ABSTRACT

The invention relates to novel forms of compounds displaying broad spectrum antibiotic activity, especially crystalline polymorphic forms and amorphous forms of such compounds, compositions comprising such crystalline polymorphic forms and amorphous forms of such compounds, processes for manufacture and use thereof. The compounds and compositions of the invention are useful in the pharmaceutical industry, for example, in the treatment or prevention of diseases or disorders associated with the use of antibiotics, chemotherapies, or antiviral therapies, including, but not limited to, colitis, for example, pseudo-membranous colitis; antibiotic associated diarrhea; and infections due to Clostridium difficile (“C. difficile”), Clostridium perfringens (“C. perfringens”), Staphylococcus species, for example, methicillin-resistant Staphylococcus or Enterococcus including Vancomycin-resistant enterococci.

MACROLIDE POLYMORPHS, COMPOSITIONS COMPRISING SUCH POLYMORPHS, AND METHODS OF USE AND MANUFACTURE THEREOF

1. RELATED APPLICATIONS

[0001] The present application is a continuation-in-part application of PCT Application PCT/US05/02887, filed Jan. 31, 2005, and claims the benefit of U.S. provisional patent application No. 60/881,950, filed Jan. 22, 2007, the entire disclosures of each are herein incorporated by reference.

2. FIELD OF THE INVENTION

[0002] The invention encompasses novel forms of compounds displaying broad spectrum antibiotic activity, especially crystalline polymorphic forms and amorphous forms of such compounds, compositions comprising such crystalline polymorphic forms and amorphous forms of such compounds, processes for manufacture and use thereof. The compounds and compositions of the invention are useful in the medical and pharmaceutical industry, for example, in the treatment or prevention of diseases or disorders associated with the use of antibiotics, chemotherapy, or antiviral therapies, including, but not limited to, colitis, for example, pseudo-membranous colitis; antibiotic associated diarrhea; and infections due to Clostridium difficile ("C. difficile"), Clostridium perfringens ("C. perfringens"), Staphylococcus species, for example, methicillin-resistant Staphylococcus or Enterococcus including Vancomycin-resistant enterococci.

3. BACKGROUND OF THE INVENTION

[0003] Antibiotic-associated diarrhea ("AAD") diseases are caused by toxin producing strains of C. difficile, Staphylococcus aureus ("S. aureus") including methicillin-resistant Staphylococcus aureus ("MRSA") and C. perfringens. AAD represents a major economic burden to the healthcare system that is conservatively estimated at $3-6 billion per year in excess hospital costs in the United States alone.

[0004] AAD is a significant problem in hospitals and long-term care facilities. C. difficile is the leading cause of AAD in the hospital setting, accounting for approximately 20% of cases of AAD and the majority of cases of antibiotic-associated colitis ("AAC"). The rising incidence of C. difficile associated diarrhea ("CDAD") has been attributed to the frequent prescribing of broad-spectrum antibiotics to hospitalized patients.

[0006] The polymorphic behavior of a compound can be of crucial importance in pharmacy and pharmacology. Polymorphs are, by definition, crystals of the same molecule having different physical properties as a result of the order of the molecules in the crystal lattice. The differences in physical properties exhibited by polymorphs affect pharmaceutical parameters such as storage stability, compressibility and density (important in formulation and product manufacturing), and dissolution rates (an important factor in determining bioavailability). Differences in stability can result from changes in chemical reactivity (e.g., differential oxidation, such that a dosage form discolors more rapidly when comprised of one polymorph than when comprised of another polymorph) or mechanical changes (e.g., tablets crumble on storage as a kinetically favored polymorph converts to thermodynamically more stable polymorph) or both (e.g., tablets of one polymorph are more susceptible to breakdown at high humidity). As a result of solubility/dissolution differences, in the extreme case, some polymorphic transitions may result in lack of potency or, at the other extreme, toxicity. In addition, the physical properties of a crystal may be important in processing; for example, one polymorph might be more likely to form solvates or might be difficult to fill and wash free of impurities (i.e., particle shape and size distribution might be different between one polymorph relative to the other).

[0007] Each pharmaceutical compound has an optimal therapeutic blood concentration and a lethal concentration. The availability of the compound determines the dosage strength in the drug formulation necessary to obtain the ideal blood level. If the drug can crystallize as two or more polymorphs differing in bioavailability, the optimal dose will depend on the polymorph present in the formulation. Some drugs show a narrow margin between therapeutic and lethal concentrations. Thus, it becomes important for both medical and commercial reasons to produce and market the drug in its most thermodynamically stable polymorph, substantially free of other kinetically favored or disfavored polymorphs.

[0008] Thus, there is a clear need to develop safe and effective polymorphs of drugs that are efficacious at treating or preventing disorders associated with bacterial pathogens. The present inventors have identified novel crystalline and amorphous forms of 18-membered macrolide compounds that exhibit broad spectrum antibiotic activity.

4. SUMMARY OF THE INVENTION

[0009] The invention encompasses novel crystalline and amorphous forms of the macrolide compounds that are useful in treating or preventing bacterial infections and protozoal infections. In an illustrative embodiment, the novel crystalline and amorphous forms of the macrolide compounds of the invention exhibit broad spectrum antibiotic activity. Thus, surprisingly novel crystalline and amorphous forms of the macrolide compounds have been identified, which act as antibiotics possessing a broad spectrum of activity in treating or preventing bacterial infections and protozoal infections, especially those associated with Gram-positive and Gram-negative bacteria and in particular, Gram-positive bacteria.

[0010] In one embodiment, the invention encompasses novel crystalline and amorphous forms of the macrolide of Formula I:
In another embodiment, the invention encompasses a mixture of compounds with varying amounts of the Compound of Formula I, which forms have the requisite stability for use in preparing pharmaceutical compositions.

In another embodiment, the invention encompasses a polymorph obtained from a mixture of tiacumicins and a Compound of Formula I.

In still another embodiment, the invention encompasses novel crystalline and amorphous forms of the Compound of Formula I.

In another embodiment, the invention encompasses a pharmaceutical composition comprising a Compound of Formula I.

In another embodiment, the invention encompasses a pharmaceutical composition comprising a Compound of Formula I, wherein the Compound of Formula I is present in an amount greater than 90% by weight.

In another embodiment, the invention encompasses a pharmaceutical composition comprising one or more novel crystalline and amorphous forms of a Compound of Formula I.

In another embodiment, the invention encompasses a pharmaceutical composition comprising a mixture of tiacumicins and a Compound of Formula I.

In another embodiment, the invention encompasses a pharmaceutical composition comprising a mixture of tiacumicins and at least about 75% or more by weight of Compound of Formula I. In another embodiment, the invention encompasses a pharmaceutical composition comprising a mixture of tiacumicins and at least about 80% or more by weight of Compound of Formula I. In another embodiment, the invention encompasses a pharmaceutical composition comprising a mixture of tiacumicins and at least about 85% or more by weight of Compound of Formula I. In another embodiment, the invention encompasses a pharmaceutical composition comprising a mixture of tiacumicins and at least about 90% or more by weight of Compound of Formula I. In another embodiment, the invention encompasses a pharmaceutical composition comprising a mixture of tiacumicins and at least about 95% or more by weight of Compound of Formula I. In another embodiment, the invention encompasses a pharmaceutical composition comprising a mixture of tiacumicins and at least about 99% or more by weight of Compound of Formula I.

The invention also encompasses methods for treating or preventing a disease or disorder including, but not limited to, bacterial infections and protozoal infections comprising administering to a subject, preferably a mammal, in need thereof, a therapeutically or prophylactically effective amount of a composition or formulation comprising a compound of the invention.

In one illustrative embodiment, the composition or formulation comprises a mixture of compounds with varying amounts of the Compound of Formula I. In another embodiment, the composition or formulation comprises a mixture of tiacumicins and a Compound of Formula I. In still another embodiment, the composition or formulation comprises novel crystalline and amorphous forms of the Compound of Formula I. In still another embodiment, the composition or formulation comprises novel crystalline and amorphous forms of the Compound of Formula I and a mixture of tiacumicins.

In another particular embodiment, the disease or disorder to be treated or prevented are caused by toxin producing strains of *C. difficile*, *Staphylococcus aureus* (*"S. aureus"*) including methicillin-resistant *Staphylococcus aureus* (*"MRSA"*) and *C. perfringens*. In another particular embodiment, the disease or disorder to be treated or prevented is antibiotic-associated diarrhea.

5. BRIEF DESCRIPTION OF THE DRAWINGS

**FIG. 1** shows the X-ray powder diffraction patterns of a first polymorph Compound of Formula I produced from methanol and water.

**FIG. 2** shows the X-ray powder diffraction patterns of a second polymorph Compound of Formula I produced from ethyl acetate.

**FIG. 3** shows the effect of temperature on a mixture of tiacumicins produced from methanol and water. The DSC indicates an endothermic curve beginning at 169° C., and weight loss beginning at 223° C. The endothermic curve at about 177° C. corresponds to the melting of a first polymorph of a Compound of Formula I.

6. DETAILED DESCRIPTION OF THE DRAWINGS

6.1. General Description

The invention broadly encompasses mixtures of compounds with varying amounts of the Compound of Formula I. The inventors have surprisingly determined that the formation of crystalline polymorphic forms and amorphous...
forms of a Compound of Formula I and optionally mixtures of tiacumcin depends on the selection of the crystallization solvent and on the method and conditions of crystallization or precipitation.

[0026] In one embodiment the invention encompasses a mixture of tiacumcins and a Compound of Formula I. In another embodiment, the invention encompasses novel crystalline and amorphous forms of the Compound of Formula I and optionally a mixture of tiacumcins. In still another embodiment, the invention encompasses novel crystalline and amorphous forms of the Compound of Formula I and a mixture of tiacumcins. In another embodiment, the invention encompasses a mixture of comprising a first polymorph of a Compound of Formula I, a second polymorph of a Compound of Formula I, and other polymorphic forms, amorphous forms and mixtures thereof.

[0027] In another particular embodiment, the crystalline polymorphs and amorphous forms are obtained from a mixture of tiacumcins.

[0028] In another embodiment, a crystalline polymorph of a Compound of Formula I exhibits a representative powder diffraction pattern comprising at least peaks at the following diffraction angles 20 of 7.7°, 15.0°, and 18.8°±0.04, preferably ±0.1, more preferably ±0.15, even more preferably ±0.2. In another embodiment, a crystalline polymorph of a Compound of Formula I exhibits a representative powder diffraction pattern comprising at least peaks at the following diffraction angles 20 of 7.8°, 15.1°, and 18.8°±0.04, preferably ±0.1, more preferably ±0.15, even more preferably ±0.2.

[0029] In another embodiment, the polymorph has the chemical structure:

[0030] In another embodiment, the polymorph has the chemical structure of a Compound of Formula I:
[0031] In another embodiment, the polymorph further comprises at least one compound selected from a mixture of ticamucins.

[0032] In another embodiment, the polymorph of Formula I is present in an amount of at least about 75% to about 99.99%.

[0033] In another embodiment, the polymorph of Formula I is present in an amount of at least about 75%.

[0034] In another embodiment, the polymorph of Formula I is present in an amount of at least about 80%.

[0035] In another embodiment, the polymorph of Formula I is present in an amount of at least about 85%.

[0036] In another embodiment, the polymorph of Formula I is present in an amount of at least about 90%.

[0037] In another embodiment, the polymorph of Formula I is present in an amount of at least about 93%.

[0038] In another embodiment, the polymorph of Formula I is present in an amount of at least about 95%.

[0039] In another embodiment, the polymorph of Formula I is present in an amount of at least about 99%.

[0040] In another embodiment, the crystalline polymorph is obtained from a mixture of ticamucins that exhibits a melting point of about 163°C to about 169°C. In another embodiment, the crystalline polymorph is obtained from a mixture of ticamucins that exhibits a melting point of about 155°C to about 175°C.

[0041] In another embodiment, the crystalline polymorph is obtained from a mixture of ticamucins and exhibits a DSC endotherm in the range of about 174°C to about 186°C; preferably 175-185°C.

[0042] In another embodiment, the crystalline polymorph is obtained from a mixture of ticamucins that exhibits a powder diffraction pattern comprising at least peaks at the following diffraction angles 2θ of 7.7°, 15.0°, and 18.8°±0.04, preferably ±0.1, more preferably ±0.15, even more preferably ±0.2 and exhibits a melting point of about 163°C to about 169°C.

[0043] In another embodiment, the crystalline polymorph is obtained from a mixture of ticamucins that exhibits a powder diffraction pattern comprising at least peaks at the following diffraction angles 2θ of 7.7°, 15.0°, and 18.8°±0.04, preferably ±0.1, more preferably ±0.15, even more preferably ±0.2 and exhibits a melting point of about 160°C to about 170°C.

[0044] In another embodiment encompasses a crystalline polymorph obtained from a mixture of ticamucins that exhibits a powder diffraction pattern comprising at least peaks at the following diffraction angles 2θ of 7.7°, 15.0°, and 18.8°±0.04, preferably ±0.1, more preferably ±0.15, even more preferably ±0.2. In a particular embodiment, the polymorph has the chemical structure of a Compound of Formula I. In another embodiment, the crystalline polymorph further comprises at least one compound selected from a mixture of ticamucins.

[0045] In another embodiment, a crystalline polymorph is obtained from a mixture of ticamucins that exhibits a melting point of about 150°C to about 156°C.

[0046] In another embodiment, a crystalline polymorph is obtained from a mixture of ticamucins that exhibits a powder diffraction pattern comprising at least peaks at the following diffraction angles 2θ of 7.4°, 15.5°, and 18.8°±0.2 and exhibits a melting point of about 150°C to about 156°C.

[0047] Another embodiment of the invention encompasses pharmaceutical compositions comprising a therapeutically or prophylactically effective amount of a crystalline polymorph of a Compound of Formula:

![Chemical structure image]

and a pharmaceutically acceptable carrier.

[0048] In a particular embodiment, the pharmaceutical composition comprises a first polymorph of a Compound of Formula I, a second polymorph of a Compound of Formula I, other polymorphic forms of a Compound of Formula I, amorphous forms of a Compound of Formula I, and mixtures thereof.

[0049] In another embodiment, the crystalline polymorph of the pharmaceutical composition has peaks at the following diffraction angles 2θ of 7.7°, 15.0°, and 18.8°±0.04, preferably ±0.1, more preferably ±0.15, even more preferably ±0.2.

[0050] In another embodiment, the crystalline polymorph of the pharmaceutical composition further comprises at least one compound selected from a mixture of ticamucins.

[0051] In another embodiment, the Compound of Formula I is present from at least about 75% to about 99.99%, preferably about 75%, about 85%, about 95%, or about 99%.

[0052] In another embodiment, the crystalline polymorph of the pharmaceutical composition exhibits a melting point of about 163°C to about 169°C.

[0053] Another embodiment encompasses a pharmaceutical composition comprising a crystalline polymorph of ticamucin comprising peaks at the following diffraction angles 2θ of 7.7°, 15.0°, and 18.8°±0.04, preferably ±0.1, more preferably ±0.15, even more preferably ±0.2 and exhibits a melting point of about 160°C to about 170°C.
angles 2θ of 7.6°, 15.4°, and 18.8°±0.04, preferably ±0.1, more preferably ±0.15, even more preferably ±0.2. In a particular embodiment, the pharmaceutical composition further comprises at least one compound selected from a mixture of tiamucins. In another particular embodiment, the Compound of Formula I is present from about 75% to about 99.99%, preferably 75%, 85%, 95%, or 99%.

[0054] In another embodiment, the invention encompasses a pharmaceutical composition containing stereomerically pure R-Tiacuminic and less than 15% of a mixture of tiamucins. In another embodiment, the invention encompasses a pharmaceutical composition containing stereomerically pure R-Tiacuminic and less than 10% of a mixture of tiamucins. In another embodiment, the invention encompasses a pharmaceutical composition containing stereomerically pure R-Tiacuminic and less than 5% of a mixture of tiamucins. In another embodiment, the invention encompasses a pharmaceutical composition containing stereomerically pure R-Tiacuminic and less than 1% of a mixture of tiamucins.

[0061] The term “antibiotic-associated condition” refers to a condition resulting when antibiotic therapy disturbs the balance of the microbial flora of the gut, allowing pathogenic organisms such as enterotoxin producing strains of C. difficile, S. aureus and C. perfringens to flourish. These organisms can cause diarrhea, pseudomembranous colitis, and colitis and are manifested by diarrhea, urgency, abdominal cramps, tenesmus, and fever among other symptoms. Diarrhea, when severe, causes dehydration and the medical complications associated with dehydration.

[0062] The term “asymmetrically substituted” refers to a molecular structure in which an atom having four tetrahedral valences is attached to four different atoms or groups. The commonest cases involve the carbon atom. In such cases, two optical isomers (D- and L-enantiomers or R- and S-enantiomers) per carbon atom result which are nonsuperposable mirror images of each other. Many compounds have more than one asymmetric carbon. This results in the possibility of many optical isomers, the number being determined by the formula 2n, where n is the number of asymmetric carbons.

[0063] The term “broth” as used herein refers to the fluid culture medium as obtained during or after fermentation. Broth comprises a mixture of water, the desired antibiotic(s), unused nutrients, living or dead organisms, metabolic products, and the adsorbent with or without adsorbed product.

[0064] As used herein and unless otherwise indicated, the terms “bacterial infection(s)” and “protozoal infection(s)” are used interchangeably and include bacterial infections and protozoal infections that occur in mammals, fish and birds as well as disorders related to bacterial infections and protozoal infections that may be treated or prevented by antibiotics such as the Compounds of the Invention. Such bacterial infections and protozoal infections, and disorders related to such infections, include the following: disorders associated with the use of antibiotics, chemotherapies, or antiviral therapies, including, but not limited to, colitis, for example, pseudo-membranous colitis, antibiotic associated diarrhea, and infections due to Clostridium difficile, Clostridium perfringens, Staphylococcus species, methicillin-resistant Staphylococcus, or Entercoccus including Vancomycin-resistant enterococci; antibiotic-associated diarrhea including those caused by toxin producing strains of C. difficile, S. aureus including methicillin-resistant Staphylococcus aureus, and C. perfringens; and antibiotic-associated colitis; pneumonia, otitis media, sinusitis, bronchitis, tonsillitis and mastoiditis related to infection by Staphylococcus pneumoniae, Haemophilus influenzae, Moraxella catarrhalis, Staphylococcus aureus, or Peptostreptococcus spp.; pharyngitis, rheumatic fever and glomerulonephritis related to infection by Streptococcus pyogenes, Groups C and G streptococci, Clostridium diptheriae, or Actinobacillus haemolyticus; respiratory tract infections related to infection by Mycoplasma pneumoniae, Legionella pneumophila, Streptococcus pneumoniae, Haemophilus...
influenzae, or Chlamydia pneumoniae; unaccompanied skin and soft tissue infections, abscesses and osteomyelitis, and purpura fuler related to infection by Staphylococcus aureus, coagulase-positive Staphylococci (e.g., S. epidermidis and S. hemolyticus), Staphylococcus pyogenes, Streptococcus agalactiae, Streptococcal groups C-F (meningitis-streptococci), viridans streptococci, Corynebacterium minutissimum, Clostridium spp., or Bartonella henselae; uncomplicated acute urinary tract infections related to infection by Staphylococcus saprophyticus or Enterococcus spp.; urethritis and cervicitis; and sexually transmitted diseases related to infection by Chlamydia trachomatis, Haemophilus ducreyi, Treponema pallidum, Ureaplasma urealyticum, or Neisseria gonorrhoeae, toxin diseases related to infection by S. aureus (food poisoning and Toxic Shock Syndrome), or Groups A, B and C streptococci; ulcers related to infection by Helicobacter pylori, systemic febrile syndromes related to infection by Borrelia recurrentis; Lyme disease related to infection by Borella burgdorferi, conjuginitis, keratitis, and dacrocystitis related to infection by Chlamydia trachomatis, Neisseria gonorrhoeae, S. aureus, S. pneumoniae, S. pyogenes, H. influenzae, or Listeria spp.; disseminated Mycobacterium avium complex (MAC) disease related to infection by Mycobacterium avium, or Mycobacterium intracellulare; gastroenteritis related to infection by Campylobacter jejuni, intestinal protozoa related to infection by Cryptosporidium spp.; odontogenic infection related to infection by viridans streptococci; persistent cough related to infection by Bordetella pertussis gas gangrene related to infection by Clostridium perfringens or Bacteroides spp.; and atherosclerosis related to infection by Helicobacter pylori or Chlamydia pneumoniae. Bacterial infections and protozoal infections and disorders related to such infections that may be treated or prevented in animals include the following: bovine respiratory disease related to infection by P. haem., P. multocida, Mycoplasma bovis, or Bordetella spp.; cow enteric disease related to infection by E. coli or protozoa (e.g., coccidia, cryptospordia, etc.); dairy cow mastitis related to infection by Staph. aureus, Strept. uberis, Strept. agalactiae, Strep. dysgalactiae, Klebsiella spp., Corynebacterium, or Enterococcus spp.; swine respiratory disease related to infection by A. pleurop., P. multocida or Mycoplasma spp.; swine enteric disease related to infection by E. coli Lowsionia intracellularis, Salmonella, or Serpulina hydysintestinalis; cow footrot related to infection by Fusobacterium spp.; cow mastitis related to infection by E. coli; cow hairy warts related to infection by Fusobacterium necrophorum or Bacteroides nodosus; cow pink-eye related to infection by Moraxella bovis; cow premature abortion related to infection by protozoa (e.g., neoplas- rium) urinary tract infection in dogs and cats related to infection by E. coli; skin and soft tissue infections in dogs and cats related to infection by Staph. epidermidis, Staph. interme- dius, coagulase neg. Staph., or P. multocida; and dental or mouth infections in dogs and cats related to infection by Alcaligenes spp., Bacteroides spp., Clostridium spp., Enterobacter spp., Eubacterium, Peptostreptococcus, Porphyromonas, or Prevotella. Other bacterial infections and protozoal infections and disorders related to such infections that may be treated or prevented in accord with the methods of the invention are referred to in Sanford, J. P., et al., “The Sanford Guide To Antimicrobial Therapy,” 27th Edition (Antimicrobial Therapy, Inc., 1996).

[0065] As used herein and unless otherwise indicated, the term “binders” refers to agents used to impart cohesive quali- ties to the powdered material. Binders, or “granulators” as they are sometimes known, impart cohesiveness to the tablet formulation, which insures the tablet remaining intact after compression, as well as improving the free-flowing qualities by the formulation of granules of desired hardness and size. Materials commonly used as binders include starch, gelatin; sugars, such as sucrose, glucose, dextrose, maltoses, and lactose; natural and synthetic gums; such as acacia, sodium alginate, extract of Irish moss, panwar gum, glihtti gum, mucilage of isapal husks, carboxymethylcellulose, methylcellulose, polyvinylpyrrolidone, Veegum, microcrystalline cellulose, microcrystalline dextrose, amylose, and larch araboglaucan, and the like.

[0066] As used herein and unless otherwise indicated, the terms “biohydroxylable carbonate,” “biohydroxylable carbonate,” “biohydroxylable uride,” “biohydroxylable phosphate” mean an amide, ester, carbonate, carbonate, uride, or phosphate, respectively, of a compound that either: 1) does not interfere with the biological activity of the compound but can confer upon that compound advantageous properties in vivo, such as uptake, duration of action, or onset of action; or 2) is biologically inactive but is converted in vivo to the biologically active compound. Examples of biohydroxylable esters include, but are not limited to, lower alkyl esters, lower aclyoxyalkyl esters (such as acetoxymethyl, acetoxyethyl, aminocarboxyloxy-methyl, pivaloxymethyl, and pivaloxy-ethyl esters), lactonyl esters (such as phthalalidyl and thipthalalylidyl esters), lower alkoxacyloxyalkyl esters (such as methoxycycloxybenzyloxyl, ethoxybenzyloxyl and isopropaneybenzyloxyl esters), alkoyalkyl esters, choline esters, and acylaminol alkyl esters (such as etacamide-domethyl esters). Examples of biohydroxylable amides include, but are not limited to, lower alkyl amides, a amino acid amides, alkoxyacetyl amides, and alkylaminoalkyl-carbonyl amides. Examples of biohydroxylable carbamates include, but are not limited to, lower alkyamines, substituted ethylendiamines, aminocids, hydroxalkylamines, hetero- cyclic and heteroaromatic amines, and polyether amines.

[0067] As used herein and unless otherwise indicated, the term “carrier” refers to a diluent, adjuvant, excipient, or vehicle with which a composition is administered. Such pharmaceu- tical carriers can be sterile liquids, such as water, and oils, including those of petroleum, animal, vegetable or syn- thetic origin, such as peanut oil, soybean oil, mineral oil, sesame oil and the like.

[0068] As used herein and unless otherwise indicated, the term “Compounds of the Invention” means, collectively, a Compound of Formula I and/or pharmaceutically acceptable salts and polymorphs thereof. The compounds of the invention are identified herein by their chemical structure and/or by their chemical name. Where a compound is referred to by both a chemical structure and a chemical name, and that chemical structure and chemical name conflict, the chemical structure is determinative of the compound’s identity. The compounds of the invention may contain one or more chiral centers and/or double bonds and, therefore, exist as stereoisomers, such as double-bond isomers (i.e., geometric isomers), enantiomers, or diastereomers. According to the invention, the chemical structures depicted herein, and therefore the compounds of the invention, encompass all of the corresponding compound’s enantiomers and stereoisomers, that is, both the stereoreformally pure form (e.g., geometrically pure, enantiomerically pure, or diastereometrically pure) and enantiomeric
and stereoisomeric mixtures. Enantiomeric and stereoisomeric mixtures can be resolved into their component enantiomers or stereoisomers by well-known methods, such as chiral-phase gas chromatography, chiral-phase high performance liquid chromatography, crystallizing the compound as a chiral salt complex, or crystallizing the compound in a chiral solvent. Enantiomers and stereoisomers can also be obtained from stereomERICally- or enantiomERICally-pure intermediates, reagents, and catalysts by well known asymmetric synthetic methods. The Compounds of the Invention are preferably substantially stereomERICally pure. In a particular embodiment, the term “Compounds of the Invention” refers to a Compound of Formula I that is greater than 75% pure, preferably greater than 85% pure, more preferably greater than 95% pure and most preferably greater than 99% pure and polymorphic form (e.g., a polymorph of Compound of Formula I) and amorphous forms thereof.

[0069] As used herein and unless otherwise indicated, “diluents” are inert substances added to increase the bulk of the formulation to make the tablet a practical size for compression. Commonly used diluents include calcium phosphate, calcium sulfate, lactose, kaolin, mannitol, sodium chloride, dry starch, powdered sugar, silica, and the like.

[0070] As used herein and unless otherwise indicated, “disintegrators” or “disintegrants” are substances that facilitate the breakup or disintegration of tablets after administration. Materials serving as disintegrants have been chemically classified as starches, clays, celluloses, alginates, or gums. Other disintegrants include Veegum HV, methylcellulose, agar, bentonite, cellulose and wood products, natural sponge, cation-exchange resins, alginic acid, guar gum, citrus pulp, cross-linked polyvinylpyrrolidone, carboxymethylcellulose, and the like.

[0071] When administered to a subject (e.g., to an animal for veterinary use or to a human for clinical use) the compounds of the invention are administered in isolated form. As used herein and unless otherwise indicated, “isolated” means that the compounds of the invention are separated from other components of either (a) a natural source, such as a plant or cell, preferably bacterial culture, or (b) a synthetic organic chemical reaction mixture, preferably, via conventional techniques, the compounds of the invention are purified. As used herein, “purified” means that when isolated, the isolate contains at least about 70% preferably at least about 80%, more preferably at least about 90%, even more preferably at least about 95%, and most preferably at least about 99% of a compound of the invention by weight of the isolate.

[0072] The term “macrolide” or “macrocycle” refers to organic molecules with large ring structures usually containing over 10 atoms.

[0073] The term “18-membered macrocycles” refers to organic molecules with ring structures containing 18 atoms.

[0074] The term “MIC” or “minimum inhibitory concentration” refers to the lowest concentration of an antibiotic that is needed to inhibit growth of a bacterial isolate in vitro. A common method for determining the MIC of an antibiotic is to prepare several tubes containing serial dilutions of the antibiotic, that are then inoculated with the bacterial isolate of interest. The MIC of an antibiotic can be determined from the tube with the lowest concentration that shows no turbidity (no growth).

[0075] The term “MIC90” refers to the lowest concentration of antibiotic required to inhibit the growth of 90% of the bacterial strains tested within a given bacterial species.

[0076] The term “MIC90” refers to the lowest concentration of antibiotic required to inhibit the growth of 90% of the bacterial strains tested within a given bacterial species.

[0077] As used herein and unless otherwise indicated, the term “mixture of tiacucins” refers to a composition containing at least one macrolide compound from the family of compounds known tiacucins. In another embodiment, the term “mixture of tiacucins” includes a mixture containing at least one member of the compounds known tiacucins and a Compound of Formula I wherein the Compound of Formula I is present in an amount of about 50%, 60%, 70%, 80%, 90%, 95%, 99%, 99.9%, or 99.99% by weight. In particular, the term “mixture of tiacucins” refers to a compositions comprising a Compound of Formula I wherein the Compound of Formula I has a relative retention time (“RRT”) ratio of 1.0, and further comprising at least one of the following compounds:

- **Compound 101**

- **Compound 102**
[0078] In certain illustrative embodiments, when compound 109 is present in the mixture optionally one of compounds 110, 111, and/or 112 is also present in the mixture. Compound 109 is also sometimes referred to as Liptamycin A4. Compound 110 is also sometimes referred to as Tiacumycin F. Compound III is also sometimes referred to as Tiacumycin C. Compound 112 is also sometimes referred to as Tiacumycin A.

[0079] As used herein, and unless otherwise indicated, the terms “optically pure,” “stereomerically pure,” and “substantially stereomerically pure” are used interchangeably and mean one stereoisomer of a compound or a composition that comprises one stereoisomer of a compound and is substantially free of other stereoisomer(s) of that compound. For example, a stereomerically pure compound or composition of a compound having one chiral center will be substantially free of the opposite enantiomer of the compound. A stereomerically pure compound or composition of a compound having two chiral centers will be substantially free of other diastereomers of the compound. A typical stereomerically pure compound comprises greater than about 80% by weight of one stereoisomer of the compound and less than about 20% by weight of other stereoisomers of the compound, more preferably greater than about 90% by weight of one stereoisomer of the compound and less than about 10% by weight of the other stereoisomers of the compound, even more preferably greater than about 95% by weight of one stereoisomer of the compound and less than about 5% by weight of the other stereoisomers of the compound, and most preferably greater than about 97% by weight of one stereoisomer of the compound and less than about 3% by weight of the other stereoisomers of the compound.

[0080] As used herein and unless otherwise indicated, “pharmaceutically acceptable” refers to materials and compositions that are physiologically tolerable and do not typically produce an allergic or similar untoward reaction, such as gastric upset, dizziness and the like, when administered to a human. Typically, as used herein, the term “pharmaceutically acceptable” means approved by a regulatory agency of the Federal or a state government or listed in the U.S. Pharma-
copeia or other generally recognized pharmacopeia for use in animals, and more particularly in humans.

[0081] As used herein and unless otherwise indicated, the term “pharmacologically acceptable hydrate” means a Compound of the Invention that further includes a stoichiometric or non-stoichiometric amount of water bound by non-covalent intermolecular forces.

[0082] As used herein and unless otherwise indicated, the term “pharmacologically acceptable polymorph” refers to a Compound of the Invention that exists in several distinct forms (e.g., crystalline, amorphous), the invention encompasses all of these forms.

[0083] As used herein and unless otherwise indicated, the term “pharmacologically acceptable prodrug” means a derivative of a modified polymorph of a compound of Formula I that can hydrolyze, oxidize, or otherwise react under biological conditions (in vitro or in vivo) to provide the compound. Examples of prodrugs include, but are not limited to, compounds that comprise biologically active moieties such as biologically active anions, biologically active esters, biologically active carbamates, biologically active carbonates, biologically active uracils, and biologically active phosphate analogues. Other examples of prodrugs include compounds that comprise oligonucleotides, peptides, lipids, aliphatic and aromatic groups, or NO, NO₂, ONO, and OONO moieties. Prodrugs can typically be prepared using well known methods, such as those described in Burger’s Medicinal Chemistry and Drug Discovery, 172 178, 949 982 (Manfred E. Wolff ed., 5th ed. 1995), and Design of Prodrugs (H. Bundgaard ed., Elsevier, New York 1985).

[0084] The phrase “pharmacologically acceptable salt,” as used herein includes but is not limited to salts of acidic or basic groups that may be present in compounds used in the present compositions. Compounds included in the present compositions that are basic in nature are capable of forming a wide variety of salts with various inorganic and organic acids. The acids that may be used to prepare pharmaceutically acceptable acid addition salts of such basic compounds are those that form non-toxic acid addition salts, i.e., salts containing pharmacologically acceptable anions including, but not limited to, sulfonic, citric, maleic, acetic, oxalic, hydrochloric, hydrobromide, hydroiodide, nitrate, sulfate, bisulfate, phosphate, acetic acid, isonicotinate, acetate, lactate, salicylate, citrate, acid citrate, tartrate, oleate, tannate, pantothenate, bitartrate, ascorbate, succinate, maleate, gentisate, fumarate, glutonate, glutaronate, saccharate, formate, benzoate, glutamate, methanesulfonate, ethanesulfonate, benzenesulfonate, p-toluene sulfonate and pamoate (i.e., 1,1'-methylene-bis-(2-hydroxy-3-naphthoate)) salts. Compounds included in the present compositions that include an amino moiety may form pharmaceutically acceptable salts with various amino acids, in addition to the acids mentioned above. Compounds, included in the present compositions, which are acidic in nature are capable of forming basic salts with various pharmacologically acceptable cations. Examples of such salts include alkali metal or alkaline earth metal salts and, particularly, calcium, magnesium, sodium lithium, zinc, potassium, and iron salts.

[0085] As used herein and unless otherwise indicated, the term “pharmacologically effective” refers to an amount of a Compound or Composition of the Invention or a pharmaceutically acceptable salt, solvate, polymorph, or prodrug thereof causing a reduction of the risk of acquiring a given disease or disorder. Accordingly, the Compounds of the Invention may be used for the prevention of one disease or disorder and concurrently treating another (e.g., prevention of AAC, while treating urinary AAD). In certain embodiments, the compositions of the invention are administered to a patient, preferably a human, as a preventative measure against such diseases. As used herein, “prevention” or “preventing” refers to a reduction of the risk of acquiring a given disease or disorder.

[0086] As used herein, the term “subject” can be a mammal, preferably a human or an animal. The subject being treated is a patient in need of treatment.

[0087] As used herein and unless otherwise indicated, the phrase “therapeutically effective amount” of a Compound or Composition of the Invention or a pharmaceutically acceptable salt, solvate, polymorph, or prodrug thereof is measured by the therapeutic effectiveness of a compound of the invention, wherein at least one adverse effect of a disorder is ameliorated or alleviated. In one embodiment, the term “therapeutically effective amount” means an amount of a drug or Compound of the Invention that is sufficient to provide the desired local or systemic effect and performance at a reasonable benefit-risk ratio attending any medical treatment. In one embodiment, the phrase “therapeutically effective amount” of a composition of the invention is measured by the therapeutic effectiveness of a compound of the invention to alleviate at least one symptom associated with bacterial or protozoal infections. Surprisingly, the inventors have found that therapeutically effective amounts of the compounds of the invention are useful in treating or preventing bacterial and protozoal infections.

[0088] As used herein and unless otherwise indicated, the terms “treatment” or “treating” refer to an amelioration of a disease or disorder, or at least one discernible symptom thereof, preferably associated with a bacterial or protozoal infection. In another embodiment, “treatment” or “treating” refers to an amelioration of at least one measurable physical parameter, not necessarily discernible by the patient. In yet another embodiment, “treatment” or “treating” refers to inhibiting the progression of a disease or disorder, either physically, e.g., stabilization of a discernible symptom, physiologically, for example, stabilization of a physical parameter, or both. In yet another embodiment, “treatment” or “treating” refers to delaying the onset of a disease or disorder.

6.3. Compositions of the Invention for Therapeutic/Prophylactic Administration

[0089] The invention encompasses compositions comprising a first polymorph of a Compound of Formula I, a second polymorph of a Compound of Formula I, other polymorphic forms, amorphous form or mixtures thereof of a mixture of tiaucinoms with varying amounts of the Compound of Formula I.

[0090] The invention further encompasses an antibiotic composition that is a mixture of tiaucinoms for use in treating CDAD as well as, AAD and AAC. The mixture of tiaucinoms contains about 76 to about 100% of a Compound of Formula I, which belongs to the tiaucinom family of 18-member macrolide.

[0091] Due to the activity of the Compounds of the Invention, the compounds are advantageously useful in veterinary and human medicine. The Compounds of the Invention are useful for the treatment or prevention of bacterial and protozoal infections. In some embodiments, the subject has an
infection but does not exhibit or manifest any physiological symptoms associated with an infection.

[0092] The invention provides methods of treatment and prophylaxis by administration to a patient of a therapeutically effective amount of a composition comprising a crystalline polymorph or amorphous form of a Compound of the Invention. The patient is a mammal, including, but not limited to, an animal such as a cow, horse, sheep, pig, chicken, turkey, quail, cat, dog, mouse, rat, rabbit, guinea pig, etc., and is more preferably a human.

[0093] The present compositions, which comprise one or more crystalline polymorph or amorphous form of a Compound of the Invention or a mixture of tiaucinics may be administered by any convenient route, for example, peroral administration, parenteral administration, by infusion or bolus injection, by absorption through epithelial or mucocutaneous linings (e.g., oral mucosa, rectal and intestinal mucosa, etc.) and may be administered together with another biologically active agent. Administration can be systemic or local. Various delivery systems are known, e.g., encapsulation in liposomes, microparticles, microcapsules, capsules, etc., and can be used to administer a compound of the invention. In certain embodiments, more than one Compound of the Invention and mixture of tiaucinics is administered to a patient. Methods of administration include but are not limited to intradermal, intramuscular, intraperitoneal, intravenous, subcutaneous, intranasal, epidural, oral, sublingual, intranasal, intravebroal, intravaginal, transdermal, rectally, by inhalation, or topically, particularly to the ears, nose, eyes, or skin. The preferred mode of administration is left to the discretion of the practitioner, and will depend in-part upon the site of the medical condition. In most instances, administration will result in the release of the crystalline polymorph or amorphous form of a Compound of the Invention into the bloodstream.

[0094] In specific embodiments, it may be desirable to administer one or more crystalline polymorph or amorphous form of a Compound of the Invention locally to the area in need of treatment. This may be achieved, for example, and not by way of limitation, by local infusion during surgery, topical application, e.g., in conjunction with a wound dressing after surgery, by injection, by means of a catheter, by means of a suppository, or by means of an implant, or by implanting a porous, non-porous, or gelatinous material, including membranes, such as sialastic membranes, or fibers. In one embodiment, administration can be by direct injection at the site (or former site) of an atherosclerotic plaque tissue.

[0095] Pulmonary administration can also be employed, e.g., by use of an inhaler or nebulizer, and formulation with an aerosolizing agent, or via perfusion in a fluorocarbon or synthetic pulmonary surfactant. In certain embodiments, the compounds of the invention can be formulated as a suppository, with traditional binders and vehicles such as triglycerides.

[0096] In another embodiment, the crystalline polymorph or amorphous form of a Compound of the Invention can be delivered in a vesicle, in particular a liposome (see Langer, 1990, Science 240:1527-1533; Treat et al., in Liposomes in the Therapy of Infectious Disease and Cancer, Lopez-Berestein and Fidler (eds.), Liss, New York, pp. 353-365 (1989); Lopez-Berestein, ibid., pp. 317-327; see generally ibid.).

[0098] The present compositions will contain a therapeutically effective amount of a crystalline polymorph or amorphous form of a Compound of the Invention, optionally more than one crystalline polymorph or amorphous form of a Compound of the Invention, preferably in purified form, together with a suitable amount of a pharmaceutically acceptable vehicle so as to provide the form for proper administration to the patient.

[0099] In a specific embodiment, the term “pharmaceutically acceptable” means approved by a regulatory agency of the Federal or a state government or listed in the U.S. Pharmacopoeia or other generally recognized pharmacopeia for use in animals, and more particularly in humans. The term “vehicle” refers to a diluent, adjuvant, excipient, or carrier with which a compound of the invention is administered. Such pharmaceutical vehicles can be liquids, such as water and oils, including those of petroleum, animal, vegetable or synthetic origin, such as peanut oil, soybean oil, mineral oil, sesame oil and the like. The pharmaceutical vehicles can be saline, gum acacia, gelatin, starch paste, talc, keratin, colloidal silica, urea, and the like. In addition, auxiliary, stabilizing, thickening, lubricating and coloring agents may be used. When administered to a patient, the compounds of the invention and pharmaceutically acceptable vehicles are preferably sterile. Water is a preferred vehicle when the compound of the invention is administered intravenously. Saline solutions and aqueous dextrose and glycerol solutions can also be employed as liquid vehicles, particularly for injectable solutions. Suitable pharmaceutical vehicles also include excipients such as starch, glucose, lactose, sucrose, gelatin, malt, rice, flour, chalk, silica gel, sodium stearate, glycerol monostearate, talc, sodium chloride, dried skim milk, glycerol, propylene, glycol, water, ethanol and the like. The present compositions, if desired, can also contain minor amounts of wetting or emulsifying agents, or pH buffering agents.

[0100] The present compositions can take the form of solutions, suspensions, emulsion, tablets, pills, pellets, capsules, capsules containing liquids, powders, sustained-release formulations, suppositories, emulsions, aerosols, sprays, suspensions, or any other form suitable for use. In one embodiment, the pharmaceutical acceptable vehicle is a capsule (see e.g., U.S. Pat. No. 5,698,155). Other examples of suitable pharmaceutical vehicles are described in “Remington’s Pharmaceutical Sciences” by A. R. Gennaro.
[0101] In a preferred embodiment, the crystalline polymorph or amorphous form of a Compound of the Invention is formulated in accordance with routine procedures as a pharmaceutical composition adapted for intravenous administration to human beings. Typically, a crystalline polymorph or amorphous form of a Compound of the Invention for intravenous administration is a solution in sterile isotonic aqueous buffer. Where necessary, the compositions may also include a solubilizing agent. Compositions for intravenous administration may optionally include a local anesthetic such as lidocaine to ease pain at the site of the injection. Generally, the ingredients are supplied either separately or mixed together in unit dosage form, for example, as a dry lyophilized powder or as a free concentrate in a hermetically sealed container such as an ampoule or sachet indicating the quantity of active agent. Where the crystalline polymorph or amorphous form of a Compound of the Invention is to be administered by infusion, it can be dispensed, for example, with an infusion bottle containing sterile pharmaceutical grade water or saline. Where the compound of the invention is administered by injection, an ampoule of sterile water for injection or saline can be provided so that the ingredients may be mixed prior to administration.

[0102] It is preferred that the compositions of the invention be administered orally. Compositions for oral delivery may be in the form of tablets, lozenges, aqueous or oily suspensions, granules, powders, emulsions, capsules, syrups, or elixirs, for example. Orally administered compositions may contain one or more optionally agents, for example, sweetening agents such as fructose, aspartame or saccharin; flavoring agents such as peppermint, oil of wintergreen, or cherry; coloring agents; and preserving agents, to provide a pharmaceutically palatable preparation. Moreover, where in tablet or pill form, the compositions may be coated to delay disintegration and absorption in the gastrointestinal tract thereby providing a sustained action over an extended period of time. Selectively permeable membranes surrounding an osmotically active driving compound are also suitable for orally administered crystalline polymorph or amorphous form of a Compound of the Invention. In these later platforms, fluid from the environment surrounding the capsule is imbied by the driving compound, which swells to displace the agent or agent composition through an aperture. These delivery platforms can provide an essentially zero order delivery profile as opposed to the spiked profiles of immediate release formulations. A time delay material such as glycerol monostearate or glycerol stearate may also be used. Oral compositions can include standard vehicles such as mannitol, lactose, starch, magnesium stearate, sodium saccharinate, cellulose, magnesium carbonate, etc. Such vehicles are preferably of pharmaceutical grade.

[0103] The amount of a crystalline polymorph or amorphous form of a Compound of the Invention that will be effective in the treatment of a particular disorder or condition disclosed herein will depend on the nature of the disorder or condition, and can be determined by standard clinical techniques. In addition, in vitro or in vivo assays may optionally be employed to help identify optimal dosage ranges. The precise dose to be employed in the compositions will also depend on the route of administration, and the seriousness of the disease or disorder, and should be decided according to the judgment of the practitioner and each patient’s circumstances. However, suitable dosage ranges for oral administration are generally about 0.001 milligram to 1000 milligrams of a compound of the invention per kilogram body weight. In specific preferred embodiments of the invention, the oral dose is 0.01 milligram to 500 milligrams per kilogram body weight, more preferably 0.1 milligram to 100 milligrams per kilogram body weight, more preferably 0.5 milligram to 50 milligrams per kilogram body weight, and yet more preferably 1 milligram to 10 milligrams per kilogram body weight. In a most preferred embodiment, the oral dose is 1 milligram of a crystalline polymorph or amorphous form of a Compound of the Invention per kilogram body weight. The dosage amounts described herein refer to total amounts administered; that is, if more than one compound of the invention is administered, the preferred dosages correspond to the total amount of the compounds of the invention administered. Oral compositions preferably contain 10% to 95% active ingredient by weight.

[0104] Suitable dosage ranges for intravenous (i.v.) administration are 0.001 milligram to 1000 milligrams per kilogram body weight, 0.1 milligram to 100 milligrams per kilogram body weight, and 1 milligram to 10 milligrams per kilogram body weight. Suitable dosage ranges for intranasal administration are generally about 0.01 mg/kg body weight to 1 mg/kg body weight. Suppositories generally contain 0.01 milligram to 50 milligrams of a compound of the invention per kilogram body weight and comprise active ingredient in the range of 0.5% to 10% by weight. Recommended dosages for intradermal, intramuscular, intraperitoneal, subcutaneous, epidural, sublingual, intracerebral, intravaginal, transdermal administration or administration by inhalation are in the range of 0.001 milligram to 1000 milligrams per kilogram body weight. Suitable doses of the compounds of the invention for topical administration are in the range of 0.001 milligram to 1 milligram, depending on the area to which the compound is administered. Effective doses may be extrapolated from dose-response curves derived from in vitro or animal model test systems. Such animal models and systems are well known in the art.

[0105] The invention also provides pharmaceutical packs or kits comprising one or more containers filled with one or more crystalline polymorph or amorphous form of a Compound of the Invention. Optionally associated with such container(s) can be a notice or in the form prescribed by a governmental agency regulating the manufacture, use or sale of pharmaceuticals or biological products, which notice reflects approval by the agency of manufacture, use or sale for human administration. In a certain embodiment, the kit contains more than one crystalline polymorph or amorphous form of a Compound of the Invention.

[0106] The crystalline polymorph or amorphous form of a Compound of the Invention is preferably assayed in vitro and in vivo, for the desired therapeutic or prophylactic activity, prior to use in humans. For example, in vitro assays can be used to determine whether administration of a specific compound of the invention or a combination of compounds of the invention is preferred for lowering fatty acid synthesis. The compounds of the invention may also be demonstrated to be effective and safe using animal model systems.

[0107] Other methods will be known to the skilled artisan and are within the scope of the invention.

6.4. General Synthesis of the Compounds of the Invention

[0108] The 18-membered macrocycles and analogs thereof are produced by fermentation. Cultivation of Dacyiospo-
rangium aurantiacum subspecies hamdenensis AB 718C-41
NRRL 18085 for the production of the tiacunicins is carried
out in a medium containing carbon sources, inorganic salts
and other organic ingredients with one or more absorbents
under proper aeration conditions and mixing in a sterile envi-
ronment.

[0109] The microorganism to produce the active antibac-
terial agents was identified as belonging to the family Actino-
planaceae, genus Dactylosporangium (J. Antibiotics, 1987,
40: 567-574 and U.S. Pat. No. 4,918,174). It has been desig-
nated Dactylosporangium aurantiacum subspecies hamden-
ensis 718C-41. The subculture was obtained from the ARS
Patent Collection of the Northern Regional Research Center,
United States Department of Agriculture, 1815 North Univer-
sity Street, Peoria, IL 61604, U.S.A., where it was assigned
accession number NRRL 18085. The characteristics of strain
AB 718C-41 are given in the Journal of Antibiotics, 1987, 40:
567-574 and U.S. Pat. No. 4,918,174.

[0110] This invention encompasses the composition of
novel antibiotic agents, Tiacunicins, by submerged aerobic
fermentation of the microorganism Dactylosporangium
aurantiacum subspecies hamdenensis. The production
method is disclosed in WO 2004/014259 A2, which is hereby
incorporated by reference.

7. EXAMPLES

7.1. Preparation of the Crude Mixtures of
Tiacunicins and the Subsequent Crystallization of
Certain Polymorphs of the Mixtures

[0111] In an illustrative embodiment, a mixture of tiacum-
incins containing the Compound of Formula I is prepared by
a process comprising:

[0112] (i) culturing a microorganism in a nutrient
medium to accumulate the mixture in the nutrient
medium; and

[0113] (ii) isolating the mixture from the nutrient
medium; wherein the nutrient medium comprises an
adsorbent to adsorb the mixture.

[0114] The nutrient medium preferably comprises
from about 0.5 to about 15% of the adsorbent by weight.
The absorbent is preferably an adsorbent resin. More preferably,
the adsorbent resin is Amberlite®, XAD16, XAD16HP,
XAD2, XAD7HP, XAD1180, XAD1600, IRC50, or Duolite®
XAD761. The microorganism is preferably Dacty-
losporangium aurantiacum subspecies hamdenensis.
The nutrient medium comprises the following combination based
on weight: from about 0.2% to about 10% of glucose, from
about 0.02% to about 0.5% of K2HPO4, from about 0.02% to
about 0.5% of MgSO4·7H2O, from about 0.01% to about
0.3% of KCl, from about 0.1% to about 2% of CaCO3, from
about 0.05% to about 2% of casamino acid, from about 0.05% to
about 2% of yeast extract, and from about 0.5% to about
15% of XAD-16 resin. The culturing step is preferably con-
ducted at a temperature from about 25°C to about 35°C, and
at a pH from about 6.0 to about 8.0.

[0115] Upon completion of fermentation, the solid mass
(including the adsorbent resin) is separated from the broth by
sieving. The solid mass is eluted with organic solvents such as,
for example, ethyl acetate then concentrated under
reduced pressure.

7.2. Structure of R-Tiacunicin B

[0116] The structure of the R-Tiacunicin B (the major most
active component) is shown below in Formula I. The X-ray
crystal structure of the R-Tiacunicin B was obtained as a
colorless, parallelepiped-shaped crystal (0.08X0.14X0.22
mm) grown in aqueous methanol. This x-ray structure con-
firms the structure shown below. The official chemical name is
3-{[6-deoxy-4-O-(3,5-dichloro-2-ethyl-4,6-dihydroxy-
benzoyl)-2-O-methyl-β-D-mannopyranosyl]oxoyl-methyl}-
12(R)-{{[6-deoxy-5-C-methyl-4-O-(2-methyl-1-oxopropyl)
-β-D-lyxo-hexopyranosyl]oxoyl}-11(S)-ethyl-8-(S)-hydroxy-
18(S)-(1(R)-hydroxyethyl)-9,13,15-trimethyloxacyclooctadeca-3,5,9,13,15-pentaene-2-one.
7.2.1 Analytical Data of R-Tiacuminic B
[0117] The analytical data of R-Tiacuminic B (which is almost entirely i.e., >90%) R-Tiacuminic.

[0122] 13C NMR (100 MHz, CD3OD) δ 178.4, 169.7, 169.1, 154.6, 153.9, 146.2, 142.7, 141.9, 137.1, 137.0, 136.4, 134.6, 128.5, 126.9, 125.6, 124.6, 114.8, 112.8, 108.2, 102.3, 97.2, 94.3, 82.5, 78.6, 76.9, 75.9, 74.5, 73.5, 73.2, 72.8, 71.6, 70.5, 68.3, 63.9, 62.2, 42.5, 37.3, 35.4, 28.7, 28.3, 26.9, 26.4, 20.3, 19.6, 19.2, 18.7, 18.2, 17.6, 15.2, 14.6, 14.0, 11.4.

7.3. Preparation of a First Polymer of R-Tiacuminic B
[0123] Another illustrative embodiment of the invention comprises a process for producing a polymer of a Compound of Formula I from a mixture of tiacuminic comprising the steps of
[0124] a) dissolving a crude mixture of tiacuminic containing from about 76% to about 100% of a compound of Formula I in a minimum amount of solvent comprising methanol, water, acetic acid, acetic anhydride, isopropyl alcohol mixtures thereof;
[0125] b) allowing the solution of a) to evaporate while standing at room temperature (e.g., about 22°C) for 3 to 7 days to precipitate a first polymer of a Compound of Formula I; and
[0126] c) separating the polymer from the solution by techniques known in the art.

7.3.1. Illustrative Example 1 of the Preparation of a Polymer of R-Tiacuminic B

7.3.2. Illustrative Example 2 of the Preparation of a Polymer of R-Tiacuminic B
[0129] After the fermentation process as described for example in Section 7.1., the crude material was purified by reverse phase chromatography using a Biotage Flash 150 system containing a 3.75 kg, Biotage KP-C18-HS silica column, eluted with 52:48:1, EtOH/H2O/ACOH. The collected fractions containing about 80-88% of Compound of Formula I were combined and concentrated to one-third the original volume to produce a precipitate. The precipitate was filtered and washed with water. The solid was dried under high vacuum. HPLC analysis showed the powder contains 85.4% of Compound of Formula I as a major product and a mixture of tiacuminics as the minor component.
[0130] The mixture containing about 85% of Compound of Formula I (i.e., 1000 mg) was dissolved in 20 mL of a mixture of methanol and water at ratios 1:1 methanol water. The solution was allowed to evaporate/stand at room temperature for 3 days to produce a polymorph crystalline precipitate. The crystal was separated from the solution by filtration.
[0131] The composition obtained is a mixture containing a first polymorph of a Compound of Formula I, and at least one of the tiacuminic compounds based on HPLC analysis. The composition has a melting point of 165-169°C.

7.3.3. Illustrative Example 3 of the Preparation of a Polymer of R-Tiacuminic B
[0132] The preparation of the polymer of the fermentation process as described for example in Section 7.1., the crude material was purified by reverse phase chromatography using a Biotage Flash 75L system containing a 1.2 kg, Biotage KP-C18-HS silica column, eluted with MeOH/H2O/ACOH 67:33:4 to 70:30:1. The collected fractions containing >90% of Compound of Formula I was combined and concentrated to one-third volume. The precipitate was filtered and washed with water. The solid was dried under high vacuum. HPLC analysis showed the powder contains 94.0% of Compound of Formula I.
[0133] The solid was subjected to X-ray diffraction (XRD) and Differential Scanning calorimetry (DSC) (See FIGS. 2 and 4). The X-ray diffraction of the solid shows peaks at angles 2θ of 7.7°, 15.0°, and 18.8°±0.1 indicating the solid is the form of a first polymorph of a Compound of Formula I. The DSC plot shows an endothermic curve starting at about 169°C. and peak at 177°C.

7.3.4. Illustrative Example 4 of the Preparation of a Polymer of R-Tiacuminic B
[0134] After the fermentation process as described for example in Section 7.1., the crude material was purified by reverse phase chromatography using a Biotage Flash 75L system containing a 1.2 kg, Biotage KP-C18-HS silica column, eluted with 52:48:1, EtOH/H2O/ACOH. The collected fractions containing >90% of Compound of Formula I were combined, one-third volume of water was added and left at room temperature overnight. The precipitate was filtered and washed with water. The solid was dried under high vacuum. HPLC analysis showed the powder contains 94.7% of Compound of Formula I.
[0135] The powder containing 94.7% of Compound of Formula I (i.e., 98 mg) was dissolved in 3 mL of methanol and then 1 mL of water was added. The solution was allowed to evaporate and stand at room temperature for 7 days to produce a crystalline precipitate. The crystals were separated from the
solution by filtration and washed with methanol/water 3:1. The crystals were analyzed by X-ray diffraction.

7.3.5. Illustrative Example 5 of the Preparation of a Polymer of R-Tiacuminic

After the fermentation process as described for example in Section 7.1., the mixture was poured on a column, and a 0.06 g-m of a mixture of tiacuminics was dissolved in 16 ml of methanol and 4 ml of water in a 20 ml vial. The vial was covered with paraffin, and pinholes were punched through. The covered vial is placed in a desiccator and stored at room temperature for ten days. Paraffin cover is then removed, and the vial is returned to desiccator. Crystalline material is produced within three to five days after the paraffin is removed. The crystalline material is washed with a solution of methanol and water and the Compound of Formula I was isolated in 75.6%.

7.3.6. Illustrative Example 6 of the Preparation of a Polymer of R-Tiacuminic

Preparation of a Polymer From Isoamyl Alcohol

After the fermentation process as described for example in Section 7.1., the crude material was purified by reverse phase chromatography using a Biogel Flash 150 system containing a 3.75 kg, Biogel KP-C18-HS silica column, eluted with 52:48:1, EtOH/H₂O/3.5%AcOH. The collected fractions containing 89-88% of Compound of Formula I were combined and concentrated to one-third of the original volume to produce a precipitate. The precipitate was filtered and washed with water. The solid was dried under high vacuum. HPLC analysis showed the powder contains 85.4% of Compound of Formula I.

The powder containing 85.4% Compound of Formula I (i.e., 2000 mg) was dissolved in 900 ml of isopropanol. The solution was heated to increase solubility and then filtered to remove insoluble materials. The clear solution was allowed to evaporate/stand at room temperature for 14 days to produce a crystalline precipitate. The crystal is separated from the solution by filtration.

Composition of the precipitate is a mixture comprising Compound of Formula I and at least one of other related substances based on HPLC analysis with mp of 163-165°C.

X-ray diffraction of the precipitate shows peaks at angles 20 of 7.6° and 15.4°.

7.3.7. Illustrative Example 7 of the Preparation of a Polymer of R-Tiacuminic

After the fermentation process as described for example in Section 7.1., and column purification, a mixture of Compound of Formula I (90%), 15 g) was dissolved in minimum amount of methanol (from about 20 ml. to about 30 ml.), the solution was triturated with isopropanol (~100 ml.) to produce a polymer. The solid is separated from the solution by filtration with melting point of 165-168°C.

The XRD diagram shows a distinct polymorphic pattern comprising 2 theta values of 7.5°, 15.2°, 15.7°, 18.6°, 18.7°.

7.3.8. Illustrative Example 5 of the Preparation of a Polymer of R-Tiacuminic

Preparation of a Polymer from Acetonitrile

The mixture of tiacuminics obtained as described above and (85-44%) of Compound of Formula I, 1000 mg) was dissolved in 30 ml of acetonitrile. The solution was allowed to evaporate and stand at room temperature for 12 days to produce a crystalline precipitate. The crystal is separated from the solution by filtration, and exhibits a melting point of 165-169°C.

The XRD diagram of this crystal shows the pattern of a polymorph comprising 2 theta values of 7.8°, 15.1°, 18.8°.

7.4. Preparation of Other Polymorphs of R-Tiacuminic

Another illustrative embodiment of the invention comprises a process for producing a polymorph of a Compound of Formula I comprising the steps of:

(a) dissolving crude mixture of tiacuminics containing from about 78 to about 100% of a Compound of Formula I in a minimum amount of ethyl acetate;

(b) allowing the solution to evaporate and stand at room temperature for 3 to 7 days to precipitate a polymorph; and

(c) separating polymorph from the solution

7.4.1. Illustrative Example 1 of the Preparation of a Polymer of R-Tiacuminic

Preparation of Example from Ethyl Acetate

After the fermentation process as described for example in Section 7.1., the crude material was purified by reverse phase chromatography using a Biogel Flash 150 system containing a 3.75 kg, Biogel KP-C18-HS silica column, eluted with 52:48:1, EtOH/H₂O/3.5%AcOH. The collected fractions containing 70-88% of Compound of Formula I was combined and concentrated to one-third volume to produce a precipitate. The precipitate is filtered and washed with water. The solid was dried under high vacuum. HPLC analysis showed the powder contains 85.4% of Compound of Formula I.

This crude tiacuminic mixture (1000 mg) was then dissolved in 30 ml of ethyl acetate. The solution was allowed to evaporate and stand at room temperature for 12 days to produce a crystalline precipitate of Polymorph B of the Compound of Formula I. The crystals were separated from the solution by filtration. The crystals have a melting point of about 153-156°C, which confirm a different polymorphic form from the first polymorph.

7.4.2. Illustrative Example 2 of the Preparation of a Polymer of R-Tiacuminic

Preparation of Polymer from Methanol and Isoamyl Alcohol

After the fermentation process as described for example in Section 7.1., six different batches of crude material of varying amounts of Compound of Formula I were combined such that the combination has an average of 91% of Compound of Formula I. The combination was dissolved in methanol and concentrated by rotary evaporation. The com-
centrated solution is then mixed with isopropanol, filtered, and dried by vacuum to produce a white powder with a melting point of 156-160°C.

[0158] X-ray powder diffraction of the white powder is shown in FIG. 6 comprising 2 theta values of 7.5°, 15.4°, and 18.7°.

7.4.3. Illustrative Example 3 of the Preparation of a Polyomorph of R-Tiacmicin

[0159] Preparation of Polymorph B from Chloroform

[0160] After the fermentation process as described for example in Section 7.1., a crude material of tiacmicins containing Compound of Formula I was dissolved in chloroform and concentrated by evaporation at room temperature to produce a solid with a melting point of 156-160°C.

7.4.4. Illustrative Example 4 of the Preparation of a Polyomorph of R-Tiacmicin

[0161] Preparation of a Polymorphic Form From Acetone

[0162] After the fermentation process as described for example in Section 7.1., a crude material of tiacmicins containing Compound of Formula I was dissolved in acetone and concentrated by evaporation at room temperature to produce a solid with a melting point of 156-160°C.

7.5. Preparation of Amorphous Forms of Compound of Formula

[0163] Preparation of Amorphous Mixture of Tiacmicins

[0164] The amorphous mixture of tiacmicins was obtained after column purification without any further processing steps. Alternatively, chloroform or acetone may be added to the mixture of tiacmicins and the solvent is evaporated to form the amorphous product.

[0165] X-ray powder diffraction of the product exhibits no defined diffraction peaks.

8. EXPERIMENTAL DATA

8.1. Polymorph Experimental Data

[0166] A first polymorph of a Compound of a Compound of Formula I is characterized by Differential Scanning Calorimetry (DSC) and powder X-Ray Diffraction (XRD).

[0167] The DSC plot of the polymorph shows an endothermic curve at 177°C.

[0168] The XRD diagram (reported in FIG. 1) shows peaks comprising at diffraction angles 2θ of 7.7°, 15.0°, 18.8°. The XRD was analyzed with a Phillips powder Diffractometer by scanning from 20 to 70 degrees two-theta at 1.0 degree per minute using Cu K-alpha radiation, at 35 KVe and 20 ma. The instrumental error (variant) is 0.04 (2 theta value).

[0169] The melting point of the mixtures containing various amounts of Compound of Formula I is summarized in Table 1. All of the products with at least 85% of a Compound of Formula I in the form of a polymorph appear to have a melting point in the range of 163-169°C. The crystallographic data are March 16-21 1001.

8.2. Second Polymorph of R-Tiacminin

Experimental Data

[0173] A second polymorph of Compound of Formula I is also characterized by Differential Scanning Calorimetry (DSC) and powder X-ray Diffraction (XRD).

[0174] The DSC plot of polymorph B shows an endothermic curve at 158°C. The XRD diagram (reported in FIG. 5) shows peaks comprising at the values of the diffraction angles 2-theta of 7.6°, 15.4° and 18.8°. Polymorph B has a melting point in the range of 153-156°C. measured by Melting Point apparatus, MEL-TEMP 1001.

[0175] It is believed that crystalline polymorphic forms of Compounds of Formula I other than the above-discussed A and B exist and are disclosed herein. These crystalline polymorphic forms, including A and B, and the amorphous form or mixtures thereof contain varying amounts of Compound of Formula I and in certain cases mixtures of tiacminics can be advantageously used in the production of medicinal preparations having antibiotic activity.

[0176] X-ray powder diffraction of the crystals is shown in FIG. 3 with peaks at angles 20 of 7.5°, 15.7°, and 18.9°±0.04 indicating the presence of Polymorph B.

[0177] The DSC plot of Polymorph B shows an endothermic curve starting at about at 150°C, and peak at 158°C.

[0178] Table 4 is a summary of the various data that was isolated for illustrative crystallization lots.

[0179] The present invention is not to be limited in scope by the specific embodiments disclosed in the examples which are intended as illustrations of a few aspects of the invention and any embodiments which are functionally equivalent are within the scope of this invention. Indeed, various modifications of the invention in addition to those shown and described herein will become apparent to those skilled in the art and are intended to fall within the appended claims.

[0180] A number of references have been cited, the entire disclosures of which are incorporated herein by reference.

What is claimed is:

1. A crystalline polymorph of tiacminic comprising a powder x-ray diffraction pattern with at least peaks at diffraction angles 20 of 7.7°, 15.0°, and 18.8°±0.2.

2. The crystalline polymorph of claim 1, comprising a polymorph having the chemical structure of Formula I:
3. The crystalline polymorph of claim 2, further comprising at least one compound selected from a mixture of tiaicumics.

4. The crystalline polymorph of claim 2, wherein the polymorph of Formula I is present in at least about 75% to about 99.99%.

5. The crystalline polymorph of claim 4, wherein the polymorph of Formula I is present in at least about 85%.

6. The crystalline polymorph of claim 4, wherein the polymorph of Formula I is present in at least about 90%.

7. The crystalline polymorph of claim 4, wherein the polymorph of Formula I is present in at least about 95%.

8. The crystalline polymorph of claim 4, wherein the polymorph of Formula I is present in at least about 99%.

9. A crystalline polymorph of tiaicumicin comprising:
   (i) a DSC endotherm in the range of about 174°C to about 186°C; and
   (ii) a chemical structure of Formula I:

10. The crystalline polymorph of claim 9, further comprising at least one compound selected from a mixture of tiaicumics.

11. The crystalline polymorph of claim 9, wherein the polymorph of Formula I is present from about 75% to about 99.99%.

12. The crystalline polymorph of claim 9, wherein the polymorph of Formula I is present in at least about 85%.

13. The crystalline polymorph of claim 11, wherein the polymorph of Formula I is present in at least about 90%.

14. The crystalline polymorph of claim 11, wherein the polymorph of Formula I is present in at least about 95%.

15. The crystalline polymorph of claim 11, wherein the polymorph of Formula I is present in at least about 99%.

16. A crystalline polymorph of tiaicumicin comprising:
   (i) a powder x-ray diffraction pattern with at least peaks at diffraction angles 2θ of 7.7°, 15.0°, and 18.8°±0.2;
   (ii) a DSC endotherm in the range of about 174°C to about 186°C; and
   (iii) a chemical structure of Formula I:
17. The crystalline polymorph of claim 16, further comprising at least one compound selected from a mixture of tia cucins.

18. The crystalline polymorph of claim 16, wherein the Compound of Formula 1 is present from about 75% to about 99.99%.

19. The crystalline polymorph of claim 16, wherein the Compound of Formula 1 is present in about 90%.

20. A composition comprising the crystalline polymorph of claim 1 and a pharmaceutically acceptable carrier.
