Abstract

Use of carboxamides of the formula (I)

R¹—CO—NR²R³ (II),

in which

R¹ represents C₇-C₁₀-alkyl,
R² represents C₁-C₆-alkyl and
R³ represents H or C₁-C₆-alkyl

for promoting the penetration of agrochemical active substances into plants.
USE OF ALKYL CARBOXYLIC ACID AMIDES AS PENETRATION ENHANCERS

[0001] The invention relates to the use of N-monooalkyl- and N,N-diakyl-alkylcarboxamides in plant protection compositions and plant protection compositions comprising such compounds.

[0002] EP A 0 453 899 discloses the use of N,N-dimethyl-C₇₋C₁₀-alkylcarboxamides as crystallization inhibitors for certain azole fungicides, such as tebuconazole, which have a tendency to crystallize.

[0003] Surprisingly, it has now been found that alkylicarboxamides are suitable for increasing the penetration of agrochemical active substances across the cuticle of the plant and therefore for increasing the biological activity of plant protection compositions.

[0004] The present invention therefore relates to the use of carboxamides of the formula (I)

\[ R^1 \cdots CO \cdots NR^1R^2 \]  

(1)

in which

[0005] R¹ represents C₃₋C₁₀-alkyl,
[0006] R² represents C₃₋C₆-alkyl and
[0007] R¹ and R² are preferably identical or different, especially preferably identical, and unbranched or branched, saturated alkyl group having 1 to 4 carbon atoms, very especially preferably n-hexyl or n-octyl.

[0010] R¹ is preferably an unbranched or branched, saturated or unsaturated, especially preferably unbranched, saturated alkyl group having 5 to 11 carbon atoms, very especially preferably n-heptyl or n-octyl.

[0011] R¹ and R² are preferably identical or different, especially preferably identical, and unbranched or branched, especially preferably unbranched alkyl group having 1 to 4 carbon atoms, very especially preferably methyl.

[0012] Especially preferred compounds of the formula (I) are therefore those of the formula (Ia)

\[ R^1 \cdots CO \cdots NC(=NCH₃)\]  

(II)

in which

[0013] R¹ has the abovementioned meanings.

[0014] R¹ has the abovementioned meanings.

[0015] The following are very especially preferred: N,N-dimethyl-n-hexamine, N,N-dimethyl-octanamide, N,N-dimethyl-n-decanamide and N,N-dimethyl-n-dodecanamide, in particular N,N-dimethyl-octanamide and N,N-dimethyl-n-decanamide.

[0016] The compounds of the formula (I) are employed individually or in the form of mixtures. Preferred is not only the use of individual active substances but also the use of a mixture which is known under the trade names Hallcomid, Genagen or Agnique and which consists on average of 95% (unless otherwise specified, all percentages are percent by weight) N,N-dimethyl-hexamine, 5% N,N-dimethyl-octanamide, 40% N,N-dimethyl-decanamide and 5% N,N-dimethyl-dodecanamide.

[0017] The acid amides of the formula (I) are known and commercially available.

[0018] The amount of one or more compounds of the formula (I) for the use according to the invention in plant protection compositions can vary within wide limits, depending on the active substance and the formulation type.

[0019] In a preferred embodiment, the acid amides of the formula (I) thus additionally act as solvents, while in another, likewise preferred embodiment, they act as additives for improving the biological activity. A further possibility is also the use as a tank mix additive, i.e. the addition to the spray mixture of the formulation and not as integral component of the formulation, and the use of the formulation as mixing partner for improving the biological activity of other agents as the result of an enhanced penetration.

[0020] Plant protection compositions according to the invention, i.e. plant protection compositions which, in accordance with the invention, comprise one or more acid amides (I) for increasing the penetration of the active substance into plants, preferably have the following composition:

[0021] 1 to 90%, especially preferably 5 to 50%, of one or more agrochemical active substances,
[0022] 1 to 90%, especially preferably 5 to 70%, of one or more acid amides of the formula (I) and
[0023] 0 to 98% of other additives.

[0024] If the acid amides of the formula (I) do not act as solvents, but as pure additives for promoting the penetration of active substances into plants, they are preferably present in the plant protection compositions according to the invention in an amount of from 1 to 30%, especially preferably from 5 to 20%, in particular from 5 to 10%.

[0025] Since the mechanism of action of the acid amides (I) as penetrants is intrinsically independent of the nature of the agrochemical active substance employed, it is possible to use all active substances whose biological activity can be increased as the result of an enhanced penetration into a crop plant or a harmful plant.

[0026] The following may be mentioned by preference: fungicides, bactericides, insecticides, acaricides, nematocides, herbicides, plant growth regulators, plant nutrients, repellents with systemic properties, and contact-acting agents which are suitable as combination partners.

[0027] Furthermore preferred are systemic active substances, i.e. those which are taken up by the plant via the leaves or the roots and which are translocated in the sap, the plant’s transport system. Especially preferred active substances are those with a log P value of ≤ 4 (determined as specified in EC Directive 79/831 Annex V. A8 by HPLC, gradient method, acetonitrile/0.1% aqueous phosphoric acid), in particular those with a log P value of ≤ 4 and ≥ 0.1.

[0028] Examples of individual active substances are:

[0029] Fungicides:

[0030] 2-phenylethon-8-hydroxyquinoline sulphate; acibenzolar-S-metyl; aldimorph; amidfuran; amiprophos; amiprophos-methyl; azoxystrobin; benalaxyl-M; benodanil; benomyl; benthiavillcarb-isopropyl; benzamcarb; benzarcarb; bilanafos; binapacryl; biphenyl; bitertanol; blasticidin-S; boscalid; bromoconazole; bupirimate; buthiobate; butylamine; calcium polysulphide; captan; captan; carbendazim; carbosulfan; carpropamid; carvone; quinomethionate; chlobenthiazolone; chlorfenac; chloroeb; chlorothalonil; chlorzoline; cloxoazen; cyanofamid; cyflufenamid; cyloxanil; cyproconazole; cyprofuran; Daggler G; debacarb; dichlofluanid; dichlofluanid; dichlorophen; diclocymet; diclozine; dicloran; diethylfencarb; difenoconazole; difuranon; dimetiram; dimethomorph; dimoxystrobin; diniconazole; diniconazole-M; dinocap; diphenylamine; dipirythion; ditosomal; di-thianon; dodine; dithianon; edifenphos; epxiconazole; ethabucarb; ethirimol; etidiazole; famoxadone; fenamidone; fenapanil; fenarimol; fenbuconazole; fenfuram; fenhexamid; fenitropan; fenoxalin; fenpiclonil; fenpropidin; fenpropimorph; ferbam; fluazinam; flubenzimine; fludioxonil; flume moth; flum
morph; fluoromide; fluoxastrobins; fluquinconazole; flurprimidol; flusilazole; flusilamid; flutolanil; flutriafol; folpet; fosetyl-Al; fosetyl-sodium; fuberidazole; furazolidone; furametpyr; furcarb, furmecylcyclo; guazatine; hexachlorobenzene; hexaconazole; hymexazol; imazalil; imibenconazole; iminoctadine triacetate; iminoctadine tri(isoalbutilate); iodocarb; ipocene; iprobenfos; iprodisc; iprovalicarb; irurarimic; isoproturon; isowax; kasugamycin; kresoxim-methyl; mancozeb; mane; mefenozide; mepa

[0036] 1.2 organophosphates (for example acephate, azamethiphos, azaphos -(-methyl, -etyl), bromophos-ethyl, bromvenufos (-methyl), butathiofos, cadusafos, carbophenothion, chlorothalonil, chlorfenvimphos, clormephos, chlorpyrifos (-methyl)-ethyl), coumaphos, cyanofos, cyphos, demeton-S-methyl, demeton-S-methyl sulphone, diaflox, diazinon, dichlofluanid, dichlorvos/DCV, diclofop, dimethoate, dimethyvinphos, diooxabenzon, disulfoton, EPN, ethion, ethoprophos, etrimfos, fampur, fenamiphos, fenitrothion, fensulfothion, fenthion, flufenoxuron, fonofos, formothion, fosmet, fosribacarb, fosribacarbaz, hexafluorocarbon, hydrogen cyanide, isoprocarb, isoproturon, isoxaben, isoxaben, isoxadifen, isoxaflutole, isoproturon, isoxuron, kasugamycin, kresoxim-methyl, mancozeb, mane, mefenozide, mepa

[0037] 2. Sodium Channel Modulators/Voltage-Dependent Sodium Channel Blockers

[0038] 2.1 pyrethroids (for example acrinathrin, allethrin (d-cis,trans,d-trans), beta-cyfluthrin, bifenthrin, bioallethrin, bioallethrin-S-cyclopropyl-isomer, bioethanomethrin, bioperrmethrin, biomesmethrin, chlorpyrifos, cis-cypermethrin, cis-permethrin, cyfluthrin, cyhalothrin, cypermethrin (alpha, beta, theta, zeta), cyphenothrin, DDT, deltamethrin, emamectin (1R isomer), esfenvalerate, etofenprox, fenfluthrin, fenpropathrin, fenpyroximate, fenvalerate, flucythrinate, flufenprox, flumethrin, flufenoxuron, fluphenoxuron, gamma-cyhalothrin, imidacloprid, kethoprid, lambdacyhalothrin, metofluthrin, permethrin (cis-, trans-) fenpropathrin (1R isomer), piretrothrin, profluthrin, pyriproxyfen, resmethrin, remsmethrin, RI 15525, sibafloxan, taufluvalinate, tetramethrin, temephos (1R isomer), temprothrin, tetramethrin, transfluorothrin, X11 8901, pyrethrins (pyrethrum))

[0039] 2.2 oxadiazines (for example indoxacarbazole)

[0040] 3. Acetylcholine Receptor Agonists/Antagonists

[0041] 3.1 Chloronicotinyls/neonicotinoids (for example acetamiprid, clothianidin, dinofeturon, imidacloprid, nitenpyram, nithiazine, thiacloprid, thiamethoxam)

[0042] 3.2 nicotine, bensultap, cartap

[0043] 4. Acetylcholine Receptor Modulators

[0044] 4.1 spinosins (for example spinosad)

[0045] 5. GABA-Controlled Chloride Channel Antagonists

[0046] 5.1 cyclodiene organochlorines (for example carbaryl, chlorfenvinphos, clorsulon, gamma-HCH, HCH, heptachlor, lindane, methoxychlor)

[0047] 5.2 fipronils (for example acectoprole, ethioprole, fipronil, vinclozolin)

[0048] 6. Chloride Channel Activators

[0049] 6.1 meclizine (for example abamectin, avermectin, emamectin, emamectin-benzoate, ivermectin, milbemectin, milbemycin)

[0050] 7. Juvenile Hormone Mimetics

[0051] 7.1 fenoxycarb, fenoprofen, fenoxycarb, hydropropene, kinoprene, methoprene, pyriproxyfen, triptene

[0052] 8. Ecdysone Agonists/Disruptors

[0053] 8.1 diaocythiazines (for example chrotomafenozide, halofenozide, methoxyfenozide, tebufenozide)
[0054] 9. Chitin Biosynthesis Inhibitors
[0055] 9.1 benzoylurea (for example bistrifluoron, chlora-zuron, dibufenazon, fluthiazuron, fluclopyuron, flupenthoxyuron, hexafluron, hexuron, nivaluron, niflurazon, penfluroazon, trifluroazon, trifluralin)
[0056] 9.2 bupropozin
[0057] 9.3 cyrimazine
[0058] 10. Inhibitors of Oxidative Phosphorylation, ATP Disruptors
[0059] 10.1 diaflenuuron
[0060] 10.2 organon compounds (for example azycocin, cyhexatin, fenbutatine-oxide)
[0061] 11. Uncoupler of Oxidative Phosphorylation by Interrupting the H2/Proton Gradient
[0062] 11.1 pyroles (for example chloroacapyraz)
[0063] 11.2 dinitrophenols (for example binaacrylazon, dinobuton, dinocap, DNCO)
[0064] 12. Site-I Electron Transport Inhibitors
[0065] 12.1 MEBs (for example fenazaquin, fenpyroximate, pyrimidifen, pyridaben, tebufenpyrad, tolenpyrad)
[0066] 12.2 hydramethylnon
[0067] 12.3 dicofol
[0068] 12.4 Site-II Electron Transport Inhibitors
[0069] 13.1 rotenone
[0071] 14.1 acequinocoul, flucytrpyrim
[0072] 15. Microbial Disruptors of the Insect Gut Membrane
[0073] Bacillus thuringiensis strains
[0074] 16. Fat Synthesis Inhibitors
[0075] 16.1 tetrionic acids (for example spirodiclofen, spiromesifen)
[0076] 16.2 tetrionic acids [for example 3-(2,5-dimethylphenyl)-8-methoxy-2-oxo-1-azaspiro[4.5]deca-3-en-4-yl ethyl carbonate (also known as: carboxonic acid, 3-(2,5-dimethylphenyl)-8-methoxy-2-oxo-1-azaspiro[4.5]deca-3-en-4-yl ethyl ester, CAS-Reg.-No.: 382608-10-8) and carboxonic acid, cis-3-(2,5-dimethylphenyl)-8-methoxy-2-oxo-1-azaspiro[4.5]deca-3-en-4-yl ethyl ester (CAS-Reg.-No.: 203313-25-1)]
[0077] 17. Carbamoxides
[0078] (for example flonicamid)
[0079] 18. Octopaminergic Agonists
[0080] (for example amitriz)
[0081] 19. Inhibitors of Magnesium-Stimulated ATPase
[0082] (for example propargate)
[0083] 20. Phthalamides
[0084] (for example N1-[1,1-dimethyl]-2-(methylsulphonyl)ethyl]-3-iodo-N1-[2-methyl-1-[1,2,2,4-tetrafluor-1-trifluoromethyl]ethyl]benzamide (CAS-Reg.-No.: 272451-65-7), fuberdiamide)
[0086] (for example thiocyclan hydrogen oxalate, thioulat-sodium)
[0087] 22. Biologicals, Hormones or Pheromones
[0088] (for example azadirachtin, Bacillus species, Beauveria species, codlemone, Metarrhizium species, Paecilomyces species, thurinigienis, Verticillium species.)
[0089] 23. Active Compounds With Unknown or Unspecific Mechanisms of Action
[0090] 23.1 fumigants (for example aluminium phosphate, methyl bromide, sulphuryl fluoride)
[0091] 23.2 selective antifeedants (for example cryolite, fonicamid, pymetrozine)

[0092] 23.3 mito growth inhibitors (for example clofentezine, etoxazole, hexythiazox)

[0093] 23.4 amidoflumet, benclothiaz, benoximate, bifennate, bromopropylate, buprofezin, quinothiemate, chloridormine, chlorobenzilate, chloropricin, clothiazoben, cyclopene, cyflutenotef, dicyclan, fenoxacin, fenurifan, flubenzimine, flufenimin, gefluzin, goxysulpr, hydramethylone, juponilure, methoxazobine, petroleum, piperonyl butoxide, potassium oleate, pyrafluprole, pyridalyl, pyriprox, sulfluramid, tetradifon, tetrasul, triathane, verbatin, ...

[0094] furthermore the compound 3-methylphenyl propylcarbamate (tiamice), the compound 3-(5- (trifluoromethyl)phenyl)-8-(2,2,2-trifluoroethyl)-8-azaspiro[3.2]jocane-3-carbonitrite (CAS-Reg.-No.: 185982-80-3) and the corresponding 3-endo isomer (CAS-Reg.-No.: 185984-60-5) (cf. WO 96/37494, WO 98/25923), and preparations which contain insecitcidally active plant extracts, nematodes, fungi or viruses.

[0095] Herbicides:

[0096] Anilides such as, for example, difluafenan and propanil; arylationether acids such as, for example, dichloropicolinic acid, diamsa and picloram; aryloxyalkanoic acids such as, for example, 2,4-D, 2,4-DB, 2,4-DP, fluoroxyprpy, MCPA, MCPP and triclopyr; aryloxyphenoxalkanoic esters, such as, for example, diclofop-methyl, fenaproxam ethyl, fluazifop-buty, haloxyp-methyl and quizalofop-ethyl; azinones, such as, for example, chloridazon and norfluzuron; carbamates such as, for example, chloropropham, desmedipham, phenmedipham and propan; chloroacetanilides such as, for example, alachlor, acetochlor, butachlor, metazachlor, metolachlor, pretalin and propachlor; dinitroanilines such as, for example, oryzalin, pendimethalin and trifluralin; diphenyl ethers such as, for example, aciflurofen, bifenux, fluoroglycosen, fomesafen, halosafen, lactofen and oxyfluorfen; ureas such as, for example, chlorotoluron, diuron, fluometuron, isoproturon, linuron and methabenzthiazuron; hydroxylamines such as, for example, alloxadim, clethodim, cycloxydim, sethoxadim and tralkoxydim; imidazolinones such as, for example, imazachip, imazamethabenz, imaza pyr and imazquin; nitriles such as, for example, bromoxynil, dichlobenil and isoxynil; oxacetanilides such as, for example, metanuets; phthaloylureas such as, for example, amidotufluron, benzenufluron-methyl, chlorimuron-ethyl, chlorosulfuron, cinosulfuron, metsulfuron-methyl, nicosulfuron, primisufuron, pyrazolosulfuron-ethyl, thifensulfuron-methyl, triasulfuron and trinemuron-methyl; thiocarbamates such as, for example, butylate, cycloate, di-allate, EPTC, esprocarb, molate, prosulfocarb, thiohecarb and tri-allate; triazines such as, for example, atrazin, cyanazin, simazin, simetryne, terbutryne and terbutlyazin; triazinones such as, for example, hexazuron, metamitron and metribuzin; others such as, for example, aminovertazole, 4-amino-N1-(1,1-dimethylthyl)-4, 5-dihydro-3-(1-methylthyl)-5-oxo-111-1,2,4-triazole-1-carboxamide, benzensulfone, benzatone, cinmethylin, clomazone, clopyrmidin, dimezquaz, dithiopyt, ethoxisulfate, fluorochlordione, glutoxosine, glyphosate, isoxaben, pyridate, quinchloric, quinmerac, sulphosate and triphaladine.

[0097] Examples of plant growth regulators which may be mentioned are chloreholin chloride, thidiazuron, cyclanilide, ethephon, benlyladenine and giberelllic acid, and examples of the salfer groups which may be mentioned are mefenpyr, isochiban and eloquentoc-oxemyl.
Examples of plant nutrients which may be mentioned are conventional inorganic or organic fertilizers for providing plants with macronutrients and/or micronutrients.

Examples of repellents which may be mentioned are diethyltoluamide, ethyhexanediol and butopyronoxyl.

Preferred examples of fungicides are the strobilurin fungicides such as, for example,

[continued]

And theazole fungicides such as
Preferred examples of fungicides which may be mentioned are prothioconazole, fluoxastrobin, trifloxystrobin, spiroxamine and tebuconazole.

Prothioconazole is especially preferred, if appropriate as a mixture with one or more of the following active substances: spiroxamine, tebuconazole, fluoxastrobin, trifloxystrobin.

The formulation types which are suitable include all formulations which are applied to plants or their propagation material. The methods used for preparing them are generally known to the skilled worker and for example described in Winnacker-Küchler, "Chemische Technologie" [Chemical Technology], volume 7, C. Hanser Verlag Munich, 4th edition, 1986; J. W. van Valkenburg, "Pesticide Formulations", Marcel Dekker N.Y., 1973, K. Martens, "Spray Drying Handbook", 3rd Ed. 1979, G. Goodwin Ltd.; London, or Mollet, Grubenmann, "Formulierungstechnik" [Formulation Technology], Wiley-VCH-Verlag, Weinheim, 2000.

Examples of formulation types are all those mentioned in the "Manual on development and use of FAO and WHO specifications for pesticides" (FAO and WHO, 2002, appendix E) (in each case using the GCPF formulation codes with English abbreviation and name): AB Grain bait; AE Aerosol dispenser; AL Any other liquid; AP Any other powder; CF Capsule Suspension for Seed Treatment; CG Encapsulated granule; CL Contact liquid or gel; CP Contact powder; CS Capsule suspension; DC Dispersible concentrate; DP Dustable powder; DS Powder for dry seed treatment; DT Tablet for direct application; EC Emulsifiable concentrate; ED Electrochargeable liquid; EG Emulsifiable Granule; EO Emulsion, water in oil; EP emulsifiable powder; ES Emulsion for seed treatment; EW Emulsion, oil in water; FG Fine granule; FS Flowable concentrate for seed treatment; GF Gel for Seed Treatment; GG Macroganule; GL Emulsifiable gel; GP Flo-dust; GR Granule; GS Grease; GW Water soluble gel; HN Hot fogging concentrate; KK Combi-pack solid/liquid; KL Combi-pack liquid/liquid; KN Cold fogging concentrate; KP Combi-pack solid/solid; LA Lacquer; LS Solution for seed treatment; ME Microemulsion; MG Microgranule; OD oil dispersion; OF Oil miscible flowable concentrate/oil mis-
cible suspension; OL Oil miscible liquid; OP Oil dispersible powder, PA Paste; PC Gel or paste concentrate; PO Pour-on; PR Plant rodlet; PS Seed coated with a pesticide; PT Pellet; RB Bait (ready for use); SA Spot-on; SC suspension concentrate, SD suspension concentrate for direct application, SE Suspension; SG Water soluble granule; SL Soluble concentrate; SO Spreading oil; SP Water soluble powder; SS Water soluble powder for seed treatment; ST Water soluble tablet; SU Ultralow volume (ULV) suspension; TB Tablet; TC Technical material; TK Technical concentrate; UL Ultralow volume (ULV) liquid; VP Vapour releasing product; WG Water dispersible granules; WP Wettable powder; WS Water dispersible powder for slurry seed treatment; WT Water dispersible tablet; XTX Other

[0106] Liquid formulation types are preferred. These include the formulation types DC (GCPF formulation code for dispersible concentrate); EC (GCPF formulation code for emulsion concentrate); EW (GCPF formulation code for oil-in-water emulsion); ES (GCPF formulation code for emulsion for seed treatment); FS (GCPF formulation code for multipurpose concentrate for non-dusting); FO (GCPF formulation code for water-in-oil emulsion); MF (GCPF formulation code for microemulsion); SE (GCPF formulation code for suspo-emulsion); SL (GCPF formulation code for soluble concentrate); SS (GCPF formulation code for capsule suspension) and AL (GCPF formulation code for ready-to-use liquid formulation, any other liquids for undiluted use).

[0107] Emulsion concentrates (formulation type EC) are especially preferred.

[0108] Suitable additives which may be present in the formulations according to the invention, preferably the liquid formulations according to the invention, are all customary formulation adjuvants such as organic solvents, antifoams, emulsifiers, dispersants, preservatives, acids and bases, colorants, fillers and also water.

[0109] Antifoams which are suitable are conventional antifoams which are present in formulations of agrochemical active substances. Examples which may be mentioned are silicone oils, silicone oil dispersions, magnesium stearate, phosphonic and phosphonic acids, in particular Fluowet PL 806.

[0110] Suitable organic solvents are not only alkane-carboxamides, such as those of the formula (I), but also all customary organic solvents which thoroughly dissolve the agrochemically active substances employed. The following may be mentioned as being preferred: aliphatic and aromatic, optionally halogenated hydrocarbons such as toluene, xylene, Solvesso®, mineral oils such as white spirit, petroleum, alkylbenzenes and spindle oil, furthermore tetrachloromethane, chloroform, methylene chloride and dichloromethane, and furthermore esters such as ethyl acetate, lactates, furthermore lactones such as butyrolactone, moreover lactams such as N-methylpyrrolidone, N-ocetylpyrrolidone, N-dodecylpyrrolidone, N-ocetylcaprolactam and N-methylcaprolactam, γ-butyrolactone, dimethylformamide and tributyl phosphate.

[0111] Preference is given to carboxamides of the formula (I), especially where a N,N-dimethyl-n-octanamide and N,N-dimethyl-n-decanamide and their mixtures.

[0112] Suitable emulsifiers are conventionally used surface-active substances which are present in formulations of agrochemically active substances. Examples which may be mentioned are ethoxylated nonylphenols, polyethylene glycol ethers of linear alcohols, end-capped and non-end-capped alkoxylated linear and branched, saturated and unsaturated alcohols, reaction products of alkylyphenols with ethylene oxide and/or propylene oxide, ethylene oxide-propylene oxide block copolymers, polyethylene glycols and polypropylene glycols, furthermore fatty acid esters, end-capped and non-end-capped alkoxylated linear and branched, saturated and unsaturated fatty acids, fatty acid polyglycol ether esters, alkyl sulphonates, alkyl sulphates, aryl sulphates, ethoxylated arylalkylenols such as, for example tristyryl phenol ethoxylate with an average of 16 ethylene oxide units per molecule, furthermore ethoxylated and propoxylated arylalkylenols and sulphonated or phosphated arylalkylenol ethoxylates or -ethoxy- and -propoxylates. Especially preferred are tristyrylphenol alkylalkylates and fatty acid polyglycol ether esters. Very especially preferred are tristyrylphenol ethoxylates, tristyrylphenol ethoxy-propoxylates and castor oil polyglycol ether esters, in each case individually or in mixtures. If appropriate, additives such as surfactants or esters of fatty acids which contribute to improving the biological activity may also be used.

[0113] Dispersants which can be used are all substances which are conventionally employed in plant protection compositions for this purpose. In addition to the examples which are mentioned hereinabove as emulsifiers, the following may be mentioned by preference: natural and synthetic, water-soluble polymers such as gelatin, starch and cellulose derivatives, in particular cellulose esters and cellulose ethers, furthermore polyvinyl alcohol, polyvinylpyrrolidone, polyacrylic acid, polyethacryl and copolymers of (meth) acryl acid and (meth)acrylic esters, and furthermore alkali-metal-hydroxide-neutralized copolymers of methacrylol and methacryl esters.

[0114] Preservatives which can be used are all substances which are conventionally present in plant treatment compositions for this purpose. Examples which may be mentioned are Preventol® and Proxel®.

[0115] Colorants which are suitable are all inorganic or organic colorants which are conventionally used for the preparation of plant protection compositions. Examples which may be mentioned are titanium dioxide, carbon black, zinc oxide and blue pigments.

[0116] Fillers which are suitable are all substances which are conventionally employed in plant protection compositions for this purpose. The following may be mentioned by preference: inorganic particles, such as carbonates, silicates and oxides with a mean particle size of from 0.005 to 5 μm, especially preferably from 0.02 to 2 μm. Examples which may be mentioned are silicon dioxide, what are known as highly dispersed silica, silica gels, and natural and synthetic silicates and aluminosilicates.

[0117] Suitable compounds which act as emulsion stabilizers and/or crystallization inhibitors are all substances which are conventionally employed in plant protection compositions for this purpose.

[0118] The content of the individual components in the formulations according to the invention can be varied within a substantial range.

[0119] The preparation of the formulations according to the invention is accomplished for example in such a manner that the components are mixed with one another in the described ratios. If the agrochemical active substance is a solid, the latter is generally employed in finely ground form or in the form of a solution or suspension in an organic solvent or water. If the agrochemical active substance is liquid, the use
of an organic solvent can frequently be dispensed with. Moreover, a solid agrochemical substance may be employed in the form of a melt.  

[0120] When carrying out the process, the temperatures can be varied within a certain range. In general, the process is carried out at temperatures of between 0° C. and 80° C., preferably between 10° C. and 60° C.  

[0121] When carrying out the process according to the invention, a procedure is generally followed in which the acid amides (I) are mixed with one or more active substances and, if appropriate, with additives. The components can be mixed with one another in any order.  

[0122] The equipment which is suitable for carrying out the process according to the invention is customary equipment which is employed for the preparation of agrochemical formulations.  

[0123] Suitable application forms are all those methods which are known to the skilled worker as being conventionally used; examples which may be mentioned are: spraying, immersion, misting and a series of specific methods for the direct below- or above-ground treatment of whole plants or parts (seeds, root, stolons, stalks, stem, leaf), such as, for example, in the case of trees the injection into the stem or in the case of perennial plants stalk bands, and a series of specific indirect application methods.  

[0124] The specific application rate of the plant protection compositions of a wide range of formulation types for controlling the abovementioned harmful organisms, either based on area and/or the object to be treated varies greatly. In general, the application media which are known to the skilled worker as being conventionally used for the field of application in question, are employed in customary amounts, such as, for example, from several hundred litres of water per hectare in the case of standard spray methods to a few litres of oil per hectare in the case of Ultra Low Volume aerial application to a few millilitres of a physiological solution in the case of injection methods. The concentrations of the plant protection compositions according to the invention in the relevant application media therefore vary within a wide range and depend on the specific field of application. In general, concentrations are used which are known to the skilled worker as being conventionally used for the specific field of application. Preferred concentrations are from 0.01% by weight to 99% by weight, especially preferred concentrations from 0.1% by weight to 90% by weight.  

[0125] The agrochemical formulations according to the invention, for example in the use forms which are conventional for liquid preparations, can be applied either as such or after previously having been diluted with water, that is to say for example as emulsions, suspensions or solutions. The application here is accomplished by the customary methods, that is to say, for example, by spraying, pouring or injecting.  

[0126] The application rate of the agrochemical formulations according to the invention can be varied within a substantial range. It depends on the agrochemical active substances in question and on their content in the formulations.  

[0127] The invention furthermore relates to a method of promoting the penetration of agrochemical active substances into plants, the agrochemical active substance being applied to the plants either simultaneously or sequentially with one or more acid amides of the formula (I).  

[0128] Some of the plant protection compositions according to the invention are known and some are new.  

[0129] The invention also relates to a plant protection composition comprising  

[0130] a) 1 to 80% of one or more acid amides of the formula (I) as stated above,  

[0131] b) 1 to 90% of one or more agrochemical active substances and  

[0132] c) 0 to 98% of additives,  

[0133] the following agrochemical substances being excluded:  

[0134] A. an azole derivative of the formula (II)  

[0135] in which  

[0136] a) R1 represents  

[0137] R2 represents tert-butyl and  

[0138] R3 represents hydroxyl,  

[0139] or  

[0140] b) R1 represents 4-fluorophenyl,  

[0141] R2 represents 2-fluorophenyl and  

[0142] R3 represents hydroxyl,  

[0143] or  

[0144] c) represents 2,4-dichlorophenyl,  

[0145] R2 represents n-butyl and  

[0146] R3 represents hydroxyl,  

[0147] or  

[0148] d) R1 represents  

[0149] R2 represents phenyl and  

[0150] R3 represents cyano,  

[0151] or  

[0152] e) R1 represents 2-chlorobenzyl,  

[0153] R2 represents 1-chlorocycloprop-1-yl  

[0154] and  

[0155] R3 represents hydroxyl,  

[0156] or  

[0157] f) R1 represents 4-chlorophenyl  

[0158] R2 represents
and

R^3 represents hydroxyl,

and/or

an azole derivative of the formula (III)

R^4 —- O —- CH —- Y —- C(=CH)x

in which

Y represents —CH(OH) and

or

Y represents CO and

and/or

an azole derivative of the formula (IV)

Cl —- CH == C —- CH —- C(=CH)x

in which

R^5 represents hydrogen or chlorine,

and/or

1-[bis(4-hydroxyphenyl)methyl(2,4-triazole)]

B. a carbamate of the formula (VI)

Ar —- O —- C —- NRR'

where

Ar represents an aryl group or a heterocyclic group, each of which is optionally substituted,

and

R, R' represent H or methyl; and

C. thiadiazuron.

The invention also relates to a plant protection composition comprising

a) 1 to 30%, preferably 5 to 20%, especially preferably 5 to 10%, of one or more acid amides of the formula (I) as stated above,

b) 1 to 90% of one or more agrochemical active substances and
c) 0 to 98% of additives,

excluding tebuconazole and triadimenol as agrochemical active substances.

Preferred plant protection compositions according to the invention are those which comprise prothioconazole as agrochemical active substance, if appropriate in mixture with further agrochemical active substances.

As regards the use of herbicides, the plants treated in accordance with the invention are all weed species. As regards the protection of crop plants by the application of, for example, fungicides and insecticides, the use in economically important, including, for example, transgenic crops of useful plants and ornamentals, for example cereals such as wheat, barley, rye, oats, sorghum and millet, rice, cassava and maize, or else crops of peanut, sugar beet, cotton, soya, oilseed rape, potato, tomato, pea and vegetables is preferred.

The invention is illustrated in greater detail by the examples without being limited thereto.

EXAMPLES

Penetration Test

In this test, the measured quantity was the penetration of active substances across enzymatically isolated cuticles of apple tree leaves.

The leaves used were leaves which had been excised in the fully developed state from cv. Golden Delicious. The cuticles were isolated in such a way that

first, using the vacuum infiltration method, leaf discs which had been marked with dye and punched from the undersides were filled with a pectinase solution (0.2 to 2% strength) which had been buffered to a pH 1 of between 3 and 4.

then, sodium azide was added and

the leaf discs treated thus were left to stand until the original leaf structure had disintegrated and the noncellular cuticle had detached itself.

Thereafter, only the cuticles of the upper side of the leaf which were free from stomata and hairs were used. They were washed repeatedly, alternating with water and a buffer solution of pH 7. The resulting clean cuticles were finally applied to Teflon discs and smoothed and dried using a weak stream of air.

In the next step, the cuticle membranes obtained were placed into stainless-steel diffusion cells (=transport chambers) in order to carry out membrane transport studies. To this end, tweezers were used to place the cuticles centrally on the edges of the diffusion cells which had been painted with silicone fat and sealed using a ring, which had also been painted with fat. The arrangement had been chosen in such a way that the morphological external side of the cuticles was directed outwardly, that is to say facing the air, while the original internal side faced the inside of the diffusion cell. The diffusion cells were filled with water or with a mixture of water and solvent.
To determine the penetration, in each case 9 μl of a spray mixture of the composition mentioned in the examples were applied to the external side of a cuticle.

In the spray mixtures, CIPAC water was used in each case.

After the spray mixtures had been applied, the water was left to evaporate in each case, and the chambers were then inverted and placed into temperature-controlled cabinets, the external side of the cuticle being flushed with air at a defined temperature and humidity. The beginning of the penetration therefore took place at a relative atmospheric humidity of 60% and a set temperature of 25°C. The penetration of the active substance was measured using a radiolabelled active substance.

As can be seen with reference to the examples in the table, the presence of acid amides (in the present case N,N-dimethyldecanamide by way of example) gives rise to a substantially increased uptake in comparison with the formulations which lack the acid amides. The employed alternatives to the acid amide are examples of commercially available solvents for formulations.

Table, Example 1

The active substance is dissolved in an acetone/water mixture at a concentration of 0.5 g/l, and the penetration is measured after 3 and 48 hours.

Table, Example 2

The water is mixed together with formulation adjuvants and N,N-dimethyldecanamide and this mixture is diluted with water so that the dilution again contains an active substance concentration of 0.5 g/l. As in Ex. 1, the penetration was then measured after 3 and 48 hours.

Table, Example 3

The active substance is mixed together with formulation adjuvants and N-methylpyrrolidone and this mixture is diluted with water so that the dilution contains an active substance concentration of 0.5 g/l. The penetration was measured after 3 and 48 hours.

Table, Example 4

The active substance is mixed together with formulation adjuvants and γ-butyrolactone and this mixture is diluted with water so that the dilution contains an active substance concentration of 0.5 g/l. The penetration was measured after 3 and 48 hours.

Table, Example 5

The active substance is mixed together with formulation adjuvants and N,N-dimethyldecanamide and this mixture is diluted with water so that the dilution contains an active substance concentration of 1.0 g/l. As in Ex. 1, the penetration was then measured after 3 and 48 hours.

Table, Example 6

The active substance is mixed together with formulation adjuvants and N-methylpyrrolidone and this mixture is diluted with water so that the dilution contains an active substance concentration of 1.0 g/l. The penetration was measured after 3 and 48 hours.

Table, Example 7

The active substance is mixed together with formulation adjuvants and γ-butyrolactone and this mixture is diluted with water so that the dilution contains an active substance concentration of 1.0 g/l. The penetration was measured after 3 and 48 hours.

Table, Example 8

The active substances prothioconazole and tebuconazole are mixed together with formulation adjuvants and N,N-dimethyldecanamide and this mixture is diluted with water so that the dilution contains a prothioconazole concentration of 0.5 g/l. The penetration was then measured after 3 and 48 hours.

Table, Example 9

The active substances prothioconazole and tebuconazole are mixed together with formulation adjuvants and N-methylpyrrolidone and this mixture is diluted with water so that the dilution contains a prothioconazole concentration of 0.5 g/l. The penetration was then measured after 3 and 48 hours.

Table, Example 10

The active substances prothioconazole and tebuconazole are mixed together with formulation adjuvants and γ-butyrolactone and this mixture is diluted with water so that the dilution contains a prothioconazole concentration of 0.5 g/l. The penetration was then measured after 3 and 48 hours.

Table, Example 11

The active substances prothioconazole and spiromamide are mixed together with formulation adjuvants and N,N-dimethyldecanamide and this mixture is diluted with water so that the dilution contains a prothioconazole concentration of 0.5 g/l. The penetration was measured after 3 and 48 hours.

Table, Example 12

The active substances prothioconazole and spiromamide are mixed together with formulation adjuvants and N-methylpyrrolidone and this mixture is diluted with water so that the dilution contains a prothioconazole concentration of 0.5 g/l. The penetration was measured after 3 and 48 hours.

Table, Example 13

The active substances prothioconazole and spiromamide are mixed together with formulation adjuvants and a mixture of aromatics (boiling point 220-290°C.) and this mixture is diluted with water so that the dilution contains a prothioconazole concentration of 0.5 g/l. The penetration was measured after 3 and 48 hours.

(*1) boiling point: 220-290°C

(**) Halocid M8-10

(***) commercial tank mix additive, mineral oil concentrate

1. A method for promoting the penetration of one or more agrochemical active substances into plants, wherein said agrochemical active substances are selected from the group consisting of prothioconazole, N-(3’,4’-dichloro-5-fluorobiphenyl-2-yi)-3’-(dihydroxymethyl)-1-methyl-1H-pyrazole-4-carboxamide and mixtures of prothioconazole and one or more active substances selected from the group consisting of spiroxamine, tebucuconazole, flucastrobin and trifloxystrobin, comprising, applying to said plants one or more carboxamides of the formula (I)

\[
R^1—\text{CO}—NR^3R^3
\]

wherein

\( R^1 \) represents an unbranched, saturated alkyl group having 5 to 11 carbon atoms,

\( R^2 \) represents \( C_1-C_2 \)-alkyl, and

\( R^3 \) represents \( H \) or \( C_1-C_2 \)-alkyl.

2. A method according to claim 1, wherein \( R^2 \) and \( R^3 \) are methyl.

3. A method according to claim 1, wherein said carboxamide is \( N,N \)-dimethyl \( n \)-octanamide or \( N,N \)-dimethyl \( n \)-decanamide.

4. A method according to claim 1, wherein said one or more carboxamides is a mixture of 5% \( N,N \)-dimethyl hexanamide, 50% \( N,N \)-dimethyl octanamide, 40% \( N,N \)-dimethyl decanamide and 5% \( N,N \)-dimethyl dodecanamide, wherein the percentages are percent by weight.

5. (canceled)

6. A method according to claim 1, wherein said one or more carboxamides is applied as an aqueous spray mixture.
7. A method according to claim 1, wherein said one or more agrochemical active substances comprises a systemic agrochemical substance.

8. (canceled)

9. A method according to claim 1, wherein said one or more agrochemical active substances is selected from the group consisting of prothioconazole and N-(3',4'-dichloro-5-fluorobiphenyl-2-yl)-3-(difluoromethyl)-1-methyl-1H-pyrazole-4-carboxamide.

10. A method according to claim 9, wherein said agrochemical active substance is prothioconazole.

11. A method of promoting the penetration of one or more agrochemical active substances into plants according to claim 1, wherein said one or more agrochemical active substances, which are selected from the group consisting of prothioconazole, N-(3',4'-dichloro-5-fluorobiphenyl-2-yl)-3-(difluoromethyl)-1-methyl-1H-pyrazole-4-carboxamide and mixtures of prothioconazole and one or more active substances selected from the group consisting of spiroxamine, tebuconazole, flusaloxfiban and trifloxystrobin, is applied to the plants simultaneously or sequentially with said one or more carboxamides of the formula (I),

\[ R^1 - CO - NR^2 R^3 \]  
(II)

wherein

R\(^1\) represents an unbranched, saturated alkyl group having 5 to 11 carbon atoms,
R\(^2\) represents C\(_2\)-C\(_8\)-alkyl,
and R\(^3\) represents H or C\(_2\)-C\(_8\)-alkyl.

12. A plant protection composition comprising,

a) 1 to 80% of one or more carboxamides of the formula (I),

\[ R^1 - CO - NR^2 R^3 \]  
(II)

wherein

R\(^1\) represents an unbranched, saturated alkyl group having 5 to 11 carbon atoms,
R\(^2\) represents C\(_2\)-C\(_8\)-alkyl,
and R\(^3\) represents H or C\(_2\)-C\(_8\)-alkyl.

b) 1 to 90% of one or more agrochemical active substances, which are selected from the group consisting of prothioconazole, N-(3',4'-dichloro-5-fluorobiphenyl-2-yl)-3-(difluoromethyl)-1-methyl-1H-pyrazole-4-carboxamide and mixtures of prothioconazole and one or more active substances selected from the group consisting of spiroxamine, tebuconazole, flusaloxfiban and trifloxystrobin, and

c) 0 to 98% of additives wherein the percentages are percent by weight.

13. A plant protection composition comprising

a) 1 to 50% of one or more carboxamides of the formula (I),

\[ R^1 - CO - NR^2 R^3 \]  
(II)

wherein

R\(^1\) represents an unbranched, saturated alkyl group having 5 to 11 carbon atoms,
R\(^2\) represents C\(_2\)-C\(_8\)-alkyl,
and R\(^3\) represents H or C\(_2\)-C\(_8\)-alkyl.

b) 1 to 90% of one or more agrochemical active substances, which are selected from the group consisting of prothioconazole, N-(3',4'-dichloro-5-fluorobiphenyl-2-yl)-3-(difluoromethyl)-1-methyl-1H-pyrazole-4-carboxamide and mixtures of prothioconazole and one or more active substances selected from the group consisting of spiroxamine, tebuconazole, flusaloxfiban and trifloxystrobin, and

c) 0 to 98% of additives wherein the percentages are percent by weight.

14. A plant protection composition according to claim 12, comprising, as agrochemical active substance, prothioconazole or N-(3',4'-dichloro-5-fluorobiphenyl-2-yl)-3-(difluoromethyl)-1-methyl-1H-pyrazole-4-carboxamide.

15. A plant protection composition according to claim 13, comprising, as agrochemical active substance, prothioconazole or N-(3',4'-dichloro-5-fluorobiphenyl-2-yl)-3-(difluoromethyl)-1-methyl-1H-pyrazole-4-carboxamide.

16. A method according to claim 1, wherein said one or more carboxamides of the formula (I) are formulated into a plant protection composition comprising,

a) 1 to 90% of one or more agrochemical active substances, which are selected from the group consisting of prothioconazole, N-(3',4'-dichloro-5-fluorobiphenyl-2-yl)-3-(difluoromethyl)-1-methyl-1H-pyrazole-4-carboxamide and mixtures of prothioconazole and one or more active substances selected from the group consisting of spiroxamine, tebuconazole, flusaloxfiban and trifloxystrobin,

b) 1 to 90% of one or more carboxamides of the formula (I), and

c) 0 to 98% of other additives wherein the percentages are percent by weight.

17. The method according to claim 1 wherein said one or more agrochemical active substances is a mixture of prothioconazole and tebuconazole.

18. The method according to claim 17 wherein said one or more carboxamides of formula (I) is N,N-dimethyl n-octanamide or N,N-dimethyl n-decanamide.

19. The method according to claim 18 wherein said one or more carboxamides of formula (I) is N,N-dimethyl n-decanamide.

20. The method according to claim 1 wherein said one or more agrochemical active substances is a mixture of prothioconazole and spiroxamine.

21. The method according to claim 20 wherein said one or more carboxamides of formula (I) is N,N-dimethyl n-octanamide or N,N-dimethyl n-decanamide.

22. The method according to claim 21 wherein said one or more carboxamides of formula (I) is N,N-dimethyl n-decanamide.

23. The plant protection composition according to claim 12 wherein said one or more agrochemical active substances is a mixture of prothioconazole and tebuconazole.

24. The plant protection composition according to claim 23 wherein said one or more carboxamides of the formula (I) is N,N-dimethyl n-octanamide or N,N-dimethyl n-decanamide.

25. The plant protection composition according to claim 24 wherein said one or more carboxamides of formula (I) is N,N-dimethyl n-decanamide.

26. The plant protection composition according to claim 12 wherein said one or more agrochemical active substances is a mixture of prothioconazole and spiroxamine.

27. The plant protection composition according to claim 26 wherein said one or more carboxamides of the formula (I) is N,N-dimethyl n-octanamide or N,N-dimethyl n-decanamide.

28. The plant protection composition according to claim 27 wherein said one or more carboxamides of formula (I) is N,N-dimethyl n-decanamide.

29. The method according to claim 16 wherein said one or more agrochemical active substances comprises a mixture of prothioconazole and tebuconazole.
30. The method according to claim 29 wherein said one or more carboxamides of formula (I) is N,N-dimethyl n-octanamide or N,N-dimethyl n-decanamide.

31. The method according to claim 30 wherein said one or more carboxamides of formula (I) is N,N-dimethyl n-decanamide.

32. The method according to claim 16 wherein said one or more agrochemical active substances comprises a mixture of prothioconazole and spiroxamine.

33. The method according to claim 32 wherein said one or more carboxamides of formula (I) is N,N-dimethyl n-octanamide or N,N-dimethyl n-decanamide.

34. The method according to claim 33 wherein said one or more carboxamides of formula (I) is N,N-dimethyl n-decanamide.
