A paper-retaining device (100) is disclosed as including a cover fixedly engaged with a lever-arch type file mechanism for releasably retaining pieces of paper, the cover including a spine (106), a front cover (102) and a rear cover (104), in which each of the spine (106), front cover (102) and rear cover (104) includes a respective lower edge (106a, 102a, 104a), and the front cover (102) is pivotably engaged with and movable relative to the spine (106) about a first edge (108), and the rear cover (104) is pivotably engaged with and movable relative to the spine (106) about a second edge (110), and an angle (\(\alpha\)) subtended between the lower edge (102a) of the front cover (102) and the first edge (108) is less than 90\(^\circ\), and when the spine and the front cover occupy a same plane, the lower edge of the spine and the lower edge of the rear cover subtend an angle of less than 180\(^\circ\).
Description

[0001] This invention relates to a paper-retaining device and, in particular, such a device adapted to releasably retain pieces of hole-punched paper.

[0002] Paper-retaining devices, such as ring-binder folders or lever-arch type files, have been available for a long time. Such devices include ring-binder mechanisms or lever-arch type file mechanisms, and are adapted to releasably retain pieces of hole-punched paper in rings of the ring-binder mechanisms or lever-arch type file mechanisms, and to allow such paper to be retrieved therefrom.

[0003] It is generally known that when such a paper-retaining device holding a large amount of paper stands with its covers in an upright position, the weight of the paper may be sufficient to bring down the device. In addition, it is also generally known that for a right-handed writer, it is ergonomically convenient to slightly tilt up the top right hand corner of the piece of paper to be written. Such is however not possible in the case of a conventional paper-retaining device, as this would mean that the lower left hand corner of the front cover of the opened paper-retaining device will point towards the user and may even extend beyond the lower end of the writing table, thus causing discomfort and even danger to the user.

[0004] It is thus an object to provide a substrate for a paper-retaining device and a paper-retaining device in which at least one of the above shortcomings is mitigated, or at least to provide a useful alternative to the public.

[0005] According to a first aspect of the present invention, there is provided a substrate for a paper-retaining device, including a spine portion, a first cover member and a second cover member, wherein each of said spine portion, said first cover member and said second cover member includes a respective lower edge, wherein said first cover member is pivotably engaged with and movable relative to said spine portion about a first edge, and wherein said second cover member is pivotably engaged with and movable relative to said spine portion about a second edge, characterized in that an angle subtended with and movable relative to said spine portion about a first edge, and said first edge is less than 90°.

[0006] According to a second aspect of the present invention, there is provided a paper-retaining device including a substrate fixedly engaged with means for releasably retaining at least a piece of paper, said substrate including a spine portion, a first cover member and a second cover member, wherein each of said spine portion, said first cover member and said second cover member includes a respective lower edge, characterized in that when said spine portion and said first cover member occupy a same plane, the lower edge of said spine portion and the lower edge of said first cover member subtend an angle of less than 180°.

[0007] According to a third aspect of the present invention, there is provided a substrate for a paper-retaining device, including a spine portion, a first cover member and a second cover member, wherein each of said spine portion, said first cover member and said second cover member includes a respective lower edge, characterized in that when said spine portion and said first cover member occupy a same plane, the lower edge of said spine portion and the lower edge of said first cover member subtend an angle of less than 180°.

[0008] According to a fourth aspect of the present invention, there is provided a paper-retaining device including a substrate fixedly engaged with means for releasably retaining at least a piece of paper, said substrate including a spine portion, a first cover member and a second cover member, wherein each of said spine portion, said first cover member and said second cover member includes a respective lower edge, characterized in that when said spine portion and said first cover member occupy a same plane, the lower edge of said spine portion and the lower edge of said first cover member subtend an angle of less than 180°.

[0009] Embodiments of the present invention will now be described, by way of examples only, with reference to the accompanying drawings, in which:

Fig. 1 is a front perspective view of a cover for a paper-retaining device according to the present invention, in a closed configuration;
Fig. 2 is a rear perspective view of the cover shown in Fig. 1;
Fig. 3 is a front perspective view of the paper-retaining device according to an embodiment of the present invention, incorporating the cover shown in Fig. 1 with the interior components shown in dotted lines;

Fig. 11 is a perspective view of the device shown in Fig. 10, in a partly opened configuration;

Fig. 10 is a front perspective view of the device shown in Fig. 9;

Fig. 9 is a rear perspective view of a cover, e.g. a ring-binder folder or lever-arch type file, according to an embodiment of the present invention.

The cover may be 100 may be made of plastics, leather, imitations of leather, cloth material, or cardboard, and includes a planar front cover 102, a planar rear cover 104 and a planar spine 106. The front cover 102 has a straight lower edge 102a, the rear cover 104 has a straight lower edge 104a, and the spine 106 also has a straight lower edge 106a. The front cover 102 is pivotally engaged with and pivotably movable relative to the spine 106 about a straight edge 108; and the rear cover 104 is pivotally engaged with and pivotably movable relative to the spine 106 about a straight edge 110.

The angle α between the lower edge 102a of the front cover 102 and the edge 108 between the front cover 102 and the spine 106 is less than 90°. The angle β between the lower edge 104a of the rear cover 104 and the edge 110 between the rear cover 104 and the spine 106 is also less than 90°. The angles α and β are preferably the same.

[0010] Figs. 1 and 2 show, respectively, a front perspective view and a rear perspective view of a cover, generally designated as 100, for a paper-retaining device, e.g. a ring-binder folder or lever-arch type file, according to an embodiment of the present invention.

[0011] The cover may be 100 may be made of plastics, leather, imitations of leather, cloth material, or cardboard, and includes a planar front cover 102, a planar rear cover 104 and a planar spine 106. The front cover 102 has a straight lower edge 102a, the rear cover 104 has a straight lower edge 104a, and the spine 106 also has a straight lower edge 106a. The front cover 102 is pivotally engaged with and pivotably movable relative to the spine 106 about a straight edge 108; and the rear cover 104 is pivotally engaged with and pivotably movable relative to the spine 106 about a straight edge 110.

The angle α between the lower edge 102a of the front cover 102 and the edge 108 between the front cover 102 and the spine 106 is less than 90°. The angle β between the lower edge 104a of the rear cover 104 and the edge 110 between the rear cover 104 and the spine 106 is also less than 90°. The angles α and β are preferably the same.

[0013] Figs. 3 and 4 show, respectively, a front per-
spective view and a rear perspective view of a lever-arch type file according to an embodiment of the present invention, generally designated as 300. The file 200 includes the cover 100 and a lever-arch type file mechanism 202 (shown in dotted lines) fixedly secured, e.g. by a number of rivets or screws, to the rear cover 104. It can be seen from Figs. 5 and 6 that the lever-arch type file mechanism 202 in the file 200 can releasably retain pieces of hole-punched paper, in the conventional manner.

[0014] A further embodiment of a paper-retaining device according to the present invention is shown in Figs. 7 to 16, and generally designated as 300. The device 300 also includes a cover 301 (which may be made of plastics, leather, imitations of leather, cloth material or cardboard) with a front cover 302 hingedly engaged with an pivotable relative to a spine 306 about a straight edge 308, and the spine 306 is also hingedly engaged with an pivotable relative to a rear cover 304 about a straight edge 310. A lever-arch type file mechanism 312 is fixedly secured, to an inner surface 304b of the rear cover 304, for releasably retaining pieces of paper.

[0015] It can be seen in Figs. 7 and 9 that the angle \( \alpha \) between the lower edge 302a of the front cover 302 and the edge 310 between the lower edge 304a of the rear cover 304 and the lower edge 306 of the spine 306 is less than 90°. The angle \( \beta \) between the lower edge 304a of the rear cover 304 and the edge 310 between the lower edge 306 of the spine 306 is also less than 90°. The angles \( \alpha \) and \( \beta \) are preferably the same. As the edges 308, 306, 308, 310 are both perpendicular to the lower edge 304a of the rear cover 304, it follows that \( \gamma = 90° + \beta \), and \( \delta = 90° + \alpha \).

[0016] Figs. 7 to 9 also clearly show that the cover 301 includes a circular aperture 314 adjacent a lower end of the spine 306 allowing insertion of one or more fingers of a user, for moving (e.g. pulling) the device 300. Two elongate apertures 316 are also formed on the front cover 302, each allowing insertion of part of a respective ring of the lever-arch type file mechanism 312 when the device 300 is in the closed configuration.

[0017] Figs. 11 and 12 show the paper-retaining device 300 in an upstanding position. It can be seen in Figs. 13 and 14 that the lever-arch type file mechanism 312 is fixedly secured by several rivets 318 onto the inner surface 304b of the rear cover 304 to form the paper-retaining device 300, for releasably retaining pieces of paper, as shown in Fig. 15.

[0018] Fig. 16 shows several significant angles and dimensions of the paper-retaining device 300. Firstly, as distinct from conventional arrangements, when the front cover 302, the rear cover 304 and the spine 306 are co-planar with one another, the obtuse angle \( \gamma \) between the lower edge 304a of the rear cover 304 and the lower edge 306a of the spine 306 is less than 180°, and so is the obtuse angle \( \delta \) between the lower edge 302a of the front cover 302 and the lower edge 306a of the spine 306. The angles \( \gamma \) and \( \delta \) are preferably the same. As the edges 308, 310 are both perpendicular to the lower edge 306a of the spine 306, it follows that \( \gamma = 90° + \beta \), and \( \delta = 90° + \alpha \).

[0019] In addition, a longitudinal axis L-L of the lever-arch type file mechanism 312 is perpendicular to the lower edge 304a of the rear cover 304 to which it is fixedly engaged. The longitudinal axis L-L of the lever-arch type file mechanism 312 is thus inclined relative to the edge 310 at an acute angle \( \phi \), which is equal to 180° - \( \gamma \).

[0020] For an A4 size device (i.e. a device 300 suitable for retaining A4 size paper):
- \( 212 \text{ mm} \leq P \leq 318 \text{ mm} \), and preferably \( P = 275 \text{ mm} \);
- \( 274 \text{ mm} \leq H \leq 351 \text{ mm} \), and preferably \( H = 305 \text{ mm} \);
- \( 212 \text{ mm} \leq W \leq 418 \text{ mm} \), and preferably \( W = 305 \text{ mm} \);
- \( 24 \text{ mm} \leq D \leq 85 \text{ mm} \), and preferably \( D = 55 \text{ mm} \), 75 mm or 85 mm;
- \( \alpha = \beta \);
- \( 69.95° \leq \alpha < 90° \);
- \( \gamma = \delta \);
- \( 159.95° \leq \gamma < 180° \); and
- \( 0° < \phi \leq 20.05° \).

[0021] For an F4 size device (i.e. a device 300 suitable for retaining F4 size paper):
- \( 225 \text{ mm} \leq P \leq 319 \text{ mm} \);
- \( 311 \text{ mm} \leq H \leq 391 \text{ mm} \);
- \( 225 \text{ mm} \leq W \leq 419 \text{ mm} \);
- \( 36 \text{ mm} \leq D \leq 87 \text{ mm} \);
- \( \alpha = \beta \);
- \( 72.18° \leq \alpha < 90° \);
- \( \gamma = \delta \);
- \( 162.18° \leq \gamma < 180° \); and
- \( 0° < \phi \leq 17.82° \).

[0022] For an B5 size device (i.e. a device 300 suitable for retaining B5 size paper):
- \( 189 \text{ mm} \leq P \leq 295 \text{ mm} \);
- \( 240 \text{ mm} \leq H \leq 325 \text{ mm} \);
- \( 189 \text{ mm} \leq W \leq 395 \text{ mm} \);
- \( 19 \text{ mm} \leq D \leq 48 \text{ mm} \);
- \( \alpha = \beta \);
- \( 67.38° \leq \alpha < 90° \);
- \( \gamma = \delta \);
- \( 157.38° \leq \gamma < 180° \); and
- \( 0° < \phi \leq 22.62° \).

[0023] It can be seen that, with such an arrangement, when pieces of paper 320 are retained by the mechanism 312 of the device 300, the top right hand corner of the paper 320 is tilted upwardly by the angle \( \phi \), thus facilitating the writing movement of a right-handed user. It is also not necessary to adjust the device 300 such that its lower left hand corner of the front cover 302 points towards the user and extends beyond an edge of the table on which it is placed, causing discomfort and possible danger to the user.

[0024] A further embodiment of a paper-retaining device according to the present invention is shown in Figs. 17 to 20, generally designated as 400, and incorporating the cover 300 discussed above.

[0025] To an inner surface 404b of a rear cover 404 of
the device 400 is fixedly secured a ring-binder mechanism 412 for retaining pieces of paper. A longitudinal axis M-M of the ring-binder mechanism 412 is inclined relative to an edge 410 between the rear cover 404 and an adjoining spine 406 by an acute angle. The axis M-M is perpendicular to the lower edge 404a of the rear cover 404, as shown in Fig. 18.

[0026] A paper-retaining device according to a yet further embodiment of the present invention is shown in Figs. 21 to 30, generally designated as 500. This device 500 is similar to the device 400 shown in Figs. 17 to 20 and discussed above, with the main difference being that the device 500 has a circular aperture 514 on a spine 506 of a cover 501 of the device 500.

[0027] It can be seen in Figs. 27 that a ring-binder mechanism 512 is fixedly secured to an inner surface 504b of a rear cover 504 of the cover 501 to form the paper-retaining device 500.

[0028] As distinct from conventional arrangements, when a front cover 502, the rear cover 504 and the spine 506 occupy a same plane, the obtuse angle γ between a lower edge 504a of the rear cover 504 and a lower edge 506a of the spine 506 is less than 180°, and so is the obtuse angle δ between a lower edge 502a of the front cover 502 and the lower edge 506a of the spine 506. The angles γ and δ are preferably the same. In addition, a longitudinal axis S-S of the ring-binder mechanism 512 is perpendicular to the lower edge 504a of the rear cover 504 to which it is fixedly engaged. The longitudinal axis S-S of the ring-binder mechanism 512 is thus inclined relative to an edge 510 adjoining the spine 506 and the rear cover 504 at an acute angle φ, which is equal to 180° - γ.

[0029] Figs. 31 to 33 show various views of a paper-retaining device according to a still further embodiment of the present invention, generally designated as 600. This device 600 is structurally similar to the device 200 shown in Figs. 3 to 6 and discussed above. The main difference between this device 600 and the device 200 is that, in the device 200, the two free corners of the rear cover 104 and the two free corners of the front cover 102 are rounded off; whereas in the device 600, the corresponding corners are not rounded-off.

[0030] A paper-retaining device according to an additional embodiment of the present invention is shown in Figs. 34 to 36, and generally designated as 700. This device 700 is structurally similar to the device 200 shown in Figs. 3 to 6 and discussed above. A special feature residing in the device 700 is that a semi-circular recess 720 is formed along an upper edge 706b of a spine 706 of the device 700, and a semi-circular recess 722 is formed along a lower edge 706a of the spine 706. These two recesses 720, 722 are sized for allowing insertion of a respective finger of a user, for pulling the device 700, for example, out from a row of devices 700 standing one next to the other.

[0031] A paper-retaining device according to an additional embodiment of the present invention is shown in Figs. 37 to 39, and generally designated as 800. This device 800 is also structurally similar to the device 200 shown in Figs. 3 to 6 and discussed above. A special feature residing in the device 800 is the provision of two apertures 820, 822, in which the aperture 820 is formed through an edge 808 adjoining a front cover 802 and a spine 806 of the device 800; and the aperture 822 is formed through an edge 810 adjoining a rear cover 804 and the spine 806 of the device 800. These two recesses 820, 822 are sized and configured for allowing insertion of a respective finger of a user, for pulling the device 800, for example, out from a row of devices 800 standing one next to the other.

[0032] A paper-retaining device according to a yet further embodiment of the present invention is shown in Figs. 40 to 42, and generally designated as 900. This device 900 is structurally similar to the device 800 shown in Figs. 37 to 39 and discussed above. A special feature of the device 900 over the device 800 is that the device 900 has three pairs of apertures 920a, 922a, 920b, 922b, 920c, 922c arranged one above another, which collectively allow insertion of more than two fingers of a user, to facilitate removal of the device 900 from a row of paper-retaining devices.

[0033] A paper-retaining device according to another further embodiment of the present invention is shown in Figs. 43 to 45, and generally designated as 1000. This device 1000 is structurally similar to the device 200 shown in Figs. 3 to 6 and discussed above. A special feature of the device 1000 over the device 200 is that each of a front cover 1002 and a rear cover 1004 of the device 1000 is formed with an undulating portion, forming a series of parallel recesses 1006. A user may thus grip the device 1000 by holding the recesses 1006, thus facilitating holding of the device 1000.

[0034] A paper-retaining device according to a still further embodiment of the present invention is shown in Figs. 46 to 51, and generally designated as 1100. The device 1100 can be said to be a combination of the device 700 shown in Fig. 34 and the device 900 shown in Fig. 40, in that it includes a semi-circular recess 1108 at an upper end of a spine 1106, a semi-circular recess 1110 at a lower end of the spine 1106, and three pairs of apertures 1112a, 1114a, 1112b, 1114b, 1112c, 1114c through edges 1116, 1118 adjoining a rear cover 1104 and the spine 1106, and a front cover 1102 and the spine 1106 respectively.

[0035] It should be understood that the above only illustrates examples whereby the present invention may be carried out, and that various modifications and/or alterations may be made thereto without departing from the spirit of the invention.

[0036] It should also be understood that certain features of the invention, which are, for clarity, described in the context of separate embodiments, may be provided in combination in a single embodiment. Conversely, various features of the invention which are, for brevity, described in the context of a single embodiment, may also
be provided separately or in any appropriate sub-combinations.

Claims

1. A substrate for a paper-retaining device, including a spine portion, a first cover member and a second cover member, wherein each of said spine portion, said first cover member and said second cover member includes a respective lower edge, wherein said first cover member is pivotably engaged with and movable relative to said spine portion about a first edge, and wherein said second cover member is pivotably engaged with and movable relative to said spine portion about a second edge, characterized in that an angle subtended between said lower edge of said first cover member and said first edge is less than 90°.

2. A substrate according to Claim 1 further characterized in that an angle subtended between said lower edge of said second cover member and said second edge is less than 90°.

3. A substrate according to Claim 2 further characterized in that said angle is equal to or larger than 67.38°.

4. A substrate according to Claim 2 or 3 further characterized in that the angle subtended between said lower edge of said first cover member and said first edge is substantially identical to the angle subtended between said lower edge of said second cover member and said second edge.

5. A substrate according to any of the preceding claims further characterized in that when said first and second cover members are substantially perpendicular to said spine portion, said lower edge of said first cover member is substantially parallel to said lower edge of said second cover member.

6. A substrate according to any of the preceding claims further characterized in that a first recess is formed on said lower edge of said spine portion.

7. A substrate according to Claim 6 further characterized in that said first recess is generally semi-circular in shape.

8. A substrate according to any of the preceding claims further characterized in that a second recess is formed on an upper edge of said spine portion.

9. A substrate according to Claim 8 further characterized in that said second recess is generally semi-circular in shape.

10. A substrate according to any of the preceding claims further characterized in that said first cover member is generally trapezoidal in shape.

11. A substrate according to any of the preceding claims further characterized in that said second cover member is generally trapezoidal in shape.

12. A substrate according to any of the preceding claims further characterized in that an aperture is formed through each of said first and second edges.

13. A substrate according to Claim 12 further characterized in that each said aperture is sized and configured to receive a finger of a user.

14. A substrate according to Claim 12 or 13 further characterized in that said apertures are of substantially the same distance from said lower edge of said spine portion.

15. A substrate according to any one of Claims 12 to 14 further characterized in that a plurality of apertures are formed through each of said first and second edges.

16. A substrate according to any of the preceding claims further characterized in that at least a recess is formed on each outer surface of said first and second cover members.

17. A substrate according to Claim 16 further characterized in that a plurality of recesses are formed on each outer surface of said first and second cover members.

18. A paper-retaining device including a substrate according to any of the preceding claims fixedly engaged with means for releasably retaining at least a piece of paper.

19. A device according to Claim 18 further characterized in that a longitudinal axis of said retaining means is inclined relative to said first edge.

20. A device according to Claim 18 or 19 further characterized in that a longitudinal axis of said retaining means is inclined relative to said second edge.

21. A device according to Claim 18, 19 or 20 further characterized in that a longitudinal axis of said retaining means is substantially perpendicular to a lower edge of said first cover member.

22. A substrate for a paper-retaining device, including a...
spine portion, a first cover member and a second cover member, wherein each of said spine portion, said first cover member and said second cover member includes a respective lower edge, characterized in that when said spine portion and said first cover member occupy a same plane, the lower edge of said spine portion and the lower edge of said first cover member subent an angle of less than 180°.

23. A substrate according to Claim 22 further characterized in that said angle is equal to or larger than 157.38°.

24. A substrate according to Claim 22 or 23 further characterized in that when said spine portion and said second cover member occupy a same plane, the lower edge of said spine portion and the lower edge of said second cover member subtend an angle of less than 180°.

25. A substrate according to Claim 23 or 24 further characterized in that when said first and second cover members are substantially perpendicular to said spine portion, said lower edge of said first cover member is substantially parallel to said lower edge of said second cover member.

26. A substrate according to any one of Claims 22 to 25 further characterized in that a first recess is formed on said lower edge of said spine portion.

27. A substrate according to Claim 26 further characterized in that said first recess is generally semicircular in shape.

28. A substrate according to any one of Claims 22 to 27 further characterized in that a second recess is formed on an upper edge of said spine portion.

29. A substrate according to Claim 28 further characterized in that said second recess is generally semicircular in shape.

30. A substrate according to any one of Claims 22 to 29 further characterized in that said first cover member is generally trapezoidal in shape.

31. A substrate according to any one of Claims 22 to 30 further characterized in that said second cover member is generally trapezoidal in shape.

32. A substrate according to any one of Claims 22 to 31 further characterized in that an aperture is formed through each of said first and second edges.

33. A substrate according to Claim 32 further characterized in that each said aperture is sized and configured to receive a finger of a user.

34. A substrate according to Claim 32 or 33 further characterized in that said apertures are of substantially the same distance from said lower edge of said spine portion.

35. A substrate according to any one of Claims 32 to 34 further characterized in that a plurality of apertures are formed through each of said first and second edges.

36. A substrate according to any one of Claims 22 to 35 further characterized in that at least a recess is formed on each outer surface of said first and second cover members.

37. A substrate according to Claim 36 further characterized in that a plurality of recesses are formed on each outer surface of said first and second cover members.

38. A paper-retaining device including a substrate according to any of Claims 22 to 37 fixedly engaged with means for releasably retaining at least a piece of paper.

39. A device according to Claim 38 further characterized in that a longitudinal axis of said retaining means is inclined relative to said first edge.

40. A device according to Claim 38 or 39 further characterized in that a longitudinal axis of said retaining means is inclined relative to said second edge.

41. A device according to Claim 38, 39 or 40 further characterized in that a longitudinal axis of said retaining means is substantially perpendicular to a lower edge of said first cover member.

### CATEGORY OF CITED DOCUMENTS

- **X**: particularly relevant if taken alone
- **Y**: particularly relevant if combined with another document of the same category
- **A**: technological background
- **Q**: non-written disclosure
- **P**: intermediate document
- **T**: theory or principle underlying the invention
- **E**: earlier patent document, but published on, or after the filing date
- **D**: document cited in the application
- **L**: document cited for other reasons
- **&**: member of the same patent family, corresponding document
This annex lists the patent family members relating to the patent documents cited in the above-mentioned European search report. The members are as contained in the European Patent Office EDP file on The European Patent Office is in no way liable for these particulars which are merely given for the purpose of information.
