Novel polymorphic Crystal forms of 5-(2-[[6-(2,2-difluoro-2-phenylethoxy) hexyl]amino]-1-(R)-hydroxyethyl)-8-hydroxyquinolin-2(1H)-one, heminapadisylate as agonist of the β2 adrenergic receptor.

The present invention is directed to novel polymorphic crystal forms of a 5-[[6-(2,2-difluoro-2-phenylethoxy)hexyl]amino]-1-(R)-hydroxyethyl]-8-hydroxyquinolin-2(1H)-one, heminapadisylate. The invention is also directed to pharmaceutical compositions comprising said polymorphic crystal forms, methods of using them to treat respiratory diseases associated with β2 adrenergic receptor activity and a process for preparing such polymorphic crystal forms.

Figure 1: X-Ray Powder Diffraction (XRPD) pattern of Type β polymorph of 5-(2-(6-(2,2-Difluoro-2-phenylethoxy)hexyl)amino)-1(R)-hydroxyethyl)-8-hydroxyquinolin-2(1H)-one heminapadisylate.
FIELD OF THE INVENTION

The present invention is directed to novel polymorphic crystal forms of a 5- (2- [6- (2, 2-difluoro-2-phenylethoxy) hexyl] amino)- 1- (R)- hydroxyethyl)- 8- hydroxyquinolin- 2 (1H)- one, heminapadisylate. The invention is also directed to pharmaceutical compositions comprising said polymorphic crystal forms, methods of using them to treat respiratory diseases associated with β2 adrenergic receptor activity and a process for preparing such polymorphic crystal forms.

BACKGROUND OF THE INVENTION

5- (2- [6- (2, 2-difluoro-2-phenylethoxy) hexyl] amino)- 1- (R)- hydroxyethyl)- 8- hydroxyquinolin- 2 (1H)- one (Compound I) is a potent β2 adrenoceptor agonist first disclosed in WO 2006/122788. This compound has the following chemical formula.

![Chemical structure of Compound I](image)

Crystalline naphthalene- 1, 5- disulfonic acid salts (heminapadisylates) of 5- (2- [6- (2, 2-difluoro-2-phenylethoxy) hexyl] amino)- 1- (R)- hydroxyethyl)- 8- hydroxyquinolin- 2 (1H)- one have been described in WO 2008/095720. The crystalline heminapadisylate salt of compound (I) (hereinafter, called type α polymorph) is identified by the X-Ray Powder Diffraction, DSC pattern and TGA pattern. This compound has the following chemical formula.

![Chemical structure of crystalline heminapadisylate](image)

This compound as a potent β2 adrenergic receptor agonists is advantageously administered directly into the respiratory tract by inhalation when used for treating pulmonary or respiratory disorders. Several types of pharmaceutical inhalation devices have been developed for administering therapeutic agents by inhalation including dry powder inhalers (DPI), metered-dose inhalers (MDI) and nebulizer inhalers.

Dry powder inhalers are well known devices for administering pharmaceutically active agents to the respiratory tract. They are particularly suitable when used for the administration of active agents in the treatment of respiratory diseases such as asthma, COPD, emphysema or the like. Since the drug acts directly on the target organ, smaller quantities of the active ingredient should be used.

Dry powder formulations typically comprise a pharmaceutically active agent and an excess of a pharmaceutically acceptable excipient or carrier. The efficacy of a dry powder inhaler is related to the extent of the drug deposition in the lungs, which in turn depends on the drug formulation and the device being used. In order to be able to reach the lower respiratory airways, the drug needs to be delivered in finely divided particles, with an aerodynamic diameter of less than 5 μm.

The Fine Particle Dose (FPD) of a drug from a dry powder inhaler is a measure of the quantity of drug of effectively deliverable particle size (i.e. with an aerodynamic diameter no greater than 5 μm) emitted after a single actuation of the DPI. The Fine Particle Fraction (FPF) is the percentage (%) of the emitted dose that the FPD represents. A high FPF is clearly desirable as more of the administered drug will be able to reach the lungs where it can be effective and thus less amount of drug will be required to achieve the optimum dose of the drug.

The use of an additive material to improve the Fine Particle Fraction (FPF) has been extensively used in a dry powder formulation. It was first mentioned in a PCT application No. WO 87/05213 where the preparation of an excipient...
(lactose) containing a lubricant, such as magnesium stearate or sodium benzoate, was described.

[0009] WO 96/23485 describes the preparation of a dry powder formulation containing additive materials selected from amino acids, phospholipids or surfactants in order to promote the release of the small particles of active ingredient leading to an increase in the Fine Particle Fraction (FPF).

[0010] US 6, 645, 466 describes the use of magnesium stearate in dry powder formulations for inhalation with the purpose of improving the dry powder formulation stability with regard to moisture and thereby maintaining the FPF when the formulation is tested at higher relative humidity.

[0011] WO 2005/041922 describes the use of a physiologically acceptable metal phosphate salt, such as dibasic calcium phosphate, instead of magnesium stearate, in dry powder formulations thus improving the FPF.

[0012] WO 2009/061273 dry powder formulations containing certain ascorbic acid derivatives. It is stated that the presence of this additive material shows good inhalation performance by increasing the FPF.

[0013] Although the problem to increase the FPF is apparently solved by means of addition of certain additive materials to the formulation, it is well known in the art that adding further ingredients to a pharmaceutical formulation leads to a greater complexity in terms of manufacturing process. For instance, some mixing problems have been described for ternary mixtures, such as agglomeration, segregation or drug uniformity issues, especially when a fine excipient is added to the drug, due to a lower adhesion to the surface of the coarse carrier particles. Moreover, additional development studies may be required in order to achieve the regulatory approval of a new ingredient for inhalation administration.

[0014] It has been surprisingly found that new polymorphic crystal forms of the heminapadisylate salt of compound I exhibit a higher Fine Particle Fraction (FPF) than the standard Type α polymorph, while maintaining the crystallinity, non hygroscopicity and stability properties. The good inhalation performance of the new polymorphic crystal forms in a dry powder formulation is enhanced without the presence of any further additive material.

SUMMARY OF THE INVENTION

[0015] The present invention is related to novel polymorphic crystal forms of the heminapadisylate salt of 5- (2- (6- (2, 2- difluoro- 2- phenyl) ethoxy) hexyl] amino)- 1- (R)- hydroxyethyl)- 8- hydroxyquinolin- 2 (1H)- one (Compound I) and a process for their preparation.

[0016] In particular, the present invention is related to two polymorphic crystal forms of the heminapadisylate of Compound (I), namely an anhydrate form (hereinafter, called type β polymorph) and a hemihydrate form (hereinafter, called hydrate polymorph).

[0017] Thus, the present invention provides a crystalline polymorph of 5- (2- (6- (2, 2- difluoro- 2- phenylethoxy) hexyl] amino)- 1 (R) - hydroxyethyl)- 8- hydroxyquinolin- 2 (1H)- one heminapadisylate, which is (i) a hydrate polymorph, or (ii) a type β polymorph which is obtainable by drying said hydrate polymorph, wherein:

the hydrate polymorph has:

a) an X-Ray Powder Diffraction (XRPD) pattern with peaks at 13.3, 16.1 and 19.2 and degrees 2θ (± 0.1 degrees 2θ); and/or

b) a Differential Scanning Calorimetry (DSC) trace which shows a first endotherm in the range 75-120 ºC (± 5 ºC) and a second endotherm with an onset at 190 ºC (± 10 ºC), and

the type β polymorph has:

a) an X-Ray Powder Diffraction (XRPD) pattern with a peak at 19.1 degrees 2θ (± 0.1 degrees 2θ); and/or

b) a Differential Scanning Calorimetry (DSC) trace which shows an endotherm with an onset at 190 ºC (± 10 ºC).

[0018] The invention also provides a pharmaceutical composition comprising the polymorph salt of the invention and a pharmaceutically-acceptable carrier. The invention further provides combinations comprising the polymorph salt of the invention and one or more other therapeutic agents and pharmaceutical compositions comprising such combinations.

[0019] The invention also provides a method of treating a pulmonary disease or condition associated with β adrenergic receptor activity such as asthma or chronic obstructive pulmonary disease, in a mammal, comprising administering to the mammal, a therapeutically effective amount of a combination of a polymorph salt of the invention together with one or more other therapeutic agents.

[0020] The invention further provides a method for preparing a polymorph salt of the invention which is suitable on an industrial scale.

[0021] The invention also provides a polymorph salt of the invention as described herein for use in medical therapy, as well as the use of a polymorph salt of the invention in the manufacture of a formulation or medicament for treating a
pulmonary disease or condition associated with β2 adrenergic receptor activity such as asthma or chronic obstructive pulmonary disease in a mammal.

BRIEF DESCRIPTION OF FIGURES

[0022]

Figure 1 shows the X-Ray Powder Diffraction (XRPD) pattern of Type β polymorph of 5- (2- (6- (2, 2- Difluoro- 2- phenylethoxy) hexylamino)- 1 (R)- hydroxyethyl)- 8- hydroxyquinolin- 2 (1H)- one heminapadisylate of the invention. Y axis presents intensity (counts) . X axis show 2 Theta (°) .

Figure 2 shows the DSC pattern of Type β polymorph of 5- (2- (6- (2, 2- Difluoro- 2- phenylethoxy) hexylamino)- 1 (R)- hydroxyethyl)- 8- hydroxyquinolin- 2 (1H)- one heminapadisylate of the invention. Y axis presents energy (W) . X axis is temperature (°C) .

Figure 3 shows the TGA pattern of Type β polymorph of 5- (2- (6- (2, 2- Difluoro- 2- phenylethoxy) hexylamino)- 1 (R)- hydroxyethyl)- 8- hydroxyquinolin- 2 (1H)- one heminapadisylate of the invention. Y axis represents weight (%) . X axis is temperature (°C) .

Figure 4 shows the FT-IR pattern of Type β polymorph of 5- (2- (6- (2, 2- Difluoro- 2- phenylethoxy) hexylamino)- 1 (R)- hydroxyethyl)- 8- hydroxyquinolin- 2 (1H)- one heminapadisylate, hemihydrate of the invention. Y axis is Transmittance (%) . X axis is wavenumber (cm⁻¹) .

Figure 5 shows the X-Ray Powder Diffraction (XRPD) pattern of Hydrate polymorph of 5- (2- (6- (2, 2- Difluoro- 2- phenylethoxy) hexylamino)- 1 (R)- hydroxyethyl)- 8- hydroxyquinolin- 2 (1H)- one heminapadisylate, hemihydrate of the invention. Y axis is intensity (counts) . X axis show 2 Theta (°) .

Figure 6 shows the DSC pattern of Hydrate polymorph of 5- (2- (6- (2, 2- Difluoro- 2- phenylethoxy) hexylamino)- 1 (R)- hydroxyethyl)- 8- hydroxyquinolin- 2 (1H)- one heminapadisylate, hemihydrate of the invention. Y axis represents energy (W) . X axis are temperature (°C) .

Figure 7 shows the TGA pattern of Hydrate polymorph of 5- (2- (6- (2, 2- Difluoro- 2- phenylethoxy) hexylamino)- 1 (R)- hydroxyethyl)- 8- hydroxyquinolin- 2 (1H)- one heminapadisylate, hemihydrate of the invention. Y axis are weight (%) . X axis are temperature (°C) .

Figure 8 shows the FT-IR pattern of Hydrate polymorph of 5- (2- (6- (2, 2- Difluoro- 2- phenylethoxy) hexylamino)- 1 (R)- hydroxyethyl)- 8- hydroxyquinolin- 2 (1H)- one heminapadisylate, hemihydrate of the invention. Y axis are Transmittance (%) . X axis are wavenumber (cm⁻¹) .

Figure 9 shows the X-Ray Powder Diffraction (XRPD) pattern of samples of the Type α, Type β and Hydrate polymorphs of 5- (2- (6- (2, 2- Difluoro- 2- phenylethoxy) hexylamino)- 1 (R)- hydroxyethyl)- 8- hydroxyquinolin- 2 (1H)- one heminapadisylate. Y axis are intensity (counts) . X axis show 2 Theta (°) .

DETAILED DESCRIPTION OF THE INVENTION

[0023] When describing the salts, compositions and methods of the invention, the following terms have the following meanings, unless otherwise indicated.

[0024] The term "polymorphism" refers to the ability of a compound to crystallize into more than one distinct crystal species. Polymorphs have an identical chemical structure but often quite different physicochemical properties, polymorphs include enantiotropic polymorphs and monotropic polymorphs.

[0025] The term "amorphous" refers to a disordered solid state, which may appear during manufacture of the drug substance (crystallization step, drying, and milling) or the drug product (granulation, compression). The X-ray powder diffraction pattern of an amorphous solid exhibits no sharp peaks.

[0026] The term "therapeutically effective amount" refers to an amount sufficient to effect treatment when administered to a patient in need of treatment.

[0027] The term "treatment" as used herein refers to the treatment of a disease or medical condition in a human patient which includes:
(a) preventing the disease or medical condition from occurring, i.e., prophylactic treatment of a patient;

(b) ameliorating the disease or medical condition, i.e., causing regression of the disease or medical condition in a patient;

(c) suppressing the our medical condition, i.e., slowing the development of the disease or medical condition in a patient; or

(d) alleviating the symptoms of the disease or medical condition in a patient.

[0028] The phrase "pulmonary disease or condition associated with β2 adrenergic receptor activity" includes all pulmonary disease states and/or conditions that are acknowledged now, or that are found in the future, to be associated with β2 adrenergic receptor activity. Such disease states include, but are not limited to asthma and chronic obstructive pulmonary disease (including chronic bronchitis and emphysema).

[0029] β polymorph provides:

- a) an X-ray powder diffraction (XRPD) pattern substantially in accordance with Figure 1, and/or
- b) a DSC pattern substantially in accordance with Figure 2, and/or
- c) an infra red spectrum substantially in accordance with Figure 4.

[0030] The type β polymorph of the invention preferably has an X-ray powder diffraction (XRPD) pattern with one or more additional peaks at 13.5, 19.7, 20.3, 22.8, 23.8 and 24.2 degrees 2θ (± 0.1 degrees 2θ). Preferably two or more such peaks are observed, preferably three or more, preferably four or more.

[0031] Typically, the peak at 19.7 degrees 2θ is most intense for the type β polymorph. Preferably, the peak at 19.7 degrees 2θ is at least 25% more intense than the next most intense peak.

[0032] Thus, it is particularly preferred that the type β polymorph of the invention has an X-ray powder diffraction (XRPD) pattern with peaks at 10.0, 11.6, 12.7, 13.5, 14.5, 16.1, 19.1, 19.7, 20.3, 22.0, 22.8, 23.8, 24.2, 25.8, 27.1, 27.7, 29.2 and 39.4 degrees 2θ (± 0.1 degrees 2θ).

[0033] It is also particularly preferred that the type β polymorph of the invention has an X-ray powder diffraction (XRPD) pattern with peaks at 11.6, 14.5, 16.1, 19.1, 20.3, 22.0, 24.2, 27.1 and 29.2 degrees 2θ (± 0.1 degrees 2θ).

[0034] Preferably, the type β polymorph has a peak at 13.5 degrees 2θ (± 0.1 degrees 2θ). Preferably, the type β polymorph has does not have a peak at 13.6 degrees 2θ (± 0.1 degrees 2θ). More preferably the type β polymorph has a peak at 13.5 degrees 2θ (± 0.1 degrees 2θ) and does not have a peak at 13.6 degrees 2θ (± 0.1 degrees 2θ).

[0035] Preferably, the type β polymorph of the invention typically has a Differential Scanning Calorimetry (DSC) trace with an endotherm with an onset at 190 9°C (± 0.5°C). Typically, the endotherm has a peak at 196.9°C (± 1°C). Preferably, the peak is at 196.9°C (± 0.5°C), more preferably at 196.3°C (± 0.1°C).

[0036] The type β polymorph of the invention typically has an infrared spectrum with absorption bands at 1650, 1185, 1031, and 764 cm⁻¹ (± 1 cm⁻¹).

[0037] Preferably the type β polymorph of the invention preferably has an infra red spectrum with one or more additional absorption bands at 1451, 1273, 634 and 698 cm⁻¹ (± 1 cm⁻¹). Preferably two or more such peaks are observed, preferably three or more. Most preferably all such peaks are observed.

[0038] In the type β polymorph of the invention more preferably has an infra red spectrum with one or more additional absorption bands at 3396, 3126, 2915, 2850, 1608, 1556, 1496, 1451, 1411, 1363, 1332, 1273, 1241, 1125, 1185, 1125, 1099, 1047, 1031, 1003, 977, 937, 897, 853, 834, 820, 805, 794, 777, 734, 698 and 663 cm⁻¹ (± 1 cm⁻¹).

[0040] Thus, it is particularly preferred that the type β polymorph of the invention has an infra red spectrum with absorption bands at 3396, 3126, 2915, 2850, 1608, 1556, 1496, 1451, 1411, 1363, 1332, 1273, 1241, 1125, 1185, 1125, 1099, 1047, 1031, 1003, 977, 937, 897, 853, 834, 820, 805, 794, 777, 734, 698 and 663 cm⁻¹ (± 1 cm⁻¹).

[0041] Most preferably, the type β polymorph provides:

- a) an X-ray powder diffraction (XRPD) pattern substantially in accordance with Figure 1, and/or
- b) a DSC pattern substantially in accordance with Figure 2, and/or
- c) an infra red spectrum substantially in accordance with Figure 4.

[0042] The hydate polymorph is a hemihydrate.
0043] The hydrate polymorph is typically obtainable by:

a) adding a solution of naphthalene-1, 5-disulfonic acid tetrahydrate in methanol/acetic acid (1:1) to a solution of 5-(2-([6-[(2,2-difluoro-2-phenylethoxy)hexyl]amino]-1(R)-hydroxyethyl)-8-hydroxyquinolin-2(1H)-one in methanol/acetic acid (1:1),
b) stirring the reaction mixture at reflux for 30 minutes and leaving the reaction mixture to cool down to 20-25 °C, then stirring at room temperature, preferably 20-25 °C, for 20 hours,
c) isolating, filtering and washed with methanol and drying, preferably in vacuum, at 500 C.

0044] The hydrate polymorph typically has a X-ray powder diffraction (XRPD) pattern with one or more additional peaks at 12.7, 19.6, 20.2, 22.7, 23.1, 24.2 and 27.7 degrees 2θ (± 0.1 degrees 2θ). Preferably two or more such peaks are observed, more preferably three or more, more preferably four or more. Most preferably all such peaks are observed.

0045] The hydrate polymorph preferably has a X-ray powder diffraction (XRPD) pattern with one or more additional peaks at 9.9, 11.5, 12.7, 14.4, 15.2, 19.6, 20.2, 21.9, 22.7, 23.1, 24.2, 25.6, 26.98, 27.6, 28.9, 30.5, 31.7, 33.4 and 37.0 degrees 2θ (± 0.1 degrees 2θ). Typically two or more such peaks are observed, more preferably three or more, more preferably four or more, more preferably five or more, more preferably ten or more, more preferably fifteen or more. Most preferably all such peaks are observed.

0046] Thus, it is particularly preferred that the hydrate polymorph has a X-ray powder diffraction (XRPD) pattern with peaks at 9.9, 11.5, 12.7, 13.3, 14.4, 15.2, 16.1, 16.7, 19.2, 19.6, 20.2, 21.9, 22.7, 23.1, 24.2, 25.6, 27.0, 27.6, 28.9, 30.5, 31.7, 33.4 and 37.0 degrees 2θ (± 0.1 degrees 2θ).

0047] It is also particularly preferred that the hydrate polymorph has a X-ray powder diffraction (XRPD) pattern with peaks at 11.5, 13.3, 14.4, 16.1, 16.7, 19.2, 20.2, 21.9, 23.1, 24.2, 25.6, 27.0, 28.9, 30.5, 31.7, 33.4 and 37.0 degrees 2θ (± 0.1 degrees 2θ).

0048] Typically, the peak at 19.6 degrees 2θ (± 0.1 degrees 2θ) is most intense for the hydrate polymorph. Preferably, the peak at 19.6 degrees 2θ (± 0.1 degrees 2θ) is at least 10% more intense than the next most intense peak.

0049] Preferably, the hydrate polymorph has peak at 13.4 degrees 2θ (± 0.1 degrees 2θ). Preferably, the hydrate polymorph does not have a peak at 13.6 degrees 2θ (± 0.1 degrees 2θ). More preferably, the hydrate polymorph has peak at 13.4 degrees 2θ (± 0.1 degrees 2θ) and does not have a peak at 13.6 degrees 2θ (± 0.1 degrees 2θ).

0050] The hydrate polymorph typically has a Differential Scanning Calorimetry (DSC) trace which shows a first endotherm in the range 75-120 °C (± 5 °C) and a second endotherm with an onset at 190 °C (± 10 °C).

0051] The first endotherm of the hydrate polymorph is a wide endotherm. It preferably has an onset at 73 °C (± 1 °C). The first endotherm preferably has a peak at 95 °C (± 1 °C).

0052] The second endotherm of the hydrate polymorph is a sharp endotherm. Preferably, the second endotherm has an onset at 190 °C (± 0.5 °C), more preferably at 190.4 °C (± 0.1 °C). Typically, the endotherm has a peak at 196 °C (± 1 °C). Preferably, the peak is at 196 °C (± 0.5 °C), more preferably at 196.3 °C (± 0.1 °C).

0053] The hydrate polymorph of the invention typically has an Infra Red spectrum with absorption bands at 1637, 1185, 1152, 1123, 1100, 1048, 1008, 976, 936, 897, 853, 819, 807, 794, 735, 725, 691, 685 and 662 cm⁻¹ (± 1 cm⁻¹). Preferably five or more such peaks are observed, more preferably ten or more, more preferably fifteen or more, more preferably twenty or more, more preferably twenty five or more. Most preferably all such peaks are observed.

0054] The hydrate polymorph of the invention preferably has an Infra Red spectrum one or more additional absorption bands at 1456, 1271 and 819 cm⁻¹ (± 1 cm⁻¹). Preferably two or more such peaks are observed. More preferably all such peaks are observed.

0055] The hydrate polymorph of the invention more preferably has an infra red spectrum with one or more additional absorption bands at 3396, 3342, 3129, 2914, 1637, 1610, 1563, 1496, 1466, 1411, 1368, 1311, 1290, 1271, 1244, 1192, 1155, 1152, 1123, 1100, 1048, 1030, 1008, 976, 936, 897, 853, 819, 807, 794, 735, 725, 691, 685 and 662 cm⁻¹ (± 1 cm⁻¹).

0056] Thus, it is particularly preferred that the hydrate polymorph of the invention has an Infra Red spectrum with absorption bands at 3396, 3342, 3129, 2914, 1637, 1610, 1563, 1496, 1466, 1411, 1368, 1311, 1290, 1271, 1244, 1192, 1185, 1155, 1152, 1123, 1100, 1048, 1030, 1008, 976, 936, 897, 853, 819, 807, 794, 776, 735, 725, 691, 685 and 662 cm⁻¹ (± 1 cm⁻¹).

0057] Most preferably, the hydrate polymorph provides:

a) an X-ray powder diffraction (XRPD) pattern substantially in accordance with Figure 5, and/or
b) a DSC pattern substantially in accordance with Figure 6, and/or
c) an Infra Red spectrum substantially in accordance with Figure 8.

0058] Typically, the type δ polymorph starts to decompose at 200 °C (± 5 °C, preferably ± 2 °C), as measured by thermogravimetric analysis. Typically, the hydrate polymorph starts to decompose at 200 °C (± 5 °C, preferably ± 2 °C), as measured by thermogravimetric analysis. The start of decomposition can be identified by a reduction in weight
of the sample of the polymorph, as described in the Examples. The thermogravimetric (TGA) analysis can be performed using any suitable apparatus and technique. Typically, a TGA-SDTA-851 Mettler-Toledo is used, preferably as described below in the Examples.

[0059] The X-Ray Powder Diffraction (XRPD) analysis can be performed using any suitable apparatus and technique. Typically, XRPD analysis is performed on a Bruker X-ray powder diffractometer, model D2 Phaser with a Cu X-ray source, preferably as described below in the Examples.

[0060] The differential scanning calorimetry (DSC) analysis can be performed using any suitable apparatus and technique. Typically, DSC analysis is performed using a DSC-821 Mettler-Toledo, preferably as described below in the Examples.

[0061] The X-Ray Powder Diffraction (XRPD) analysis can be performed using any suitable apparatus and technique. Typically, infrared analysis is performed using a Nicolet 710 FT-IR spectrometer, preferably as described below in the Examples.

[0062] The present invention encompasses the type β polymorph isolated in a pure form, or a substantially pure form, or admixed with other polymorphs selected from the hydrate polymorph and the known type α polymorph disclosed in WO 2008/095720. The type β polymorph is preferably isolated in a pure form, or a substantially pure form. Thus, preferably the crystalline form consists, or consists essentially of, the type β polymorph. The type α polymorph is preferably not present.

[0063] The present invention also encompasses the hydrate polymorph isolated in a pure form, or a substantially pure form, or admixed with other polymorphs selected from the type β polymorph and the known type α polymorph disclosed in WO 2008/095720. The hydrate polymorph is preferably isolated in a pure form, or a substantially pure form. Thus, preferably the crystalline form consists, or consists essentially of, the hydrate polymorph. The type α polymorph is preferably not present.

[0064] The present invention also encompasses a pharmaceutical composition comprising a therapeutically effective amount of a crystalline Type β polymorph of 5- (2- { [6- (2, 2- difluoro- 2- phenylethoxy) hexyl] amino} - 1 (R) - hydroxyethyl)- 8- hydroxyquinolin- 2 (1H)- one in a free base form and having the following chemical structure:
The invention is also directed to the use of the crystalline Type β or Hydrate polymorph as defined according to the invention, in the manufacture of a medicament for the treatment of a pulmonary disease or condition in a mammal. The mammal is preferably a human being. Particularly relevant pulmonary diseases or conditions are asthma or chronic obstructive pulmonary disease.
Particularly relevant pulmonary diseases or conditions are asthma or chronic obstructive pulmonary disease.

**General Synthetic Procedures**

[0083] The crystalline Type β and Hydrate polymorphs of the invention can be prepared using the methods and procedures described herein, or using similar methods and procedures. It will be appreciated that where typical or preferred process conditions (i.e., reaction temperatures, times, mole ratios of reactants, solvents, pressures, etc.) are given, other process conditions can also be used unless otherwise stated. Optimum reaction conditions may vary with the particular reactants or solvent used, but such conditions can be determined by one skilled in the art by routine optimization procedures.

[0084] Processes for preparing polymorphic crystal forms of the invention are provided as further embodiments of the invention and are illustrated by the procedures below.

[0085] The crystalline salts of the invention can be synthesized from 5- {2- [6- {2, 2-difluoro- 2- phenylethoxy) hexyl] amino}- 1 (R)- hydroxyethyl)- 8- hydroxyquinolin- 2 (1H)- one and from naphthalene- 1, 5- disulfonic acid (also known as Armstrong’s Acid) or from its tetrahydrate. Both the naphthalene- 1, 5- disulfonic acid and its tetrahydrate are commercially available and can be purchased from, for example, Aldrich.

**EXAMPLES**

[0086] General. Reagents, starting materials, and solvents were purchased from commercial suppliers and used as received.

**Example 1.**

Crystalline 5-(2- [6-(2,2-difluoro-2-phenylethoxy)hexyl]amino)-1(R)-hydroxyethyl)-8-hydroxyquinolin-2 (1H)-one, heminapadisylate, hemihydrate (the crystalline Hydrate polymorph).

[0087] To a solution 13.9 g of 5- {2- [6- [2, 2- difluoro- 2- phenylethoxy) hexyl] amino]- 1 (R)- hydroxyethyl)- 8- hydroxyquinolin- 2 (1H)- one as a free base in 304 ml of methanol and 304 ml of acetic acid was slowly added a solution of 6.0 g of naphthalene- 1, 5- disulfonic acid tetrahydrate in 52 ml of methanol/ acetic acid (1: 1) . The mixture was then stirred for 30 minutes at reflux temperature and then cooled down slowly to 20/25°C. The mixture was stirred at this temperature for 20 additional hours. The precipitate formed was isolated by filtration, washed with methanol and dried under vacuum at 50°C. (Yield 91 % of the Hydrate polymorph).

**Example 2.**

Crystalline 5-(2- [6-(2,2-difluoro-2-phenylethoxy)hexyl]amino)-1(R)-hydroxyethyl)-8-hydroxyquinolin-2 (1H)-one, heminapadisylate (the crystalline Type β polymorph).

[0088] Crystalline Hydrate polymorph as prepared in Example 1 was dried at 105°C under vacuum during 24 hours to yield the anhydrous form Type β (yield 99.8%).

**Example 3**

Pharmaceutical inhalation composition comprising a polymorphic salt of compound (I) and a carrier.

[0089] The process for manufacturing the pharmaceutical composition comprising a polymorphic salt of compound (I) (Type α, Type β or Hydrate) and a carrier is as follows:

1. 20% by weight of lactose used as a carrier was blended with one polymorph (Type α, Type β or Hydrate). The resulting mixture was sieved and mixed again.
2. The remaining 80% by weight of lactose was sieved and added to the mixture of Step 1. The whole mixture was blended, sieved and blended again resulting in the final inhalation powder blend.

[0090] When two different types of lactose, for example a coarse lactose and a fine lactose as defined above, are used, these lactose types are previously mixed together and blended before adding the polymorph salt of the invention as described above.

[0091] The test on the aerodynamic assessment of the fine particles (FPD <5 μm) of the inhalation powder composition
is carried out in combination with the Genuair® inhaler. The Fine Particle Fraction of the three formulations was calculated on basis of the principles of the aerodynamic assessment of fine particles according to the Current European pharma-
copoeia (Ph. Eur. Chapter 2.9.18) and USP <601> by the aid of aerodynamic impactor analyses using a modified
Anderson Cascade Impactor (ACI), 60 L/min-configuration including pre-separator, stage -1, -0, and stage 1-7 (filter
stage). The content of the active ingredient on each stage of the impactor is determined my means of HPLC.

[0092] The fine particle dose (FPD <5 μm) is calculated based on Ph. Eur. Chapter 2.9.18 and USP <601> by point
to point interpolation per dosage. Linear point to point interpolation is done between the stages with a corresponding
effective cut-off diameter which enclose the 5 μm mark.

[0093] To obtain the Fine Particle Dose, the cumulative percent value (y-value) at which the line of data plot crosses
5 μm mark is determined. The found cumulative percent must be multiplied by the sum of mass of the active ingredient
per dosage on stage -1 -stage 7 (Filter) to obtain the fine particle dose, < 5μm, in μg.

\[
\text{FPD [μg]} = \frac{y_{\text{FPD}} \cdot F}{100}
\]

\[
F = \text{sum of mass on stage -1 -stage 7 (filter) per dosage [μg]}
\]

[0094] The Fine Particle Fraction (FPF) is the percentage of the emitted dose that the Fine Particel Dose represents
and is calculated as follows:

\[
\text{FPF [%]} = \left( \frac{\text{FPD [μg]}}{\text{Total sum [μg]}} \right) \times 100
\]

[0095] Total sum = the amount of drug substance in the respective impactor (Adapter- Filter).

[0096] The results of the FPF are shown in the following Table 1:

<table>
<thead>
<tr>
<th>Formulation</th>
<th>FPF(%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Comparative Example (polymorph Type α as disclosed in WO 2008/095720)</td>
<td>42.2</td>
</tr>
<tr>
<td>Polymorph Type β</td>
<td>49.3</td>
</tr>
<tr>
<td>Polymorph Hydrate</td>
<td>49.8</td>
</tr>
</tbody>
</table>

[0097] As it can be seen from the table, the fine particle fraction was increased by about 17% when compared with
the comparative Example (α polymorph). The increase in the FPF is enhanced without the addition of any additive
material. This finding results in a simpler manufacture of the dry powder formulation way and allows a higher portion of
the administered drug to reach the lung. This results in that less amount of drug is required to achieve the optimum dose
of the drug and therefore a better inhalation performance for use in the treatment of respiratory diseases is achieved.

CHARACTERIZING DATA

[0098] The following characterising data were generated for both polymorphic crystal form Type β and Hydrate (Example
1 and Example 2, respectively).

X-Ray Powder Diffraction (XRPD)

[0099] X- Ray Powder Diffraction (XRPD) analysis was performed on a Brucker X- ray powder diffractometer, model
D2 Phaser with a Cu X- ray source. The method runs from 5 to 40 degrees 2- Theta with a 0.01 degree 2- Theta step
size and a 0.4 second collection time at each step using a Lynxeye detector.
Crystalline Type $\beta$ polymorph.

[0100] The XRP pattern of the crystalline Type $\beta$ polymorph is shown in Figure 1 and a summary of the XRPD angles and relative intensities are given in Table 2. The relative intensities are expressed by S = Strong, M = Medium, W = weak, VS = very Strong and VW = Very Weak.

Figure 9 shows the X-Ray Powder Diffraction (XRPD) pattern of samples of the Type α, Type β and Hydrate polymorphs of 5- (2- (6- (2,2-Difluoro-2-phenylethoxy) hexylamino)-1 (R)-hydroxyethyl)-8-hydroxyquinolin-2 (1H)-one heminapadisylate. As it can be seen from the figure all the 3 polymorphs Types can be unambiguously identified thus allowing easy differentiation between each other.

A summary of the XRPD angles and relative intensities for the Type α polymorph is given in Table 5. The relative intensities are expressed by S = Strong, M = Medium, W = weak, VS = very Strong and VW = Very Weak.

Differential Scanning Calorimetry (DSC)

[0104] The differential scanning calorimetry (DSC) analysis was obtained using a DSC-821 Mettler-Toledo, serial number 5117423874. Samples were weighed into an aluminium pan, an aluminium lid placed on top of the sample and compressed with a brass rod. Samples were equilibrated at 25°C and heated at 10°C / min to 300°C. The instrument was calibrated using indium and zinc standards.

Crystalline Type \(\beta\) polymorph.

[0105] Figure 2 shows a DSC pattern of the Type \(\beta\) polymorph. The sample exhibits an endotherm with an onset of around 190°C and there are no changes prior to the decomposition. This indicates that the sample does not convert into any other polymorphs.

Crystalline form Hydrate polymorph.

[0106] Figure 5 shows a DSC pattern of the Hydrate polymorph. The sample exhibits a wide endotherm in the range 75-120°C due to the loss of water. The second endotherm with an onset of around 190°C corresponds to decomposition.

Thermogravimetric analysis.

[0107] The thermogravimetric (TGA) analysis was obtained using a TGA-SDTA-851 Mettler-Toledo, serial number 5118408555. Samples were placed into a tared aluminium pan and then positioned on a platinum crucible. Samples were heated from 30°C at 10°C / min to 350°C. The instrument was calibrated using indium and aluminium standards.

Crystalline form Type \(\beta\) polymorph.

[0108] Figure 3 shows a TGA pattern of the Type \(\beta\) polymorph. The sample does not exhibit weight losses prior to the decomposition at approximately 200°C.

Crystalline form Hydrate polymorph.

[0109] Figure 6 shows a TGA pattern of the Hydrate polymorph. The sample exhibits a weight loss of about 1.3% at 100°C due to the dehydration (which corresponds to 1/2 water molecule). Finally the sample starts to lose weight near 200°C due to decomposition.

Infrared spectrum

[0110] The infrared spectrum was obtained using a Nicolet 710 FT-IR spectrometer at 2 cm\(^{-1}\). Data were digitised at 1 cm\(^{-1}\).

Crystalline form Type \(\beta\) polymorph.

[0111] Figure 4 shows an IR spectrum of the Type \(\beta\) polymorph. The peak positions are as follows: 3396, 3126, 2915, 2850, 1650, 1608, 1556, 1496, 1451, 1411, 1363, 1332, 1273, 1241, 1185, 1125, 1099, 1047, 1031, 1003, 977, 937, 897, 853, 834, 820, 805, 794, 777, 764, 734, 698 and 663 cm\(^{-1}\).
Pharmaceutical Compositions

Pharmaceutical compositions according to the present invention comprise a therapeutically effective amount of a Type \( \beta \) polymorph, in a pure form or admixed with Hydrate and/or Type \( \alpha \) polymorphs and a pharmaceutically acceptable carrier.

Pharmaceutical compositions according to the present invention comprise a therapeutically effective amount of a Hydrate polymorph, in a pure form or admixed with Type \( \beta \) and/or Type \( \alpha \) polymorphs and a pharmaceutically acceptable carrier.

The pharmaceutical formulations may conveniently be presented in unit dosage form and may be prepared by any of the methods well known in the art of pharmacy. All methods include the step of bringing the active ingredient(s) into association with the carrier. In general the formulations are prepared by uniformly and intimately bringing into association the active ingredient with liquid carriers or solid carriers or both and then, if necessary, shaping the product into the desired formulation.

Dry powder compositions for topical delivery to the lung by inhalation may, for example, be presented in capsules and cartridges of, for example, gelatine or blisters of, for example, laminated aluminium foil, for use in an inhaler or insufflator. Formulations generally contain a powder mix for inhalation of the polymorph of the invention and a suitable powder base (carrier substance) such as lactose or starch. Use of lactose is preferred.

Each capsule or cartridge may generally contain between 1 \( \mu \)g and 150 \( \mu \)g of each therapeutically active ingredient. Alternatively, the active ingredient(s) may be presented without excipients.

Packaging of the formulation may be suitable for unit dose or multi-dose delivery. In the case of multi- dose delivery, the formulation can be pre-metered or metered in use. Dry powder inhalers are thus classified into three groups: (a) single dose, (b) multiple unit dose and (c) multi dose devices.

For inhalers of the first type, single doses have been weighed by the manufacturer into small containers, which are mostly hard gelatine capsules. A capsule has to be taken from a separate box or container and inserted into a receptacle area of the inhaler. Next, the capsule has to be opened or perforated with pins or cutting blades in order to allow part of the inspiratory air stream to pass through the capsule for powder entrainment or to discharge the powder from the capsule through these perforations by means of centrifugal force during inhalation. After inhalation, the emptied capsule has to be removed from the inhaler again. Mostly, disassembling of the inhaler is necessary for inserting and removing the capsule, which is an operation that can be difficult and burdensome for some patients.

Other drawbacks related to the use of hard gelatine capsules for inhalation powders are (a) poor protection against moisture uptake from the ambient air, (b) problems with opening or perforation after the capsules have been exposed previously to extreme relative humidity, which causes fragmentation or indenture, and (c) possible inhalation of capsule fragments. Moreover, for a number of capsule inhalers, incomplete expulsion has been reported (e. g. Nielsen et al, 1997).

Some capsule inhalers have a magazine from which individual capsules can be transferred to a receiving chamber, in which perforation and emptying takes place, as described in WO 92/03175. Other capsule inhalers have revolving magazines with capsule chambers that can be brought in line with the air conduit for dose discharge (e. g. WO91/02558 and GB 2242134). They comprise the type of multiple unit dose inhalers together with blister inhalers, which have a limited number of unit doses in supply on a disk or on a strip.

Blister inhalers provide better moisture protection of the medicament than capsule inhalers. Access to the powder is obtained by perforating the cover as well as the blister foil, or by peeling off the cover foil. When a blister strip is used instead of a disk, the number of doses can be increased, but it is inconvenient for the patient to replace an empty strip. Therefore, such devices are often disposable with the incorporated dose system, including the technique used to transport the strip and open the blister pockets.

Multi- dose inhalers do not contain pre- measured quantities of the powder formulation. They consist of a relatively large container and a dose measuring principle that has to be operated by the patient. The container bears multiple doses that are isolated individually from the bulk of powder by volumetric displacement. Various dose measuring principles exist, including rotatable membranes (Ex. EP0069715) or disks (Ex. GB 2041763; EP 0424790; DE 4239402 and EP 0674533), rotatable cylinders (Ex. EP 0166294; GB 2165159 and WO 92109322) and rotatable frustums (Ex. WO 92/00771), all having cavities which have to be filled with powder from the container. Other multi dose devices have measuring slides (Ex. US 5201308 and WO 97/00703) or measuring plungers with a local or circumferential recess to displace a certain volume of powder from the container to a delivery chamber or an air conduit (Ex. EP 0505321, WO
The powder formulation has to exhibit good and stable flow properties, because filling of the dose measuring cups or cavities is mostly under the influence of the force of gravity. For reloaded single dose and multiple unit dose inhalers, the dose measuring accuracy and reproducibility can be guaranteed by the manufacturer. Multi dose inhalers on the other hand, can contain a much higher number of doses, whereas the number of handlings to prime a dose is generally lower.

The inspiratory air stream in multi-dose devices is often straight across the dose measuring cavity, and because the massive and rigid dose measuring systems of multi dose inhalers can not be agitated by this inspiratory air stream, the powder mass is simply entrained from the cavity and little de-agglomeration is obtained during discharge. Consequently, separate disintegration means are necessary. However in practice, they are not always part of the inhaler design. Because of the high number of doses in multi- dose devices, powder adhesion onto the inner walls of the air conduits and the de- agglomeration means must be minimized and/or regular cleaning of these parts must be possible, without affecting the residual doses in the device. Some multi dose inhalers have disposable drug containers that can be replaced after the prescribed number of doses has been taken (e. g. WO 97/000703) . For such semi-permanent multi dose inhalers with disposable drug containers, the requirements to prevent drug accumulation are even more strict.

Apart from applications through dry powder inhalers the compositions of the invention can be administered in aerosols which operate via propellant gases or by means of so-called atomisers, via which solutions of pharmacologically-active substances can be sprayed under high pressure so that a mist of inhalable particles results. The advantage of these atomisers is that the use of propellant gases can be completely dispensed with. Such atomiser is the Respimat® which is described, for example, in PCT patent applications Nos. WO 91/14468 and WO 97/12687, reference here is being made to the contents thereof.

Medicaments for administration by inhalation desirably have a controlled particle size. The optimum particle size for inhalation into the bronchial system is usually 1-10 μm, preferably 2-5 μm. Particles having a size above 20 μm are generally too large when inhaled to reach the small airways. To achieve these particle sizes, the particles of the active ingredient as produced may be size reduced by conventional means eg by micronisation. The desired fraction may be separated out by air classification or sieving. Preferably, the particles will be crystalline.

Apart from applications through dry powder inhalers the compositions of the invention can also be administered in aerosols which operate via propellant gases or by means of so-called atomisers, via which solutions of pharmacologically-active substances can be sprayed under high pressure so that a mist of inhalable particles results. Such atomisers are described, for example, in WO 91/14468 and WO 97/12687.

Achieving high dose reproducibility with micronised powders is difficult because of their poor flowability and extreme agglomeration tendency. To improve the efficiency of dry powder compositions, the particles should be large while in the inhaler, but small when discharged into the respiratory tract. Thus, an excipient such as lactose or glucose is generally employed. The particle size of the excipient will usually be much greater than the inhaled medicament within the present invention. When the excipient is lactose it will typically be present as milled lactose, preferably crystalline alpha lactose hemihydrate. Pressurized aerosol compositions will generally be filled into canisters fitted with a valve, especially a metering valve. Canisters may optionally be coated with a plastics material e.g. a fluorocarbon polymer as described in WO96/32150. Canisters will be fitted into an actuator adapted for buccal delivery.

The compositions of the invention can optionally comprise a therapeutically effective amount of one or more other therapeutic agents which are known to be useful in the treatment of respiratory disorders, such as PDE4 inhibitors, corticosteroids and/or anticholinergics.

The amount of each active which is required to achieve a therapeutic effect will, of course, vary with the particular active, the route of administration, the subject under treatment, and the particular disorder or disease being treated. Preferably, the active ingredients are administered once or twice a day, most preferably once a day.

Examples of suitable PDE4 inhibitors that can be combined with β2- agonists are benafentrine dimaleate, etazolate, denbufylline, rolipram, cipamfylline, zardaverine, arofylline, filaminast, tipelukast, piclamilast, tofletrine, mesopram, drotagerine hydrochloride, lirmilast, roflumilast, cilomilast, ogilimilast, apremilast, tetromilast, revamplast, ronmilast, (R)- (+)- 4- [2- (3- Cyclopentonyloxy- 4- methoxyphenyl)- 2- phenethyl] pyridine (CDP- 840) , N- (3, 5- Dichloro- 4- pyridyl)- 2- [1- (4- florenzyl)- 5- hydroxy- 1H- indol- 3- yl]- 2- oxoacetamide (GSK- 842470) , 9- (2- Fluorobenzyl)- N6- methyl- 2- (trifluoromethyl) adenine (NCS- 613) , N- (3, 5- Dichloro- 4- pyridyl)- 8- methoxyquinoline- 5- carboxamide (D- 4418) , 3- [3- (Cyclopentonyloxy- 4- methoxybenzyl)- 6- (ethylamino)- 8- isopropyl- 3H- purine hydrochloride (V- 11294A) , 6- [3- (N, N- Dimethylcarbamoyl)- phenylsulfonyl]- 4- (3- methoxyphenylamino)- 8- methylquinoline- 3- carboxamide hydrochloride (GSK- 256066) , 4- [6, 7- Diethiox- 2, 3- bis (hydroxymethyl) naphthalen- 1- yl]- 1- (2- methoxyethyl) pyridin- 2 (1H)- one (T- 440) , (- )- trans- 2- [3'- (N- Cyclopropylcarbamoyl)- 4- oxo- 1, 4- dihydro- 1,
Examples of suitable corticosteroids and glucocorticoids that can be combined with β2-agonists are prednisolone, methylprednisolone, dexamethasone, dexamethasone acetate, dexamethasone cipiclate, naflcocort, deflazacort, halopredone acetate, budesonide, beclometasone dipropionate, hydrocortisone, triamcinolone acetonide, flucinolone acetonide, fluorocortisone, clocortolone pivalate, methylprednisolone acetonate, dexamethasone palmitate, tiapredone, hydrocortisone acetonide, prednicarbate, alclometasone dipropionate, halometasone, methylprednisolone suleptanate, mometasone, mometasone furoate, rimexolone, prednisolone farnesylate, ciclesonide, butoxycort propionate, AS-85095, CGP-13774, GW-250495, deltacortisone, NO-Prednisolone, NO-Budesonide, etiprednol dicloacetate, QAE-397, beta-TH- EPIA, RPR-106541, depredone propionate, fluticasone, fluticasone propionate, fluticasone furoate, halobetasol propionate, loteprednol etabonate, betamethasone butyrate propionate, flunisolide, prednisone, dexamethasone sodium phosphate, triamcinolone, betamethasone 17-valerate, betamethasone, betamethasone dipropionate, 21-Chloro-11β-hydroxy-17α-[2-(methylsulfanyl) acetoxy]-4- pregnene-3,20-dione, des-iso-dexamethasone sodium succinate, prednisona, methylprednisolone sulphate, flunisolide, betamethasone butyrate propionate, hydrocortisone, triamcinolone acetonide, flucinolone, methylprednisolone acetonide, dexamethasone, methylprednisolone succinate, prednisolone sodium phosphate and hydrocortisone butyrate, prednisolone sodium metasulfoxonate and clobetasol propionate.

Particularly preferred pharmaceutical composition according to the invention comprise a polymorphic crystal form as defined above and a therapeutically effective amount of one or more additional therapeutic agents selected from the group consisting of mometasone furoate, ciclesonide, budesonide, fluticasone propionate, fluticasone furoate, tiotropium salts, glycopirronium salts, 3-[2-Hydroxy-2, 2-bis-(2-thienyl) acetoy]-1-(3-phenoxypropyl)-1-azoniabicyclo[2.2.2]octane salts (in particular aclidinium salts, preferably aclidinium bromide), 1-(2-Phenylethyl)-3-(9H-xanthen-9-ylcarbonyloxy)-1-azoaniabicyclo[2.2.2]octane salts, glycopirronium salts, 3-[2-Hydroxy-2, 2-bis-(2-thienyl) acetoy]-1-(3-phenoxypropyl)-1-azoniabicyclo[2.2.2]octane salts, rolipram, roflumilast, cilomilast and the compounds claimed in the PCT patent applications number WO 03/097613, WO 2004/058729, WO 2005/049581, WO 2005/123693, WO 2005/123692 and WO 2010/069504.

Thus, in one aspect of the invention, the composition comprises a corticosteroid and a crystalline Type β and/or Hydrate polymorph. Particularly preferred corticosteroids are those selected from the group consisting of mometasone furoate, ciclesonide, budesonide, fluticasone propionate, fluticasone furoate, tiotropium salts, glycopirronium salts, 3-[2-Hydroxy-2, 2-bis-(2-thienyl) acetoy]-1-(3-phenoxypropyl)-1-azoniabicyclo[2.2.2]-
octane salts and 1- (2- phenylethyl)- 3- (9H-xanthen- 9- ylcarbonyloxy)- l- azoniabicyclo [2.2.2]- octane salts. The composition may further comprise a corticosteroid selected from the group consisting of mometasone furoate, ciclesonide, budesonide, fluticasone furoate and fluticasone propionate.

[0141] In a still other aspect of the invention, the composition comprises a PDE4 inhibitor and a crystalline Type $\beta$ and/or Hydrate polymorph. Particulally preferred PDE4 inhibitors are those selected from the group consisting of rolipram, roflumilast, cilomilast and the compounds claimed in the PCT patent applications number WO03/097613 WO2004/058729 WO 2005/049581, WO 2005/123693 and WO 2005/123692. The composition may further comprise a corticosteroid selected from the group consisting of mometasone furoate, ciclesonide, budesonide, fluticasone furoate and fluticasone propionate. In addition to the salt of the invention and to the PDE4 inhibitor, the composition may further comprise an anticholinergic agent selected from the group consisting of tiotropium salts, glycopirronium salts, 3- [2- Hydroxy- 2- bis (2- thienyl) acetoyx]- 1- (3- phenoxypropyl)- 1- azoniabicyclo [2.2.2] octane salts and 1- (2-Phenylethyl)- 3- (9H-xanthen- 9- ylcarbonyloxy)- 1- azoniabicyclo [2.2.2] octane salts.

[0142] In a particularly preferred embodiment of the present invention, the composition comprises a crystalline Type $\beta$ and/or Hydrate polymorph and a therapeutically effective amount of a 3- [2- hydroxy- 2- bis (2- thienyl) acetoyx]- 1- (3- phenoxypropyl)- 1- azoniabicyclo [2.2.2] octane salts. Optionally, the composition further comprises a corticosteroid and/or a PDE4 inhibitor.

[0143] In another particularly preferred embodiment of the present invention, the composition comprises a crystalline Type $\beta$ and/or Hydrate polymorph and a therapeutically effective amount of mometasone furoate. Optionally, the composition further comprises an anticholinergic and/or a PDE4 inhibitor.

[0144] In yet another embodiment of the invention, the composition comprises a crystalline Type $\beta$ and/or Hydrate polymorph, a corticosteroid, an anticholinergic agent and a PDE4 inhibitor.

[0145] The crystalline polymorphic salts of the present invention and the combinations of the invention may be used in the treatment of respiratory diseases, wherein the use of bronchodilating agents is expected to have a beneficial effect, for example asthma, acute or chronic bronchitis, emphysema, or Chronic Obstructive Pulmonary Disease (COPD).

[0146] The active crystalline polymorphic salts in the combination, i.e. the $\beta2$-agonist of the invention and the PDE4 inhibitors, corticosteroids or glucocorticoids and/or anticholinergics may be administered together in the same pharmaceutical composition or in different compositions intended for separate, simultaneous, concomitant or sequential administration by the same or a different route.

[0147] It is contemplated that all active agents would be administered at the same time, or very close in time. Alternatively, one or two actives could be taken in the morning and the other (s) later in the day. Or in another scenario, one or two actives could be taken twice daily and the other (s) once daily, either at the same time as one of the twice-a-day dosing occurred, or separately. Preferably at least two, and more preferably all, of the actives would be taken together at the same time. Preferably, at least two, and more preferably all actives would be administered as an admixture.

[0148] The active substance compositions according to the invention are preferably administered in the form of compositions for inhalation delivered with the help of inhalers, especially dry powder inhalers; however, any other form of topical, parenteral or oral application is possible. Here, the application of inhaled compositions embodies the preferred application form, especially in the therapy of obstructive lung diseases or for the treatment of asthma.

[0149] Additional suitable carriers for formulations of the active salts of the present invention can be found in Remington: The Science and Practice of Pharmacy, 20th Edition, Lippincott Williams & Wilkins, Philadelphia, Pa., 2000. The following non-limiting examples illustrate representative pharmaceutical compositions of the invention.

1, 1, 1, 2, 3, 3, 3- heptafluoro-n-propane                                  q.s. to 200 ml
Claims

1. A crystalline polymorph of 5-(2-{{6-(2,2-difluoro-2-phenylethoxy)hexyl}amino}-1(R)-hydroxyethyl)-8-hydroxyquinolin-2(1H)-one heminapadisylate, which is (i) a hydrate polymorph, or (ii) or a type β polymorph which is obtainable by drying of said hydrate polymorph, wherein:

   the hydrate polymorph has:

   a) an X-Ray Powder Diffraction (XRPD) pattern with peaks at 13.3, 16.1 and 19.2 degrees 2θ (± 0.1 degrees 2θ); and/or
   b) a Differential Scanning Calorimetry (DSC) trace which shows a first endotherm in the range 75-120 °C (± 5 °C) and a second endotherm with an onset at 190 °C (± 9 °C),

   the type β polymorph has:

   a) an X-Ray Powder Diffraction (XRPD) pattern with a peak at 19.1 degrees 20 (± 0.1 degrees 20); and/or
   b) a Differential Scanning Calorimetry (DSC) trace which shows an endotherm with an onset at 190 °C (± 1 °C).

2. A crystalline polymorph according to claim 1, which is the hydrate polymorph and which is obtainable by:

   a) adding a solution of naphthalene-1,5-disulfonic acid tetrahydrate in methanol/acetic acid (1:1) to a solution of 5-(2-{{6-(2,2-difluoro-2-phenylethoxy)hexyl}amino}-1(R)-hydroxyethyl)-8-hydroxyquinolin-2(1H)-one in methanol/acetic acid (1:1),
   b) stirring the reaction mixture at reflux for 30 minutes and leaving the reaction mixture to cool down to 20-25 °C, then stirring at room temperature, preferably 20-25 °C, for 20 hours,
   c) isolating, filtering and washed with methanol and drying, preferably in vacuum, at 50 °C.

3. A crystalline polymorph according to claim 1 or 2, which is the hydrate polymorph and wherein the X-Ray Powder Diffraction (XRPD) pattern additionally has one or more peaks at 9.9, 11.5, 12.7, 14.4, 15.2, 16.7, 19.6, 20.2, 21.9, 22.7, 23.1, 24.2, 25.6, 27.0, 27.6, 28.9, 30.5, 31.7, 33.4 and 37.0 degrees 2θ (± 0.1 degrees 2θ).

4. A crystalline polymorph according to any one of the preceding claims, which is the hydrate polymorph and wherein the X-Ray Powder Diffraction (XRPD) pattern has peaks at 9.9, 11.5, 12.7, 13.3, 14.4, 15.2, 16.1, 16.7, 19.2, 19.6, 20.2, 21.9, 22.7, 23.1, 24.2, 25.6, 27.0, 27.6, 28.9, 30.5, 31.7, 33.4 and 37.0 degrees 2θ (± 0.1 degrees 2θ).

5. A crystalline polymorph according to any one of the preceding claims, which is the hydrate polymorph and which provides:

   a) a X-Ray powder diffraction (XRPD) pattern substantially in accordance with Figure 5, and/or
   b) a DSC pattern substantially in accordance with Figure 6, and/or
   c) an infrared spectrum substantially in accordance with Figure 8.

6. A crystalline polymorph according to claim 1, which is the type β polymorph and is obtainable by drying the hydrate polymorph as defined in any of the preceding claims at 105 °C for 20 hours, preferably in a vacuum.

7. A crystalline polymorph according to claim 1 or 6, which is the type β polymorph and wherein the X-ray powder diffraction (XRPD) pattern additionally has one or more peaks at 10.0, 11.6, 12.7, 13.5, 14.5, 16.1, 19.7, 20.3, 22.0, 22.8, 23.8, 24.2, 25.8, 27.1, 27.7, 29.2 and 39.4 degrees 2θ (± 0.1 degrees 2θ).

8. A crystalline polymorph according to any one of claims 1, 6 or 7, which is the type β polymorph and wherein the X-ray powder diffraction (XRPD) pattern has peaks at 10.0, 11.6, 12.7, 13.5, 14.5, 16.1, 19.1, 19.7, 20.3, 22.0, 22.8, 23.8, 24.2, 25.8, 27.1, 27.7, 29.2 and 39.4 degrees 2θ (± 0.1 degrees 2θ).

9. A crystalline polymorph according to any one of claims 1 or 6 to 8, which is the type β polymorph and provides:

   a) a X-Ray powder diffraction (XRPD) pattern substantially in accordance with Figure 1, and/or
   b) a DSC pattern substantially in accordance with Figure 2, and/or
c) an infrared spectrum substantially in accordance with Figure 4.

10. A type β crystalline polymorph of 5-(2-((6-(2,2-difluoro-2-phenylethoxy)hexyl)amino)-1 (R)-hydroxyethyl)-8-hydroxyquinolin-2(1H)-one heminapadisylate, which has:
   a) an X-Ray Powder Diffraction (XRPD) pattern with peaks at 19.1, 19.7 and 22.8 degrees 2θ (± 0.1 degrees 2θ); and/or
   b) a Differential Scanning Calorimetry (DSC) trace which shows an endotherm with an onset at 190 ⁰C (± 1 ⁰C); and/or
   c) an infrared spectrum with absorption bands at 1650, 1185, 1031, and 764 cm⁻¹ (± 1 cm⁻¹).

11. A type β crystalline polymorph according to claim 10, which has:
   a) an X-Ray Powder Diffraction (XRPD) pattern as defined in any one of claims 7 to 9; and/or
   b) a Differential Scanning Calorimetry (DSC) as defined in claim 9; and/or
   c) an infrared spectrum as defined in any one of claims 7 to 9.

12. A crystalline polymorph according to any one of claims 1 to 5, which is the hydate polymorph and which is isolated in a pure form or is admixed with a polymorph selected from the type β polymorph as defined in any one of claims 1 and 6 to 11 and the type a polymorph.

13. A crystalline polymorph according to any one of claims 1 and 6 to 11, which is the type β polymorph and is isolated in a pure form or is admixed with a polymorph selected from the hydrate polymorph as defined in any one of claims 1 to 5 and the type a polymorph.

14. A pharmaceutical composition comprising a therapeutically effective amount of a crystalline polymorph according to any one of claims 1 to 13 and a pharmaceutically acceptable carrier.

15. The pharmaceutical composition according to claim 14, wherein the composition is formulated for administration by inhalation.

16. The pharmaceutical composition according to claim 15, which comprises less than 0.1 wt% of an additive for improving the Fine Particle Fraction (FPF).

17. The pharmaceutical composition of any one of claims 14 to 16, wherein the composition further comprises a therapeutically effective amount of one or more other therapeutic agent.

18. The pharmaceutical composition of claim 17 wherein the other therapeutic agent is a corticosteroid, an anticholinergic agent, and/or a PDE4 inhibitor.

19. The pharmaceutical composition of claim 17 or 18 wherein the other therapeutic agent is a corticosteroid selected from the group consisting of prednisolone, methylprednisolone, dexamethasone, dexamethasone acetate, dexamethasone cipiclate, naflcocort, deflazacort, halopredone acetate, budesonide, beclomethasone dipropionate, hydrocortisone, triamcinolone acetonide, fluticasone propionate, prednisolone, dexamethasone palmitate, tipredane, hydrocortisone acetone, prednicarbate, aclometasone dipropionate, halometasone, methylprednisolone sulpetnate, mometasone, mometasone furoate, rimexolone, prednisolone farnesylate, ciclesonide, butixocort propionate, RS-85095, CGP-13774, GW-250495, deltacortisone, O-Prednisolone, NO-Budesonide, etiprednol dicloacetate, QAE-397, 7beta-OH-EPIA, RPR-106541, depodrone propionate, fluticasone, fluticasone propionate, fluticasone furoate, halobetasol propionate, loteprednol etabonate, betamethasone butyrate propionate, flunisolide, prednisolone, dexamethasone sodium phosphate, triamcinolone, betamethasone 17-valerate, betamethasone, betamethasone dipropionate, 21-Chloro-11beta-hydroxy-17alpha-[2-(methylsulfanyl)acetoxy]-4-pregnene-3,20-dione, des-isobutyrylciclesonide, hydrocortisone acetate, hydrocortisone sodium succinate, prednisolone sodium phosphate and hydrocortisone probutate, prednisolone sodium metasulfobenzoate and clobetasol propionate.

20. The pharmaceutical composition of claim 17 or 18 wherein the other therapeutic agent is an anticholinergic agent selected from the group consisting of tiotropium salts, oxtropium salts, flutropium salts, ipratropium salts, glycopyrronium salts, tropium salts, zamifenacin, revatropate, espatropate, darotropium bromide, CI-923, NPC-14695,
The pharmaceutical composition according to any one of claims 17 to 18 wherein the other therapeutic agent is 2-adrenergic receptor activity.

The method of treating a pulmonary disease or condition in a mammal associated with 2-adrenergic receptor activity, the method comprising administering to the mammal, a therapeutically effective amount of a pharmaceutical composition as defined in any one of claims 14 to 22.

The method of claim 24 wherein the pulmonary disease is asthma or chronic obstructive pulmonary disease.

The method according to claim 24 or 25, which method further comprises administering a therapeutically effective amount of one or more other therapeutic agent, as defined in any one of claims 17 to 22.

The pharmaceutical composition of claim 17 or 18 wherein the other therapeutic agent is a PDE4 inhibitor selected from the group consisting of mometasone furoate, ciclesonide, budesonide, fluticasone propionate, fluticasone furoate, tiotropium salts, glycopirrolate, 3-(2-Hydroxy-2,2-bis(2-thienyl)acetoxy)-1-(3-phenoxypyrrol)-1-azoniabicyclo[2.2.2]octane salts (in particular acidinium salts, more preferably acidinium bromide), 1-(2-Phenylethyl)-3-(9H-xanthen-9-ylcarboxyloxy)-1-azoniabicyclo[2.2.2]octane salts, 2-oxo-1,2,3,4-tetrahydroquinazoline-3-carboxylic acid etho-8-methyl-8-azacyclo[3.2.1]oct-3-yl ester salts (DAU-5884), 3-(4-Benzylpiperazin-1-yl)-1-cyclobutyl-1-hydroxy-1-phenylpropan-2-one (NPC-14695), N-[1-(6-Aminopiridin-2-yl)methyl]pyperidin-4-yl]-2(R)-[3,3-difluoro-1(R)-cyclopentyl]-2-hydroxy-2-phenylacetamide (J-104135), 2(R)-Cyclopentyl-2-hydroxy-N-[1-(4-Methyl-3-pententyl)-4-piperidinyl]-2-hydroxy-2-phenylethanamide (J-104129), 1-[4-(2-Aminoethyl)piperidin-1-yl]-2(R)-[3,3-difluorocyclopent-1(R)-yl]-2-hydroxy-2-phenylethan-1-one (Banyu-280634), N-[N-[2-[N-1-(Cyclohexylmethyl)piperidin-3(R)-ylmethyl]carbamoy]ethyl[carbamoyl]methyl]pyrrolidin-9-yl]-3,3,3-triphenylpropionamidone (Banyu CPTP), 2(R)-Cyclopentyl-2-hydroxy-2-phenylacetic acid 4-{3-azabiciclo[3.1.0]hex-3-yl}-2-butylnyl ester (Ranbaxy 364057), 3(R)-4,4-Bis(4-fluorophenyl)-2-oxoimidazolidin-1-yl]-1-methyl-1-[2-oxo-2-(3-thienyl)ethyl]pyrrolidinium iodide, N-[1-(3-Hydroxybenzyl]-1-methylpiperidin-3(S)-yl]-N-[N-[isopropoxyacarbonyl]phenyl]carbamoy]-L-tyrosinamide trifluoroacetate, UCB-101333, Merck’s OrM3, 7-endo-(2-hydroxy-2,2-diphenylacetoxy)-9,9-dimethyl-3-oxa-9-azoniatricyclo[3.3.1.0(2,4)]nonane salts, 7-endo-(2-hydroxy-2,2-diphenylacetoxy)-9,9-dimethyl-3-oxa-9-azoniatricyclo[3.3.1.0(2,4)]nonane salts.

The pharmaceutic composition of claim 17 or 18 wherein the other therapeutic agent is a PDE4 inhibitor selected from the group consisting of benafentrine dimaleate, etazolato, denbufylline, rolipram, cipamfylline, zardaverine, arofylline, filaminat, tipefukast, tofimilast, picamfylline, tafamidil, tofimilast, rolipram, rofuminat, cimilast, oglumlilast, apremilast, tetomilast, revamilast, oromilast, (R)-(+)-4-[2-(3-Cyclopentylcarboxyloxy)-2-phenylethyl]pyridine (CDP-840), N-(3,5-Dichloro-4-pyridinyl)-2-[1-(4-fluorobenzyl)-5-hydroxy-1H-indol-3-yl]-2-oxoacetamide (GSK-842470), 9-(2-Fluorobenzyl]-N6-methyl-2-(trifluromethyl)adenine (NCS-613), N-(3,5-Dichloro-4-pyridinyl)-8-methoxyquinoline-5-carboxamide (D-4418), 3-[3-Cyclopentyl-4-methoxybenzyl]-6-(ethylamino)-8-isopropyl-3H-purine hydrochloride (V-11294A), 6-[3-(N,N-Dimethylcarbamoyl)phenylsulfonyl]-4-(3-methoxyphenylamino)-8-methylquinoline-3-carboxylic acid hydrochloride (GSK-256066), 4-[6,7-Diethoxy-2,3-bis(hydroxymethyl)naphthalen-1-yl]-1-(2-methoxy-ethyl)pyridin-2(1H)-one (T-440), (-)-trans-2-[3′-[3-(N-Cyclopropylcarbamoyl)-4-oxo-1,4-dihydro-1,8-naphthyridin-1-yl]-3-fluorobiphenyl-4-yl]cyclopropane-carboxylic acid, MK-0873, CDC-801, GSK-356278, TA-7906, CP-80633, PL-554, NIK-616, GDP-1116, D4396, UK-500001, BLX-914, 2-carbomethoxy-4-cyano-4-(3-cyclopentylmethoxy-4-difluoromethoxyphenyl)cyclohexan-1-one, cis-[4-cyano-4-(3-cyclopentylmethoxy-4-difluoromethoxyphenyl)cyclohexan-1-ol, 5(S)-[3-(Cyclopentyl)-4-methoxypyrrol]-3(S)-[3-(methylbenzy)piperidin-2-one (IPL-455903), ONO-6126 (Eur Respir J 2003, 22 (Suppl. 45): Abst 2557) and the compounds claimed in the PCT patent applications number WO 03/097613, WO 2004/058729, WO 2005/049581, WO 2005/123693, WO 2005/123692, and WO 2010/069504.
27. Use of a crystalline polymorph according to any one of claims 1 to 13 or a pharmaceutical composition according to any one of claims 14 to 22, in the manufacture of a medicament for the treatment of a pulmonary disease or condition, as defined in claim 24 or 25, in a mammal.

28. A crystalline polymorph according to any one of claims 1 to 13, or a pharmaceutical composition according to any one of claims 14 to 22, for use in the treatment of a pulmonary disease or condition, as defined in claim 24 or 25.
Figure 1: X-Ray Powder Diffraction (XRPD) pattern of Type β polymorph of 5-(2-(6-(2,2-Difluoro-2-phenylethoxy)hexylamino)-1(R)-hydroxyethyl)-8-hydroxyquinolin-2(1H)-one heminapadisylate.
Figure 2: DSC pattern of Type β polymorph of 5-(2-(6-(2,2-Difluoro-2-phenylethoxy)hexylamino)-1(R)- hydroxyethyl)-8-hydroxyquinolin-2(1H)-one heminapadisylate of the invention.
