), piperazinyl (e.g., piperazin-1-yl, piperazin-2-yl, etc.), and the like.

[0065] "Acyclic Heteroatomic Bridge" refers to a divalent bridge in which the backbone atoms are exclusively heteroatoms and/or heteroatomic groups. Typical acyclic heteroatomic bridges include, but are not limited to, -O-, -S-, -SO-, -SO2-, -S(O)2-, -S(O)2NR-, -S(O)2NR2- and the like, including combinations thereof, where each R' is independently hydrogen or (C1-C8) alkyl.

[0066] "Parent Aromatic Ring System" refers to an unsaturated cyclic or polycyclic ring system having a conjugated π electron system. Specifically included within the definition of "parent aromatic ring system" are fused ring systems in which one or more of the rings are aromatic and one or more of the rings are saturated or unsaturated, such as, for example, fluorene, indane, indene, phenalene, tetrahydronaphthalene, etc. Typical parent aromatic ring systems include, but are not limited to, acenaphthylene, acenaphthene, anthracene, azulene, benzene, chrysene, coronene, fluoranthene, fluorene, hexacene, hexaphene, hexalene, indacene, s-indacene, indane, indene, naphthalene, octacene, octaphene, octalene, ovalene, penta-2,4-diene, pentacene, pentalene, pentaphene, perylene, phenalene, phenanthrene, picene, pireiadiene, pyrene, pyranthrene, rubicene, triphenylbenzene, triphenylene, trinaphthalene, and the like.

[0067] "Aryl" by itself or as part of another substituent refers to a monovalent aromatic hydrocarbon group having the stated number of carbon atoms (i.e., C6-C15 means from 6 to 15 carbon atoms) derived by the removal of one hydrogen atom from a single carbon atom of a parent aromatic ring system. Typical aryl groups include, but are not limited to, groups derived from acenaphthylene, acenaphthene, acenaphthylene, anthracene, azulene, benzene, chrysene, coronene, fluoranthene, fluorene, hexacene, hexaphene, hexalene, azs-indacene, s-indacene, indane, indene, naphthalene, octacene, octaphene, octalene, ovalene, penta-2,4-diene, pentacene, pentalene, pentaphene, perylene, phenalene, phenanthrene, picene, pireiadiene, pyrene, pyranthrene, rubicene, triphenylbenzene, triphenylene, trinaphthalene, and the like, as well as the various hydro isomers thereof. In preferred embodiments, the aryl group is (C6-C15) aryl, with (C6-C10) being more typical. Specific exemplary aryls include phenyl and naphthyl.

[0068] "Arylaryl" by itself or as part of another substituent refers to a monovalent hydrocarbon group derived by the removal of one hydrogen atom from a single carbon atom of a ring system in which two or more identical or non-identical parent aromatic ring systems are joined directly together by a single bond, where the number of such direct ring junctions is one less than the number of parent aromatic ring systems involved. Typical arylaryl groups include, but are not limited to, biphenyl, triphenyl, phenyl-naphthyl, biphenyl, biphenyl-naphthyl, and the like. Where the number of carbon atoms in an arylaryl group are specified, the numbers refer to the carbon atoms comprising each parent aromatic ring. For example, (C6-C15) arylaryl is an arylaryl group in which each aromatic ring comprises from 6 to 15 carbons, e.g., biphenyl, triphenyl, biphenyl, phenyl-naphthyl, etc. In some embodiments, each parent aromatic ring system of an arylaryl group is independently a (C6-C15) aromatic, more preferably a (C6-C10) aromatic. Specific exemplary arylaryl groups include those in which all of the parent aromatic ring systems are identical, e.g., biphenyl, triphenyl, biphenyl, trinaphthalenyl, etc.

[0069] "Biaryl" by itself or as part of another substituent refers to an arylaryl group having two identical parent aromatic systems joined directly together by a single bond. Typical biaryl groups include, but are not limited to, biphenyl, binaphthyl, bianthracyl, and the like. In some embodiments, the aromatic ring systems are (C6-C15) aromatic rings, more typically (C6-C10) aromatic rings. A particular exemplary biaryl group is biphenyl.

[0070] "Arylalkyl" by itself or as part of another substituent refers to an acyclic alkyl group in which one of the hydrogen atoms bonded to a carbon atom, typically a terminal or sp3 carbon atom, is replaced with an aryl group. Typical arylalkyl groups include, but are not limited to, benzyl, 2-phenyleth-1-yl, 2-phenyleth-1-yl, naphthylmethyl, 2-naphthylmethyl, 1-yl, 2-naphthylethen-1-yl, napthobenzyl, 2-naphthophenylethen-1-yl and the like. Where specific alkyl moieties are intended, the nomenclature arylalkanyl, arylakenyl and/or arylalkynyl is used. In some embodiments, the arylalkyl group is (C7-C21) arylalkyl, e.g., the alkanyl, alkenyl or alkynyl moiety of the arylalkyl group is (C1-C6) and the aryl moiety is (C6-C15). In some specific embodiments the arylalkyl group is (C7-C13), e.g., the alkanyl, alkenyl or alkynyl moiety of the arylalkyl group is (C1-C3) and the aryl moiety is (C6-C10).

[0071] "Parent Heteroaromatic Ring System" refers to a parent aromatic ring system in which one or more carbon atoms are each independently replaced with the same or different heteroatoms or heteroatomic groups. Typical heteroatoms or heteroatomic groups to replace the carbon atoms include, but are not limited to, N, NH, P, O, S, S(O), S(O)2, Si, etc. Specifically included within the definition of "parent heteroaromatic ring systems" are fused ring systems in which one or more of the rings are aromatic and one or more of the rings are saturated or unsaturated, such as, for example, benzoxazin, benzofuran, chromane, chroomene, indole, indoline, xanthene, etc. Also included in the definition of "parent heteroaromatic ring system" are those recognized rings that include common substituents, such as, for example, benzopyrone and 1-methyl-1,2,3,4-tetrazole. Specifically excluded from the definition of "parent heteroaromatic ring system" are benzene rings fused to cyclic polyalkylene glycols such as cyclic polyethylene glycols. Typical parent heteroaromatic
ring systems include, but are not limited to, acridine, benzimidazole, benzisoxazole, benzodioxan, benzodioxole, benzofuran, benzopyrone, benzothiazole, benzotriazole, benzoxazole, benzothiazoline, carbazole, β-carboline, chromane, chromene, cinnoline, furan, imidazole, indazole, indole, indoline, indolizine, isobenzofuran, isochromene, isoindole, isoindoline, isoquinoline, isothiazole, isoazole, naphthyridine, oxadiazole, oxazole, perimidine, phenantridine, phenanthroline, phenantrene, pteridine, purine, pyran, pyrazine, pyrazole, pyridazine, pyridine, pyrimidine, pyrrole, pyrrolizine, quinazoline, quinoline, quinolinol, quinoxaline, tetrazole, thiadiazole, thiazole, thiophene, triazole, xanthene, and the like.

[0072] "Heteroaryl" by itself or as part of another substituent refers to a monovalent heteroaromatic group having the stated number of ring atoms (e.g., "5-14 membered" means from 5 to 14 ring atoms) derived by the removal of one hydrogen atom from a single parent heteroaromatic ring system. Typical heteroaryl groups include, but are not limited to, groups derived from acridine, benzimidazole, benzisoxazole, benzodioxan, benzodioxole, benzofuran, benzopyrone, benzothiazole, benzotriazole, benzoxazole, benzothiazoline, carbazole, β-carboline, chromane, chromene, cinnoline, furan, imidazole, indazole, indole, indoline, indolizine, isobenzofuran, isochromene, isoindole, isoindoline, isoquinoline, isothiazole, isoazole, naphthyridine, oxadiazole, oxazole, perimidine, phenantridine, phenanthroline, phenantrene, pteridine, purine, pyran, pyrazine, pyrazole, pyridazine, pyridine, pyrimidine, pyrrole, pyrrolizine, quinazoline, quinoline, quinolinol, quinoxaline, tetrazole, thiadiazole, thiazole, thiophene, triazole, xanthene, and the like. In preferred embodiments, the heteroaryl group is a 5-14 membered heteroaryl, with 5-10 membered heteroaryl being particularly preferred.

[0073] "Heteroaryl-Heteroaryl" by itself or as part of another substituent refers to a monovalent heteroaromatic group derived by the removal of one hydrogen atom from a single atom of a ring system in which two or more identical or non-identical parent heteroaromatic ring systems are joined directly together by a single bond, where the number of such direct ring junctions is one less than the number of parent heteroaromatic ring systems involved. Typical heteroaryl-heteroaryl groups include, but are not limited to, bipyridyl, tripyrindyl, pyridylpyridinium, etc. Where the number of atoms is specified, the numbers refer to the number of atoms comprising each parent heteroaromatic ring systems.

For example, 5-15 membered heteroaryl-heteroaryl is a heteroaryl-heteroaryl group in which each parent heteroaromatic ring systems includes from 5 to 15 atoms, e.g., bipyridyl, tripyrindyl, etc. In some embodiments, each parent heteroaromatic ring system is independently a 5-15 membered heterocyclic, more typically a 5-10 membered heterocyclic. Specific exemplary heteroaryl-heteroaryl groups include those in which all of the parent heteroaromatic ring systems are identical.

[0074] "Biheteroaryl" by itself or as part of another substituent refers to a heteroaryl-heteroaryl group having two identical parent heteroaromatic ring systems joined directly together by a single bond. Typical biheteroaryl groups include, but are not limited to, bipyridyl, bipyrindyl, bisquinolinyl, and the like. In some embodiments, the heteroaromatic ring systems are 5-15 membered heterocyclic rings, more typically 5-10 membered heterocyclic rings.

[0075] "Heteroarylalkyl" by itself or as part of another substituent refers to an acyclic alkyl group in which one of the hydrogen atoms bonded to a carbon atom, typically a terminal or sp2 carbon atom, is replaced with a heteroaryl group. Where specific alkyl moieties are intended, the nomenclature heteroarylalkanyl and/or heteroaryllkylnyl is used. In some embodiments, the heteroarylalkyl group is a 6-21 membered heteroarylalkyl, e.g., the alkenyl, alkenyl or alkyl moiety of the heteroarylalkyl is (C1-C6) alkyl and the heteroaryl moiety is a 5-15 membered heteroaryl. In some specific exemplary embodiments, the heteroarylalkyl is a 6-13 membered heteroarylalkyl, e.g., the alkenyl, alkenyl or alkyl moiety is (C1-C3) alkyl and the heteroaryl moiety is a 5-10 membered heteroaryl.

[0076] "Halogen" or "Halo" by themselves or as part of another substituent, unless otherwise stated, refer to fluoro, chloro, bromo and iodo.

[0077] "Haloalkyl" by itself or as part of another substituent refers to an alkyl group in which one or more of the hydrogen atoms is replaced with a halogen. Thus, the term "haloalkyl" is meant to include monohaloalkyls, dihaloalkyls, trihaloalkyls, etc. up to perhaloalkyls. For example, the expression "(C1-C2) haloalkyl" includes fluoromethyl, difluoromethyl, trifluoromethyl, 1-fluoroethyl, 1,1-difluoroethyl, 1,2-difluoroethyl, 1,1,1-trifluoroethyl, perfluoroethyl, etc.

[0078] The above-defined groups may include prefixes and/or suffixes that are commonly used in the art to create additional well-recognized substituent groups. For example, the expression "(C1-C2) haloalkyl" includes fluoromethyl, difluoromethyl, trifluoromethyl, 1-fluoroethyl, 1,1-difluoroethyl, 1,2-difluoroethyl, 1,1,1-trifluoroethyl, perfluoroethyl, etc.
"Receptor" refers to a member of the family of cell surface molecules that binds the Fc portion (containing the FcR gamma homodimer that bears an activation motif (ITAM) in the cytoplasmic domain and phosphorylates Syk kinase. The Fc γ RIII (also known as CD16). Fc ε RII is a low affinity receptor expressed on NK, eosinophil, macrophage, neutrophil and mast cells. Fc γ RII comprises a single polypeptide chain and does not include the gamma chain homodimer discussed above. The Fc γ RII possesses one alpha chain, one beta chain and the gamma chain homodimer discussed above. The Fc γ RII is a low affinity receptor expressed on mononuclear phagocytes, B lymphocytes, eosinophils and platelets. The Fc γ RII comprises a single polypeptide chain and does not include the gamma chain homodimer.

The Fc γ R family includes three types, designated Fc γ RI and Fc γ RII (also known as CD64), Fc γ RIII (also known as CD16). Fc γ RI is a high affinity receptor (binds IgE with an affinity of about 10^{10} M^{-1} ) found on mast, basophil and eosinophil cells that anchors monomeric IgE to the cell surface. The Fc γ RI possesses one alpha chain, one beta chain and the gamma chain homodimer discussed above. The Fc γ RI is a low affinity receptor expressed on mononuclear phagocytes, B lymphocytes, eosinophils and platelets. The Fc γ RI comprises a single polypeptide chain and does not include the gamma chain homodimer.

The Fc γ RI is a low affinity receptor expressed on neutrophils, monocytes, eosinophils, platelets and B lymphocytes. The Fc γ RI includes one alpha chain, and does not include the gamma chain homodimer discussed above. The Fc γ RI is a low affinity (binds IgG1 with an affinity of 5x10^{5} M^{-1} ) expressed on NK, eosinophil, macrophage, neutrophil and mast cells. It comprises one alpha chain and the gamma homodimer shared by Fc γ RI, Fc γ RI and Fc γ RII.
"Fc Receptor-Mediated Degranulation" or "Fc Receptor-Induced Degranulation" refers to degranulation that proceeds via an Fc receptor signal transduction cascade initiated by crosslinking of an Fc receptor.

"IgE-Induced Degranulation" or "FcεRI-Mediated Degranulation" refers to degranulation that proceeds via the IgE receptor signal transduction cascade initiated by crosslinking of FcεRI-bound IgE. The crosslinking may be induced by an IgE-specific allergen or other multivalent binding agent, such as an anti-IgE antibody. In mast and/or basophil cells, the FcεRI signaling cascade leading to degranulation may be broken into two stages: upstream and downstream. The upstream stage includes all of the processes that occur prior to calcium ion mobilization. The downstream stage includes calcium ion mobilization and all processes downstream thereof. Compounds that inhibit FcεRI-mediated degranulation may act at any point along the FcεRI-mediated signal transduction cascade. Compounds that selectively inhibit upstream FcεRI-mediated degranulation act to inhibit that portion of the FcεRI signaling cascade upstream of the point at which calcium ion mobilization is induced. In cell-based assays, compounds that selectively inhibit upstream FcεRI-mediated degranulation inhibit degranulation of cells such as mast or basophil cells that are activated or stimulated with an IgE-specific allergen or binding agent (such as an anti-IgE antibody) but do not appreciably inhibit degranulation of cells that are activated or stimulated with degranulating agents that bypass the FcεRI signaling pathway, such as, for example the calcium ionophores ionomycin and A23187.

"IgG-Induced Degranulation" or "FcγRI-Mediated Degranulation" refers to degranulation that proceeds via the FcγRI signal transduction cascade initiated by crosslinking of FcγRI-bound IgG. The crosslinking may be induced by an IgG-specific allergen or another multivalent binding agent, such as an anti-IgG or fragment antibody. Like the FcεRI signaling cascade, in mast and basophil cells the FcγRI signaling cascade also leads to degranulation which may be broken into the same two stages: upstream and downstream. Similar to FcεRI-mediated degranulation, compounds that selectively inhibit upstream FcγRI-mediated degranulation act upstream of the point at which calcium ion mobilization is induced. In cell-based assays, compounds that selectively inhibit upstream FcγRI-mediated degranulation inhibit degranulation of cells such as mast or basophil cells that are activated or stimulated with an IgG-specific allergen or binding agent (such as an anti-IgG antibody or fragment) but do not appreciably inhibit degranulation of cells that are activated or stimulated with degranulating agents that bypass the FcγRI signaling pathway, such as, for example the calcium ionophores ionomycin and A23187.

"Ionophore-Induced Degranulation" or "Ionophore-Mediated Degranulation" refers to degranulation of a cell, such as a mast or basophil cell, that occurs upon exposure to a calcium ionophore such as, for example, ionomycin or A23187.

"Syk Kinase" refers to the well-known 72kDa non-receptor (cytoplasmic) spleen protein tyrosine kinase expressed in B-cells and other hematopoietic cells. Syk kinase includes two consensus Src-homology 2 (SH2) domains in tandem that bind to phosphorylated immunoreceptor tyrosine-based activation motifs ("ITAMs"), a "linker" domain and a catalytic domain (for a review of the structure and function of Syk kinase see Sada et al., 2001, J. Biochem. (Tokyo) 130:177-186; see also Turner et al., 2000, Immunology Today 21:148-154). Syk kinase has been extensively studied as an effector of B-cell receptor (BCR) signaling (Turner et al., 2000, supra). Syk kinase is also critical for tyrosine phosphorylation of multiple proteins which regulate important pathways leading from immunoreceptors, such as Ca2+ mobilization and mitogen-activated protein kinase (MAPK) cascades and degranulation. Syk kinase also plays a critical role in integrin signaling in neutrophils (see, e.g., Mocsai et al. 2002, Immunity 16:547-558).

As used herein, Syk kinase includes kinases from any species of animal, including but not limited to, homosapiens, simian, bovine, porcine, rodent, etc., recognized as belonging to the Syk family. Specifically included are isoforms, splice variants, allelic variants, mutants, both naturally occurring and man-made. The amino acid sequences of such Syk kinases are well known and available from GENBANK. Specific examples of mRNAs encoding different isoforms of human Syk kinase can be found at GENBANK accession nos. gi|21361552|ref|NM_003177.2|, gi|496899|emb|Z29630.1|HSSYKPTK[496899] and gi|15030258|gb|BC011399.1|BC011399[15030258], which are incorporated herein by reference.

Skilled artisans will appreciate that tyrosine kinases belonging to other families may have active sites or binding pockets that are similar in three-dimensional structure to that of Syk. As a consequence of this structural similarity, such kinases, referred to herein as "Syk mimics," are expected to catalyze phosphorylation of substrates phosphorylated by Syk. Thus, it will be appreciated that such Syk mimics, signal transduction cascades in which such Syk mimics play a role, and biological responses effected by such Syk mimics and Syk mimic-dependent signaling cascades may be regulated, and in particular inhibited, with many of the prodrugs described herein.

"Syk-Dependent Signaling Cascade" refers to a signal transduction cascade in which Syk kinase plays a role. Non-limiting examples of such Syk-dependent signaling cascades include the FccRI, FcεRI, FcγRI, FcγRIII, BCR and...
Autoimmune Disease" refers to those diseases which are commonly associated with the nonanaphylactic hypersensitivity reactions (Type II, Type III and/or Type IV hypersensitivity reactions) that generally result as a consequence of the subject’s own humoral and/or cell-mediated immune response to one or more immunogenic substances of endogenous and/or exogenous origin. Such autoimmune diseases are distinguished from diseases associated with the anaphylactic (Type I or IgE-mediated) hypersensitivity reactions.

6.2 The Prodrug Compounds

Prodrugs of these 2,4-pyrimidinediamine compounds are of particular interest, as these compounds inhibit upstream Fc receptor signaling cascades as well as Syk kinase and Syk kinase-dependent signaling cascades. The prodrugs generally include such active 2,4-pyrimidinediamine compounds in which one or more of the available primary or secondary amine groups is masked with a progroup \( \text{Rp} \) that metabolizes \textit{in vivo} by to yield the active 2,4 pyrimidinediamine drug. As also discussed in the Summary section, and as will be discussed in more detail, below, the nature of the progroup can vary, and will depend upon, among other factors, the desired water solubility of the prodrug, its intended mode of administration and/or its intended mechanism or site of metabolism to the active 2,4-pyrimidinediamine compound.

For example, it has been discovered that a specific active 2,4-pyrimidinediamine drug (Compound 1, below), exhibits vastly superior water solubility when formulated as a phosphate prodrug (Compound 4, below):

<table>
<thead>
<tr>
<th>Compound</th>
<th>Structure</th>
<th>Solubility</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compound 1</td>
<td><img src="image" alt="Structure of Compound 1" /></td>
<td>1-2 ( \mu \text{g/ml} )</td>
</tr>
<tr>
<td>Compound 4</td>
<td><img src="image" alt="Structure of Compound 4" /></td>
<td>&gt;5 mg/ml</td>
</tr>
</tbody>
</table>

This prodrug Compound 4 also exhibits superior bioavailability compared to the corresponding active drug Compound 1 when administered orally to test animals. In fact, unlike the drug Compound 1, absorption of the prodrug Compound 4 is not dependent upon formulation. In pharmacokinetics studies carried out in rats, the prodrug Compound 4 was absorbed equally well from solutions (e.g., PEG-400 solutions and carboxymethylcellulose solutions) and powders (packed in hard gelatin capsules). While not intending to be bound by any particular theory of operation, it is believed that the improved oral bioavailability of the prodrug Compound 4, as well as its formulation-independent absorption, is due, at least in part, to its higher water-solubility. It is expected that other active 2,4-pyrimidinediamine compounds that have similarly low water solubilities, and hence oral bioavailabilities, will exhibit similar increases in water solubility and oral bioavailability when formulated as phosphate prodrugs.

Conversely, the corresponding phosphate ester prodrug of active drug Compound 1 would be expected to have lower water-solubility than the active Compound 1 compound. Thus, it is expected that phosphate ester prodrugs of active 2,4-pyrimidinediamine compounds that have lower water-solubility than the corresponding active 2,4-pyrimidinediamine compounds will be especially useful in applications and formulations where low water-solubility is desirable, such as formulations adapted for delivery via inhalation.

It has recently been discovered that a phosphate-containing prodrug according to the structure illustrated below:
metabolizes in vivo to the corresponding active 2,4-pyrimidinediamine compound (Compound 1), illustrated below:

---

[0105] While not intending to be bound by any particular theory of operation, it is believed that this prodrug metabolizes to active Compound 1 via the corresponding hydroxymethylamine intermediate illustrated below:

---

[0106] Such hydroxymethylamine compounds are known to be unstable under physiological conditions and various pH ranges where they hydrolyze in vivo to yield formaldehyde and the active drug substance. Based on this observation, it is believed that prodrugs that include hydroxy "protecting" groups that can be metabolized in vivo, for example by the acidic conditions of the stomach and/or by enzymes present in the digestive tract or other organs and/or tissues or fluids with the body, to yield the hydroxymethylamine intermediate illustrated above will likewise metabolize to the active 2,4-pyrimidinediamine drug.

[0107] Moreover, it is expected that the amino and thio analogs of this hydroxymethylamine intermediate, will be similarly unstable at physiological conditions and also hydrolyze in vivo to the active 2,4-pyrimidinediamine drug. Accordingly, it is also expected that the corresponding amino and thio compounds, as well as compounds in which the α-amino and α-thio groups are masked with "protecting" groups that are removed under physiological conditions of use to yield the α-amino and α-thio groups, will likewise make suitable prodrugs.

[0108] As alkaline phosphatases are abundant in the digestive tract of humans, the phosphate-containing prodrug -CH₂-O-P(O)(OH)₂ that can be cleaved in the presence of alkaline phosphatases is particularly suitable for formulating phosphate-containing prodrugs intended for oral administration.

[0109] Although phosphate-containing prodrugs suitable for oral administration are of interest, skilled artisans will appreciate that prodrugs including phosphate-containing progroups RP can be administered via other routes of administration, as phosphatases are distributed throughout the body. For example, exemplary prodrug Compound 4 has been found to metabolize to the active drug Compound 1 in in vitro experiments carried out with rat plasma, as well as with rat hepatic and intestinal microsomal preparations, indicating that phosphatases are also present in plasma. Thus, the only requirement is that the particular phosphate-containing progroup RP selected should be removable under the conditions of intended use.

[0110] While not intending to be bound by any theory of operation, it is believed that when y is 1, phosphate-containing prodrugs, such as those according to structural formula (Ia), are metabolized to the active 2,4-pyrimidinediamine compound via the corresponding hydroxymethylamine. This metabolism is illustrated in Fig. 1A. Referring to Fig. 1A, removal of phosphoric acid from phosphate prodrug 16 via enzymatic hydrolysis yields the corresponding hydroxymethylamine.
which undergoes hydrolysis in vivo to yield formaldehyde and active 2,4-pyrimidinediamine compound 10.

Referring to FIG. 1B, when \( y \) is 2, it is believed that in vivo hydrolysis of phosphate prodrug 26 yields active 2,4-pyrimidinediamine 10 and enol phosphate, which then hydrolyses in vivo to acetaldehyde and phosphoric acid.

Referring again to FIG. 1A, skilled artisan will appreciate that while hydroxymethylamine 18 metabolizes under physiological conditions to yield active 2,4-pyrimidinediamine compound 10, it is stable at pH 7 and can therefore be prepared and administered as a hydroxalkyl-containing prodrug of active compound 10. Thus, in some embodiments of the prodrugs of structural formula (I), \( R^p \) is a hydroxalkyl-containing progroup of the formula \(-CR^dR^d-OH\), where \( R^d \) is as previously defined. In a specific exemplary embodiment, \( R^p \) is \(-CH_2OH\).

Still referring again to FIG. 1A, skilled artisans will also appreciate that phosphate prodrugs can be generated by in vivo hydrolysis of phosphate ester prodrugs, such as phosphate ester prodrugs 20 and/or by in vivo oxidation of phosphate prodrugs, such as phosphate prodrugs 24. Such phosphate ester and phosphate prodrugs can in turn be generated by either in vivo oxidation or hydrolysis of phosphate ester prodrugs such as phosphate ester prodrugs 22. The corresponding phosphate ester, phosphate and phosphite ester prodrugs of phosphate prodrug 26 are illustrated in FIG. 1B as compounds 30, 34 and 32, respectively. Thus, as will be appreciated by skilled artisans, prodrugs that include precursors of phosphates that can metabolize into phosphate groups in vivo are also described.

The suitability of any particular progroup \( R^p \) for a desired mode of administration can be confirmed in biochemical assays. For example, if a prodrug is to be administered by injection into a particular tissue or organ, and the identities of the various phosphatases expressed in the tissue or organ are known, the particular prodrug can be tested for metabolism in biochemical assays with the isolated phosphatase(s). Alternatively, the particular prodrug can be tested for metabolism to the active 2,4-pyrimidinediamine compound with tissue and/or organ extracts. Using tissue and/or organ extracts can be of particular convenience when the identity(ies) of the phosphatases expressed in the target tissues or organs are unknown, or in instances when the isolated phosphatases are not conveniently available. Skilled artisans will be able to readily select progroups \( R^p \) having metabolic properties (such as kinetics) suitable for particular applications using such in vitro tests. Of course, specific prodrugs could also be tested for suitable metabolism in in vitro animal models.

Those of skill in the art will appreciate that many of the prodrugs described herein, as well as the various prodrug species specifically described and/or illustrated herein, may exhibit the phenomena of tautomerism, conformational isomerism, geometric isomerism and/or optical isomerism. For example, the prodrugs may include one or more chiral centers and/or double bonds and as a consequence may exist as stereoisomers, such as double-bond isomers (i.e., geometric isomers), enantiomers and diastereomers and mixtures thereof, such as racemic mixtures. As another example, the e.g. the prodrugs may exist in several tautomer forms, including the enol form, the keto form and mixtures thereof. As the various compound names, formulae and drawings within the specification and claims can represent only one of the possible tautomeric, conformational isomorphic, optical isomorphic or geometric isomorphic forms, it should be understood that the invention encompasses any tautomeric, conformational isomeric, optical isomeric and/or geometric isomeric forms of the prodrugs having one or more of the utilities described herein, as well as mixtures of these various different isomeric forms. In cases of limited rotation around the 2,4-pyrimidinediamine moiety, atrop isomers are also possible and are also specifically included in the compounds of the invention.

The prodrugs described herein may be identified by either their chemical structure or their chemical name. When the chemical structure and the chemical name conflict, the chemical structure is determinative of the identity of the Specific prodrug.

Depending upon the nature of the various substituents, the prodrugs described herein may be in the form of salts. Such salts include salts suitable for pharmaceutical uses ("pharmaceutically-acceptable salts"), salts suitable for veterinary uses, etc. Such salts may be derived from acids or bases, as is well-known in the art.

In one embodiment, the salt is a pharmaceutically acceptable salt. Generally, pharmaceutically acceptable salts are those salts that retain substantially one or more of the desired pharmacological activities of the parent compound and which are suitable for administration to humans. Pharmaceutically acceptable salts include acid addition salts formed with inorganic acids or organic acids. Inorganic acids suitable for forming pharmaceutically acceptable acid addition salts include, by way of example and not limitation, hydrohalide acids (e.g., hydrochloric acid, hydrobromic acid, hydriodic, etc.), sulfuric acid, nitric acid, phosphoric acid, and the like. Organic acids suitable for forming pharmaceutically acceptable acid addition salts include, by way of example and not limitation, acetic acid, trifluoroacetic acid, propionic acid, hexanoic acid, cyclopentanopropionic acid, glycolic acid, oxalic acid, pyruvic acid, lactic acid, malonic acid, succinic acid, malic acid, maleic acid, fumaric acid, tartaric acid, citric acid, palmitic acid, benzoic acid, 3-(4-hydroxybenzoyl) benzoic acid, cinnamic acid, mandelic acid, alkylsulfonic acids (e.g., methanesulfonic acid, ethanesulfonic acid, 1,2-ethane-disulfonic acid, 2-hydroxyethanesulfonic acid, etc.), arylsulfonic acids (e.g., benzenesulfonic acid, 4-chlorobenzenesulfonic acid, 2-naphthalenesulfonic acid, 4-toluenesulfonic acid, camphorsulfonic acid, etc.), 4-methylbicyclo[2.2.2]oct-2-ene-1-carboxylic acid, glucoheptonic acid, 3-phenylpropanoic acid, trimethylacetic acid, tertiary butylacetic acid, lauryl sulfuric acid, gluconic acid, glutamic acid, hydroxynaphthoic acid, salicylic acid, stearic acid, muconic acid, and the like.

Pharmaceutically acceptable salts also include salts formed when an acidic proton present in the parent com-
pound is either replaced by a metal ion (e.g., an alkali metal ion, an alkaline earth metal ion or an aluminum ion) or
coordinates with an organic base (e.g., ethanolamine, diethanolamine, triethanolamine, N-methylglucamine, morpholine,
piperidine, dimethylamine, diethylamine, etc.).

[0120] The prodrugs described herein, as well as the salts thereof, may also be in the form of hydrates, solvates and
N-oxides, as are well-known in the art. Unless specifically indicated otherwise, the expression "prodrug" is intended to
encompass such salts, hydrates, solvates and/or N-oxides. Specific exemplary salts include, but are not limited to,
mono- and disodium salts, mono- and di-potassium salts, mono- and di-lithium salts, mono- and di-alkylamino salts,
mono-magnesium salts, mono-calcium salts and ammonium salts.

6.3 Methods of Synthesis

[0121] The prodrugs described herein, as well as intermediates therefor, may be synthesized via a variety of different
synthetic routes using commercially available starting materials and/or starting materials prepared by conventional
synthetic methods. Suitable exemplary methods that may be routinely used and/or adapted to synthesize active 2,4-
pyrimidinediamine compounds can be found in U.S. Patent No. 5,958,935, U.S. application Serial No. 10/355,543 filed
(US2005/0234049), and international application Serial No. PCT/US2004/24716 WO/2005/016893). These active 2,4-
pyrimidinediamine compounds can be used as starting materials to synthesize the prodrugs. Specific examples describing
the synthesis of phosphate prodrug Compound 4, as well as a synthetic intermediate therefor, are provided in the
Examples section. All of the prodrugs described herein may be synthesized by routine adaptation of this method.

[0122] For example, some embodiments of prodrugs according to structural formula (I) and/or (Ia) can be prepared
by reacting the corresponding active 2,4-pyrimidinediamine (i.e., compounds according to structural formulae (I) and/or
(Ia) in which each Rp is hydrogen) with an aldehyde or a ketone to give an α-hydroxymethyl amine, which can then be
reacted with an electrophile to yield a prodrug. An exemplary synthesis of this type is illustrated in Scheme (I), below:
In scheme (I), $Z_1$, $Z_2$, $R^2$, $R^5$, $R^{17}$, $R^{18}$, $R^{19}$ and $R^{20}$ are as defined for structural formula (I) and $Y^1$ is selected.
from CH₂, NR₂₄, O, S(O) and S(O)₂; and R₂⁴ is selected from hydrogen, lower alkyl and progroup R_p. R³ and R_d are as defined in the text, supra. According to Scheme (I), active 2,4-pyrimidinediamine 10 is reacted with ketone 12 to yield a mixture of four products: unreacted starting material 10 (not illustrated) and compounds 14a, 14b and 14c. At this stage, the products can be isolated from one another using standard chromatographic techniques. Reaction with electrophilic R³ yields prodrugs 15a, 15b and 15c.

[0124] As illustrated above, α-hydroxymethylamines 14a, 14b and 14c can be converted into a variety of different types of prodrugs 15a, 15b and 15c. For example, the α-hydroxymethylamines can be reacted with an alcohol in the presence of a strong acid catalyst, or a carbon-bearing halide (e.g., CH₃Br), to yield the corresponding ether derivatives (e.g., compounds in which R³ is R¹, where R¹ is as previously defined).

[0125] Reacting α-hydroxymethylamines 14a, 14b and 14c with a carboxylic acid in the presence of a strong acid catalyst or a carboxylic acid anhydride or a carboxylic acid halide (e.g. with an appropriate acid scavenger) yields the corresponding ester derivatives (e.g., compounds in which R³ is -C(O)R¹, where R¹ is as defined above).

[0126] Reaction of α-hydroxymethylamines 14a, 14b and 14c with a haloformate ester (e.g., Cl-C(O)OCH₃) yields the corresponding carbonate derivatives (e.g., compounds in which R³ is -C(O)OR¹, where R¹ is as previously defined).

[0127] Reaction of α-hydroxymethylamines 14a, 14b and 14c with a haloformamide (e.g., Cl-C(O)N(CH₃)₂) yields the corresponding carbamate or urethane derivatives (e.g., compounds in which R³ is -C(O)NR¹R², where R¹ is as previously defined).

[0128] As will be recognised by skilled artisans, other hydroxyl protecting groups could also be used, including, for example, the various different hydroxyl protecting groups described in Green & Wuts "Protective Groups in Organic Chemistry," 2d Edition, John Wiley & Sons, New York, pp. 10-142.

[0129] Alternatively, prodrugs according to structural formulae (I) and (Ia) can be synthesised by nucleophilic substitution of the corresponding phosphate esters. An example of this synthetic route is illustrated in Scheme (II), below:
According to Scheme (II), active 2,4-pyrimidinediamine 10 is reacted with di-tert-butyl chloromethylphosphate 13 in the presence of cesium carbonate to yield a mixture of four products: unreacted starting material 10 (not illustrated) and phosphate esters 17a, 17b and 17c, which are themselves prodrugs as described herein. When R2 is 3,4,5-trimethoxyphenyl phosphate ester 17a is the major product. Reaction of this phosphate ester 17a with R1-AH (where A is O, S, or NR50), yields prodrug 19. The minor phosphate esters 17b and 17c can be similarly reacted to yield the corresponding prodrugs.

Di-tert-butyl chloromethyl phosphate 13 can be prepared from di-tert-butyl phosphate as illustrated in Scheme (III), below:

According to Scheme (III), di-tert-butyl phosphate 9 is obtained from the corresponding di-tert-butyl phosphite 7 as described in Krise et al., 1999, J. Med. Chem. 42:3094-3100. Reaction of phosphate 9 with chloromethyl chlorosulfate 11 (available from Synergetica, Inc., Sicklerville, NJ 08081) as described in Mantyla et al., 2002, Tet. Lett. 43:3793-3794 yields di-tert-butyl chloromethyl phosphate 13, which can be used in Scheme (II), above, crude without purification.

Although the Schemes illustrated above depict the synthesis of prodrugs that include a single progroup, prodrugs having a plurality of progroups could be obtained by adjusting the number of equivalents of reagent 12 or 13 used.

As another alternative to Schemes (I), hydroxymethylamine 14a can be prepared in a two-step process by first reacting active 2,4-pyrimidinediamine 10 with a bis functional electrophile, such as, for example, chloro-iodomethane (I-CH2Cl), to yield a chloro-methyl intermediate, which can then be hydroxylated by reaction with basic hydroxide or reacted with various nucleophilic reagents such as alkoxydes, amines or sulfide to make Rp. Specific conditions for carrying out reactions of this type that can be used to synthesize the prodrugs described herein, for example, in Bansal et al., 1981, J. Pharm. Sci. 70(8):850-854 and Bansal et al., 1981, J. Pharm. Sci. 70(8):855-857.

An exemplary synthetic route that can be used to synthesize an exemplary phosphate prodrug 16 according to structural formula (Ia) is illustrated in Scheme (IV), below. This method may be routinely adapted to synthesize the full range of phosphate prodrugs described herein.
In Scheme (IV), \( Y^1, Z^1, Z^2, R^2, R^5, R^{17}, R^{18}, R^{19} \) and \( R^{20} \) are as defined for structural formula (I) or (Ia).
According to Scheme (IV), active 2,4-pyrimidinediamine 10 is reacted with di-tert-butyl chloromethylphosphate 13 in the presence of cesium carbonate to yield a mixture of four products: unreacted starting material 10 (not illustrated) and compounds 17a, 17b and 17c. When R² is 3,4,5-trimethoxyphenyl, compound 17a is the major product. At this stage, the major product can be isolated from the minor products using standard chromatographic techniques. Removal of the tert-butyl groups yields a mixture of desired product 16 and impurities 18 and 10. The desired product 16 can be isolated using standard techniques.

[0137] An alternative method of obtaining phosphate prodrug 16 is illustrated in Scheme (V); below.
According to Scheme (V), the reaction of active 2,4-pyrimidinediamine 10 again yields a mixture of four products:
unreacted pyrimidinediamine 10 (not illustrated) major product 17a and minor products 17b and 17c. Major product 17a can be isolated via crystallization (see the Examples section for suitable conditions), dissolved in a mixture of acetic acid and water (4:1 AcOH:H2O) and heated to 65°C for approximately 3 hr to yield phosphate prodrug 16 as the major product.

[0139] Although Schemes (IV) and (V) illustrate the synthesis of a phosphate prodrug in which the phosphate progroup is \(-\text{CH}_2\text{O-P(O)}(\text{OH})_2\), skilled artisans will appreciate that phosphate prodrugs including other phosphate progroups could be readily obtained according to the same methods by using the appropriate reagent 13. Phosphate ester prodrugs, phosphite prodrugs and phosphate ester prodrugs can also be synthesized via routine adaptation of the methods using the appropriate phosphate ester, phosphite and phosphate ester halides 13. Exemplary methods for synthesizing cyclic phosphate ester prodrugs, which can be used as prodrugs in the various methods described herein, or converted into phosphate prodrugs, are illustrated in FIG. 3. Moreover, while Schemes (I) and (III) depict compound 16 as being the desired product, prodrugs having progroups at other positions within the prodrug molecule could be readily obtained by isolating, for example minor product 17a or 17b and/or by adjusting the number of equivalents of reagent 13 used.

[0140] Referring to FIG. 3, diols 21 are converted to the corresponding cyclic phosphates 23 using literature procedures as depicted. Cyclic phosphates 23 are converted to the corresponding chloromethyl phosphate esters 25 in any of the three ways depicted. Compound 1 is converted to cyclic phosphate ester derivatives 27, 29, and 31, via addition of 25 under conditions as previously described for the synthesis of compounds 17a-c. Cyclic phosphate ester derivatives 27, 29, and 31, are converted to the corresponding phosphate derivatives via treatment under acidic conditions as described for the synthesis of compound 16, or via hydrogenation using, for example, palladium catalyst.

[0141] Skilled artisans will recognize that in some instances, the active 2,4-pyrimidinediamine compounds used as starting materials may include functional groups that require protection during synthesis. The exact identity of any protecting group(s) used will depend upon the identity of the functional group being protected, and will be apparent to those of skill in the art. Guidance for selecting appropriate protecting groups, as well as synthetic strategies for their attachment and removal, may be found, for example, in Greene & Wuts, Protective Groups in Organic Synthesis, 3rd Edition, John Wiley & Sons, Inc.; New York (1999) and the references cited therein (hereinafter “Greene & Wuts”).

6.4 Inhibition of Fc Receptor Signal Cascades

[0142] Many of the prodrugs described herein, and in particular the prodrugs according to structural formulae (I) and (Ia), metabolize to active 2,4-pyrimidinediamine compounds that inhibit Fc receptor signaling cascades that lead to, among other things, degranulation of cells. As a specific example, these active compounds inhibit the FccRI and/or FceRI signal cascades that lead to degranulation of immune cells such as neutrophil, eosinophil, mast and/or basophil cells. Both mast and basophil cells play a central role in allergen-induced disorders, including, for example, allergic rhinitis and asthma. Upon exposure allergens, which may be, among other things, pollen or parasites, allergen-specific IgE antibodies are synthesized by B-cells activated by IL-4 (or IL-13) and other messengers to switch to IgE class specific antibody synthesis. These allergen-specific IgEs bind to the high affinity FccRI. Upon binding of antigen, the FcεRI-bound IgEs are cross-linked and the IgE receptor signal transduction pathway is activated, which leads to degranulation of the cells and consequent release and/or synthesis of a host of chemical mediators, including histamine, proteases (e.g., tryptase and chymase), lipid mediators such as leukotrienes (e.g., LTC4), platelet-activating factor (PAF) and prostaglandins (e.g., PGD2) and a series of cytokines, including TNF-α, IL-4, IL-13, IL-5, IL-6, IL-8, GMCSF, VEGF and TGF-β. The release and/or synthesis of these mediators from mast and/or basophil cells accounts for the early and late stage responses induced by allergens, and is directly linked to downstream events that lead to a sustained inflammatory state.

[0143] The molecular events in the FccRI signal transduction pathway that lead to release of preformed mediators via degranulation and release and/or synthesis of other chemical mediators are well-known. The FcεRI is a heterotetrameric receptor composed of an IgE-binding alpha-subunit, a beta subunit, and two gamma subunits (gamma homodimer). Cross-linking of FcεRI-bound IgE by multivalent binding agents (including, for example IgE-specific allergens or anti-IgE antibodies or fragments) induces the rapid association and activation of the Src-related kinase Lyn. Lyn phosphorylates immunoreceptor tyrosine-based activation motifs (ITAMS) on the intracellular beta and gamma subunits, which leads to the recruitment of additional Lyn to the beta subunit and Syk kinase to the gamma homodimer. These receptor-associated kinases, which are activated by intra- and intermolecular phosphorylation, phosphorylate other components of the pathway, such as the Btk kinase, LAT, and phospholipase C-gamma PLC-gamma). Activated PLC-gamma initiates pathways that lead to protein kinase C activation and Ca^{2+} mobilization, both of which are required for degranulation. FcεRI cross-linking also activates the three major classes of mitogen activated protein (MAP) kinases, i.e. ERK1/2, R4K1/2, and p38. Activation of these pathways is important in the transcriptional regulation of proinflammatory mediators, such as TNF-α and IL-6, as well as the lipid mediator leukotriene C4 (LTCL).
activation of the FcγRI signaling cascade leads to, among other things, degranulation. Other Fc receptors that share the gamma homodimer, and which can be regulated by the active 2,4-pyrimidiamine compounds include, but are not limited to, FcεRI and FcγRIII.

**[0146]** The ability of a particular prodrug to metabolize to an active 2,4-pyrimidinediamine compound under the desired conditions of use can be confirmed in in vitro and/or in vivo assays, as previously described.

### 6.5 Uses and Compositions

**[0147]** As previously discussed, the prodrugs described herein, such as the prodrugs according to structural formulae (I) and (Ia) metabolize when administered to animals and humans into active compounds that inhibit Fc receptor signaling cascades, especially those Fc receptors including a gamma homodimer, such as the FcεRI and/or FcγRI signaling cascades, that lead to, among other things, the release and/or synthesis of chemical mediators from cells, either via degranulation or other processes. As also discussed, the active compounds are also potent inhibitors of Syk kinase. As a consequence of these activities, prodrugs of these active compounds may be used in a variety of in vitro, in vivo and ex vivo contexts to regulate or inhibit Syk kinase, signaling cascades in which Syk kinase plays a role, Fc receptor signaling cascades, and the biological responses effected by such signaling cascades. For example, the prodrugs may be used to inhibit Syk kinase, either in vitro or in vivo, in virtually any cell type expressing Syk kinase. They may also be used to regulate signal transduction cascades in which Syk kinase plays a role. Such Syk-dependent signal transduction cascades include, but are not limited to, the FcεRI, FcγRI, FcγRIII, BCR and integrin signal transduction cascades. The prodrugs may also be used in vitro or in vivo to regulate, and in particular inhibit, cellular or biological responses effected by such Syk-dependent signal transduction cascades. Such cellular or biological responses include, but are not limited to, respiratory burst, cellular adhesion, cellular degranulation, cell spreading, cell migration, cell aggregation, phagocytosis, cytokine synthesis and release, cell maturation and Ca^{2+} flux. Importantly, the prodrugs may be used to inhibit Syk kinase in vivo as a therapeutic approach towards the treatment or prevention of diseases mediated, either wholly or in part, by a Syk kinase activity. Non-limiting examples of Syk kinase mediated diseases that may be treated or prevented with the prodrugs are those discussed in more detail, below.

**[0148]** The prodrugs may be used to regulate or inhibit the Fc receptor signaling, cascades and/or FcεRI- and/or FcγRII-mediated degranulation as a therapeutic approach towards the treatment or prevention of diseases characterized by, caused by and/or associated with the release or synthesis of chemical mediators of such Fc receptor signaling cascades or degranulation. Such treatments may be administered to animals in veterinary contexts or to humans. Diseases that are characterized by, caused by or associated with such mediator release, synthesis or degranulation, and that can therefore be treated or prevented with the active compounds include, by way of example and not limitation, atopy or anaphylactic hypersensitivity or allergic reactions, allergies (e.g., allergic conjunctivitis, allergic rhinitis, atopic asthma, atop dermatitis and food allergies), low grade scarring (e.g., of scleroderma, increased fibrosis, keloids, post-surgical scars, pulmonary fibrosis, vascular spasms, migraine, reperfusion injury and post myocardial infarction), diseases associated with tissue destruction (e.g., of COPD, cardiobronchitis and post myocardial infarction), diseases associated with tissue inflammation (e.g., irritable bowel syndrome, spastic colon and inflammatory bowel disease), inflammation and scarring.

**[0149]** Recent studies have shown that activation of platelets by collagen is mediated through the same pathway used by immune receptors, with an immunoreceptor tyrosine kinase motif on the FeRγ playing a pivotal role (Watson & Gibbons, 1998, Immunol. Today 19:260-264), and also that FcγRI plays a pivotal role in the generation of neointimal hyperplasia following balloon injury in mice, most likely through collagen-induced activation of platelets and leukocyte recruitment (Konishi et al., 2002, Circulation 105:912-916). Thus, the prodrugs described herein can also be used to inhibit collagen-induced platelet activation and to treat or prevent diseases associated with or caused by such platelet activation, such as, for example, intimal hyperplasia and restenosis following vascular injury.

**[0150]** In addition to the myriad diseases discussed above, cellular and animal empirical data confirm that the active 2,4-pyrimidinediamine compounds described in U.S. application Serial No. 10/631,029 filed July 29, 2003 (US2007/0060603), international application Serial No. PCT/US03/24087 (WO2004/014382), U.S. application Serial No. 10/903,263 filed July 30, 2004 (US2005/0234049), and international application Serial No. PCT/US2004/24716 WO/2005/016893) are also useful for the treatment or prevention of autoimmune diseases, as well as the various symptoms associated with such diseases. Thus, prodrugs of these active compounds are useful for treating or preventing such diseases and/or symptoms. The types of autoimmune diseases that may be treated or prevented with such prodrugs...
generally include those disorders involving tissue injury that occurs as a result of a humoral and/or cell-mediated response to immunogens or antigens of endogenous and/or exogenous origin. Such diseases are frequently referred to as diseases involving the nonanaphylactic (i.e., Type II, Type III and/or Type IV) hypersensitivity reactions.

[0151] As discussed previously, Type I hypersensitivity reactions generally result from the release of pharmacologically active substances, such as histamine, from mast and/or basophil cells following contact with a specific exogenous antigen. As mentioned above, such Type I reactions play a role in numerous diseases, including allergic asthma, allergic rhinitis, etc.

[0152] Type II hypersensitivity reactions (also referred to as cytotoxic, cytolytic complement-dependent or cell-stimulating hypersensitivity reactions) result when immunoglobulins react with antigenic components of cells or tissue, or with an antigen or hapten that has become intimately coupled to cells or tissue. Diseases that are commonly associated with Type II hypersensitivity reactions include, but are not limited to, autoimmune hemolytic anemia, erythroblastosis fetalis and Goodpasture’s disease.

[0153] Type III hypersensitivity reactions, (also referred to as toxic complex, soluble complex, or immune complex hypersensitivity reactions) result from the deposition of soluble circulating antigen-immunoglobulin complexes in vessels or in tissues, with accompanying inflammatory reactions at the site of immune complex deposition. Non-limiting examples of prototypical Type III reaction diseases include the Arthus reaction, rheumatoid arthritis, serum sickness, systemic lupus erythematosus, certain types of glomerulonephritis, multiple sclerosis and bullous pemphigoid.

[0154] Type IV hypersensitivity reactions (frequently called cellular, cell-mediated, delayed, or tuberculin-type hypersensitivity reactions) are caused by sensitized T-lymphocytes which result from contact with a specific antigen. Non-limiting examples of diseases cited as involving Type IV reactions are contact dermatitis and allograft rejection.

[0155] Autoimmune diseases associated with any of the above nonanaphylactic hypersensitivity reactions may be treated or prevented with the prodrugs according to structural formulae (I) and (Ia). In particular, the methods may be used to treat or prevent those autoimmune diseases frequently characterized as single organ or single cell-type autoimmune disorders including, but not limited to: Hashimoto’s thyroiditis, autoimmune hemolytic anemia, autoimmune atrophic gastritis of pernicious anemia, autoimmune encephalomyelitis, autoimmune orchitis, Goodpasture’s disease, autoimmune thrombocytopenia, sympathetic ophthalmia, myasthenia gravis, Graves’ disease, primary biliary cirrhosis, chronic aggressive hepatitis, ulcerative colitis and membranous glomerulopathy, as well as those autoimmune diseases frequently characterized as involving systemic autoimmune disorder, which include but are not limited to: systemic lupus erythematosus (SLE), rheumatoid arthritis, Sjögren’s syndrome, Reiter’s syndrome, polymyositis-dermatomyositis, systemic sclerosis, polyarteritis nodosa, multiple sclerosis and bullous pemphigoid.

[0156] It will be appreciated by skilled artisans that many of the above-listed autoimmune diseases are associated with severe symptoms, the amelioration of which provides significant therapeutic benefit even in instances where the underlying autoimmune disease may not be ameliorated. Many of these symptoms, as well as their underlying disease states, result as a consequence of activating the FcγR signaling cascade in monocyte cells. As the prodrugs of structural formulae (I) and (Ia) metabolize to 2,4-pyrimidinediamine compounds that are potent inhibitors of such FcγR signaling in monocytes and other cells, they find use in the treatment and/or prevention of myriad adverse symptoms associated with the above-listed autoimmune diseases.

[0157] As a specific example, rheumatoid arthritis (RA) typically results in swelling, pain, loss of motion and tenderness of target joints throughout the body. RA is characterized by chronically inflamed synovium that is densely crowded with lymphocytes. The synovial membrane, which is typically one cell layer thick, becomes intensely cellular and assumes a form similar to lymphoid tissue, including dendritic cells, T-, B- and NK cells, macrophages and clusters of plasma cells. This process, as well as a plethora of immunopathological mechanisms including the formation of antigen-immunoglobulin complexes, eventually result in destruction of the integrity of the joint, resulting in deformity, permanent loss of function and/or bone erosion at or near the joint. The claimed compounds may be used in a method to treat or ameliorate any one, several or all of these symptoms of RA. Thus, in the context of RA, the methods are considered to provide therapeutic benefit (discussed more generally, infra) when a reduction or amelioration of any of the symptoms commonly associated with RA is achieved, regardless of whether the treatment results in a concomitant treatment of the underlying RA and/or a reduction in the amount of circulating rheumatoid factor ("RF").

[0158] The American College of Rheumatology (ACR) has developed criteria for defining improvement and clinical remission in RA. Once such parameter, the ACR20 (ACR criteria for 20% clinical improvement), requires a 20% improvement in the tender and swollen joint count, as well as a 20% improvement in 3 of the following 5 parameters: patient’s global assessment, physician’s global assessment, patient’s assessment of pain, degree of disability, and level of acute phase reactant. These criteria have been expanded for 50% and 70% improvement in ACR50 and ACR70, respectively. Other criteria includes Paul’s criteria and radiographic progression (e.g. Sharp score).

[0159] In some embodiments, therapeutic benefit in patients suffering from RA is achieved when the patient exhibits an ARC20. In specific embodiments, ARCs of ARC50 or even ARC70 may be achieved.

[0160] Systemic lupus erythematosus ("SLE") is typically associated with symptoms such as fever, joint pain (arthralgias), arthritis, and serositis (pleurisy or pericarditis). In the context of SLE, the methods are considered to provide
therapeutic benefit when a reduction or amelioration of any of the symptoms commonly associated with SLE are achieved, regardless of whether the treatment results in a concomitant treatment of the underlying SLE.

[0161] Multiple sclerosis ("MS") cripples the patient by disturbing visual acuity; stimulating double vision; disturbing motor functions affecting walking and use of the hands; producing bowel and bladder incontinence; spasticity; and sensory deficits (touch, pain and temperature sensitivity). In the context of MS, the methods are considered to provide therapeutic benefit when an improvement or a reduction in the progression of any one or more of the crippling effects commonly associated with MS is achieved, regardless of whether the treatment results in a concomitant treatment of the underlying MS.

[0162] When used to treat or prevent such diseases, the prodrugs described herein may be administered singly, as mixtures of one or more prodrugs or in mixture or combination with other agents useful for treating such diseases and/or the symptoms associated with such diseases. The prodrugs may also be administered in mixture or in combination with agents useful to treat other disorders or maladies, such as steroids, membrane stabilizers, 5LO inhibitors, leukotriene synthesis and receptor inhibitors, inhibitors of IgE isotype switching or IgE synthesis, IgG isotype switching or IgG synthesis, β-agonists, tryptase inhibitors, aspirin, COX inhibitors, methotrexate, anti-TNF drugs, retuxin, PD4 inhibitors, p38 inhibitors, PDE4 inhibitors, and antihistamines, to name a few. The prodrugs may be administered in the form of compounds per se, or as pharmaceutical compositions comprising a prodrug.

[0163] Pharmaceutical compositions comprising the prodrug(s) may be manufactured by means of conventional mixing, dissolving, granulating, dragee-making levigating, emulsifying, encapsulating, entrapping or lyophilization processes. The compositions may be formulated in conventional manner using one or more physiologically acceptable carriers, diluents, excipients or auxiliaries which facilitate processing of the prodrugs into preparations which can be used pharmaceutically.

[0164] The prodrug may be formulated in the pharmaceutical composition per se, or in the form of a hydrate, solvate, N-oxide or pharmaceutically acceptable salt, as previously described. Typically, such salts are more soluble in aqueous solutions than the corresponding free acids and bases, but salts having lower solubility than the corresponding free acids and bases may also be formed.

[0165] Pharmaceutical compositions may take a form suitable for virtually any mode of administration, including, for example, topical, ocular, oral, buccal, systemic, nasal, injection, transdermal, rectal, vaginal, etc., or a form suitable for administration by inhalation or insufflation.

[0166] For topical administration, the prodrug(s) may be formulated as solutions, gels, ointments, creams, suspensions, etc. as are well-known in the art.

[0167] Systemic formulations include those designed for administration by injection, e.g., subcutaneous, intravenous, intramuscular, intrathecal or intraperitoneal injection, as well as those designed for transdermal, transmucosal oral or pulmonary administration.

[0168] Useful injectable preparations include sterile suspensions, solutions or emulsions of the active compound(s) in aqueous or oily vehicles. The compositions may also contain formulating agents, such as suspending, stabilizing and/or dispersing agent. The formulations for injection may be presented in unit dosage form, e.g., in ampules or in multidose containers, and may contain added preservatives.

[0169] Alternatively, the injectable formulation may be provided in powder form for reconstitution with a suitable vehicle, including but not limited to sterile pyrogen free water, buffer, dextrose solution, etc., before use. To this end, the active compound(s) may be dried by any art-known technique, such as lyophilization, and reconstituted prior to use.

[0170] For transmucosal administration, penetrants appropriate to the barrier to be permeated are used in the formulation. Such penetrants are known in the art.

[0171] For oral administration, the pharmaceutical compositions may take the form of, for example, lozenges, tablets or capsules prepared by conventional means with pharmaceutically acceptable excipients such as binding agents (e.g., pregelatinised maize starch, polyvinylpyrrolidone or hydroxypropyl methylcellulose); fillers (e.g., lactose, microcrystalline cellulose or calcium hydrogen phosphate); lubricants (e.g., magnesium stearate, talc or silica); disintegrants (e.g., potato starch or sodium starch glycolate); or wetting agents (e.g., sodium lauryl sulfate). The tablets may be coated by methods well known in the art with, for example, sugars, fats or enteric coatings. Phosphate prodrugs in which the progroup(s) is of the formula \(-\text{CR}^{R\alpha}_y\text{-O-P(O)(OH)}_{2}\), where each \(R^\alpha\) is, independently of the others, selected from hydrogen and lower alkyl and \(y\) is 1 or 2 and that exhibit a water-solubility in the range of about 0.1 to 1000 mg/ml at physiological pH are especially suited for oral administration via tablets and capsules. When administered t Sprague-Dawley rats orally from capsules, prodrug Compound 4 exhibits a bioavailability of drug Compound 1 of about 30% (see FIG. 5), with absorption being nearly identical to that of active drug Compound 1 (see FIG. 6). Other phosphate prodrugs having water-solubility properties similar to those of prodrug Compound 4 are expected to exhibit similar pharmacokinetic properties.

[0172] A specific exemplary tablet formulation for prodrug Compound 4 (as well as other phosphate-containing prodrugs) contains about 50-400 mg prodrug compound (or a salt thereof), about 0.05 to 0.5 wt% colloidal silicon dioxide, about 0.5 to 5.0 wt% croscarmellose sodium, about 0.25 to 5.0 wt% magnesium stearate and about 20 to 80 wt%
microcrystalline cellulose. If desired, the tablets can be coated with a film, such as a hypromellose film carboxymethyl

 cellulose or fructose, which can optionally contain coloring agents, such as for example FD&C blue #1, PD&C green

 #3, FD&C yellow #6 and titanium dioxide.

[0173] Liquid preparations for oral administration may take the form of, for example, elixirs, solutions, syrups or

 suspensions, or they may be presented as a dry product for constitution with water or other suitable vehicle before use.

 Such liquid preparations may be prepared by conventional means with pharmaceutically acceptable additives such as

 suspending agents (e.g., sorbitol syrup, cellulose derivatives or hydrogenated edible fats); emulsifying agents (e.g.,

 lecithin or acacia); non-aqueous vehicles (e.g., almond oil, oily esters, ethyl alcohol, cremophore™ or fractionated veg-

 etable oils); and preservatives (e.g., methyl or propyl-p-hydroxybenzoates or sorbic acid). The preparations may also

 contain buffer salts, preservatives, flavoring, coloring and sweetening agents as appropriate.

[0174] Preparations for oral administration may be suitably formulated to give controlled release of the prodrug, as is

 well known.

[0175] For buccal administration, the compositions may take the form of tablets or lozenges formulated in conventional

 manner.

[0176] For rectal and vaginal routes of administration, the prodrug(s) may be formulated as solutions (for retention

 enemas) suppositories or ointments containing conventional suppository bases such as cocoa butter or other glycerides.

[0177] For nasal administration or administration by inhalation or insufflation, the prodrug(s) can be conveniently

 delivered in the form of an aerosol spray from pressurized packs or a nebulizer with the use of a suitable propellant,

 e.g., dichlorodifluoromethane, trichlorofluoromethane, dichlorotetrafluoroethane, fluorocarbons, carbon dioxide or other

 suitable gas. In the case of a pressurized aerosol, the dosage unit may be determined by providing a valve to deliver a

 metered amount. Capsules and cartridges for use in an inhaler or insufflator (for example capsules and cartridges

 comprised of gelatin) may be formulated containing a powder mix of the compound and a suitable powder base such

 as lactose or starch.

[0178] For ocular administration, the prodrug(s) may be formulated as a solution, emulsion, suspension, etc. suitable

 for administration to the eye. A variety of vehicles suitable for administering compounds to the eye are known in the art.

 Specific non-limiting examples are described in U.S. Patent No. 6,261,547; U.S. Patent No. 6,197,934; U.S. Patent No.

[0179] For prolonged delivery, the prodrug(s) can be formulated as a depot preparation for administration by implan-

 tation or intramuscular injection. The prodrug(s) may be formulated with suitable polymeric or hydrophobic materials

 (e.g., as an emulsion in an acceptable oil) or ion exchange resins, or as sparingly soluble derivatives, e.g., as a sparingly

 soluble salt. Alternatively, transdermal delivery systems manufactured as an adhesive disc or patch which slowly releases

 the prodrug(s) for percutaneous absorption may be used. To this end, permeation enhancers may be used to facilitate

 transdermal penetration of the prodrug(s). Suitable transdermal patches are described in for example, U.S. Patent No.

[0180] Alternatively, other pharmaceutical delivery systems may be employed. Liposomes and emulsions are well-

 known examples of delivery vehicles that may be used to deliver prodrug(s). Certain organic solvents such as dimeth-

 ylsulfoxide (DMSO) may also be employed, although usually at the cost of greater toxicity.

[0181] The pharmaceutical compositions may, if desired, be presented in a pack or dispenser device which may

 contain one or more unit dosage forms containing the prodrug(s). The pack may, for example, comprise metal or plastic

 foil, such as a blister pack. The pack or dispenser device may be accompanied by instructions for administration.

 6.6 Effective Dosages

[0182] The prodrug(s) described herein, or compositions thereof, will generally be used in an amount effective to

 achieve the intended result, for example in an amount effective to treat or prevent the particular disease being treated.

 The prodrug(s) may be administered therapeutically to achieve therapeutic benefit or prophylactically to achieve pro-

 phylactic benefit. By therapeutic benefit is meant eradication or amelioration of the underlying disorder being treated

 and/or eradication or amelioration of one or more of the symptoms associated with the underlying disorder such that

 the patient reports an improvement in feeling or condition, notwithstanding that the patient may still be afflicted with the

 underlying disorder. For example, administration of a compound to a patient suffering from an allergy provides therapeutic

 benefit not only when the underlying allergic response is eradicated or ameliorated, but also when the patient reports a

 decrease in the severity or duration of the symptoms associated with the allergy following exposure to the allergen. As

 another example, therapeutic benefit in the context of asthma includes an improvement in respiration following the onset

 of an asthmatic attack, or a reduction in the frequency or severity of asthmatic episodes. Therapeutic benefit in the

 context of RA also includes the ACR20, or ACR50 or ACR70, as previously described. Therapeutic benefit also generally
includes halting or slowing the progression of the disease, regardless of whether improvement is realized.

[0183] For prophylactic administration, the prodrug(s) may be administered to a patient at risk of developing one of the previously described diseases. For example, if it is unknown whether a patient is allergic to a particular drug, the prodrug(s) may be administered prior to - administration of the drug to avoid or ameliorate an allergic response to the drug. Alternatively, prophylactic administration may be applied to avoid the onset of symptoms in a patient diagnosed with the underlying disorder. For example, the prodrug(s) may be administered to an allergy sufferer prior to expected exposure to the allergen. Prodrug(s) may also be administered prophylactically to healthy individuals who are repeatedly exposed to agents known to one of the above-described maladies to prevent the onset of the disorder. For example, prodrug(s) may be administered to a healthy individual who is repeatedly exposed to an allergen to induce allergies, such as latex, in an effort to prevent the individual from developing an allergy. Alternatively, prodrug(s) may be administered to a patient suffering from asthma prior to partaking in activities which trigger asthma attacks to lessen the severity of, or avoid altogether, an asthmatic episode.

[0184] The amount of prodrug(s) administered will depend upon a variety of factors, including, for example, the particular indication being treated, the mode of administration, whether the desired benefit is prophylactic or therapeutic, the seventy of the indication being treated and the age and weight of the patient, the bioavailability of the particular prodrug(s) the conversation rate and efficiency into active drug compound under the selected route of administration, etc. Determination of an effective dosage of prodrugs (s) for a particular use and mode of administration is well within the capabilities of those skilled in the art.

[0185] Effective dosages may be estimated initially from in vitro activity and metabolism assays. For example, an initial dosage of prodrug for use in animals may be formulated to achieve a circulating blood or serum concentration of the metabolite active compound that is at or above an IC₅₀ of the particular compound as measured in as in vitro assay, such as the in vitro CHMC or BMIM and other in vitro assays described in U.S. application Serial No. 10/355,543 filed January 31, 2003 (US2007/0029902A1), international application Serial No. PCT/US03/03022 filed January 31, 2003 (WO 03/063794), U.S. application Serial No. 10/631,029 filed July 29, 2003 US 2001/0060603 (WO 03/063794), U.S. application Serial No. PCT/US03/24087 (WO2004/014382), U.S. application Serial No. PCT/US03/24087 (WO2004/014382) filed July 30, 2004 (US2005/0234049), and international application Serial No. PCT/US2004/24716 60/2005/016893. Calculating dosages to achieve such circulating blood or serum concentrations taking into account the bioavailability of the particular prodrug via the desired route of administration is well within the capabilities of skilled artisans. For guidance, the reader is referred to Fingl & Woodbury, “General Principles,” in: Goodman and Gilman’s The Pharmaceutical Basis of Therapeutics, Chapter 1, pp. 1-46, latest edition, Pagamonon Press, and the references cited therein.

[0187] Dosage amounts will typically be in the range of from about 0.0001 mg/kg/day, 0.001 mg/kg/day or 0.01 mg/kg/day to about 100 mg/kg/day, but may be higher or lower, depending upon, among other factors, the activity of the active metabolite compound, the bioavailability of the prodrug, its metabolism kinetics and other pharmacokinetic properties, the mode of administration and various other factors, discussed above. Dosage amount and interval may be adjusted individually to provide plasma levels of the prodrug(s) and/or active metabolite compound(s) which are sufficient to maintain therapeutic or prophylactic effect. For example, the prodrugs may be administered once per week, several times per week (e.g., every other day), once per day or multiple times per day, depending upon, among other things, the mode of administration, the specific indication being treated and the judgment of the prescribing physician. In cases of local administration or selective uptake, such as local topical administration, the effective local concentration of prodrug(s) and/or active metabolite compound(s) may not be related to plasma concentration. Skilled artisans will be able to optimize effective local dosages without undue experimentation.
Preferably, the prodrugs will metabolize into active compound(s) that will provide therapeutic or prophylactic benefit without causing substantial toxicity. Toxicity of the active and other metabolites, as well as the unmetabolized prodrug may be determined using standard pharmaceutical procedures. The dose ratio between toxic and therapeutic (or prophylactic) effect is the therapeutic index. Prodrug(s) that exhibit high therapeutic indices are preferred.

The inventions having been described, the following examples are offered by way of illustration and not limitation.

7. EXAMPLES

7.1 Synthesis of Prodrug Compound 4

7.1.1 N4-(2,2-dimethyl-4-[(di-tert-butyl phosphonoxy)methyl]-3-oxo-5-pyrido[1,4]oxazin-6-yl)-5-fluoro-N2-(3,4,5-trimethoxyphenyl)-2,4-pyrimidinediamine (Compound 3)

N4-(2,2-dimethyl-3-oxo-4H-5-pyrido[1,4]oxazin-6-yl)-5-fluoro-N2-(3,4,5-trimethoxyphenyl)-2,4-pyrimidinediamine (1, 1.0 g, 2.12 mmol), Cs2CO3 (1.0 g, 3.07 mmol) and di-tert-butyl chloromethyl phosphate (2, 0.67 g, 2.59 mmol) in acetone (20 mL) was stirred at room temperature under nitrogen atmosphere. Progress of the reaction was monitored by LC/MS. Crude reaction mixture displayed three product peaks with close retention times with M++H 693 (minor-1), 693 (major; 3) and 477 (minor-2) besides starting material (Compound 1). Upon stirring the contents for 4 days (70% consumption), the reaction mixture was concentrated and diluted with water. The resultant pale yellow precipitate formed was collected by filtration and dried. The crude solid was purified by silica gel (pretreated with 10%NEt3/CH2Cl2 followed by eluting with hexanes) column chromatography by gradient elution with 70% EtOAc / hexanes-100% EtOAc. The fractions containing Compound 1 and M++H 693 were collected and concentrated. The resulting crude white solid was subjected to repurification in the similar manner as described previously but by eluting with 30%-50%-75%-100% EtOAc/ hexanes. The major product peak with M++H 693 was collected as a white solid (270 mg, 18%) and was characterized as N4-(2,2-dimethyl-4-[(di-tert-butyl phosphonoxy)methyl]-3-oxo-5-pyrido[1,4]oxazin-6-yl)-5-fluoro-N2-(3,4,5-trimethoxyphenyl)-2,4-pyrimidinediamine (Compound 3). δ 9.21 (s, 1H), 9.17 (s, 1H), 8.16 (d, 1H, J = 2.6 Hz), 7.76 (d, 1H, J = 8.5 Hz), 7.44 (d, 1H, J = 8.5 Hz), 7.02 (s, 2H), 5.78 (d, 1H, JPh = 6.1 Hz), 3.64 (s, 6H), 3.58 (s, 3H), 1.45 (s, 6H), 1.33 (s, 9H). LCMS: ret. time: 14.70 min.; purity: 95%; MS (m/e): 693 (MH+) 31P NMR (DMSO-d6): δ -11.36.
7.1.2 N4-(2,2-dimethyl-4-[(dihydrogen phosphonoxy)methyl]-3-oxo-5-pyrido[1,4]oxazin-6-yl)-5-fluoro-N2-(3,4,5-trimethoxyphenyl)-2,4-pyrimidinediamine (Compound 4)

[0192] Trifluoroacetic acid (1.5 mL) was added dropwise as a neat for 5 min to N4-(2,2-dimethyl-4-[(di-tert-butyl phosphonoxy)methyl]-3-oxo-5-pyrido[1,4]oxazin-6-yl)-5-fluoro-N2-(3,4,5-trimethoxyphenyl)-2,4-pyrimidinediamine (Compound 3, 120 mg, 0.173 mmol) dissolved in CH2Cl2 (10 mL) at 0˚C under nitrogen atmosphere. The contents were allowed to stir for 1.5 h. Progress of the reaction mixture was monitored by LC/MS. After complete consumption of the starting material, reaction mixture was concentrated, dried and triturated with ether. The ethereal layer was decanted and dried to provide the crude solid. LC/MS analysis of the crude displayed three peaks with M++H 581, 471 and 501. The peak corresponding to M++H 581 was collected by preparative HPLC chromatographic purification. The fractions were lyophilised and dried to provide 53 mg (52%) of off white fluffy solid and characterized as N4-(2,2-dimethyl-4-[(dihydrogen phosphonoxy)methyl]-3-oxo-5-pyrido[1,4]oxazin-6-yl)-5-fluoro-N2-(3,4,5-trimethoxyphenyl)-2,4-pyrimidinediamine (Compound 4).1H NMR (DMSO-d6): δ 9.21 (br s, 2H), 8.16 (d, 1H, J = 2.6 Hz), 7.93 (d, 1H, J = 8.5 Hz), 7.39 (d, 1H, J = 8.5 Hz), 7.05 (s, 2H), 5.79 (d, 1H, J = 6.6 Hz), 3.67 (s, 6H), 3.59 (s, 3H), 1.44 (s, 6H). LCMS: ret. time: 8.52 min.; purity: 95%; MS (m/e): 581 (MH+). 31P NMR (DMSO-d6): -2.17.

7.2 Alternative Synthesis of Prodrug Compound 4

[0193] An alternative method of synthesizing prodrug Compound 4 which alleviates the need for column chromatography and HPLC purification is provided below.

7.2.1 Synthesis of N4-(2,2-dimethyl-4-[(di-tert-butyl phosphonoxy)methyl]-3-oxo-5-pyrido[1,4]oxazin-6-yl)-5-fluoro-N2-(3,4,5-trimethoxyphenyl)-2,4-pyrimidinediamine (Compound 3)

[0194]
1. Upon stirring the contents for 30 h (92% consumption), reaction mixture was poured onto ice-water (400 mL) and stirred the contents by adding brine solution (200 mL). Fine yellow tan solid formed was filtered, washed with water and dried overnight.

2. The solid (35 g) was dissolved in MTBE (500 mL) and washed with water (400 mL). Aqueous layer was extracted with MTBE (2 X 350 mL) till the absence of UV on TLC. Combined organic layers were dried over anhydrous Na₂SO₄ and decanted. Note: step 2 can be done directly, however, DMF extraction back into solution leads to difficulty in the crystallization step.

3. The dark red clear solution was subjected to 10 g of activated charcoal treatment, heated to boil and filtered.

4. The dark red clear solution was concentrated by normal heating to 400 mL of its volume and left for crystallization. The solid crystallized as granules was filtered, crushed the granules to powder, washed with MTBE (400 mL) and dried under high vacuum. See step 7 for the workup of mother liquor. Weight of the solid: 17 g; purity: 90% (Compound 3), 6.26% (Compound 1), 1.8% (minor M+ 693).

5. At this stage solid was taken in 500 ml of ethylether and heated to boil. Cooled and filtered to remove undissolved material. Filtrate was concentrated.

6. Above concentrate was subjected to crystallization in MTBE (300 mL). The white solid formed was filtered, washed with MTBE (100 mL) and dried under high vacuum to provide the desired N₄-(2,2-dimethyl-4-[(di-tert-butyl phosphonoxy)methyl]-3-oxo-5-pyrido[1,4]oxazin-6-yl)-5-fluoro-N₂-(3,4,5-trimethoxyphenyl)-2,4-pyrimidinediamine (Compound 3) in 97% purity. ¹H NMR (DMSO-d₆): δ 9.21 (s, 1H), 9.17 (s, 1H), 8.16 (d, 1H, J = 2.6 Hz), 7.76 (d, 1H, J = 8.5 Hz), 7.44 (d, 1H, J = 8.5 Hz), 7.02 (s, 2H), 5.78 (d, 1H, J₃PH = 6.1 Hz), 3.64 (s, 6H), 3.58 (s, 3H), 1.45 (s, 6H), 1.33 (s, 9H). LCMS: ret. time: 14.70 min.; purity: 95%; MS (m/e): 693 (MH⁺). ³¹P NMR (DMSO-d₆): -11.36. Weight of the solid: 15.64 g (yield: 55%); purity: 97% (R935787), 3% (Compound 1).

7. Mother liquor was concentrated and steps 5 and 6 were repeated to provide Compound 3.

7.2.2 Synthesis of N₄-(2,2-dimethyl-4-[(dihydrogen phosphonoxy)methyl]-3-oxo-5-pyrido[1,4]oxazin-6-yl)-5-fluoro-N₂-(3,4,5-trimethoxyphenyl)-2,4-pyrimidinediamine (Compound 4)

N₄-(2,2-dimethyl-4-[(di-tert-butyl phosphonoxy)methyl]-3-oxo-5-pyrido[1,4]oxazin-6-yl)-5-fluoro-N₂-(3,4,5-trimethoxyphenyl)-2,4-pyrimidinediamine (Compound 3): (15.0 g, 21.67 mmol) dissolved in AcOH:H₂O (225 mL, 4:1) was heated at 65˚C (oil bath temp). The progress of the reaction was monitored by in process LC/MS. The reaction mixture transformed to faint tan white solid after 1h of heating. At this point most of Compound 3 converted to mono des tert-butylated product. After 3h of heating, consumption of SM and complete conversion of intermediate (mono des tert-butylated) to product was observed.

Reaction mixture was cooled, poured onto ice-water (200 mL), stirred for 20 min and filtered. The clear white filter cake was washed with water (600 ml) and acetone (200 mL) successively, dried for 2h followed by drying under high vacuum over P₂O₅ in a desiccator. Weight of the solid: 12.70 g; purity: 97% (Compound 3) and 3% (Compound 1). ¹H NMR indicated acetic acid presence (1:1)

To remove acetic acid, the solid was taken in acetonitrile (300 mL) and concentrated by rotovap vacuum. This process was repeated 2 times with acetonitrile and toluene (3 X 300 mL). The solid obtained was dried under high vacuum at 50 0C.

Finally, the solid was taken in acetone (400 mL), filtered and dried to provide N₄-(2,2-dimethyl-4-[(dihydrogen phosphonoxy)methyl]-3-oxo-5-pyrido[1,4]oxazin-6-yl)-5-fluoro-N₂-(3,4,5-trimethoxyphenyl)-2,4-pyrimidinediamine (Compound 4). ¹H NMR (DMSO-d₆): δ 9.21 (br s, 2H), 8.16 (d, 1H, J = 2.6 Hz), 7.93 (d, 1H, J = 8.5 Hz), 7.39 (d, 1H, J = 8.5 Hz), 7.05 (s, 2H), 5.79 (d, 1H, J₃PH = 6.6 Hz), 3.67 (s, 6H), 3.59 (s, 3H), 1.44 (s, 6H). LCMS: ret. time: 8.52 min.; purity: 95%; MS (m/e): 581 (MH⁺). ³¹P NMR (DMSO-d₆): -2.17.

7.3 Synthesis of N₄-(2,2-dimethyl-4-[(dihydrogen phosphonoxy)methyl]-3-oxo-5-pyrido[1,4]oxazin-6-yl)-5-fluoro-N₂-(3,4,5-trimethoxyphenyl)-2,4-pyrimidinediamine mono calcium salt (Compound 6)

[0200]
Aqueous (10 mL) NaHCO$_3$ (0.17 g, 2.02 mmol) solution was added dropwise to a suspension of N4-(2,2-dimethyl-4-[(dihydrogen phosphonoxy)methyl]-3-oxo-5-pyrido[1,4]oxazin-6-yl)-5-fluoro-N2-(3,4,5-trimethoxyphenyl)-2,4-pyrimidinediamine (0.5 g, 0.86 mmol) in water (5 mL) at room temperature while stirring the contents. The clear solution formed was treated with aqueous (10 mL) CaCl$_2$ (0.11 g in 10 mL water, 0.99 mmol) in a dropwise manner at room temperature. The addition resulted in the precipitation of a white solid from reaction mixture. Upon completion of addition, the contents were stirred for a period of 30 min, filtered, washed with water (40 mL) and dried. The clear white solid was taken in water (30 mL) and heated on a stir plate to boil. The solution was cooled, filtered and dried. The white solid collected and further dried under high vacuo at 80˚C for 32 h to provide 0.41 g (83%) of N4-(2,2-dimethyl-4-[(dihydrogen phosphonoxy)methyl]-3-oxo-5-pyrido[1,4]oxazin-6-yl)-5-fluoro-N2-(3,4,5-trimethoxyphenyl)-2,4-pyrimidinediamine mono calcium salt (Compound 6).

7.4 Synthesis of Prodrug Compound 8

N4-(22-dimethyl-4-[(di-tert-butyl phosphonoxy)methyl]-3-oxo-5-pyrido[1,4]oxazin-6-yl)-5-fluoro-N2-(3,4,5-trimethoxyphenyl)-2,4-pyrimidinediamine (prepared as described above) (0.2 g, 0.29 mmol) was added to a mixture of MeOH (5 mL) and Et$_2$O (5 mL). 2N aq. NaOH (0.023 g, 0.58 mmol) was added at once while stirring the contents at room temperature. Progress of the reaction was monitored by LC/MS. After 8h of stirring, the solid precipitated was filtered and dried to provide N4-(2,2-dimethyl-4-methoxymethyl-3-oxo-5-pyrido[1,4]oxazin-5-yl)-5-fluoro-N2-(3,4,5-trimethoxyphenyl)-2,4-pyrimidinediamine (Compound 8) as a white solid (0.11 g, 74%). $^1$H NMR (DNLSO-d6): $\delta$ 9.47 (s, 1H), 9.15 (s, 1H), 8.16 (d, 1H, J = 3.8 Hz), 7.87 (d, 1H, J = 8.5 Hz), 7.37 (d, 1H, J = 8.5 Hz), 7.03 (s, 2H), 5.40 (s, 2H), 3.66 (s, 6H), 3.59 (s, 3H), 3.27 (s, 3H), 1.44 (s, 6H). LC/MS: ret time: 12.88 min; purity: 92%; MS (m/e): 515(MH$^+$).

7.5 The Active 2,4-Pyrimidinediamine Compounds Are Tolerated In Animals

The ability of numerous biologically active 2,4-pyrimidinediamine compounds to exert their activity at doses

[0205] The safety pharmacology of active Compound 1 has been studied in a core battery of studies (respiratory, CNS, cardiovascular, and HERG). A slight reduction in heart rate and increase in RR interval was noted at 50 mg/kg in the cardiovascular study and a slight effect on a few behavioral parameters at 50 mg/kg was also noted in the CNS (Irwin) study. Otherwise the safety pharmacology studies determined that Compound 1 was well tolerated. GLP toxicology studies included negative mutagenicity and clastogenicity studies (Ames, chromosomal aberration, and mouse micronucleus). In 28-day toxicity studies in rats and monkeys, higher doses had evidence of a reversible effect on hematology, liver transaminase (mild effect in the rat only), spleen and thymus size (rat only) and bone marrow cellularity (rat and monkey). Immunophenotyping in the rat study revealed a significant decrease in the percentage of CD3+ cells in high dose rats while a significant increase in CD45RA+ cells was noted following recovery. Histopathology was noteworthy only for mild reductions in marrow cellularity at high doses. There was no evidence for untoward effects on humoral immunity in the anti-KLH antibody assessment. The No Observed Adverse Effect Level (NOAEL) is 10-30 mg/kg/day for rats and 100 mg/kg/day for monkeys.

7.6 Drug Compound 1 is Biologically Active in In Vitro Assays

[0206] Compound 1 blocks FcεRI-dependent activation of Cord-Blood Derived Primary Human Mast Cells (CHMC) in a dose-dependent manner with an EC50 of approximately 43nM as assessed by measuring the activity of tryptase released upon degranulation. Compound 1 does not inhibit ionomycin-induced degranulation of CHMCs. Ionomycin is a calcium ionophore that induces CHMC degranulation bypassing early FcR signaling, thus indicating that Compound 1 is specific to FcR signaling, and not degranulation per se. Compound 1 also inhibits the FcεRI-dependent production and release of LTC4 (EC50= 39nM) and all cytokines tested (EC50 ranging from 158nM-462nM).

7.7 Drug Compound 1 is Effective in Animal Models of Rheumatoid Arthritis

[0207] The biologic activity of Compound 1 in IC-mediated vascular edema (Arthus reaction in the rat), in collagen antibody-induced arthritis in the mouse, and in a rat model of collagen-induced arthritis.

7.7.1 Arthus Reaction

[0208] IC-mediated acute inflammatory tissue injury is implicated in a variety of human autoimmune diseases, including vasculitis, serum sickness, systemic lupus erythematosus, RA, and glomerulonephritis. The classical experimental model for IC-mediated tissue injury is the Reverse Passive Arthus (RPA) reaction. Intravenous injection of antigen (ovalbumin, OVA) following intradermal injection of antibodies specific to OVA (rabbit anti-OVA IgG) results in perivascular deposition of IC and a rapid inflammatory response characterized by edema, neutrophil infiltration, and hemorrhage at the injection sites (Szalai, et al., 2000, J. Immunol. 164(1):463-468).

[0209] A single oral treatment of rats with Compound 1 one hour prior to antigen/antibody administration reduced the cutaneous RPA reaction and inflammatory edema in a dose-dependent manner. Administration of 10 mg/kg oral Compound 1 inhibited extravascular leakage of Evans blue dye (OD610) from tissue biopsies by 80% compared with vehicle control.

7.7.2 Collagen Antibody-Induced Arthritis

[0210] The anti-inflammatory activity of Compound 1 was evaluated in the mouse collagen antibody-induced arthritis (CAIA) model in which an anti-type II collagen antibody cocktail is applied to induce arthritis (Teroto et al., 1992, J. Immunol. 148(7):2103-2108; McCoy et al., 2002, J. Clin. Invest. 110(5):651-658; Kagari et al., 2002, J. Immunol. 169 (3):1459-1466). This passive model differs from the traditional rodent collagen-induced arthritis (CIA) in that disease symptoms appear quickly (developing within 24-48 hrs after an IV-injection of antibodies), arthritis is inducible in both CIA-susceptible and CIA-resistant mouse strains, and it allows evaluation of inflammation that is independent of antibody production.

[0211] CAIA was induced in Balb/c mice by intravenous injection of Arthrogen-CIA® Monoclonal Antibody Blend (Chemicon International, Inc., Temecula, CA) via the tail vein, followed 2 days later by an intraperitoneal injection of LPS. Oral Compound 1 treatment was started within 4 hours of antibody administration (Day 0). The severity of the arthritis in hind-paws was scored daily (scale of 0-4 per paw, sum of scores for both hind paws). By Day 5, both control
groups, saline and vehicle, reached their peak clinical score with a disease incidence of 100%.

Reduced inflammation and swelling was evident in animals treated with Compound 1, and the arthritis progressed more slowly. Treatment with Compound 1 (b.i.d.) significantly reduced clinical arthritis (p < 0.05) compared with animals treated with vehicle only, while lower dose levels of Compound 1 showed a trend toward reduced arthritis severity, disease incidence, and time of onset; however, the differences were not significant (p>0.05).

7.7.3 Collagen-Induced Arthritis

One of the experimental models for IC-mediated tissue injury is the CIA in rodents (Kleinau et al., 2000, J. Exp. Med. 191:1611-1616). Injection of type II collagen (CII) into rodents produces an immune reaction that characteristically involves inflammatory destruction of cartilage and bone of the distal joints with concomitant swelling of surrounding tissues. CIA in rats is commonly used to evaluate compounds that might be of potential use as drugs for treatment of rheumatoid arthritis and other chronic inflammatory conditions and is induced in susceptible strains of either mice or rats by injection of CII in incomplete Freund's adjuvant (IFA). Administration of this emulsion gives rise to polyarthritis, characterized by synovial hyperplasia, infiltration of mononuclear cells, pannus formation, and destruction of cartilage and bone. It has been previously well documented that antibodies to CII are a prerequisite for CIA in mice, as B-cell deficient mice do not develop arthritis (Svensson et al., 1998, Clin. Exp. Immunol. 111:521-526).

Syngeneic LOU rats were immunized on Day 0 with native chicken CII/IFA. Oral treatment began at the onset of arthritis symptoms (Day 10). A total of 59 rats were treated with either a vehicle control or Compound 1 at one of four dose levels (1, 3, 10, and 30 mg/kg, q.d. by p.o. gavage). Hind limbs were scored daily for clinical arthritis severity using a standardized method based on the degree of joint inflammation. High resolution digital radiographs of hind limbs were obtained at the conclusion of the study (Day 28). These limbs were also analyzed for histopathologic changes. IgG antibodies to native CII were measured in quadruplicate by ELISA. There was a significant reduction (p<0.05) in arthritis severity that was evident within 7 days after initiation of therapy in the high-dose (30 mg/kg) group that continued to improve throughout the study. By Day 28, the clinical score in the animals treated with vehicle alone was 6.08 ± 0.98 compared to 2.54 ± 0.67 in the Compound 1 30 mg/kg group (p<0.001). Blinded radiographs at study termination (Day 28), demonstrated a significant reduction in joint damage: 3.66 ± 0.71 (vehicle) vs. 1.63 ± 0.67 (Compound 1) (p<0.02) (E. Brahn. 2004). Blinded composite histopathologic studies confirmed the regression of pannus and erosions: Mean modified Mankin scores were 11.8 ± 0.9 (vehicle) vs. 3.7 ± 0.9 (30 mg/kg Compound 1) (p<0.001). Antibodies to native CII were not decreased in Compound 1-treated rats.

7.8 The Prodrug Compounds Are Orally Bioavailable

Prodrug Compound 4 was tested for oral bioavailability. For the study, the prodrug was dissolved in various vehicles (e.g. PEG 400 solution and CMC suspension) for intravenous and oral dosing in the rats. Where indicated, the active metabolite Compound 1 compound (drug) was formulated and administered in the same vehicles. Following administration of the prodrug and/or drug, plasma samples were obtained and extracted. The plasma concentrations of the prodrug and/or drug were determined by high performance liquid chromatography/tandem mass spectrometry (LC/MS/MS) methods. Pharmacokinetic analyses were performed based on the plasma concentration data. The pharmacokinetic parameters of interest include Clearance (CL), Volume of distribution at steady-state (Vss), terminal half-life (t½), and oral bioavailability (%F).

The results of these various pharmacokinetic experiments are illustrated in FIGS. 4-12. Referring to FIG. 4, PK profiles are shown for IV and PO administration in Spraque-Dawley rats. For IV administration, Compound 4 was dissolved in PEG-400 and administered at a dose of 1 mg/kg. Rapid disappearance of prodrug Compound 4 was observed and drug Compound 1 was found in plasma samples obtained from the jugular vein. Given orally in the same vehicle, no prodrug Compound 4 was present systemically, but high levels of drug metabolite Compound 1 were observed.

FIG. 5 summarizes the PK parameters for the study described in FIG. 4. Prodrug Compound 4 is rapidly cleared and, in part, converted to drug Compound 1. Given orally at a dose of 4 mg/kg, bioavailability was determined to be 29.9%. This bioavailability number is based on data obtained from a previous study (data not shown) in which drug Compound 1 was administered as an IV bolus dose at 1 mg/kg.

FIG. 6 compares drug Compound 1 exposure in Spraque-Dawley rats following oral administration of either drug Compound 1 (2.5 mg/kg in PEG-400) or prodrug Compound 4 (4 mg/kg in PEG-400). The values for AUC/dose are nearly identical indicating that the prodrug Compound 4 is absorbed equally as well as drug Compound 1.

FIG. 7 shows a plot of cLogD vs pH calculated using in-situ predictions for both Compound 1 and Compound 4. Compound 1 is highly lipophilic and only weakly ionizable (measured solubility is less than 1 mcg/ml in phosphate buffer at pH = 7.5, data not shown). In contrast, Compound 4 is highly polar at neutral pH. Measured solubility values are consistent with the predicted cLogD values at pH = 7.5.
FIG. 8 demonstrates that prodrug Compound 4 is stable under acidic and neutral conditions at 37°C.

FIG. 9 illustrates the conversion of prodrug Compound 4 to drug Compound 1 in microsome preparations. Prodrug Compound 4 failed to convert to drug Compound 1 in microsomal preparations obtained from Xenotech. In follow-up studies using intestinal and hepatic microsomes obtained from a different source, conversion of Compound 4 to Compound 1 was observed (data not shown).

FIG. 10 illustrates that prodrug Compound 4 is unstable in rat plasma — hydrolysis to drug Compound 1 is observed and the conversion to Compound 1 is thought to be catalyzed by phosphatase enzymes. The presence of Phosphatase activity in rat plasma was confirmed using p-nitrophenyl phosphate — a known substrate for phosphatase.

FIG. 11 illustrates the absorption of prodrug Compound 4 from different vehicles. Unlike drug Compound 1, absorption of prodrug Compound 4 is not dependent on formulation. Prodrug Compound 4 is absorbed equally well in solution formulations (PEG-400 and carboxymethylcellulose (CMC)) and as a powder in hard gelatin capsules.

Based on the pharmacokinetic data, the oral bioavailability (%F) of prodrug Compound 4 from all three vehicles tested (PEG-400 solution; CMC Solution; and powder in capsules) was determined to be approx. 30%.

Claims

1. A compound which is of structural formula:

   ![Chemical Structure]

   or a pharmaceutically acceptable salt or hydrate, solvate, or N-oxide of the compound or salt.

2. The compound of claim 1 which is a pharmaceutically acceptable salt.

3. The compound of claim 2 which is in the form of a hydrate.

4. The compound of claim 2 or 3 which is an alkali metal salt.

5. The compound of claim 4 which is a mono- or di- sodium salt.

6. The compound of claim 5 which is a disodium salt.

7. A compound according to claim 1 which is in water.
8. The compound of claim 4 which is a mono- or di- potassium salt.

9. The compound of claim 8 which is a dipotassium salt.

10. The compound of claim 2 or 3 which is an alkaline earth metal salt.

11. The compound of claim 10 which is a mono- calcium salt.

12. The compound of claim 10 which is a mono- magnesium salt.

13. The compound of claim 2 or 3 which is a mono- or di- alkylamino salt.

14. The compound of claim 2 or 3 which is an ammonium salt.

15. A composition comprising a compound according to any one of the preceding claims and a pharmaceutically acceptable carrier, excipient and/or diluent.

16. A composition as claimed in claim 15 adapted for oral administration.

17. A compound as claimed in any one of claims 1 to 14 for use in a method of inhibiting cell degranulation in a subject.

18. The compound of claim 17 in which the method is for the treatment or prevention of a disease selected from an allergic disease, low grade scarring, a disease associated with tissue destruction, a disease associated with tissue inflammation, inflammation and scarring.

19. The compound of claim 17 in which the method is for the treatment or prevention of rheumatoid arthritis.

20. A compound as claimed in any one of claims 1 to 14 for use in a method of inhibiting an activity of a Syk kinase in a subject.

21. A compound as claimed in any one of claims 1 to 14 for use in a method of inhibiting an Fc receptor signal transduction cascade in a subject.

22. The compound of claim 21 in which the Fc receptor is selected from FcαRI, FcγRI, FcγRII and FcεRI.

23. A compound as claimed in any one of claims 1 to 14 for use in a method of treating or preventing an autoimmune disease in a subject.

24. The compound of claim 23 in which the autoimmune disease is selected from autoimmune diseases that are frequently designated as single organ or single cell-type autoimmune disorders and autoimmune disorders that are frequently designated as involving systemic auto-immune disorder.

25. The compound of claim 23 in which the autoimmune disease is selected from Hashimoto’s thyroiditis, autoimmune hemolytic anemia, autoimmune atrophic gastritis of pernicious anemia, autoimmune encephalomyelitis, autoimmune orchitis, Goodpasture’s disease, autoimmune thrombocytopenia, sympathetic ophthalmia, myasthenia gravis, Graves’ disease, primary biliary cirrhosis, chronic aggressive hepatitis, ulcerative colitis, membranous glomerulopathy, systemic lupus erythematosus, rheumatoid arthritis, Sjogren’s syndrome, Reiter’s syndrome, polymyositis dermatomyositis, systemic sclerosis, polyarteritis nodosa, multiple sclerosis and bullous pemphigoid.

26. The compound of any one of claims 17 to 25 for use in a method comprising oral administration of the compound.

Patentansprüche

1. Verbindung mit der Strukturformel:
oder ein pharmazeutisch annehmbares Salz, oder ein Hydrat, Solvat, oder N-Oxid der Verbindung oder des Salzes.

2. Verbindung nach Anspruch 1, die ein pharmazeutisch annehmbares Salz ist.

3. Verbindung nach Anspruch 2, die in der Form eines Hydrats ist.

4. Verbindung nach Anspruch 2 oder 3, die ein Alkalimetallsalz ist.

5. Verbindung nach Anspruch 4, die ein Mononatriumsalz oder ein Dinatriumsalz ist.

6. Verbindung nach Anspruch 5, die ein Dinatriumsalz ist.

7. Verbindung nach Anspruch 1, die in Wasser ist.

8. Verbindung nach Anspruch 4, die ein Monokaliumsalz oder ein Dikaliumsalz ist.

9. Verbindung nach Anspruch 8, die ein Dikaliumsalz ist.

10. Verbindung nach Anspruch 2 oder 3, die ein Erdalkalimetaasalz ist.

11. Verbindung nach Anspruch 10, die ein Monocalciumsalz ist.

12. Verbindung nach Anspruch 10, die ein Monomagnesiumsalz ist.

13. Verbindung nach Anspruch 2 oder 3, die ein Monoalkylaminosalz oder ein Dialkylaminosalz ist.

15. Zusammensetzung, die eine Verbindung nach einem der vorangehenden Ansprüche und einen pharmazeutisch annehmbaren Träger, ein pharmazeutisch annehmbares Vehikel und/oder Verdünnungsmittel aufweist.

16. Zusammensetzung wie in Anspruch 15 beansprucht, die zur oralen Verabreichung geeignet ist.

17. Verbindung wie in einem der Ansprüche 1 bis 14 beansprucht, zur Verwendung in einem Verfahren zur Hemmung von Zelldegranulierung bei einem Individuum.

19. Verbindung nach Anspruch 17, bei der das Verfahren zur Behandlung oder Prävention von rheumatoider Arthritis ist.

22. Verbindung nach Anspruch 21, bei der der Fc-Rezeptor ausgewählt ist aus FcαRI, FcγRI, FcγRIII und FcεRI.

23. Verbindung wie in einem der Ansprüche 1 bis 14 beansprucht, zur Verwendung in einem Verfahren zum Behandeln oder Verhindern einer Autoimmunerkrankung bei einem Individuum.

24. Verbindung nach Anspruch 23, bei der die Autoimmunerkrankung ausgewählt ist aus Autoimmunerkrankungen, die häufig als Autoimmunerkrankungen vom Einzelorgan- oder Einzelzell-Typ bezeichnet werden, und Autoimmunerkrankungen, die häufig als eine systemische Autoimmunerkrankung beinhalten bezeichnet werden.

Revendications

1. Composé de formule structurale suivante:

   ![Chemical Structure]

   ou sel pharmacologiquement admissible de ce composé, ou hydrate, solvat ou N-oxyde de ce composé ou d’un tel sel.

2. Composé conforme à la revendication 1, qui est un sel pharmacologiquement admissible.

3. Composé conforme à la revendication 2, qui se présente sous forme d’hydrate.

4. Composé conforme à la revendication 2 ou 3, qui est un sel de métal alcalin.
5. Composé conforme à la revendication 4, qui est un sel mono-sodique ou disodique.

6. Composé conforme à la revendication 5, qui est un sel disodique.

7. Composé conforme à la revendication 1, qui est le composé de formule :

\[
\text{[Image of chemical structure]}
\]

dans de l'eau.

8. Composé conforme à la revendication 4, qui est un sel mono-potassique ou dipotassique.

9. Composé conforme à la revendication 8, qui est un sel dipotassique.

10. Composé conforme à la revendication 2 ou 3, qui est un sel de métal alcalino-terreux.

11. Composé conforme à la revendication 10, qui est un sel mono-calcaire.

12. Composé conforme à la revendication 10, qui est un sel mono-magnésique.

13. Composé conforme à la revendication 2 ou 3, qui est un sel de monoalkyl-amine ou de dialkyl-amine.

14. Composé conforme à la revendication 2 ou 3, qui est un sel d'ammonium.

15. Composition comprenant un composé conforme à l'une des revendications précédentes et un véhicule, excipient et/ou diluant pharmacologiquement admissible.

16. Composition conforme à la revendication 15, adaptée pour administration par voie orale.

17. Composé, conforme à l'une des revendications 1 à 14, pour utilisation dans un procédé permettant d'inhiber la dégranulation cellulaire chez un sujet.

18. Composé conforme à la revendication 17, le procédé étant conçu pour traiter ou prévenir une maladie choisie parmi une maladie allergique, une cicatrisation de faible grade, une maladie associée à une destruction de tissu, une maladie associée à une inflammation de tissu, une inflammation et une cicatrisation.

19. Composé conforme à la revendication 17, le procédé étant conçu pour traiter ou prévenir la polyarthrite rhumatoïde.

20. Composé, conforme à l'une des revendications 1 à 14, pour utilisation dans un procédé permettant d'inhiber une activité de Syk kinase chez un sujet.

21. Composé, conforme à l'une des revendications 1 à 14, pour utilisation dans un procédé permettant d'inhiber une cascade de transduction du signal de récepteur Fc chez un sujet.

22. Composé conforme à la revendication 21, le récepteur Fc étant choisi parmi les récepteurs FcαRI, FcγRI, FcγRIII et FcεRI.
23. Composé, conforme à l’une des revendications 1 à 14, pour utilisation dans un procédé conçu pour traiter ou prévenir une maladie auto-immune chez un sujet.

24. Composé conforme à la revendication 23, la maladie auto-immune étant choisie parmi les affections auto-immunes souvent désignées comme étant des troubles auto-immuns affectant un organe unique ou un type cellulaire unique et les affections auto-immunes souvent désignées comme impliquant un trouble auto-immun systémique.
