Description

[0001] The invention relates to a preparing device for preparing a beverage from a powdery substance and a hot liquid.

[0002] Such a preparing device is known from the prior art. This known preparing device is often used in practice for preparing hot beverages, such as coffee or tea.

[0003] Devices of this type prepare a hot beverage from hot water and powder. This powder is supplied to a mixing chamber from a reservoir. Hot water is then added to the mixing chamber in order to dissolve the powder in the former by mixing. The hot water is accompanied by vapour. If this vapour reaches the powder inlet, lumps will form in the latter and lead to clogging. In addition, the powder supplied also causes some fine powder particles to fly up and spread together with the vapour. The latter makes it necessary to extract the vapour and the swirling powder particles. Said extraction is effected by means of an extraction duct.

[0004] However, it is a drawback of the known device that the extraction duct is difficult to (un)install. In the known preparing devices, the extraction duct extends through the housing of the preparing device. In this case, the extraction duct winds itself through the spaces between the components accommodated in the housing, including electrical components and pipework. As a result, removal and fitting of the extraction duct involves complicated operations, such as disassembling the first housing. These operations are cumbersome and take up a relatively large amount of time. One of the results is that, in practice, the extraction duct is not cleaned or replaced sufficiently often. During use, the extraction duct tends to become soiled quickly, as the combination of air, moisture and powdery particles travelling through the extraction duct has the tendency to stick against the inner wall of the latter. This subsequently forms an encrusted substance on the inside walls of the extraction duct. As a result, the extraction duct initially becomes partially blocked and subsequently completely blocked. This has an adverse effect on the operation of the preparing device and on the flavour of the beverages prepared with the latter. If the extraction is poor, the preparing device will be (un)installed in a relatively simple manner.

[0005] As the extraction duct extends through the housing, there is a great risk of failures and malfunctions of the components which are inside the housing when the extraction duct starts to leak. Another drawback is the fact that the housing has openings leading to the interior thereof. These openings increase the risk of pollution and moisture entering the housing, which will result in failures and malfunctions of the components housed in the housing.

[0006] A preparing device for preparing a beverage from a powdery substance and a hot liquid is disclosed in EP 1,088,505. In Figures 3, 4 and 5, this publication illustrates, in a highly diagrammatical form, a mixing chamber (9) provided with a mixing member (14) which is driven around a vertical shaft (13) by means of a mixing motor (10) placed vertically above the mixing chamber (9). Five of these mixing chambers are connected to an extraction duct 15 via connecting apertures (16A-E). This extraction duct (15) consists of a top section (16) and a bottom section 20. On the underside of the bottom section (20), a ventilating fan (23) is provided. In order to detach the top section (16) from the bottom section (20), vertical screws 24 have to be removed, which are accessible from below. This publication does not describe how this assembly is accommodated in the preparing device. However, as the mixing motors (10) have to be screened off by the housing when replacing the reservoirs (1A-G) for powder, and are in a slightly higher position than the upper side of the extraction duct (15), and because the reservoirs in Figure 1 are at a relatively large distance above the mixing motors, it is clear that the mixing motors and the extraction duct will jointly be screened off with respect to the reservoirs, probably by means of a closed housing. The extraction duct in accordance with EP 1,088,505 can thus not be removed in a simple manner, something which is confirmed by the fact that the screws (24) are difficult to access from below.

[0007] It is an object of the invention to provide a preparing device in which the extraction duct can be (un)installed in a relatively simple manner. It is a further object to provide a preparing machine which is less susceptible to failures and malfunctions of the components accommodated in the first housing, such as electrical components.

[0008] This object is achieved by the preparing machine according to claim 1. As a result, the (un)installation of the extraction duct of the preparing device according to the invention does not require any complicated operations, such as the disassembly of the first housing. The result of this is that the extraction duct can be (un)installed in a relatively simple manner.

[0009] Furthermore, the preparing device according to the invention is less susceptible to failures and malfunctions of the components accommodated in the first housing, as the first housing has no apertures for the extraction duct and the extraction duct cannot leak in the interior of the first housing. Preferably, the extraction duct essentially runs in a straight line. In this case, the extraction duct may comprise a bend near the connection to the extractor hood.

[0010] In one embodiment according to the invention, the first housing forms a service area. This term is defined in standard NEN-EN-IEC60335-2-75 “particular requirements for commercial dispensing appliances and vending machines” (article 3). According to this standard, such a preparing device is subdivided into a user area (article
3.109), a maintenance area (article 3.110) and a service area (article 3.111). The user area is the space where the user receives the hot beverages. The maintenance area is the space where daily maintenance takes place, in this case, consideration may be given to replenishing the powdery substance. The service area is the space where technical maintenance is carried out. The purpose of the first housing is to screen off the service area. As, in the preparing device according to the invention, the extraction duct is located entirely outside the service area, access to the extraction duct is simple.

[0011] According to the invention, the preparing device comprises a second housing accommodating the extraction duct and one or more reservoirs for powdery substance. The second housing may be a maintenance area, as a result of which it becomes possible to check, clean and, if necessary, replace the extraction duct in the course of daily maintenance. The purpose of the second housing is to screen off the maintenance area. The second housing may also be delimited by the first housing and comprise a door for access to the interior of the second housing. In this manner, an individual is able to gain access to the interior of the second housing in a simple manner and a preparing device of compact design is provided.

[0012] It should be noted that US 3,709,408 discloses a preparing device for beverages having a first housing which delimits a so-called service area, and a second housing which delimits a so-called maintenance area. Furthermore, an extraction duct (100) is present. In column 2, lines 53-59 of this document, it is described how empty reservoirs 24 can be replaced by filled reservoirs by removing the front panel of the housing. Thus, the space behind this panel, the so-called maintenance area, is made accessible. However, behind the latter is the first housing which delimits the service area. In this case, however, there is no access to the extraction duct (100), which is accommodated in the interior of the first housing.

[0013] In a further embodiment, the extraction duct is of split design in the longitudinal direction in such a manner that the extraction duct can be opened in order to provide an access aperture extending along a longitudinal side for access to the interior of the duct. As a result of the fact that the extraction duct can be opened in this manner, it can readily be cleaned. The access aperture may extend essentially over the entire longitudinal direction of the extraction duct, which makes it possible to clean the extraction duct well over its entire length. The extraction duct may comprise a duct element and a wall part, the duct element comprising the access aperture extending along the longitudinal side and it being possible to close the access aperture by means of the wall part. Furthermore, the wall part may be provided on the external wall of the first housing, thus creating an extraction duct of simple design. The wall part may form part of this external wall, as a result of which a compact design is achieved.

[0014] According to the invention, the second housing comprises a blow-off passage for fluid extracted via the extraction duct and the extraction duct comprises a blow-off end which is situated near the blow-off aperture. Thus, a good extraction of the extracted fluid is achieved, with the extracted fluid being transported away from the second housing. The term fluid is understood to mean a combination of air, vapour and powder particles.

[0015] In case the preparing device comprises a plurality of mixing chambers, a plurality of extraction ducts may be provided. This plurality of extraction ducts may be connected to one another. In this case, each mixing chamber may comprise a separate extraction duct. As a result, the extraction ducts can be (un)installed in a single operation. In order to simplify production, these extraction ducts may be formed by an integrally formed extraction housing.

[0016] In one embodiment, the extraction duct may be hingedly connected to the first housing.

[0017] The invention also relates to an extraction duct which is suitable for use in an abovementioned preparing device.

[0018] One embodiment according to the invention will be explained in more detail below with reference to the drawings, in which:

Figure 1 shows a diagrammatic perspective view of a preparing device according to the invention,

Figure 2 shows a diagrammatic view in cross section along line II-II of the preparing device from Fig. 1,

Figure 3 shows a diagrammatic view in cross section along line III-III of the preparing device from Fig. 2,

Figure 4 shows a diagrammatic perspective bottom view of the cross section from Fig. 3,

Figure 5 shows a diagrammatic perspective view of a partially disassembled preparing device from Fig. 1, and

Figure 6 shows a diagrammatic view of the preparing device from Fig. 1 having a hinged extraction duct.

[0019] Figure 1 shows a perspective view of an embodiment of a preparing device according to the invention. The preparing device 1 comprises a second housing 25, which gives access by means of a door 24 to the interior of the second housing 25. Inside the second housing 25, there is a maintenance area. In the maintenance area 27, there are reservoirs 22 for powdery substance. The powder from the reservoirs 22 is conveyed into the two mixing chambers 11 by means of a powder conveying system 23 via an inlet 21 for powdery substance. In the mixing chambers 11, the powder is mixed with a certain quantity of hot liquid which is conveyed into the mixing chamber 11 by means of an inlet 38 (see Figure 2) for a liquid.
The hot beverages flow out of the mixing chambers 11 via a beverage outlet 9 and towards the user area, where the beverages are presented to the user of the preparing device 1. An extractor hood 4 is placed on each mixing chamber 11. The extractor hood 4 extracts a combination of air, vapour and powdery particles from the mixing chamber 11.

Figure 2 shows a view in cross section along line II-II of the preparing device from Fig. 1. For the sake of clarity, the reservoirs and powder inlet to the mixing chambers 11 are not illustrated. The extractor hood 4 is connected via an extraction opening 5 to an extraction duct 3 which is provided with a ventilating fan 16. Any other extraction means known from the prior art may be used instead of a ventilating fan 16.

Further components of the preparing device are accommodated in a first housing 26, such as a drive means 12 for the mixing means 37 situated in the mixing chambers 11, a power supply 13 for the ventilating fan 16 and a drive means 20 for the powder conveying system 23. The first housing 26 forms the service area 2. The service area 2 is screened off from the first housing 26 by the walls 6, 7 and 14 together form a duct part having an access aperture 30. This access aperture 30 is closed off by a wall part 8 of the external wall 15 of the first housing 26. It is possible to remove the second side wall 14. In this situation, the walls 6 and 7 together form a duct part having an access aperture and this access aperture is closed off by the external wall 15 of the first housing 26. The extraction duct 3 has a rectangular cross section which is at right angles to the longitudinal direction 29. On the outside of the top wall 6, there are fitting lugs 17 for positioning the powder reservoirs 22 in the correct position.

Figure 3 shows a cross-sectional view along line III-III of the preparing device from Fig. 2. In this figure, guide walls 19 are incorporated in the extraction housing 33 in such a manner that two separate extraction ducts 3 are obtained. As a result thereof, each extractor hood 4 is in individual fluid communication with the ventilating fan 16. The extraction ducts 3 have a longitudinal direction 29 and the access apertures 30 extend over the entire longitudinal direction 29 of each extraction duct 3. The guide walls 19 conduct the sucked-in fluid in such a manner that there are no sections in the extraction ducts 3 where the flow rate of the fluid is greatly reduced. If the flow rate of the fluid does decrease greatly in certain sections of an extraction duct 3, an accumulation of powdery particles results in those sections. Such accumulations will in time cause the extraction duct 3 to become blocked.

By designing the guide walls 19 in this manner, the risk of (partial) blocking of the extraction ducts 3 is reduced. In addition, a filter 18 is accommodated in the extraction duct 3. The function of the filter 18 is to prevent soiling of the ventilating fan 16 by the vapour and the powdery particles in the air which is sucked in. The filter 18 is positioned near the ventilating fan 16. The second housing 25 furthermore comprises a blow-off passage 31 for fluid extracted via the extraction duct 3 and the extraction duct 3 comprises a blow-off end 32 which is situated near the blow-off passage 31. By means of the latter, the sucked-in fluid is removed from the second housing 25 in an effective manner.

Figure 4 shows a perspective bottom view of the cross section from Fig. 3. In this case, the filter has not been shown for the sake of clarity.

Figure 5 shows a perspective view of a partially disassembled preparing device from Fig. 1. It can clearly be seen that the extraction housing 33 of the extraction duct 3 is substantially box-shaped. The extraction housing 33 is preferably formed as a single part, for example by means of an injection-moulding process. In order to install the extraction duct 3, the filter 18 is placed in the extraction duct 3 and the housing 33 is placed in the indentation 28 of the first housing 26. When the extraction duct 3 is placed in the indentation 28, the walls 6, 7 and 14 (the duct element) are placed in such a manner that a part of the external wall 15 (the wall part 8) closes off the access aperture 30. In order to uninstall the extraction duct 3, the housing 33 only has to be lifted out of the indentation 28. In this way, direct access is achieved to the part of the external wall 15 which forms the wall part 8, as a result of which this wall part 8 can be cleaned in a simple manner. The filter 18 can be taken out of the extraction duct 3 in order to be replaced or cleaned. The access aperture 30 gives direct access to the extraction duct 3, as a result of which the latter can be cleaned in a simple manner. The extraction duct 3 can thus also be cleaned in a dishwasher.

Figure 6 shows a view of the preparing device from Fig. 1 with a hinged extraction duct. In this case, the components of the preparing device which are identical to those of Fig. 1 have been denoted by the same reference numerals. The extraction duct 3 is connected to the first housing 26 at a hinge point 35. The extraction duct 3 has a top wall 6' and a first side wall 7' and may also have a second side wall 14'. These walls 6' and 7' together form a duct part having an access aperture 30'. The extraction duct 3 is hingedly connected to the external wall 15 of the first housing 26 in such a manner that the walls 6' and 7' can be displaced in the direction of arrow 34. The walls 6' and 7' can be placed in a folded-down position, in which the access aperture 30' is closed off by the wall part 8 of the external wall 15 of the first housing 26. As a result of the hinged displacement, the walls 6' and 7' can be placed in a folded-up position in which the access aperture 30' is made accessible. As a result, it is possible to access the interior of the extraction
duct 3' so that the latter can be cleaned in a simple manner. By placing the walls 6' and 7' in the folded-up position, the wall part 8 also becomes accessible, as a result of which this part of the external wall 15 can be cleaned in a simple manner. The first side wall 7' and the external wall 15 are provided with interacting securing means 36 for securing the extraction duct 3'.

[0028] It will be clear to the person skilled in the art that many variants of the preparing device according to the invention are possible without departing from the scope of protection sought in the claims.

Claims

1. Preparing device (1) for preparing a beverage from a powdery substance and a hot liquid, the preparing device comprising:

- at least one mixing chamber (11) for mixing a quantity of the powdery substance and a quantity of the hot liquid using mixing means (37), the mixing means being drivable by means of drive means (12);
- an inlet (38) opening into the mixing chamber (11) for the quantity of hot liquid;
- an inlet (21) opening into the mixing chamber (11) for the quantity of powdery substance;
- an extractor hood (4) placed on the mixing chamber (11);
- an extraction duct (3) connected to the extractor hood (4) and provided with suction means (16), such as a ventilating fan, for extracting vapour and dust particles from the mixing chamber (11) via the extraction duct (3) and the extractor hood (4), wherein the preparing device furthermore comprises:
  - a first housing (26) accommodating further components (12, 19, 20) of the preparing device, including electrical components and pipework; and
  - a second housing (25) accommodating the extraction duct (3) and one or more reservoirs (22) for powdery substance;

wherein the extraction duct (3) extends entirely along the exterior of the first housing (26), wherein the drive means (12) for the mixing means of the at least one mixing chamber (11) are situated in the first housing (26), the first housing having no apertures for the extraction duct (3) and the extraction duct cannot leak in the interior of the first housing, and in which the second housing (25) comprises a blow-off passage (31) for fluid extracted via the extraction duct (3) and the extraction duct (3) comprises a blow-off end (32), the suction means (16) and the blow-off end (32) being situated near the blow-off passage (31).

2. Preparing device according to Claim 1, in which the first housing (26) forms a service area (2).

3. Preparing device according to one of the preceding claims, in which one powder conveying system (23) with a drive means (20) is provided for each reservoir (22), in which said drive means (20) of the powder conveying system (23) for each reservoir (22) is accommodated in the first housing, and in which the power supply (13) for the suction means (16) is accommodated in the first housing.

4. Preparing device according to Claim 3, in which the second housing (25) is delimited by the first housing (26) and a door (24) for access to the interior of the second housing (25).

5. Preparing device according to Claim 3 or 4, in which the second housing (25) forms a maintenance area (27).

6. Preparing device according to one of the preceding claims, in which the first housing (26) comprises an indentation (28) in which the extraction duct (3) can be accommodated.

7. Preparing device according to one of the preceding claims, in which the extraction duct (3) is of split design in the longitudinal direction (29) in such a manner that the extraction duct (3) can be opened in order to provide an access aperture (30) extending along the longitudinal side for access to the interior of the duct.

8. Preparing device according to Claim 7, in which the access aperture (30) extends substantially over the entire longitudinal direction (29) of the extraction duct (3).

9. Preparing device according to Claim 7 or 8, in which the extraction duct (3) comprises a duct element (6, 7, 14) and a wall part (8), in which the duct element (6, 7, 14) comprises the access aperture (30) extending along the longitudinal side and in which the access aperture can be closed off by means of the wall part (8).

10. Preparing device according to Claim 9, in which the wall part (8) is provided on the external wall (15) of the first housing (26).

11. Preparing device according to Claim 10, in which the wall part (8) forms part of said external wall (15).

12. Preparing device according to Claim 1, in which the extraction duct (3) comprises a filter (18) situated...
near the blow-off passage (31).

13. Preparing device according to one of the preceding claims, in which the preparing device comprises a plurality of mixing chambers (11), each mixing chamber (11) comprises a separate extraction duct (3) and the extraction ducts (3) are formed by a housing (33) which is formed as a single part.

14. Preparing device according to one of the preceding claims, in which the extraction duct (3) is hingedly connected to the first housing (26).

Patentansprüche

1. Zubereitungsvorrichtung (1) zum Zubereiten eines Getränks aus einer pulverförmigen Substanz und einer heißen Flüssigkeit, wobei die Zubereitungsvorrichtung umfasst:
- wenigstens eine Mischkammer (11) zum Mischen einer Menge der pulverförmigen Substanz und einer Menge der heißen Flüssigkeit unter Verwendung von Mischmitteln (37), wobei die Mischmittel durch Antriebsmittel (12) antriebbar sind;
- eine Öffnung für einen Einlass (38) in die Mischkammer (11) für die Menge heißer Flüssigkeit;
- eine Öffnung für einen Einlass (21) in die Mischkammer (11) für die Menge pulverförmiger Substanz;
- eine Extraktorhaube (4), die auf der Mischkammer (11) platziert ist;
- eine Extraktionsleitung (3), die mit der Extraktorhaube (4) verbunden ist und mit Saugmitteln (16), so beispielsweise einem Belüftungsgebläse, zum Extrahieren von Dampf und Staubteilchen aus der Mischkammer (11) über die Extraktionsleitung (3) und die Extraktorhaube (4) versehen ist, wobei die Zubereitungsvorrichtung des Weiteren umfasst:
- ein erstes Gehäuse (26) zum Unterbringen weiterer Komponenten (12, 19, 20) der Zubereitungsvorrichtung einschließlich elektrischer Komponenten und einer Verrohrung; und
- ein zweites Gehäuse (25) zum Unterbringen der Extraktionsleitung (3) und eines oder mehrerer Behälter (22) für pulverförmige Substanz; wobei die Extraktionsleitung (3) sich gänzlich entlang des Äußeren des ersten Gehäuses (26) erstreckt, wobei die Antriebsmittel (12) für die Mischmittel der wenigstens einen Mischkammer (11) in dem ersten Gehäuse (26) gelegen sind, das erste Gehäuse keine Öffnungen für die Extraktionsleitung (3) aufweist und die Extraktionsleitung nicht in das Innere des ersten Gehäuses lecken kann, und wobei das zweite Gehäuse (25) einen Abblasdurchlass (31) für über die Extraktionsleitung (3) extrahiertes Fluid umfasst und die Extraktionsleitung (3) ein Abblasende (32) umfasst, wobei die Saugmittel (16) und das Abblasende (32) in der Nähe des Abblasdurchlasses (31) gelegen sind.

2. Zubereitungsvorrichtung nach Anspruch 1, wobei das erste Gehäuse (26) einen Bedienbereich (2) bildet.

3. Zubereitungsvorrichtung nach einem der vorhergehenden Ansprüche, wobei ein Pulverzuführsystem (23) mit einem Antriebsmittel (20) für jeden Behälter (22) vorgesehen ist, wobei das Antriebsmittel (20) des Pulverzuführsystems (23) für jeden Behälter (22) in dem ersten Gehäuse untergebracht ist und wobei die Pulverzuführung (13) für die Saugmittel (16) in dem ersten Gehäuse untergebracht ist.

6. Zubereitungsvorrichtung nach einem der vorhergehenden Ansprüche, wobei das erste Gehäuse (26) eine Vertiefung (28) umfasst, in der die Extraktionsleitung (3) untergebracht werden kann.

7. Zubereitungsvorrichtung nach einem der vorhergehenden Ansprüche, wobei die Extraktionsleitung (3) in der Längsrichtung (29) einen geteilten Aufbauterart aufweist, dass die Extraktionsleitung (3) geöffnet werden kann, um eine Zugangsoffnung (30) bereitzustellen, die sich entlang der Längsseite für einen Zugang in das Innere der Leitung erstreckt.

8. Zubereitungsvorrichtung nach Anspruch 7, wobei sich die Zugangsoffnung (30) im Wesentlichen über die gesamte Längsrichtung (29) der Extraktionsleitung (3) erstreckt.

9. Zubereitungsvorrichtung nach Anspruch 7 oder 8, wobei die Extraktionsleitung (3) ein Leitungselement (6, 7, 14) und einen Wandteil (8) umfasst, wobei das Leitungselement (6, 7, 14) die Zugangsoffnung (30) umfasst, die sich entlang der Längsseite erstreckt, und wobei die Zugangsoffnung mittels des Wandteiles (8) abgeschlossen werden kann.

10. Zubereitungsvorrichtung nach Anspruch 9, wobei
der Wandteil (8) an der äußeren Wand (15) des ersten Gehäuses (26) vorgesehen ist.

11. Zubereitungsvorrichtung nach Anspruch 10, wobei der Wandteil (8) einen Teil der äußeren Wand (15) bildet.

12. Zubereitungsvorrichtung nach Anspruch 1, wobei die Extraktionsleitung (3) einen Filter (18) aufweist, der in der Nähe des Abblasdurchlasses (31) angeordnet ist.

13. Zubereitungsvorrichtung nach einem der vorhergehenden Ansprüche, wobei die Zubereitungsvorrichtung eine Mehrzahl von Mischkammern (11) umfasst, wobei jede Mischkammer (11) eine separate Extraktionsleitung (3) umfasst und die Extraktionsleitungen (3) von einem Gehäuse (33), das als einziges Teil ausgebildet ist, gebildet werden.

Revendications

1. Dispositif de préparation (1) destiné à préparer une boisson à partir d’une substance pulvérulente et d’un liquide chaud, le dispositif de préparation comprenant :
   - au moins une chambre de mélange (11) pour le mélange d’une quantité de substance pulvérulente et d’une quantité de liquide chaud en utilisant des moyens de mélange (37), les moyens de mélange pouvant être actionnés à l’aide de moyens d’actionnement (12) ;
   - une entrée (38) ouvrant dans la chambre de mélange (11) pour la quantité de liquide chaud ;
   - une entrée (21) ouvrant dans la chambre de mélange (11) pour la quantité de substance pulvérulente ;
   - une hotte (4) placée sur la chambre de mélange (11) ;
   - un conduit d’extraction (3) relié à la hotte (4) et doté de moyens d’aspiration (16) tels qu’un ventilateur pour l’extraction de vapeur et de particules de poussière de la chambre de mélange (11) via le conduit d’extraction (3) et la hotte (4),

   caractérisé en ce que le dispositif de préparation comprend en outre :
   - un premier logement (26) logeant d’autres composants (12, 19, 20) du dispositif de préparation tels que des composants électriques et la tuyauterie ; et
   - un second logement (25) logeant le conduit d’extraction (3) et un ou plusieurs réservoirs (22) pour la substance pulvérulente ;

le conduit d’extraction (3) s’étend entièrement le long de l’extérieur du premier logement (26), et les moyens d’actionnement (12) pour les moyens de mélange d’au moins une chambre de mélange (11) sont situés dans le premier logement (26), le premier logement n’ayant pas de trous pour le conduit d’extraction (3) et le conduit d’extraction ne pouvant pas fuiter dans l’intérieur du premier logement, et dans lequel le second logement (25) comprend un passage d’évacuation (31) pour le fluide extrait via le conduit d’extraction (3) et le conduit d’extraction (3) comprend une extrémité d’évacuation (32), les moyens d’aspiration (16) et l’extrémité d’évacuation (32) étant situés près du passage d’évacuation (31).

2. Dispositif de préparation selon la revendication 1, dans lequel le premier logement (26) forme une zone de service (2).

3. Dispositif de préparation selon l’une quelconque des revendications précédentes, dans lequel un système de transport de poudre (23) avec des moyens d’actionnement (20) est prévu pour chaque réservoir (22), dans lequel lesdits moyens d’actionnement (20) du système de transport de poudre (23) pour chaque réservoir (22) sont logés dans le premier logement, et dans lequel l’alimentation en énergie (13) pour les moyens d’aspiration (16) est logée dans le premier logement.

5. Dispositif de préparation selon la revendication 3 ou 4, dans lequel le second logement (25) forme une zone de maintenance (27).

6. Dispositif de préparation selon l’une quelconque des revendications précédentes, dans lequel le premier logement (26) comprend un enfoncement (28), dans lequel le conduit d’extraction (3) peut être logé.

7. Dispositif de préparation selon l’une quelconque des revendications précédentes, dans lequel le conduit d’extraction (3) présente une conception fendue dans la direction longitudinale (29) de telle manière que le conduit d’extraction (3) puisse être ouvert dans le but de fournir une ouverture d’accès (30) s’étendant le long du côté longitudinal pour l’accès à l’intérieur du conduit.
8. Dispositif de préparation selon la revendication 7, dans lequel l’ouverture d’accès (30) s’étend sensiblement sur toute la direction longitudinale (29) du conduit d’extraction (3).

9. Dispositif de préparation selon la revendication 7 ou 8, dans lequel le conduit d’extraction (3) comprend un élément de conduit (6, 7, 14) et une partie de paroi (8), dans lequel l’élément de conduit (6, 7, 14) comprend l’ouverture d’accès (30) s’étendant le long du côté longitudinal et dans lequel l’ouverture d’accès peut être fermée à l’aide de la partie de paroi (8).

10. Dispositif de préparation selon la revendication 9, dans lequel la partie de paroi (8) est prévue sur la paroi externe (15) du premier logement (26).

11. Dispositif de préparation selon la revendication 10, dans lequel la partie de paroi (8) forme une partie de ladite paroi externe (15).

12. Dispositif de préparation selon la revendication 1, dans lequel le conduit d’extraction (3) comprend un filtre (18) situé près du passage d’évacuation (31).

13. Dispositif de préparation selon l’une quelconque des revendications précédentes, dans lequel le dispositif de préparation comprend une pluralité de chambres de mélange (11), chaque chambre de mélange (11) comprend un conduit d’extraction séparé (3) et les conduits d’extraction (3) sont formés par un logement (33) qui est constitué en une seule partie.

14. Dispositif de préparation selon l’une quelconque des revendications précédentes, dans lequel le conduit d’extraction (3) est relié par articulation au premier logement (26).
