Technical Field

[0001] The present patent application relates to fused pyrimidinedinedione derivatives with transient receptor potential ankyrin1 (TRPA1) activity.

Background of the Invention

[0002] The transient receptor potential (TRP) channels or receptors are pain receptors. They have been classified into seven subfamilies: TRPC (canonical), TRPV (vanilloid), TRPM (melastatin), TRPP (polycystin), TRPML (mucolipin), TRPA (ankyrin, ANKTM1) and TRPN (NOMPC) families. The TRPC family can be divided into 4 subfamilies (i) TRPC1 (ii) TRPC2 (iii) TRPC3, TRPC6, TRPC7 and (iv) TRPC4, TRPC5 based on sequence functional similarities. Currently the TRPV family has 6 members. TRPV5 and TRPV6 are more closely related to each other than to TRPV1, TRPV2, TRPV3 or TRPV4. TRPA1 is most closely related to TRPV3 and is more closely related to TRPV1 and TRPV2 than to TRPV5 and TRPV6. The TRPM family has 8 members. Constituents include the following: the founding member TRPM1 (melastatin or LTRPC1), TRPM3 (KIAA1616 or LTRPC3), TRPM7 (TRP-PLIK, ChaK(1), LTRPC7), TRPM6 (ChaK2), TRPM2 (TRPC7 or LTRPC2), TRPM8 (TRP-p8 or CMR1), TRPM5 (MTR1 or LTRPC5) and TRPM4 (FLJ20041 or LTRPC4). The TRPML family consists of the mucolipins, which include TRPML1 (mucolipin 1), TRPML2 (mucolipin 2) and TRPML3 (mucolipin 3). The TRPP family consists of two groups of channels: those predicted to have six transmembrane domains and those that have eleven. The TRPA family is ANKTM1.

[0003] It is believed TRPA1 is expressed in nociceptive neurons. Nociceptive neurons of the nervous system sense the peripheral damage and transmit pain signals. TRPA1 is membrane bound and most likely acts as a heterodimeric voltage gated channel. It is believed to have a particular secondary structure, its N-terminus is lined with a large number of ankyrin repeats which are believed to form a spring-like edifice. TRPA1 is activated by a variety of noxious stimuli, including cold temperatures (activated at 17°C), pungent natural compounds (e.g., mustard, cinnamon and garlic) and environmental irritants (MacPherson LJ et al, Nature, 2007, 445; 541-545). Noxious compounds activate TRPA1 ion channels through covalent modification of cysteines to form covalently linked adducts. Variety of endogenous molecules produced during tissue inflammation / injury have been identified as pathological activators of TRPA1 receptor. These include hydrogen peroxide which is produced due to oxidative stress generated during inflammation, alkenyl aldehyde 4-HNE - an intracellular lipid peroxidation product and cyclopentenone prostaglandin 15dPGJ2 which is produced from PGD2 during inflammation / allergic response. TRPA1 is also activated in receptor dependant fashion by Bradykinin (BK) which is released during tissue injury at peripheral terminals.

[0004] The difference between TRPA1 and other TRP receptors is that TRPA1 ligand binding persists for hours due to which the physiological response (e.g., pain) is greatly prolonged. Hence to dissociate the electrophile, an effective antagonist is required.

[0006] In efforts to discover better analgesics for the treatment of both acute and chronic pain and to develop treatments for various neuropathic and nociceptive pain states, there exists a need for a more effective and safe therapeutic treatment of diseases, conditions and/or disorders modulated by TRPA 1.

For instance, the compounds and pharmaceutical compositions as described herein are suitable for treatment or prophylaxis of the following diseases, conditions and disorders mediated or associated with the activity of TRPA1 receptors: pain, chronic pain, complex regional pain syndrome, neuropathic pain, postoperative pain, rheumatoidarthritic pain, osteoarthritic pain, back pain, visceral pain, cancer pain, algesia, neuralgia, migraine, neuropathies, diabetic neuropathy, sciatica, HIV-related neuropathy, postherpetic neuralgia, fibromyalgia, nerve injury, ischaemia, neurodegeneration, stroke, post stroke pain, multiple sclerosis, respiratory diseases, asthma, cough, COPD, inflammatory disorders, oesophagitis, gastroesophageal reflux disorder (GERD), irritable bowel syndrome, inflammatory bowel disease, pelvic hypersensitivity, urinary incontinence, cystitis, bums, psoriasis, eczema, emesis, stomach duodenal ulcer and pruritus. The connection between therapeutic effect and inhibition of TRPA1 is illustrated, for example, in Story GM et al, Cell, 2003, 112, 819-829; McMahon SB and Wood JN, Cell, 2006, 124, 1123-1125; Voorhoeve PM et al, Cell, 2006, 124, 1169-1181; Wissenbach U, Niemeyer BA and Flockerzi V, Biology of the Cell, 2004, 96, 47-54, Dayne YO, Albert YH & Michael X, Expert Opinion on Therapeutic Targets, 2007, 11(3), 391-401 and the references cited therein.

Pain can be acute or chronic. While acute pain is usually self-limiting, chronic pain persists for 3 months or longer and can lead to significant changes in a patient’s personality; lifestyle, functional ability and overall-quality of life (K. M. Foley, Pain, in Cecil Textbook of Medicine; J. C. Bennett & F. Plum (eds.), 20th ed., 1996, 100-107). The sensation of pain can be triggered by any number of physical or chemical stimuli and the sensory neurons which mediate the response to this harmful stimulus are termed as “nociceptors”. Nociceptors are primary sensory afferent (C and Aδ fibers) neurons that are activated by a wide variety of noxious stimuli including chemical, mechanical, thermal and proton (pH<6) modalities. Nociceptors are the nerves which sense and respond to parts of the body which suffer from damage. They signal tissue irritation, impending injury, or actual injury. When activated, they transmit pain signals (via the peripheral nerves as well as the spinal cord) to the brain.

Chronic pain can be classified as either nociceptive or neuropathic. Nociceptive pain includes tissue injury-induced pain and inflammatory pain such as that associated with arthritis. Neuropathic pain is caused by damage to the...
sensory nerves of the peripheral or central nervous system and is maintained by aberrant somatosensory processing. The pain is typically well localized, constant and often with an aching or throbbing quality. Visceral pain is the subtype of nociceptive pain that involves the internal organs. It tends to be episodic and poorly localized. Nociceptive pain is usually time limited, meaning when the tissue damage heals, the pain typically resolves (arthritis is a notable exception in that it is not time limited).

The formyl derivative of formula (13) can be prepared by formylation of uracil derivative of formula (1) [Senda, S. et al., Yakugaku Zasshi, 1971, 91, 1372] followed by bromination of formyl derivative thus formed. Cyclization of formyl derivative of formula (13) [as described in Senda, S et al., Synthesis, 1978, 463-465] with amine of the formula (19) in suitable solvent (e.g., EtOAc) followed by halogenation using suitable halogenating reagent (e.g., N-bromosuccinimide, N-iodosuccinimide, Br2 in acetic acid) gives halopyrrole of general formula (14). Transformation of allyl pyrrole of formula (16) into corresponding aldehyde can be accomplished by methods known in the art [e.g., Postema, M. H. D. et al., in J. Org. Chem., 2003, 68, 4748-4754]. Further oxidation of aldehyde thus formed can be carried out by oxidation methods well known in the literature to give corresponding carboxylic acid of general formula (17). Scheme 6

An alternative approach for the synthesis of compounds of the general formula (Ic-1) is described in Scheme 7. Reaction of commercially available 6-aminouracil derivative of the formula (26) with chloroacetaldehyde dimethyl acetal gives pyrrole derivative (as described by Noell, G. W. et al., J. Het. Chem., 1964, 34-41) which upon alkylation with appropriate alkylation agent (R^aX) gives compound of formula (27). Compound of formula (27) can be converted into α-keto ester of general formula (28) using oxalyl chloride followed by reaction of acid chloride thus formed with anhydrous protic solvent (e.g., methanol, ethanol, tert-butanol). Deoxygenation of α-keto ester of general formula (28) with triethylsilane in the presence of trifluoroacetic acid affords ester of general formula (29) [similar procedure described by Han, Q. et al., J. Med. Chem., 2000, 43, 4398-4415]. Acidic hydrolysis of ester of formula (29) gives corresponding carboxylic acid of formula (25). Coupling of carboxylic acid of formula (25) with appropriate amines of formula (18) by using a standard amide coupling method give compounds of general formula (Ic-1).
An approach for the synthesis of compounds of the general formula (Id-1) where $R^1$, $R^2$, $U$ and $V$ are as defined herein above is depicted in Scheme 8. The synthesis starts from known 6-hydrazino-1,3-dimethyluracil (30) which is readily prepared by the displacement of halogen of 6-chloro-1,3-dialkyluracil of the formula (20) with hydrazine hydrate according to the known procedure. The cyclisation of compound of the formula (30) with acetic anhydride gave pyrazole of the formula (31) The deacetylation followed by selective $N$-alkylation of pyrazole (31) with dimethyl sulfate afforded compounds of the formula (33) (Pfleiderer, W. et al., Justus Liebig's Ann. Chem. 1958, 615, 42-47). The reaction of compound of formula (33) with dimethyl carbonate in presence of a strong base (e.g. NaH) under reflux conditions gives ester of the formula (34). Hydrolysis of ester (34) with aqueous acid afforded the desired pyrazolo[3,4-d] pyrimidinedione acetic acid of the formula (35). The coupling of compound of formula (35) with respective amines of formula (18) by using a standard amide coupling method gives compounds of general formula (Id-1).

Scheme 8

An approach for the synthesis of compounds of the general formula (Ie) where $R^1$, $R^2$, $U$ and $V$ are as defined herein above is also depicted in Scheme 9. Synthesis starts from readily available 1,3-dialkyobarbituric acid of the formula (36). The known 6-chloro-5-formyl-1,3-dimethyluracil of formula (37) wherein $R^1$ and $R^2$ are methyl is prepared according to a reported procedure (Singh, J. S. et al., Synthesis, 1988, 342-344). The reaction of 6-chloro-5-formyl-1,3-dimethyluracil (37) with hydroxylamine in methanol followed by dehydration with phosphorous oxychloride give 6-chloro-5-cyano-1,3-dimethyluracil of formula (38). The cyclisation of compounds of the formula (38) with alkylhydrazine of the formula (39) in the presence of suitable base afforded amino pyrazole of the formula (40) The amino pyrazole (40) on diazotization followed by halide substitution with copper halide (such as copper bromide or copper iodide) gives a halide derivative of the formula (41) (wherein $X$ is halogen) Suzuki-Miyaura coupling reaction of aryl halide of formula (41) with allyl boronic acid pinacol ester of the formula (15) as described by Kotha et al., Synlett, 2005, 12, 1877-1890) gives allyl pyrazole of the formula (42). This can be converted to pyrazolo[3,4-d]pyrimidiny lacetic acid of the formula (43) by oxidative cleavage methods well known in the literature The coupling of carboxylic acid of the formula (43) with respective amines of formula (18) by using a standard amide coupling method can give compounds of general formula (Ie).
An approach for the synthesis of compounds of the general formula (If-1) where R₁, R₂, U and V are as defined herein above is depicted in Scheme 10. The approach described is similar to that described by Papesch, P. et al., J. Org Chem., 1965, 30, 199-203. Compound of the formula (44) was prepared by nitration of pyrimidine-2,4(1H,3H)-dione of the formula (1) followed by reduction (Egg, H. et al., Synthesis, 1982, 12, 1071-1073) The compound of the formula (44) was transformed into the compound of the formula (45) by diazotization followed by in situ cyclisation with base (eg. NaOH). The compound of the formula (45) on alkylation with suitable 2-halo-acetamide of general formula (4) in the presence of a suitable base (e.g Cs₂CO₃, NaH etc.) and a suitable solvent (e.g. DMF, THF, DMSO etc.) gives compound of general formula (If-1).

The 2-haloacetamides of formula (53) (wherein R₂ is selected from alkyl, cyano, halogen, haloalkyl, alkoxy, haloalkoxy, cycloalkylalkoxy and arylalkoxy, and ‘p’ is selected from 0 to 5) required for the synthesis of compound of the present invention can be prepared according to methods known to one skilled in the art (Carroll, L. et al., J. Am. Chem. Soc., 1950, 72, 3722-3725; Ohkubo, M. et al., Chem. Pharm. Bull., 1995, 43(9), 1497-1504). Thus, acylation of an aryl, heteroaryl or aryl alkyl amine with bromoacetyl bromide in the presence of a suitable base such as triethylamine or pyridine gives N-substituted bromoacetamide of the general formula (53) (Scheme 11).

A few of aniline derivatives, arylalkylamines and 2-amino-4-arylthiazoles (52) were commercially available. Many of the disubstituted and trisubstituted arylaminothiazoles were prepared from appropriate aryl alkyl ketones. Commercially unavailable aryl alkyl ketones were prepared from the corresponding benzoic acids as shown in Scheme 11.
Substituted benzoic acid of the formula (46) was converted to the corresponding acetophenone in three steps as shown in Scheme 11. Thus, acid (46) was converted to the corresponding acid chloride (47) using oxalyl chloride in the presence of catalytic amounts of DMF in dry dichloromethane. Alternatively, this transformation can be carried out using excess thionyl chloride. The acid chloride (47) was converted to corresponding Weinreb amide (48) by treating with N,O-dimethyl hydroxylamine hydrochloride in the presence of a suitable base such as triethylamine. Addition of methyl magnesium iodide to Weinreb amide (48) gives acetophenone derivative of the formula (49). In addition, commercially unavailable aryl alkyl ketones were prepared from mono or di-substituted phenol (50) as depicted in Scheme 11. Thus, acetylation of phenol (50) with acetic anhydride followed by Fries rearrangement of the ester formed in the presence of Lewis acid (e.g., AlCl3) affords corresponding hydroxyacetophenone of general formula (51). Alkylation of hydroxyacetophenone of general formula (51) with suitable alkyl halide in suitable base (e.g., NaH, Cs2CO3) and suitable solvent (e.g., DMSO, THF, DMF) gives acetophenone derivative of general formula (49).

The aryl alkyl ketone of the formula (49) is converted to 2-aminothiazole of the formula (52) in one step by its reaction with thiourea in the presence of iodine in ethanol. This conversion is similar to the one described by Carroll, K. et al., J. Am. Chem. Soc. 1950, 73, 3722; and Naik, S., J.; Halkar, U. P., ARKIVOC, 2005, xiii, 141-149. Alternatively, 2-aminothiazoles of the formula (52) can be prepared by the reaction of compounds of formula (49) with bromine in acetic acid to give the alpha halo intermediate, which on reaction with thiourea in THF at reflux condition give compounds of the formula (52). The compound of the formula (52) is converted to 2-bromo-N-thiazolyl acetamide of the formula (53) by acylation with bromoacetyl bromide in the presence of a suitable base (e.g., pyridine or triethylamine) and in a suitable solvent (e.g., THF, DMF).

5-Aryl-1H-imidazol-2-amines of the formula (55) were prepared as shown in Scheme 12. The reaction of acetophenones of the formula (49) (wherein R2 and 'p' are as defined above in scheme 11) with bromine in acetic acid to give the alpha bromo intermediate, which on reaction with acetyl guanidine in acetonitrile at reflux condition give compounds of the formula (54). The deacetylation of (54) in the presence of catalytic amount of concentrated sulphuric acid using suitable solvent afforded desired 5-Aryl-1H-imidazol-2-amine of the formula (55). (This is similar to procedure reported by Thomas, L. et al., J. Org. Chem., 1994, 59, 7299-7305)

The intermediates and examples described herein are prepared using the procedure described below. The preparation methods which fall under the scope of claim as well the intermediate 8 represent embodiments of the invention. The other examples are only reference embodiments.

General procedure for the preparation of 2-amino-4-aryl thiazoles:

Method 1

A solution of acetophenone derivative (1.0 eq) in glacial acetic acid (5 vol) was added liquid bromine (1.0 eq) at 0 °C and reaction mixture was stirred at room temperature for 2h. The reaction mixture was diluted with water and extracted with ethyl acetate, washed with brine and dried over Na₂SO₄. The crude product obtained upon concentration was dissolved in dry THF (10 vol) and thiourea (2.0 eq) was added and refluxed for overnight. The reaction mixture was diluted with ethyl acetate, washed with sodium thiosulfate solution and organic layer was treated with 1N HCl to result salt formation of the amine. The precipitated salt was collected by filtration. The salt was then treated with saturated solution of NaHCO₃ to re-generate the amine. The mixture was extracted with dichloromethane (2x 50 ml) and the combined organic extracts were washed with water and brine. The solvent was evaporated under reduced pressure to afford the 2-amino-4-aryl-thiazole derivative.

Method 2

A solution of acetophenone derivative (1.0 equiv.), thiourea (2.0 equiv.) and iodine (1.0 equiv.) in dry ethanol (5 vol) was refluxed for 24 h. The reaction mixture was diluted with ethyl acetate and the layers were separated. The organic layer was washed with sodium thiosulfate solution to remove iodine. The ethyl acetate solution was treated with 1N HCl and precipitated salt collected by filtration. The free amine was re-generated as described in Method 1 given above.

All the 2-amino-4-aryl-thiazole derivatives were prepared by either Method 1 or Method 2 starting from appropriate aryl alkyl ketones. Structure information and characterization data for selected intermediates are given in Table 2.

5-(4-Bromophenyl)isoxazol-3-amine used for the preparation of Examples 33, 65 and 84 is purchased from Aldrich. 5-(Trifluoromethoxy)-1,3-benzothiazol-2-amine used for the preparation of Example 66 is also purchased from Aldrich.
For further illustration of methods of preparing the compounds of formula (I) the following examples are disclosed below.

**EXAMPLES**

General procedure for the preparation of Examples

**Method A:**

To a stirred mixture of pyrrolo[3,2-d]pyrimidinedione (Intermediates 1-6, 1.0 equiv.) or pyrazolo[4,3-d]pyrimidinedione (Intermediates 9-10, 1.0 equiv.) and NaH (1.5 equiv.) in dry DMF (10 ml/g) was added 2-bromo-N-phenyl-1,3-thiazol-2-yl acetamide (1.1 equiv.) at 0°C, the reaction mixture was warmed to room temperature and stirred for 30 min. The reaction mixture was heated to 80°C for overnight. After this time, the reaction mixture was concentrated under reduced pressure and the residue purified by silica gel column chromatography by using 2 % methanol in chloroform to afford the product.

**Method B:**

To a stirred solution of (1,3,7-Trimethyl-2,4-dioxo-2,3,4,7-tetrahydro-1H-pyrrolo[2,3-d]pyrimidin-5-yl)acetic acid (Intermediate 7, 1.0 equiv.) or 2,5,7-Trimethyl-4,6-dioxo-4,5,6,7-tetrahydro-2H-pyrazolo[3,4-d]pyrimidin-3-yl)acetic acid (Intermediate 8, 1.0 equiv.) in 1,2-dichloroethane was added EDCI (1.2 equiv.), HOBt (0.3 equiv.) and 4-dimethylaminopyridine (0.1 equiv.) and the mixture was stirred at room temperature for 10-15 min. An appropriate amine (1.0 equiv.) was then added and mixture was stirred at the same temperature for 48 h. The solvent was evaporated under reduced pressure and the residue obtained was diluted with methanol and stirred at room temperature for 30 min. The solid separated out was collected by filtration. The solid product was further purified by recrystallization from isopropanol or methanol to give the desired products.

Pharmacological activity

[0306] The illustrative examples 1-85 are screened for TRPA1 activity according to a modified procedure described in (a) Tóth, A. et al., Life Sciences, 2003, 73, 487-498. (b) McNamara C, R. et al., Proc. Natl. Acad. Sci. U.S.A., 2007, 104, 13525-13530. The screening of the compounds can be carried out by other methods and procedures known to persons skilled in the art.

Screening for TRPA1 antagonist using the \(^{45}\text{Ca}\) uptake assay

[0307] The inhibition of TRPA1 receptor activation was measured as inhibition of allyl isothiocyanate (AITC) induced cellular uptake of radioactive calcium. Test compounds were dissolved in DMSO to prepare 10 mM stock solution and then diluted using plain medium with 0.1% BSA and 1.8 mM CaCl\(_2\) to get desired concentration. Final concentration of DMSO in the reaction was 0.5% (v/v). Human TRPA1 expressing CHO cells were grown in F-12 DMEM medium with 10% FBS, 1% penicillin-streptomycin solution, 400 \(\mu\)g / ml of G-418. Cells were seeded 24 h prior to the assay in 96 well plates so as to get \(\sim\) 50,000 cells per well on the day of experiment. Cells were treated with test compounds for 10 min followed by addition of AITC at a final concentration of 30 \(\mu\)M and 5 \(\mu\)Ci/ml \(^{45}\text{Ca}\) for 3 min. Cells were washed and lysed using buffer containing 1% Triton X-100, 0.1% deoxycholate and 0.1% SDS. Radioactivity in the lysate was measured in Packard Top count after addition of liquid scintillant. Concentration response curves were plotted as a % of maximal response obtained in the absence of test antagonist. \(I_{C50}\) value was calculated from concentration response curve by nonlinear regression analysis using GraphPad PRISM software.

[0308] The compounds prepared were tested using the above assay procedure and the results obtained are given in Table 3. Percentage inhibition at concentrations of 1.0 \(\mu\)M and 10.0 \(\mu\)M are given in the table along with \(I_{C50}\) (nM) details for selected examples. The \(I_{C50}\) (nM) values of the compounds are set forth in Table 3 wherein "A" refers to an \(I_{C50}\) value of less than 50 nM, "B" refers to \(I_{C50}\) value in range of 50.01 to 100.0 nM and "C" refers to an \(I_{C50}\) values above 100.0 nM.
