Note: Within nine months of the publication of the mention of the grant of the European patent in the European Patent Bulletin, any person may give notice to the European Patent Office of opposition to that patent, in accordance with the Implementing Regulations. Notice of opposition shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).
The present invention relates to an information processing apparatus and a license distribution system which transmit license information for permitting the reproduction of content to a reproducing device participating in a domain, and relates to an information processing apparatus and a license distribution system which can offer a privilege related to a license in accordance with the participation of a reproducing device in a domain.

Conventionally, items of content such as music, video, or images have been distributed digitally enabling high convenience and the possibility of storage or duplication without degradation. Accordingly, the digital content is used via a communication network such as the Internet or digital broadcasting, and distributed to many reproducing devices to be viewed or listened to.

To promote the circulation and frequent use of digital content, there is proposed a system in which a privilege is offered in accordance with the use of the digital content such as, e.g., consecutively viewing or listening to series content, or viewing or listening to content in specific hours (for example, Japanese Laid-Open Patent Publication No. 2004-145867).

However, since the digital content has the problem of piracy resulting from its easiness to duplicate, Digital Rights Management which requires permission by license when the digital content is viewed, listened to, or duplicated is essential.

To prevent piracy, there is proposed a system in which a plurality of personal computers (hereinafter referred to as "PCs") or devices managed in, e.g., a home network are organized into one group, and each group is provided with a shared license so that the digital content can be viewed, listened to, or duplicated freely (for example, Japanese Laid-Open Patent Publication No. 2004-110816). Such a group is also termed a domain, and devices belonging to the domain share a domain key to allow distribution of content within the domain. As a result, unlimited spreading of the digital content can be prevented and piracy by duplicating the digital content can be minimized.

Moreover, by providing a license to be given with a specific expiration date, unauthorized use of the content by using duplicated or altered license can be minimized.

EP-A-1 603 045 describes a terminal apparatus that properly restricts use of a license in each terminal apparatus including: a license storage unit that stores a license permitting use of a content which is a digital copyrighted work, in association with domain identification information indicating one of a plurality of domains; and a domain judgment unit that prohibits another terminal apparatus from using the license in the case where a domain to which another terminal apparatus belongs and a domain indicated in the domain identification information are different; and a license processing result transmission unit.

Aspects of the invention provide an information processing apparatus according to claim 1 and a license distribution system according to claim 5.

Reference is made, by way of example only, to the accompanying drawings in which:

FIG. 1 is a schematic view showing an overall structure of a license distribution system according to a first embodiment;
FIG. 2 is a block diagram for illustrating a function of a reproducing device;
FIG. 3 is a block diagram showing a structure of a server;
FIG. 4 is a block diagram for illustrating a function of a CPU;
FIG. 5 is a diagram showing an example of the storage of a content information table;
FIG. 6 is a diagram showing an example of the storage of a domain attribute information table;
FIG. 7 is a diagram showing a data structure of participation information;
FIG. 8 is an operation flow showing a procedure for a license distribution process at the time of participating in a domain;
FIG. 9 is the operation flow showing the procedure for the license distribution process at the time of participating in the domain;
FIG. 10 is an operation flow showing a procedure for the license distribution process after an expiration date;
FIG. 11 is an operation flow showing a procedure for a validity confirmation process according to the first embodiment;
FIG. 12 is an operation flow showing a procedure for a validity confirmation process according to a second embodiment;
FIG. 13 is a schematic view showing an overall structure of a license distribution system according to a third embodiment;
FIG. 14 is an operation flow showing a procedure for a validity confirmation process according to the third embodiment;
FIG. 15 is a schematic view showing an overall structure of a license distribution system according to a first example;
FIG. 16 is an operation flow showing a procedure for a validity confirmation process according to the first example; and
FIG. 17 is an operation flow showing a procedure for an additional service determination process according to a second example.

In the above-mentioned Japanese Laid-Open Patent Publication No. 2004-145867, sufficient consideration is not given to copyright protection for content.

In accordance with the above-mentioned Japanese Laid-Open Patent Publication No. 2004-110816, for example, digital content which can be viewed or lis-
content should be utilized more effectively.

In addition, in accordance with the above-mentioned Japanese Laid-Open Patent Publication No. 2004-110816, a benefit based on the fact of previous participation in a domain cannot be made available at the time of reacquiring a license. Accordingly, it is relatively difficult for a user to have an incentive to reacquire the license after the expiration date of the license.

Embodiments of the present invention may provide an information processing apparatus and a license distribution system including the information processing apparatus which confirm validity of participation information in response to the reception of a request for a license for permitting the reproduction of content in a domain and the participation information, determine a specific privilege information related to the license when the validity of the participation information is confirmed, and transmit the determined specific privilege information and the license information to an external device, whereby the reproduction or duplication of the content can be limited to the interior of the domain according to the presence or absence of the issuance of the license, and the benefit based on the fact that the external device has participated in the domain can be made available at the time of reissuing the license.

EMBODIMENT 1

A description will be given hereinbelow of an information processing apparatus and a license distribution system according to a first embodiment based on the drawings showing the embodiment. FIG. 1 is a schematic view showing the overall structure of the license distribution system according to the first embodiment.

As shown in FIG. 1, the license distribution system according to the first embodiment includes reproducing devices 1, 1, ... , a server 2 connectable to each of the reproducing devices 1 via a communication network, a content information database DB1, a domain attribute information database DB2, a billing information database DB3, a license database DB4, and a content database DB5 each connected to the server 2. The license distribution system according to the first embodiment is also connectable to an external electronic authentication system or communication network via a communication network.

Each of the reproducing devices 1 is managed as part of a group in each domain. The domain is a concept for managing a plurality of reproducing devices 1, 1, ... which are authorized by an identical license as one group. For example, it is possible to classify the group of the reproducing devices 1 managed by a router installed on a campus as a university domain 1000, classify the group of the reproducing devices 1 managed by a router installed at home as a home domain 2000, and classify the group of the reproducing devices 1 managed by a router installed at a lecture hall as a lecture domain 3000 and a lecture domain 4000. The server 2 can identify and manage each domain by identifying each router.

It is to be noted that it is not required to have a device for managing the reproducing devices 1 in each domain. All of the reproducing devices 1 and the domains may be managed by one server.

A description will be given to an example where a user A participates in a specific domain at a specific time. When the reproducing device 1 of the user A participates in the university domain 1000 and acquires content for a lecture, the procedure shown below is performed.

When the server 2 receives a request for participation in the university domain 1000 transmitted from the reproducing device 1 of the user A, the server 2 transmits participation information including a domain ID of the university domain 1000, a domain key, and the expiration date of a license to the reproducing device 1 of the user A.

The reproducing device 1 of the user A receives the participation information, and transmits a request for acquiring the content to the server 2.

The server 2 receives the request for acquiring the content. The server 2 then encrypts the content using the content key, and transmits the encrypted content to the reproducing device 1 of the user A. The server 2 also transmits the license which is encrypted using the domain key corresponding to the university domain 1000 and which includes the content key to the reproducing device 1 of the user A.

The reproducing device 1 of the user A receives the encrypted content and license. The reproducing device 1 of the user A acquires the license by decrypting the encrypted license using the domain key, decrypts the encrypted content using the license, and reproduces the decrypted content in response to an instruction for reproducing the content inputted by the user A. That is, in accordance with the license, there is a case where the content can be freely reproduced, where the number of times of reproduction is limited, or where the expiration date is set in the reproducing device 1 of the user A.

The validity of the participation information is confirmed by using a PKI (Public Key Infrastructure) of an external electronic authentication system.

When the reproducing device 1 of the user A reproduces at home, e.g., the content acquired in the university domain 1000 after the expiration date for the license thereof, it is necessary to reacquire the license acquired in the university domain 1000. The reproducing device 1 of the user A receives the request for reissuing the license inputted by the user A, and transmits the participation information acquired in the university domain 1000 together with the received request for reissuing the license to the server 2.

The server 2 receives the request for reissuing the license and the participation information, and confirms the validity of the received participation information. The confirmation of the validity of the participation infor-
mation is performed e.g., by requesting the external electronic authentication system to verify an issuer’s signature in the participation information, or by verifying whether or not the combination of the domain ID and the expiration date for the license in the participation information is stored in the domain attribute information database DB2. When the validity of the participation information is confirmed, the server 2 determines a specific privilege related to the license such as a discount on a license fee for the user A, and transmits the determined privilege information to the reproducing device 1 of the user A.

[0026] The reproducing device 1 of the user A receives the privilege information. After the user A settles the payment for the license fee using the external payment system, the reproducing device 1 of the user A transmits a settlement notification to the server 2.

[0027] It is to be noted that the server 2 may directly request the settlement of the payment of the license fee using the payment system and acquire the settlement notification without the intervention of the user A.

[0028] The server 2 receives the settlement notification and reissues the license to the reproducing device 1 of the user A.

[0029] When the validity of the received participation information is not confirmed, the server 2 requests a regular license fee from the user A.

[0030] When the license acquired in the university domain 1000 is not expired, the server 2 reissues the license with no charge.

[0031] When the reproducing device 1 participates in the home domain 2000 and requests the acquisition of the content encrypted for the home domain 2000, the reproducing device 1 of the user A transmits the ID of the home domain 2000 and the request for participation to the server 2, while the server 2 encrypts the content using the content key and transmits the encrypted content to the reproducing device 1 of the user A.

[0032] Next, a description will be given of the structure and the function of each of the reproducing devices 1. FIG. 2 is a block diagram for illustrating the function of the reproducing device 1. The reproducing device 1 includes, e.g., a PC, a mobile phone, or a PDA (Personal Digital Assistant) having communication and content reproducing functions. The reproducing device 1 includes an external storage device 11, a network transmission/reception unit 12, a domain management unit 13, a license management unit 14, a content management unit 15, a content reproduction unit 18, and an operation unit 19. The individual hardware devices are connected to each other via a signal line (not shown).

[0033] The external storage device 11 is a device for reading a program or various data recorded in a recording medium 111. When the recording medium 111 is inserted into an insertion opening (not shown), the external storage device 11 reads the program or various data recorded in the inserted recording medium 111, and outputs the read program or various data to the domain management unit 13, the license management unit 14, or the content management unit 15. The external storage device 11 reads, e.g., content data recorded in the recording medium 111 and outputs the data to the auxiliary storage device 17.

[0034] In addition, the external storage device 11 is a device for recording various data in the recording medium 111. The external storage device 11 reads, e.g., content data stored in the auxiliary storage device 17 and records the data in the recording medium 111.

[0035] The network transmission/reception unit 12 is a terminal end of a communication network, and functions as the contact for performing communication with another reproducing device 1, the server 2, external systems, or the like via the communication network. The communication network includes, e.g., the Internet, an intranet, an LAN, an ISDN, a VAN, a CATV network, Virtual Private Network, a telephone communication network, a mobile communication network, and the like.

[0036] The network transmission/reception unit 12 outputs information received from the outside to the domain management unit 13, the license management unit 14, or the content management unit 15. The network transmission/reception unit 12 further transmits information received from the domain management unit 13, the license management unit 14, or the content management unit 15 to the outside.

[0037] The domain management unit 13 receives the participation information transmitted from the server 2 via the network transmission/reception unit 12, and retains the received participation information. In addition, the domain management unit 13 outputs the retained participation information to the license usage unit 16, and receives the result determined in the license usage unit 16. The domain management unit 13 then notifies the user of the received result. When the domain management unit 13 receives the input of the request for reissuing the license via the operation unit 19, the domain management unit 13 transmits the retained participation information and the request for reissuing the license to the server 2.

[0038] The license management unit 14 receives the license information or the like transmitted from the server 2, and stores the received license information in the auxiliary storage device 17.

[0039] When the license management unit 14 receives the input of an instruction for reproducing the content via the operation unit 19, the license management unit 14 reads the license information stored in the auxiliary storage device 17 and outputs the license information to the content reproduction unit 18.

[0040] The content management unit 15 transmits the request for acquiring the content to the server 2.

[0041] The content management unit 15 receives the content transmitted from the server 2, and stores the received content in the auxiliary storage device 17.

[0042] When the content management unit 15 receives
the input of the instruction for reproducing the content via the operation unit 19, the content management unit 15 reads the content stored in the auxiliary storage device 17, and outputs the content to the content reproduction unit 18.

[0043] The license usage unit 16 receives the participation information outputted from the domain management unit 13, determines whether or not the license included in the received participation information is expired, and outputs the determination result to the domain management unit 13.

[0044] The auxiliary storage device 17 receives and stores the license information outputted from the license management unit 14, reads the stored license information as necessary, and outputs the information to the license management unit 14. The auxiliary storage device 17 receives and stores the content outputted from the content management unit 15, reads the stored content as necessary, and outputs the content to the content management unit 15.

[0045] The content reproduction unit 18 includes, e.g., a liquid crystal display device, a speaker, or the like. When the content reproduction unit 18 receives the input of the instruction for reproducing the content via the operation unit 19, the content reproduction unit 18 decrypts the content based on the license information, and reproduces the decrypted content.

[0046] The operation unit 19 receives various instructions or requests inputted by the user, and outputs the received instructions or requests to individual hardware devices.

[0047] Next, the structure and function of the server 2 will be described. FIG. 3 is a block diagram showing the structure of the server 2, while FIG. 4 is a block diagram for illustrating the function of a CPU 28. The server 2 includes an external storage device 21, a network transmission/reception interface 22, a RAM 23, an auxiliary storage device 24, an input interface 25, an output interface 26, a database transmission/reception interface 27, and the CPU 28. Individual hardware devices are connected to each other via a bus 20.

[0048] The external storage device 21 is a device for reading a program or various data recorded in a recording medium 211. When the recording medium 211 is inserted into an insertion opening (not shown), the external storage device 21 reads the program or various data recorded in the inserted recording medium 211, and outputs the read program or various data to the auxiliary storage device 24.

[0049] The network transmission/reception interface 22 is the terminal end of the communication network, and functions as the contact for performing communication with the reproducing device 1 or the external systems via the communication network. The communication network includes, e.g., the Internet, the intranet, the extranet, the LAN, the ISDN, the VAN, the CATV network, Virtual Private Network, the telephone communication network, the satellite communication network, and the like.

[0050] The RAM 23 is a main storage device capable of storing a plurality of information items and reading the information items irrespective of the order and the positions in which they are stored. The RAM 23 includes, e.g., a program stored in the auxiliary storage device 24, various data generated by performing the program, and various information received from the outside, and reads the stored program, various data, or various information in response to a read instruction from the CPU 28.

[0051] The auxiliary storage device 24 includes, e.g., a magnetic-storage hard disk. The auxiliary storage device 24 stores a program and data for causing the server 2 to execute a license distribution process. The auxiliary storage device 24 reads the stored program or data in response to the read instruction from the CPU 28.

[0052] The input interface 25 is connected to an input device 251. The input device 251 includes, e.g., a keyboard, a mouse, or the like. The input device 251 is operated by a server manager and is used to input various instructions for the maintenance and management of the server 2 or the license distribution. The input interface 25 receives various instructions inputted via the input device 251, and outputs the received various instructions to the CPU 28.

[0053] The output interface 26 is connected to an output device 261. The output device 261 includes, e.g., the liquid crystal display device or the like. The output device 261 is used to output various instructions for the maintenance and management of the server 2 or the license distribution. The output interface 26 outputs information for the maintenance and management of the server 2 or the license distribution to the output device 261.

[0054] The database transmission/reception interface 27 functions as the contact for the connection with the content information database DB1, the domain attribute information database DB2, the billing information database DB3, the license database DB4, and the content database DB5.

[0055] The CPU 28 executes the license distribution process by controlling each of the hardware devices in the server 2. The procedure for the license distribution process executed by the CPU 28 will be described later. The CPU 28 has functions as a presence confirmation unit 281, an additional service determination unit 282, a license issuance unit 283, an encryption process unit 284, an attribute information management confirmation unit 285, a content management unit 286, and a billing process unit 287.

[0056] The presence confirmation unit 281 confirms the validity of the participation information. The presence confirmation unit 281 confirms the validity of the participation information e.g., by requesting the external electronic authentication system to authenticate an issuer’s signature included in the participation information to receive the result, or verifying whether or not the combination of the domain ID and the expiration date for the license in the participation information is stored in the do-
main attribute information database DB2. The presence confirmation unit 281 outputs the confirmation result to the additional service determination unit 282.

When the validity of the participation information is confirmed, the additional service determination unit 282 determines the specific privilege related to the license and outputs the determined specific privilege information to the billing process unit 287. The specific privilege is determined, e.g., by offering a flat discount rate of 20 percent on the fee of the license to be reissued, or on the basis of a discount rate according to consecutive participation in the domain, or on the basis of a discount rate according to the number of participants in the domain.

The license issuance unit 283 receives the content key and the content ID outputted from the encryption process unit 284, generates the license information based on the received content key, sorts the generated license information for each content ID, and stores the license information in the license database DB4. When the license issuance unit 283 receives an instruction for issuing the license outputted from the billing process unit 287, the license issuance unit 283 extracts the license information stored in the license database DB4, and transmits the extracted license information to the reproducing device 1 via the network transmission/reception interface 22. In addition, the license issuance unit 283 refers to the number of issues (times of issuance) of the participation information in a domain attribute information table T2 to manage the number of issues in the domain.

The encryption process unit 284 extracts the content key from the content information database DB1 and encrypts the content using the extracted content key. The encryption process unit 284 outputs the content key and the content ID to the license issuance unit 283, and transmits the encrypted content to the reproducing device 1 via the network transmission/reception interface 22.

The attribute information management confirmation unit 285 extracts the expiration date and the like from the domain attribute information database DB2, and generates the participation information. The attribute information management confirmation unit 285 transmits the generated participation information to the reproducing device 1 via the network transmission/reception interface 22.

The content management unit 286 extracts the content key and the like from the content information database DB1 and transmits them to the encryption process unit 284.

The billing process unit 287 receives the specific privilege information outputted from the additional service determination unit 282, and stores the received privilege information in the billing information database DB3, while at the same time transmitting the privilege information to the reproducing device 1 via the network transmission/reception interface 22. When the billing process unit 287 receives the settlement notification transmitted from the reproducing device 1, the billing process unit 287 then outputs an issuance instruction to the license issuance unit 283.

Next, a description will be given of an example of the storage of a content information table T1 in the content information database DB1. FIG. 5 shows the example of the storage of the content information table T1. In the content information table T1, information related to the content reproducible in the domain is sorted and stored for each domain ID. The information related to the content includes a group ID, the content ID for identifying the content, the content key for encrypting the content, and an area control for limiting an area where the content can be reproduced. The group ID defines domains denoted by a plurality of domain IDs as domains belonging to one group. The information related to the content is preset by a system manager.

Next, a description will be given of an example of the storage of a domain attribute information table T2 in the domain attribute information database DB2. FIG. 6 shows the example of the storage of the domain attribute information table T2. In the domain attribute information table T2, information related to the license issued in the domain is sorted for each domain ID and stored. The information related to the license includes the expiration date of the license, the issuer of the participation information, and the number of issues of the participation information.

Next, a data structure of the participation information will be described. FIG. 7 shows the data structure of participation information. In the data structure of participation information, a version/serial number, the domain ID, the expiration date of the license, the issuer of the participation information, a signature algorithm, an electronic signature, and the like are included. The version/serial number, the domain ID, and the expiration date of the license are preset by the system manager. The issuer of the participation information is used to confirm the validity of the participation information. The signature algorithm and the electronic signature are issued from the external electronic authentication system when the participation information is generated, and used to confirm the validity of the participation information.

Next, a description will be given of the procedure for the license distribution process at the time of participating in (joining) the domain. FIGS. 8 and 9 illustrate an operation flow showing the procedure for the license distribution process at the time of participating in the domain.

To cause the reproducing device 1 to participate in the university domain 1000, the user A inputs the domain ID in which the reproducing device is to participate and the request for participation via the operation unit 19. The reproducing device 1 of the user A receives the domain ID and the request for participation inputted by the user A and transmits the received domain ID and the request for participation to the server 2 (S101).

The CPU 28 of the server 2 receives the domain
The reproducing device 1 of the user A receives the participation information to the reproducing device 1 (S103). The CPU 28 generates the participation information including the domain ID, the expiration date of the license, the issuer, the signature algorithm, and the electronic signature (S104). The CPU 28 makes an access to the content information database DB1 to extract the content key corresponding to the domain ID (S110). The CPU 28 extracts the content key by using the extracted content key (S112). The CPU 28 associates the content key with the domain ID and stores them in the license database DB4 (S113). The CPU 28 generates the license information based on the content key (S114). The CPU 28 transmits the encrypted content and the generated license information to the reproducing device 1 (S115).

Next, a description will be given of the procedure for the license distribution process after the expiration date. FIG. 11 illustrates an operation flow showing the procedure for the license distribution process after the expiration date.

The user A inputs the request for reissuing the license via the operation unit 19 in order to view or listen to, e.g., the acquired content in the reproducing device 1 after the expiration date. The reproducing device 1 of the user A receives the request for reissuing the license and transmits the received request for reissuing the license and the retained participation information to the server 2 (S201).

The reproducing device 1 of the user A receives the participation information (S107), and transmits the request for acquiring the content to the server 2 (S108).

The CPU 28 of the server 2 receives the request for acquiring the content (S109), and makes an access to the content database DB5 to extract the content corresponding to the domain ID (S110). The CPU 28 makes an access to the content information database DB1 to extract the content key corresponding to the domain ID (S111), and encrypts the content by using the extracted content key (S112). The CPU 28 associates the content key with the domain ID and stores them in the license information database DB4 (S113). The CPU 28 generates the license information based on the content key (S114). The CPU 28 transmits the encrypted content and the generated license information to the reproducing device 1 (S115).

Conversely, when the CPU 28 determines that the confirmation signal is outputted (YES in S204), the CPU 28 executes an additional service determination process (S205), and transmits the privilege information determined by the process to the reproducing device 1 (S206). The CPU 28 statically determines an additional service such as, e.g., a flat 20 percent discount on the fee of the license to be reissued in the additional service determination process.

The CPU 28 of the server 2 receives the request for reissuing the license and the retained participation information to the server 2 (S201).

The CPU 28 of the server 2 receives the request for reissuing the license and the participation information (S202), and executes a validity confirmation process (S203). The CPU 28 determines whether or not a confirmation signal is outputted by the validity confirmation process (S204). As a result, when the CPU 28 determines that the confirmation signal is not outputted (NO in S204), the user A settles the payment of a regular license fee with the external payment system without being offered the privilege information. The CPU 28 receives the settlement notification, which indicates the completion of the payment of the regular license fee, transmitted from the reproducing device 1 of the user A (S209), and reissues the license (S210). Then the reproducing device 1 and the server 2 end the license distribution process after the expiration date.

The CPU 28 of the server 2 receives the settlement notification (S209), and reissues the license (S210). Then the reproducing device 1 and the server 2 end the license distribution process after the expiration date.

Next, a description will be given of the validity confirmation process executed by the CPU 28 in the operation S203. FIG. 11 illustrates an operation flow showing the validity confirmation process according to the first embodiment.

The CPU 28 of the server 2 determines whether or not the participation information received from the reproducing device 1 of the user A is valid (S301). As a result, when it is determined that the received participation information is not valid (NO in S301), the CPU 28 does not output the confirmation signal and suspends the validity confirmation process until the next execution.

Conversely, when it is determined that the received participation information is valid (YES in S301), the CPU 28 outputs the confirmation signal (S302) and suspends the validity confirmation process until the next execution.

Thus, the user A can gain the benefit based on the fact of having participated in the domain at the time of reissuing the license in said domain so that the user...
A is offered a discount on the fee required for reissuing the license.

EMBODIMENT 2

[0083] The foregoing first embodiment has described an example where the content is reproducible in any area without limiting the area where the content can be reproduced. However, the present technology is not limited to the embodiment. For example, the area where the content is reproducible may be limited.

[0084] In a second embodiment, each reproducing device 1 further comprises a Global Positioning System (GPS) unit capable of detecting the position thereof. Since the structure and the function of the GPS unit are well known, the description thereof will be omitted.

[0085] Next, a description will be given of the procedure for a validity confirmation process executed by the CPU 28. FIG. 12 illustrates an operation flow showing the procedure for the validity confirmation process according to the second embodiment.

[0086] The CPU 28 of the server 2 requests the ID of the content to be viewed or listened to and positional information on the reproducing device 1 from the reproducing device 1 of the user A. The reproducing device 1 of the user A detects the position thereof using the GPS unit in response to the request from the server 2, and transmits the detected positional information and the ID of the content to be viewed or listened to, to the server 2.

[0087] The CPU 28 of the server 2 receives the content ID and the positional information transmitted from the reproducing device 1 of the user A (S401). The CPU 28 makes an access to the content information database DB1 to extract an area control corresponding to the received content ID (S402). Then the CPU 28 determines whether or not the position of the reproducing device 1 of the user A is within the content-reproducible area (permitted area) based on the extracted area control (S403). When it is determined that the position of the reproducing device 1 of the user A is not within the content-reproducible area (NO in S403), the CPU 28 does not output a confirmation signal and suspends the validity confirmation process until the next execution.

[0088] Conversely, when it is determined that the position of the reproducing device 1 of the user A is within the content-reproducible area (YES in S403), the CPU 28 determines whether or not the received participation information is valid (S404). When it is determined that the received participation information is not valid (NO in S404), the CPU 28 does not output the confirmation signal and suspends the validity confirmation process until the next execution.

[0089] Conversely, when it is determined that the received participation information is valid (YES in S404), the CPU 28 outputs the confirmation signal (S405) and suspends the validity confirmation process until the next execution.

[0090] As for other details of the structure, function, and process procedure, they are the same as described in the first embodiment so that the descriptions thereof will be omitted by using like reference numerals to designate corresponding parts.

[0091] By thus performing the control for limiting the content-reproducible area, the content-reproducible area can be limited to, e.g., Japan so that the content distributed overseas cannot be reproduced, thereby giving consideration to the copyright protection for the content.

[0092] It is to be noted that the control for limiting the content-reproducible area according to the second embodiment may be executed before an operation for confirming the validity of the participation information in an embodiment described later.

EMBODIMENT 3

[0093] The foregoing embodiments have described an example where the license is reissued based on the fact that the reproducing device 1 of the user A has participated in the university domain 1000. However, the present technology is not limited to these embodiments. For example, by considering the fact that the reproducing device 1 of the user A has participated in the lecture domain 4000 in addition to the fact that it has participated in the university domain 1000, the license may be reissued based on participation information items in a plurality of domains. That is, when it can be determined that one domain and another domain can be defined as domains belonging to the identical group (see FIG. 5), the reproducing device may gain the benefit based on the fact of having participated in a plurality of domains. In addition, specific privilege information may be determined in accordance with a participation history showing the participation in a plurality of domains.

[0094] FIG. 13 is a schematic view showing an overall structure of a license distribution system according to a third embodiment. In the case where the reproducing device 1 of the user A acquires a license in each of the university domain 1000 and the lecture domain 4000 both of which belong to the identical group, and reproduces the content acquired in the university domain 1000 at home after at least the license acquired in the university domain 1000 is expired, it is necessary to reacquire the license acquired in the university domain 1000.

[0095] The reproducing device 1 of the user A receives a request for reissuing the license inputted by the user A, and transmits the participation information acquired in the university domain 1000 and the participation information acquired in the lecture domain 4000 together with the received request for reissuing the license, to the server 2.

[0096] The server 2 receives the request for reissuing the license and a plurality of participation information items, and confirms the validity of the plurality of received participation information items. The confirmation of the validity is performed by, e.g., verifying the issuer’s signatures included in the received participation information...
items. When the validity of all of the participation information items is confirmed, the server 2 determines a specific privilege related to the license such as a discount on the license fee for the user A or the like. The specific privilege includes, e.g., based on the fact that the reproducing device 1 of the user A has consecutively participated in the university domain 1000 and the lecture domain 4000 both of which belong to the identical group, a higher discount rate than in the case of participation in either one of them.

Next, a description will be given of the procedure for a validity confirmation process according to the third embodiment. FIG. 14 illustrates an operation flow showing the procedure of the validity confirmation process according to the third embodiment.

The CPU 28 of the server 2 makes an access to the content information database DB1 and extracts group IDs corresponding to the received individual domain IDs. The CPU 28 determines whether or not the extracted group IDs corresponding to the individual domain IDs are identical with each other (S501). As a result, when it is determined that the group IDs corresponding to the individual domain IDs are not identical with each other (NO in S501), the CPU 28 does not output a confirmation signal and suspends the validity confirmation process until the next execution.

Conversely, when it is determined that the group IDs corresponding to the individual domain IDs are identical with each other (YES in S501), the CPU 28 determines whether or not the received participation information items are valid (S502). When it is determined that the received participation information items are not valid (NO in S502), the CPU 28 does not output the confirmation signal and suspends the validity confirmation process until the next execution.

Conversely, when it is determined that the received participation information items are valid (YES in S502), the CPU 28 outputs the confirmation signal (S503) and suspends the validity confirmation process until the next execution.

As for other structure, function, and process procedure, they are the same as described in the first embodiment so that the descriptions thereof will be omitted by using like reference numerals to designate corresponding parts.

Thus, when a plurality of domains are involved, the user A can gain the benefit based on the fact of having participated in a different domain at the time of reissuing the license, and is offered a discount on the fee required for reissuing the license. In addition, the user A receives a discount in accordance with the participation history showing the consecutive participation in a plurality of domains.

EXAMPLE 1

The foregoing embodiments have described an example where the server 2 reissues the license for the content acquired by the reproducing device 1 of the user A. However, the present disclosure is not limited to these embodiments. For example, when the reproducing device 1 of the user A takes over the content acquired by the reproducing device 1 of the user B in the lecture domain 3000, the server 2 may reissue the license for the content taken over by the reproducing device 1 of the user A. That is, when it can be determined that one content and another content can be defined as content belonging to the identical group, the reproducing device which requests a license for one piece of content may gain the benefit based on the fact of having participated in the domain where another item of content is acquired.

FIG. 15 is a schematic view showing an overall structure of a license distribution system according to a first example. In the case where the reproducing device 1 of the user A acquires a license in the university domain 1000, takes over the content acquired by the reproducing device 1 of the user B in the lecture domain 3000, and reproduces the content taken over thereby at home after at least the license acquired in the university domain 1000 is expired, it is necessary to acquire the license to be acquired in the lecture domain 3000.

The reproducing device 1 of the user A takes over the content transferred from the reproducing device 1 of the user B via the recording medium 111 or a network. The reproducing device 1 of the user A receives a request for reissuing the license inputted by the user A, and transmits, together with the received request for reissuing the license, the participation information acquired in the university domain 1000 and the ID of the content taken over thereby to the server 2.

The server 2 receives the request for reissuing the license, the participation information, and the content ID, and confirms the validity of the received participation information. Based on the content information table T1, it is determined whether or not the group to which the received content ID belongs and the group to which the domain ID included in the received participation information belongs are identical with each other. When the validity of the participation information in the group to which the content ID belongs is confirmed, the server 2 determines a specific privilege related to the license such as a discount on the license fee for the user A or the like. The specific privilege includes, e.g., when the content acquired by the reproducing device 1 of the user A in the university domain 1000 and the content taken over thereby from the reproducing device 1 of the user B, both of which belong to the identical group, are part of a series of items of related content (e.g. a course of lectures), a higher discount rate than in the case of acquiring either one of them based on the fact of having consecutively acquired these content items.

Next, a description will be given of the procedure for a validity confirmation process according to the first example. FIG. 16 illustrates an operation flow showing the procedure for the validity confirmation process according to the first example.
The CPU 28 of the server 2 requests the ID of the content taken over from the reproducing device 1 of the user B, i.e., the ID of the content which is subject to the license from the reproducing device 1 of the user A. The reproducing device 1 of the user A transmits the ID of the content subject to the license to the server 2.

The CPU 28 of the server 2 receives the ID of the content which is a license target (S601). The CPU 28 makes an access to the content information database DB1 and extracts a group ID corresponding to the received content ID (S602). The CPU 28 also extracts the group ID corresponding to a domain ID included in the received participation information (S603). The CPU 28 then determines whether or not the plurality of extracted group IDs are identical with each other (S604). When it is determined that the plurality of extracted group IDs are not identical with each other (NO in S604), the CPU 28 does not output a confirmation signal and suspends the validity confirmation process until the next execution.

Conversely, when the plurality of extracted group IDs are identical with each other (YES in S604), the CPU 28 determines whether or not the received participation information is valid (S605). When it is determined that the received participation information is not valid (NO in S605), the CPU 28 does not output the confirmation signal and suspends the validity confirmation process until the next execution.

Conversely, when it is determined that the received participation information is valid (YES in S605), the CPU 28 suspends the validity confirmation process until the next execution.

As for other parts of the structure, function, and process procedure, they are the same as described in the first embodiment so that the descriptions thereof will be omitted by using like reference numerals to designate corresponding parts.

Thus, when a plurality of pieces of content are involved, the user A can gain the benefit based on the fact of having participated in a domain where a different content item has been acquired at the time of issuing the license so that the user A can be offered a discount on the fee required for reissuing the license.

EXAMPLE 2

The foregoing embodiments have described an example where the privilege is determined by executing the static additional service determination process when the validity of the participation information is confirmed. However, the present disclosure is not limited to these embodiments. For example, a dynamic additional service determination process may be executed in which the content of the privilege is changed according to the number of issues (times of issuance) of the participation information. That is, a specific privilege may be determined according to the number of participation information items issued in a domain.

A description will be given of the procedure for an additional service determination process according to a second example. FIG. 17 illustrates an operation flow showing the procedure for the additional service determination process according to the second example.

The CPU 28 of the server 2 makes an access to the domain attribute information database DB2 and extracts the number of issues corresponding to a domain ID included in the received participation information (S701). The CPU 28 derives a discount rate on the license fee based on the extracted number of issues (S702). For example, a higher discount rate is offered to a user participating in a domain where the number of issues is smaller, i.e., the number of participants is smaller, while a lower discount rate is offered to a user participating in a domain where the number of issues is larger, i.e., the number of participants is larger. The CPU 28 determines the privilege based on the derived discount rate (S703).

Thus, by executing such dynamic additional service determination process as to offer a higher discount rate to a user participating in a domain where the number of issues is smaller, i.e., the number of participants is smaller, the participation in a domain where the number of participants is small can be promoted.

In the present invention, by transmitting license information to an external device which requests a license for permitting the reproduction of the content in the domain, the reproduction or duplication of the content is limited to the interior of the domain. Further, by confirming the validity of the participation information transmitted from the external device, the validity of the fact that the external device has participated in the domain is confirmed. Furthermore, when the validity of the participation information is confirmed, by determining a specific privilege information related to the license and transmitting the information to the external device, the benefit based on the fact that the external device has participated in the domain is made available at the time of reissuing the license.

In accordance with the present invention, by limiting the reproduction or duplication of the content to the interior of the domain, unlimited spreading of the content can be prevented and proper consideration can be given to copyright protection of the content. In addition, the benefit based on the fact that the external device has participated in the domain can be made available at the time of reissuing the license, thereby giving a user an incentive for reissuing the license so that the circulation of the content can be increased. Moreover, by enhancing the incentive for reissuing the license, it becomes possible to encourage a user to, e.g., reproduce the expired content again or reproduce the content in a different domain, whereby the use of the content can be increased.
Claims

1. An information processing apparatus (2) configured to output license information for permitting a reproduction of content in a plurality of domains (1000, 2000, 3000, 4000) to a plurality of external devices (1), the plurality of external devices (1) configured to participate in the plurality of domains (1000, 2000, 3000, 4000) for managing, as one group, the plurality of external devices (1) which can be authorized to participate in the plurality of domains (1000, 2000, 3000, 4000) for managing, as one group, the plurality of external devices (1) which can be authorized to reproduce the content by an identical license, the information processing apparatus (2) including:

   a database (DB2, DB4) configured to store key information sorted for each domain (1000, 2000, 3000, 4000), for generating the license information, in association with at least domain identification information for identifying each domain (1000, 2000, 3000, 4000), an expiration date of the identical license in each domain (1000, 2000, 3000, 4000), and identification information of the content which is a target of permission to reproduce the content by the identical license; means (22) configured to transmit, to an external device (1), participation information including the domain identification information, the expiration date, information identifying the issuer of the participation information, signature algorithm and electronic signature information, each time the external device (1) participates in one of the domains (1000, 2000, 3000, 4000); receiving means (22) configured to receive, from the external device (1) participating in a second domain (2000), the participation information of a first domain (1000) together with a request for reissuing a license acquired in the first domain (1000) for content acquired in the first domain (1000) after the expiration date for the license thereof, wherein the first domain (1000) is different from the second domain (2000); confirming means (28) configured to confirm validity of the received participation information; privilege determining means (28) configured to determine a discount on a license fee for a reissued license when the validity of the received participation information is confirmed; and means (22) configured to output the reissued license information generated based on the key information common to all of the domains (1000, 2000), the confirming means (28) includes:

   means (28) configured to determine, when the receiving means (22) receives, from the external device (1) participating in the second domain (2000) after at least the license acquired in the first domain (1000) has expired, the participation information of the first domain (1000) and the participation information of the third domain (4000) together with the request, whether or not the first domain (1000) and the third domain (4000) can be defined as domains belonging to an identical group based on the domain-related information, and

   the privilege determining means (28) is configured to determine the discount when the validity of all of the participation information items are confirmed, and

   the information processing apparatus (2) includes generating means (28) configured to generate the reissued license information based on the key information common to all of the domains whose participation information items have been received.

2. The information processing apparatus (2) according to claim 1, wherein

   the privilege determining means (28) includes:

   means (28) configured to derive, when the validity of all of the participation information items is confirmed, a history of participation of the external device (1) in each domain based on the confirmed participation information items; and

   means (28) configured to determine the discount in accordance with the derived history.

3. The information processing apparatus (2) according to claim 1 or 2, wherein

   the participation information includes an issuer's signature, and

   the confirming means (28) is configured to confirm the validity of the participation information by verifying the issuer's signature included in the received participation information.

4. The information processing apparatus (2) according to any one of claims 1 to 3, wherein

   the database (DB1, DB2, DB4) is configured to store
the key information further in association with information on an area which can be authorized by the identical license, the receiving means (22) is configured to receive positional information transmitted by the external device (1) which detects a position thereof, the confirming means (28) includes means (28) configured to determine whether or not the position of the external device (1) indicated by the received positional information is within the area, and the confirming means (28) is configured to confirm the validity of the received participation information when it is determined that the position of the external device (1) is within the area.

5. A license distribution system comprising:

a license distribution device (2) which is an information processing apparatus according to any one of claims 1 to 4; and

a plurality of reproducing devices (1) which are external devices; wherein the license distribution device (2) is configured to be connected to each of the reproducing devices (1), the license distribution device (2) is configured to manage the domain (1000, 2000, 3000, 4000), and each of the reproducing devices (1) includes communicating means (12) configured to receive the participation information transmitted by the license distribution device (2) and transmit the received participation information together with the request for reissuing the license.

Patentansprüche

1. Informationsverarbeitungsvorrichtung (2), die dazu konfiguriert ist, Lizenzinformationen an mehrere externe Geräte (1) auszugeben, um eine Reproduktion von Inhalt in mehreren Domänen (1000, 2000, 3000, 4000) zu erlauben, wobei die mehreren externen Geräte (1) dazu konfiguriert sind, in den mehreren Domänen (1000, 2000, 3000, 4000) teilzunehmen, um die mehreren externen Geräte (1) als eine Gruppe zu verwalten, die durch eine identische Lizenz autorisiert werden können, den Inhalt zu reproduzieren, wobei die Informationsverarbeitungsvorrichtung (2) aufweist:

   eine Datenbank (DB2, DB4), die dazu konfiguriert ist, Schlüsselinformationen, die für jede Domäne (1000, 2000, 3000, 4000) sortiert sind, zu speichern, zur Erzeugung von Lizenzinformationen, in Verbindung mit mindestens Domänendifferenzinformationen zur Identifizierung jeder Domäne (1000, 2000, 3000, 4000), einem Ablaufdatum der identischen Lizenz in jeder Domäne (1000, 2000, 3000, 4000), und Identifikationsinformationen des Inhalts, der ein Ziel der Erlaubnis ist, um den Inhalt durch die identische Lizenz zu reproduzieren

Mittel (22), die dazu konfiguriert sind, die Teilnahmenformationen, einschließlich der Identifikationsinformationen, das Ablaufdatum, Informationen, die den Emittenten der Teilnahmenformationen identifizieren, Signaturalgorithmen, und elektronische Signaturinformationen, an ein externes Gerät (1) zu senden, jedes Mal, wenn das externe Gerät (1) in einer der Domänen (1000, 2000, 3000, 4000) teilnimmt, Empfangsmittel (22), die dazu konfiguriert sind, von dem externen Gerät (1), das an einer zweiten Domäne (2000) teilnimmt, die Teilnahmenformation einer ersten Domäne (1000) zusammen mit einer Anforderung zum erneuten Ausgeben einer in der ersten Domäne (1000) erworbenen Lizenz für in der ersten Domäne (1000) erworbenen Inhalt zu empfangen, nachdem die Lizenz dafür abgelaufen ist, wobei die erste Domäne (1000) von der zweiten Domäne (2000) verschieden ist;

Bestätigungsbestimmungsmittel (28), die dazu konfiguriert sind, die Gültigkeit der empfangenen Teilnahmenformationen zu bestätigen;

und

Mittel (22), die dazu konfiguriert sind, die neu ausgegebenen Lizenzinformationen, die basierend auf die Schlüsselinformationen, die den in den empfangenen Teilnahmenformationen enthaltenen Domänendifferenzinformationen entsprechen, erzeugt sind, und Informationen über den ermittelten Rabatt, an das externe Gerät (1) auszugeben, wobei die Datenbank (DB1, DB2, DB4) ferner dazu konfiguriert ist, die domänenbezogenen Informationen zu speichern, die die erste Domäne (1000) und eine dritte Domäne (4000) als eine Gruppe definieren, wobei die dritte Domäne (4000) von der ersten und der zweiten Domäne (1000, 2000) verschieden ist, wobei die Bestätigungsbestimmungsmittel (28) aufweisen:

Mittel (22), die dazu konfiguriert sind, wenn die Empfangsmittel (22) von dem externen Gerät (1), das an der zweiten Domäne (2000) teilnimmt, nachdem zumindest die in der ersten Domäne (1000) erworbenen Lizenz abgelaufen ist, die Teilnahmenformation der ersten Domäne (1000) Teilnahme-
information und die Teilnahmeinformationen der dritten Domäne (4000) zusammen mit der Anforderung empfangen, zu bestimmen, ob die erste Domäne (1000) und die dritte Domäne (4000) als Domänen definiert werden können, die zu einer identischen Gruppe gehören, basierend auf den domänenbezogenen Informationen, und Mittel (28), die dazu konfiguriert sind, die Gültigkeit aller empfangenen Teilnahmeinformationselemente zu bestätigen, wenn bestimmt wird, dass die erste Domäne (1000) und die dritte Domäne (4000) als Domänen definiert werden können, die zu der identischen Gruppe gehören, wobei die Berechtigungsbestimmungsmittel (28) dazu konfiguriert sind, den Rabatt zu bestimmen, wenn die Gültigkeit aller Teilnahmeinformationselemente bestätigt ist, und die Informationsverarbeitungsmittel (2) Erzeugungsmittel (28) aufweisen, die dazu konfiguriert sind, die neu ausgegebenen Lizenzinformationen zu erzeugen, basierend auf den Schlüsselinformationen, die allen Domänen gemeinsam sind, deren Teilnahmeanpassungselemente empfangen werden sind.

2. Informationsverarbeitungsvorrichtung (2) nach Anspruch 1, wobei die Bestätigungsbestimmungsmittel (28) aufweisen:

Mittel (28), die dazu konfiguriert sind, wenn die Gültigkeit aller Teilnahmeinformationselemente bestätigt ist, eine Historie der Teilnahme des externen Geräts (1) in jeder Domäne auf der Grundlage der bestätigten Teilnahmeinformationselemente zusammenzuführen, und Mittel (28), die dazu konfiguriert sind, den Rabatt in Übereinstimmung mit der abgeleiteten Historie zu bestimmen.

3. Informationsverarbeitungsvorrichtung (2) nach Anspruch 1 oder 2, wobei die Teilnahmeinformationen die Signatur eines Ausstellers aufweisen, und die Bestätigungsmitte (28) dazu konfiguriert sind, die Gültigkeit der Teilnahmeinformationen durch Überprüfen der Signatur des Ausstellers in der empfangenen Teilnahmeinformation zu bestätigen.

4. Informationsverarbeitungsvorrichtung (2) nach einem der Ansprüche 1 bis 3, wobei die Datenbank (DB1, DB2, DB4) dazu konfiguriert ist, die Schlüsselinformation ferner in Verbindung mit Informationen über einen Bereich zu speichern, der durch die identische Lizenz autorisiert werden kann,

die Empfangsmittel (22) dazu konfiguriert sind, von dem externen Gerät (1), das eine Position davon erfasst, gesendete Positionsinformationen zu empfangen, die Bestätigungsmitte (28) Mittel (28) aufweisen, die dazu konfiguriert sind, zu bestimmen, ob die Position des externen Geräts (1), die durch die empfangene Positionsinformation angezeigt wird, innerhalb des Bereiches ist oder nicht, und die Bestätigungsmitte (28) dazu konfiguriert sind, die Gültigkeit der empfangenen Teilnahmeinformationen zu bestätigen, wenn bestimmt wird, dass die Position des externen Geräts (1) innerhalb des Bereiches ist.

5. Lizenzzuteilungssystem, aufweisend:

ein Lizenzzuteilungsgerät (2), das eine Informationsverarbeitungsvorrichtung nach einem der Ansprüche 1 bis 4 ist; und mehrere Reproduktionsgeräte (1), die externe Geräte sind; wobei das Lizenzzuteilungsgerät (2) dazu konfiguriert ist, mit jedem der Reproduktionsgeräte (1) verbunden zu sein, wobei das Lizenzzuteilungsgerät (2) dazu konfiguriert ist, die Domäne (1000, 2000, 3000, 4000) zu verwalten, und wobei jedes der Reproduktionsgeräte (1) Kommunikationsmittel (12) aufweist, die so konfiguriert sind, dass sie die von der Lizenzzuteilungsgeräte (2) gesendeten Teilnahmeinformationen empfangen und die empfangenen Teilnahmeinformationen zusammen mit der Anforderung zur erneuten Ausgabe der Lizenz senden.

Revidendations

1. Appareil de traitement d’informations (2) configuré de manière à délivrer en sortie des informations de licence visant à permettre une reproduction de contenu dans une pluralité de domaines (1000, 2000, 3000, 4000) à une pluralité de dispositifs externes (1), la pluralité de dispositifs externes (1) étant configurée de manière à prendre part à la pluralité de domaines (1000, 2000, 3000, 4000) en vue de gérer, en tant qu’un groupe unique, la pluralité de dispositifs externes (1) qui peut être autorisée à reproduire le contenu en utilisant une licence identique, l’appareil de traitement d’informations (2) comportant :

une base de données (DB2, DB4) configurée de manière à stocker des informations clés triées pour chaque domaine (1000, 2000, 3000, 4000), en vue de produire les informations de licence, en association avec au moins des informations d’identification de domaine destinées à identifier
le moyen de confirmation (28) inclut :

1. Appareil de traitement d’informations (2) selon la revendication 1, dans lequel

le moyen de détermination de privilèges (28) est configuré de manière à déterminer la remise lors la validité de la totalité des éléments d’informations de participation est confirmée ; et l’appareil de traitement d’informations (2) inclut un moyen de génération (28) configuré de manière à générer les informations de licence rééditée sur la base des informations clés communées à tous les domaines dont les éléments d’informations de participation ont été reçus.

5

2. Appareil de traitement d’informations (2) selon la revendication 2, dans lequel

un moyen (28) configuré de manière à déterminer, lorsque la validité de la totalité des éléments d’informations de participation est confirmée, un historique de participation du dispositif externe (1) dans chaque domaine, sur la base des éléments d’informations de participation confirmés ; et un moyen (28) configuré de manière à déterminer la remise selon l’historique dérivé.

15

3. Appareil de traitement d’informations (2) selon la revendication 1 ou 2, dans lequel

les informations de participation incluent une signature de l’éditeur ; et le moyen de confirmation (28) est configuré de manière à confirmer la validité des informations de participation, en vérifiant la signature de l’éditeur incluse dans les informations de participation reçues.

25

4. Appareil de traitement d’informations (2) selon l’une quelconque des revendications 1 à 3, dans lequel

la base de données (DB1, DB2, DB4) est en outre configurée de manière à stocker des informations connexes au domaine qui définissent le premier domaine (1000) et un troisième domaine (4000) en tant qu’un groupe unique, dans lequel le premier domaine (1000) et le troisième domaine (4000) peuvent ou non être définis comme des domaines appartenant à un groupe identique, sur la base des informations connexes aux domaines ; et le moyen de détermination de privilèges (28) est configuré de manière à déterminer la remise lorsque la validité de la totalité des éléments d’informations de participation est confirmée ; et l’appareil de traitement d’informations (2) inclut un moyen de génération (28) configuré de manière à générer les informations de licence rééditée sur la base des informations clés communées à tous les domaines dont les éléments d’informations de participation ont été reçus.

35

5. Appareil de traitement d’informations (2) selon l’une quelconque des revendications 1 à 3, dans lequel

la base de données (DB1, DB2, DB4) est configurée de manière à stocker les informations clés en outre en association avec des informations sur une zone qui peut être autorisée par la licence identique ;
le moyen de réception (22) est configuré de manière à recevoir des informations de position transmises par le dispositif externe (1) qui détecte une position connexe ;
le moyen de confirmation (28) inclut un moyen (28) configuré de manière à déterminer si la position du dispositif externe (1) indiquée par les informations de position reçues est située ou non au sein de la zone ; et
le moyen de confirmation (28) est configuré de manière à confirmer la validité des informations de participation reçues, lorsqu’il est déterminé que la position du dispositif externe (1) se situe au sein de la zone.

5. **Système de distribution de licences comprenant :**

    un dispositif de distribution de licences (2) lequel correspond à un appareil de traitement d’informations selon l’une quelconque des revendications 1 à 4 ; et
    une pluralité de dispositifs de reproduction (1) lesquels correspondent à des dispositifs externes ; dans lequel
    le dispositif de distribution de licences (2) est configuré de manière à être connecté à chacun des dispositifs de reproduction (1) ;
    le dispositif de distribution de licences (2) est configuré de manière à gérer le domaine (1000, 2000, 3000, 4000) ; et
    chacun des dispositifs de reproduction (1) inclut un moyen de communication (12) configuré de manière à recevoir les informations de participation transmises par le dispositif de distribution de licences (2), et à transmettre les informations de participation reçues, conjointement avec la demande de réédition de la licence.
