The invention discloses a novel quinazoline derivative LU1501 and a preparing method thereof, wherein the quinazoline derivative has a chemical name of N-[(4-fluorophenyl)methyl]-4-N-[7-methoxy-6-[2-pyrrolidin-1-yl]hydroxymethyl]quinazoline-4-yl]phen-1,4-diamine. The quinazoline derivative and a pharmaceutically acceptable salt, a solvate and a hydrate thereof have excellent anti-tumor activity in vitro and in vivo to MCF-7, SK-BR-3, A549, HCT 116, U-118 MG, U-87 MG and MDA-MB-468, and have preferable application prospects on preparing anti-tumor drugs.
NOVEL QUINAZOLINE DERIVATIVE LU1501 AND PREPARING METHOD AND APPLICATION THEREOF

TECHNICAL FIELD

[0001] The invention belongs to the field of biological medicines, and more particularly, relates to a novel quinazoline derivative LU1501 and a preparing method and application thereof.

BACKGROUND

[0002] Malignant tumor is a common and frequently-occurring disease which severely threatens human’s health. In recent 20 years, the tumor death rate in our country has been increased by 29.42%. Among the middle and prime aged crowds who are 35-59 years old, tumor has ranked the first among various causes of death. Data shows that the tumor incidence of our country is 200/100,000 people. In each year, there are about 2,200,000 or more newly-incident cases, and there are more than 6,000,000 patients receiving treatments. The treatment methods of tumor include operative treatment, radiotherapy and chemotherapy. At present, the chemotherapy is still the major means to treat tumor in clinic. One hotpot for new medicine study is to find out anti-tumor drugs. In recent years, 4-aminooquinazoline compounds have greatly drawn people’s attention due to excellent biological activity thereof, and have become the researching hotspot of scholars from the biology and chemistry circles. The 4-aminooquinazoline compounds produce better inhibiting effects on EGF receptor or PDGF receptor tyrosine kinase, presenting such efficacy like resisting lung cancer, gastric cancer, colon cancer, breast cancer, gallbladder cancer, and prostate cancer, and having effect like antibiosis, anti-HIV, anti-inflammatory, and diabetes treatment, like those drugs on sale including gefitinib, erlotinib, lapatinib, dithyrate, etc. It is found by the inventor that N-[(4-fluorophenyl)methyl]-4-N-[7-methoxy-6-(2-pyrrolidin-1-yl)hydroxyethyl]quinazolin-4-yl]phen-1.4-diamine has certain anti-tumor activity. The invention proposes an invention related to the N-[(4-fluorophenyl)methyl]-4-N-[7-methoxy-6-(2-pyrrolidin-1-yl)hydroxyethyl]quinazolin-4-yl]phen-1.4-diamine or a pharmaceutically acceptable salt, a solvate or a prodrug thereof, or a stereoisomer or a tautomer or a metabolite thereof.

SUMMARY OF THE INVENTION

[0003] Object of the invention: in order to solve the problems in the prior art, the invention provides a novel quinazoline derivative LU1501, wherein the quinazoline derivative has a chemical name of N-[(4-fluorophenyl) methyl]-4-N-[7-methoxy-6-(2-pyrrolidin-1-yl)hydroxyethyl]quinazolin-4-yl]phen-1.4-diamine, and has inhibitory activity on the proliferation of seven tumor cells including MCF-7, SK-BR-3, A549, HCT116, U-118 MG, U-87 MG and MDA-MB-468.

[0004] Technical solution: in order to implement the above object, the invention provides a novel quinazoline derivative LU1501 which has a chemical name of N-[(4-fluorophenyl) methyl]-4-N-[7-methoxy-6-(2-pyrrolidin-1-yl)hydroxyethyl]quinazolin-4-yl]phen-1.4-diamine, wherein the structural formula of the quinazoline derivative is as follows:

[0005] The invention further provides a preparing method for the above novel quinazoline derivative LU1501, which includes the following steps of:

[0006] S1: adding DMF to SOC12 dropwise slowly under the protection of nitrogen to catalyze, then adding 7-methoxy-4-oxo-3,4-di-hydro-quinazolin-6-yl acetate, heating at 60-100° C. for 3-6 h, and reacting to generate a compound (1) which is namely 4-chloro-7-methoxy quinazolin-6-yl acetate;

[0007] S2: adding a solution of amino methanol dropwise slowly to the compound (1) while stirring in an ice bath, reacting for over 30 min while stirring when the reaction fluid is under 10° C., filtering, and washing a filter residue with diethyl-ether, thereby obtaining a reduced product compound (2) which is namely 4-chloro-7-methoxy quinazolin-6-ol;

[0008] S3: dissolving the compound (2), N-(2-hydroxyethyl)pyrrolidine, and PPh3 in tetrahydrofuran under the protection of nitrogen, adding DIAD by batch while stirring in an ice bath, and reacting for over 6 h, thus generating a compound (3) which is namely 4-chloro-7-methoxy-6-[(2-pyrrolidin-1-yl)hydroxyethyl]quinazoline;

[0009] S4: dissolving 1-fluoro-4-nitrobenzene, 4-fluorophenyl methylamine and sodium carbonate with DMSO under the protection of argon, and reacting for 4-12 h with stirring at 100-120° C., thus generating a compound (4) which is namely N-[(4-fluorophenyl)methyl]-4-nitroaniline;

[0010] S5: adding the compound (4) to Boc2O with dichloromethane as a solvent in an ice bath under the protection of nitrogen, then adding DMAP to catalyze, reacting for 4-12 h with stirring, and performing secondary amine Boc protection, thus generating a compound (5) which is namely tert-butyl N-[(4-fluorophenyl)methyl]-N-(4-nitrophenyl)carbamate;

[0011] S6: dissolving the compound (5) in methanol, adding 10% Pd/C to catalyze, pumping in H2, and reacting for 4-12 h with stirring to reduce to a compound (6) which is namely tert-butyl N-[(4-aminophenyl)]N-[(4-fluorophenyl)methyl]carbamate;

[0012] S7: dissolving the compound (6) and the compound (5) in isopropanol, and reacting for 3-12 h at 80-100° C. under the catalysis of p-toluene sulfonic acid with stirring, thus generating a compound (7) which is namely tert-butyl N-[(4-fluorophenyl)methyl]-N-[(4-methoxy-6-[(2-pyrrolidin-1-yl)hydroxyethyl]quinazolin-4-yl]aminophenyl carbamate; and

[0013] S8: dissolving the compound (7) in a mixed solvent of dichloromethane/trifluoroacetic acid, and stirring at 25-45° C. for 1-6 h to remove Boc, thus generating a compound (8) which is namely N-[(4-fluorophenyl)methyl]-4-N-[7-methoxy-6-(2-pyrrolidin-1-yl)hydroxyethyl]quinazolin-4-yl]phen-1.4-diamine.

[0014] Preferably, in step S1, the adding rate of DMF is 2-3 mL/min, and the dosage ratio of the SOC12 to the DMF;
to the 7-methoxy-4-oxo-3,4-dihydropyrazinazolin-6-yl acetate is 500-1000 ml to 10-20 ml to 100-150 g; and in step S2, the concentration of the NH₃-methanol solution is 3-10 ml/min, and the dosage of the NH₃-methanol solution being added to per gram compound (1) is 10-20 ml.

[0015] In step S3, the DTAD is added by 3-6 batches, with an interval of 2-4 h between each of the batches, wherein the dosage ratio by mole of the N-(2-hydroxyethyl)pyrrolidine to the PPh₃ to the DTAD to compound (2) is 1 to 1 to 1 to 0.8-1.4.

[0016] In step S4, the dosage ratio by mole of the 1-fluoro-4-nitrobenzene to the 4-fluorophenyl methylamine to the sodium carbonate is 1 to 1 to 0.8-1.4.

[0017] In step S5, the compound (4) is added to Boc₂O by 3-6 batches, with an interval of 5-10 min between each of the batches, wherein the dosage ratio by mole of the compound (4) to the Boc₂O is 1 to 0.8-1.5, and the dosage ratio by mole of the compound (4) to the DMAP is 1 to 0.8-1.5.

[0018] In step S6, the amount of the 10% Pd/C being added to per 10 mmol solvent (5) is 0.6-1.5 g.

[0019] In step S7, the dosage ratio by mole of the compound (6) to the compound (3) to the p-toluenesulfonic acid is 1 to 1 to 1.1-1.5.

[0020] In step S8, the mixed solvent of the dichloromethane/trifluoroacetic acid is obtained by mixing dichloromethane and trifluoroacetic acid with a volume ratio of 2:5 to 1, and the dosage of the mixed solvent being added to per 1 g compound (7) is 10-20 ml.

[0021] The invention further provides an application of the novel quinazoline derivative in anti-tumor agent preparation.

[0022] The invention provides a pharmaceutical composition at the same time, wherein the pharmaceutical composition includes the compound and the pharmaceutically acceptable carrier according to claim 1.

[0023] Further, the invention provides a use of the compound or the pharmaceutical composition in drug preparation.

[0024] Meanwhile, the invention further provides an application of the novel quinazoline derivative LU1501 or the pharmaceutically acceptable salt, the solvate or prodrg thereof, or the stereoisomer or tautomer or metabolite thereof in anti-tumor agent preparation.

[0025] Finally, the invention provides an application of the novel quinazoline derivative LU1501 or the pharmaceutically acceptable salt, the solvate or prodrg thereof, or the stereoisomer or tautomer or metabolite combined with one or more anti-cancer agents in preparing medicine for treating tumor.

Beneficial effects: the invention discloses a novel quinazoline derivative LU1501, and employs an MTT method to evaluate the inhibitory activity thereof on the proliferation of seven tumor cells including MCF-7, SK-BR-3, A549, HCT116, U-118 MG, U-87 MG and MDA-MB-468, and calculate the IC₅₀ value of the proliferation of the seven tumor cell. The result shows that the prepared novel quinazoline derivative LU1501 has inhibition effect on the above tumor cells, and can be used for preparing anti-tumor agents.

BRIEF DESCRIPTION OF THE DRAWINGS

[0026] FIG. 1 is a synthetic route diagram of quinazoline derivative, wherein i) SOCl₂, DMF; ii) NH₃/MeOH; iii) (N-(2-hydroxyethyl)pyrrolidine, PPh₃, DTAD, THF; iv) 4-fluorophenyl methylamine, Na₂CO₃, DMSO; v) Boc₂O, DMAP; vi) MeOH, H₂, Pd/C; vii) i-PrOH, TsOH; viii) DCM, TFA.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

[0027] In order to further describe the invention, a series of embodiments are given hereinafter. These embodiments are completely exemplary, which are only used to describe the invention in details, but should not be deemed as a limitation to the invention.

Embodiment 1 Prepare 4-chloro-7-methoxy quinazolin-6-yl acetate (compound 1)

[0028] 1000 ml sulfoxide chloride (SOCl₂) was added into 2000 ml nitrogen-protected four-neck round-bottom flask, 10 ml DMF was dropwise added slowly for catalyzing (dropwise added in 20 min), then 100 g 7-methoxy-4-oxo-3,4-dihydropyrazinazolin-6-yl acetate was added, and stirred for 3 h under 100℃. The reaction fluid is cooled to room temperature in an ice bath, subjected to vacuum concentration, dried and then dissolved with 1000 ml dichloromethane, and then 1000 ml ice water was poured in. A mixture fluid was extracted by twice using dichloromethane to combine an organic layer, and then were washed by thrice using saturated aqueous sodium chloride solution. The organic layer was separated out and dried for 6 h in a 250 ml triangular flask by adding anhydrous sodium sulfate, then was subjected to vacuum filtration. The filtrate was subjected to vacuum concentration and dried, and washed by diethyl ether, thus obtaining 65 g (yield 60%) compound 1, which was pale yellow powder.

Embodiment 2 Prepare 4-chloro-7-methoxy quinazolin-6-ol (compound 2)

[0029] 10 g 4-chloro-7-methoxy quinazolin-6-yl acetate (compound 1) was placed into a 250 ml three-neck round-bottom flask, 100 ml 7M NH₃-methanol solution was dropwise added while being stirred in an ice bath, and completely dropwise added in 30 min. The stirring reaction was performed for more than 30 min under 100℃. The reaction fluid was subjected to vacuum filtration, then a filtration residue was washed by twice using diethyl ether, thus obtaining 6.5 g (yield 78%) compound 2, which was pale yellow powder.

Embodiment 3 Prepare 4-chloro-7-methoxy-6-(2-pyrrolidin-1-yl)hydroxyethylquinazoline (compound 3)

[0030] 6.5 g 4-chloro-7-methoxy quinazolin-6-ol (compound 2), 4.6 g N-(2-hydroxyethyl)pyrrolidine, and 10.54 g PPh₃ were dissolved into 120 ml tetrahydrofuran, placed in a 250 ml nitrogen-protected three-neck round-bottom flask, and 9.25 g DTAD was added by three batches with an interval of 3 h times under an ice bath, and stirred for 12 h under a room temperature. 100 ml water was added for terminating the reaction, and the reaction fluid was extracted by thrice using 200 ml dichloromethane to combine an organic layer, and then was washed by once using saturated aqueous sodium chloride solution. The organic layer was separated out and dried for 6 h in a 250 ml triangular flask by adding anhydrous sodium sulfate, then was subjected to
vacuum filtration. The filtrate was subjected to vacuum concentration and dried, and then subjected to column chromatography, thus obtaining 4 g (yield 42%) compound 3, which was colorless powder.

**Embodiment 4 Prepare**
N-[(4-fluorophenyl)methyl]-4-nitroaniline (compound 4)

[0031] 10 g 1-fluoro-4-nitrobenzene and 8.86 g 4-fluorophenyl methylamine were dissolved into 100 mL DMS. 22.6 g sodium carbonate was placed into a 250 mL nitrogen-protected three-neck flask, stirred for 12 h at 100°C, and cooled to room temperature under an ice bath. 200 mL ice water was added into the reaction fluid, then vacuum filtration was performed, and the filtration residue was washed by 100 mL diethyl-ether, thus obtaining 12 g (yield 69%) compound 4, which was yellow powder.

**Embodiment 5 Prepare** tert-butyl N-[(4-fluorophenyl)methyl]-N-(4-nitrophenyl) carbamate (compound 5)

[0032] 3 g N-[(4-fluorophenyl)methyl]-4-nitroaniline (compound 4) and 4 g BocO were dissolved into 100 mL dichloromethane, placed in a 250 mL nitrogen-protected three-neck flask, 2.23 g DMAP was added by three batches under an ice bath for catalyzing with an interval of 5 min times, and stirred for 12 h under room temperature. 200 mL dichloromethane was additionally added into a reaction fluid, washed by once using 100 mL 1M HCl solution, and washed by once using 100 mL saturated aqueous sodium chloride solution. A dichloromethane layer was separated out and dried for 6 h in a 250 mL triangular flask by adding anhydrous sodium sulfate, then was subjected to vacuum filtration. The filtrate was subjected to vacuum concentration and dried, then subjected to column chromatography, thus obtaining 3.4 g (yield 81%) compound 5, which was colorless powder.

**Embodiment 6 Prepare** tert-butyl N-[(4-aminophenyl)-N-[(4-fluorophenyl)methyl] carbamate (compound 6)

[0033] 3.4 g tert-butyl N-[(4-fluorophenyl)methyl]-N-(4-nitrophenyl) carbamate (compound 5) was dissolved in 100 mL methanol, placed in a 250 mL round-bottom flask, 1.5 g 10% palladium on carbon was added, and sufficient nitrogen was pumped in. The mixture was stirred for 12 h under room temperature, subjected to vacuum filtration, then the filtrate was concentrated and dried, thus obtaining 2.8 g (yield 90%) compound 6, which was yellow powder.

**Embodiment 7 Prepare** tert-butyl N-[(4-fluorophenyl)methyl]-N-[(7-methoxy-6-[(2-pyridinyl-1)-hydroyethyl]quinazolin-4-yl]aminophenyl carbamate (compound 7)

[0034] 1.46 g 4-chloro-7-methoxy-6-[(2-pyridinyl-1)-hydroyethyl]quinazoline (compound 3), 1.5 g tert-butyl N-[(4-aminophenyl)-N-[(4-fluorophenyl)methyl] carbamate (compound 6), and 1.06 g p-toluene sulfonic acid were dissolved into 50 mL isopropanol, placed in a 100 mL nitrogen-protected three-neck flask, stirred for 3 h at 90°C, and then cooled to room temperature in an ice bath. The reaction fluid was subjected to vacuum concentration and dried, then subjected to column chromatography, thus obtaining 4 g (yield 33%) compound 7, which was yellow powder.

**Embodiment 8 Prepare** N-[(4-fluorophenyl)methyl]-4-N-[(7-methoxy-6-[(2-pyridinyl-1)-hydroyethyl]quinazolin-4-yl]phen-1,4-diamine (compound 8, i.e. L151801)

[0035] 4 g N-tert-butyl N-[(4-fluorophenyl)methyl]-N-[(7-methoxy-6-[(2-pyridinyl-1)-hydroyethyl]quinazolin-4-yl]aminophenyl carbamate (compound 7) was dissolved in 60 mL mixed solvent of dichloromethane/trifluoroacetic acid (2:1), placed in an 100 mL three-neck round-bottom flask, subjected to heating reflux, stirred for 2 h, and then cooled to room temperature in an ice bath. The reaction fluid was subjected to vacuum concentration and dried, then 100 mL dichloromethane was added to adjust the pH value to 9. The mixture fluid was extracted by thrice using dichloromethane to combine an organic layer, and then was washed by twice using saturated aqueous sodium chloride solution. A dichloromethane layer was separated out and dried for 6 h in a 250 mL triangular flask by adding anhydrous sodium sulfate, then was subjected to vacuum filtration. The filtrate was subjected to vacuum concentration and dried, then subjected to column chromatography, thus obtaining 1.35 g (yield 41%) compound 8, which was yellow powder.

**[0036]** ESI-MS standard was conducted on the prepared compound 8, wherein the results were as follows:

[0037] ESI-MS(m/z): 488[M+H]+; 1H-NMR (300 MHz, CD3Cl, ppm): δ 8.60 (s, 1H), 7.69-7.63 (m, 1H), 7.53-7.51 (m, 3H), 7.43-7.35 (m, 2H), 7.21 (s, 1H), 7.08-7.03 (t, J=8.4 Hz, 2H), 6.70-6.68 (d, J=8.7 Hz, 2H), 4.50-4.46 (t, J=6.0 Hz, 2H), 4.35-4.33 (m, 2H), 4.08-4.06 (m, 1H), 4.00 (s, 3H), 3.18-3.11 (t, J=5.7 Hz, 4H), 2.92-2.78 (m, 1H), 1.93-1.84 (m, 4H).

**Embodiment 9 Evaluation of inhibitory activity of compound 8 on the proliferation of tumor cells**

(1) Tested Sample:

[0038] The compound 8 of the invention was prepared into required concentrations using a culture medium containing 0.1% DMSO.

(2) Cell Strain:

(3) Main instruments and materials

Cell incubator: HF151UVCO2 incubator, Shanghai Lishen Corporation; Refrigerated centrifuge: Shanghai Anting Scientific Instrument Plant Microplate reader: ELx800, Biotek Corporation Flat oscillator: ZD-9556, Tailang Science and Education Instrument Plant 96 hole cell culture plate, and 25 cm² culture bottle: Corning Costar Corporation; 2 ml. freezing tube: Corning Costar Corporation; (4) Major reagents RPMI-1640 culture medium: Gibco Corporation; DMEM culture medium: Gibco Corporation; L-15 culture medium: Gibco Corporation; MEM culture medium: Gibco Corporation; PBS buffer solution: Gibco Corporation; Fetal calf serum: Gibco Corporation; 0.25% pancreatin solution: Hyclone Corporation; DMSO was added into each hole to dissolve purple residue (formazan), flaskly oscillated for 10 min to completely dissolve deposits, then O.D. value (absorbancy) was measured on a microplate reader, wherein the wavelength was 570 nm.

The inhibition rates of the samples under each sample concentration on the tumor cells were calculated according to a formula that “relative survival rate=(D drug-containing−D blank)/D control−D blank×100%”.

[0042] The test was repeated for thrice. A diagram was made by plotting the inhibition rate against the concentration of the compound, and the IC₅₀ (half effective inhibitory concentration) value of the compound 8 of the invention was calculated. Meanwhile, adriamycin amycin (ADR) was employed as a control positive drug.

[0044] As shown in FIG. 1, the test result of the inhibitory activity of compound 8 on the proliferation of tumor cells was given, wherein the result indicated that the novel quinazoline derivative prepared had certain inhibition effect on the above tumor cells, and may be used to prepare anti-tumor agents.

1. (canceled)
2. A method for preparing a quinazoline derivative comprising the following steps of:
   S1: adding DMF to SOCl₂ dropwise slowly under the protection of nitrogen to catalyze, then adding 7-methoxy-4-oxo-5,4-dihydropyrimidin-6-yl acetate, heating at 60-100°C for 3-6 h, and reacting to generate a compound (1) which is 4-chloro-7-methoxy quinazolin-6-yl acetate;
   S2: adding NH₄-methanol solution dropwise slowly to the compound (1) while stirring in an ice bath, reacting for over 30 min while stirring when the reaction fluid is under 10°C, filtering, and washing a filter residue with diethyl ether, thus obtaining a reduced product compound (2) which is 4-chloro-7-methoxy quinazolin-6-ol;
   S3: dissolving the compound (2), N-(2-hydroxyethyl) pyrrolidine, and PPh₃ in tetrahydrofuran under the protection of nitrogen, adding DIAD while stirring in an ice bath, and reacting for over 6 h, thus generating a compound (3) which is 4-chloro-7-methoxy-6-[2-pyrrrolidin-1-yl]hydroxyethyl]quinazoline;
   S4: dissolving 1-fluoro-4-nitrobenzene, 4-fluorophenyl methylamine and sodium carbonate with DMSO under the protection of argon, and reacting for 4-12 h with stirring at 100-120°C, thus generating a compound (4) which is N-[4-fluorophenyl]methyl]4-nitroaniline;
   S5: adding the compound (4) to Boc₂O with dichlo-romethane as a solvent in an ice bath under the pro-
tection of nitrogen, then adding DMAP to catalyze, reacting for 4-12 h with stirring, and performing secondary amine Boc protection, thus generating a compound (5) which is tert-butyl N-[(4-fluorophenyl) methyl]-N-(4-nitrophenyl) carbamate;

S6: dissolving the compound (5) in methanol, adding 10% Pd/C to catalyze, pumping in Hz, and reacting for 4-12 h with stirring to reduce to a compound (6) which is tert-butyl N-(4-aminophenyl)-N-[(4-fluorophenyl) methyl] carbamate;

S7: dissolving the compound (6) and the compound (3) in isopropanol, and reacting for 3-12 h at 80-100°C, under the catalysis of p-toluenesulfonic acid with stirring, thus generating a compound (7) which is tert-butyl N-[(4-fluorophenyl)methyl]-N-4-[7-methoxy-6-[2-pyridin-1-hydroxyethyl]quinazolin-4-yl]aminophenyl carbamate; and

S8: dissolving the compound (7) in a mixed solvent of dichloromethane/trifluoroacetic acid, and stirring at 25-45°C for 1-6 h to remove Boc, thus generating a quinazoline derivative of compound (8) which is N-[(4-fluorophenyl)methyl]-4-N-[7-methoxy-6-(2-pyridin-1-yl)hydroxyethyl]quinazolin-4-yl]phen-1,4-diamine.

3. The method according to claim 2, wherein in step S1, the adding rate of DMF is 2-3 m³/min, and the dosage ratio of the SOCl₂ to the DMF to the 7-methoxy-4-oxo-3,4-dihydroquinazolin-6-yl acetate is 500-1000 mL to 10-20 mL to 100-150 g; and in step S2, the concentration of the NH₃ methanol solution is 7M, the adding rate of the NH₃ methanol solution is 3-10 mL/min, and 10-20 mL of the NH₃ methanol solution is added per gram of the compound (1).

4. The method according to claim 2, wherein in step S3, the DTAD is added in 3-6 batches, with an interval of 2-4 h between adding each of the batches of the DTAD, wherein the dosage ratio by mole of the N-[(2-hydroxyethyl)pyrrolidin-2-yl]pyrroli dine to the PPh₃ to the DTAD to compound (2) is 1 to 1 to 1 to 0.8-1.4.

5. The method according to claim 2, wherein in step S4, the dosage ratio by mole of the 1-fluoro-4-nitrobenzene to the 4-fluorophenyl methylamine to the sodium carbonate is 1 to 1 to 0.8-1.4.

6. The method according to claim 2, wherein in step S5, the compound (4) is added in 3-6 batches to Boc₂O, with an interval of 5-10 min between adding each of the batches of the compound (4), wherein the dosage ratio by mole of the compound (4) to the Boc₂O is 1 to 0.8-1.5, and the dosage ratio by mole of the compound (4) to the DMAP is 1 to 0.8-1.5.

7. The method according to claim 2, wherein in step S6, 0.6-1.5 g of the 10% Pd/C is added per 10 mmol of the compound (5).

8. The method according to claim 2, wherein in step S7, the dosage ratio by mole of the compound (6) to the compound (3) to the p-toluenesulfonic acid is 1 to 1 to 1.1-1.5.

9. The method according to claim 2, wherein in step S8, the mixed solvent of the dichloromethane/trifluoroacetic acid is obtained by mixing dichloromethane and trifluoroacetic acid with a volume ratio of 2:5 to 1, and 10-20 mL of the mixed solvent is added per 1 g compound (7).

10. A pharmaceutical composition, comprising a pharmaceutically acceptable carrier and a quinazoline derivative, a pharmaceutically acceptable salt thereof, a solvate thereof, a prodrug thereof, a stereoisomer thereof, a tautomer thereof, or a metabolite thereof,

wherein the quinazoline derivative is N-[(4-fluorophenyl) methyl]-4-N-[7-methoxy-6-(2-pyridin-1-yl)hydroxyethyl]quinazolin-4-yl]phen-1,4-diamine.

11. (canceled)

12. An anti-tumor agent preparation comprising a quinazoline derivative, a pharmaceutically acceptable salt thereof, a solvate thereof, a prodrug thereof, a stereoisomer thereof, a tautomer thereof, or a metabolite thereof,

wherein the quinazoline derivative is N-[(4-fluorophenyl) methyl]-4-N-[7-methoxy-6-(2-pyridin-1-yl)hydroxyethyl]quinazolin-4-yl]phen-1,4-diamine.

13. The anti-tumor agent preparation according to claim 12, further comprising one or more anti-cancer agents.
