Novel compounds of formula (I) are described herein. These compounds inhibit the production of Tumor Necrosis Factor and are useful in the treatment of disease states mediated or exacerbated by TNF production. The compounds of the present invention are also useful in the mediation or inhibition of enzymatic or catalytic activity of phosphodiesterase IV and are therefore useful in the treatment of disease states in need of mediation or inhibition thereof.

"Compounds Useful for Treating Allergic and Inflammatory Diseases"

Field of Invention

The present invention relates to novel compounds, pharmaceutical compositions containing these compounds, and their use in treating allergic and inflammatory diseases and for inhibiting the production of Tumor Necrosis Factor (TNF).

Background of the Invention

Bronchial asthma is a complex, multifactorial disease characterized by reversible narrowing of the airway and hyperreactivity of the respiratory tract to external stimuli. Identification of novel therapeutic agents for asthma is made difficult by the fact that multiple mediators are responsible for the development of the disease. Thus, it seems unlikely that eliminating the effects of a single mediator will have a substantial effect on all three components of chronic asthma. An alternative to the "mediator approach" is to regulate the activity of the cells responsible for the pathophysiology of the disease.

One such way is by elevating levels of cAMP (adenosine cyclic 3',5'-monophosphate). Cyclic AMP has been shown to be a second messenger mediating the biologic responses to a wide range of hormones, neurotransmitters and drugs; [Krebs Endocrinology Proceedings of the 4th International Congress Excerpta Medica, 17-29, 1973]. When the appropriate agonist binds to specific cell surface receptors, adenylate cyclase is activated, which converts Mg$^{+2}$-ATP to cAMP at an accelerated rate.

Cyclic AMP modulates the activity of most, if not all, of the cells that contribute to the pathophysiology of extrinsic (allergic) asthma. As such, an elevation of cAMP would produce beneficial effects including: 1) airway smooth muscle relaxation, 2) inhibition of mast cell mediator release, 3) suppression of neutrophil degranulation, 4) inhibition of basophil degranulation, and 5) inhibition of macrophage activation. Hence, compounds that activate adenylate cyclase or inhibit phosphodiesterase should be effective in suppressing the inappropriate activation of airway smooth muscle and a wide variety of inflammatory cells. The principal cellular mechanism for the inactivation of cAMP is hydrolysis of the 3'-phosphodiester bond by one or more of a family of isozymes referred to as cyclic nucleotide phosphodiesterases (PDEs).

It has now been shown that a distinct cyclic nucleotide phosphodiesterase (PDE) isozyme, PDE IV, is responsible for cAMP breakdown in airway smooth muscle and inflammatory cells. [Torphy, "Phosphodiesterase Isozymes: Potential Targets for Novel Antiasthmatic Agents" in New Drugs for Asthma, Barnes, ed. IBC Technical Services Ltd., 1989]. Research indicates that inhibition of this enzyme not only produces airway smooth muscle relaxation, but also suppresses degranulation of mast cells, basophils and neutrophils along with inhibiting the activation of monocytes and neutrophils. Moreover, the beneficial effects of PDE IV inhibitors are markedly potentiated when adenylate cyclase activity of target cells is elevated by appropriate hormones or autacoids, as would be the case in vivo.

1
Thus PDE IV inhibitors would be effective in the asthmatic lung, where levels of prostaglandin E2 and prostacyclin (activators of adenylate cyclase) are elevated. Such compounds would offer a unique approach toward the pharmacotherapy of bronchial asthma and possess significant therapeutic advantages over agents currently on the market.

The compounds of this invention also inhibit the production of Tumor Necrosis Factor (TNF), a serum glycoprotein. Excessive or unregulated TNF production has been implicated in mediating or exacerbating a number of diseases including rheumatoid arthritis, rheumatoid spondylitis, osteoarthritis, gouty arthritis and other arthritic conditions; sepsis, septic shock, endotoxic shock, gram negative sepsis, toxic shock syndrome, adult respiratory distress syndrome, cerebral malaria, chronic pulmonary inflammatory disease, silicosis, pulmonary sarcoidosis, bone resorption diseases, reperfusion injury, graft vs. host reaction, allograft rejections, fever and myalgias due to infection, such as influenza, cachexia secondary to infection or malignancy, cachexia secondary to human acquired immune deficiency syndrome (AIDS), AIDS, ARC (AIDS related complex), keloid formation, scar tissue formation, Crohn's disease, ulcerative colitis, or pyrexia, in addition to a number of autoimmune diseases, such as multiple sclerosis, autoimmune diabetes and systemic lupus erythematosus.

AIDS results from the infection of T lymphocytes with Human Immunodeficiency Virus (HIV). At least three types or strains of HIV have been identified, i.e., HIV-1, HIV-2 and HIV-3. As a consequence of HIV infection, T-cell-mediated immunity is impaired and infected individuals manifest severe opportunistic infections and/or unusual neoplasms. HIV entry into the T lymphocyte requires T lymphocyte activation. Viruses such as HIV-1 or HIV-2 infect T lymphocytes after T cell activation and such virus protein expression and/or replication is mediated or maintained by such T cell activation. Once an activated T lymphocyte is infected with HIV, the T lymphocyte must continue to be maintained in an activated state to permit HIV gene expression and/or HIV replication.

Cytokines, specifically TNF, are implicated in activated T-cell-mediated HIV protein expression and/or virus replication by playing a role in maintaining T lymphocyte activation. Therefore, interference with cytokine activity such as by inhibition of cytokine production, notably TNF, in an HIV-infected individual aids in limiting the maintenance of T cell activation, thereby reducing the progression of HIV infectivity to previously uninfected cells which results in a slowing or elimination of the progression of immune dysfunction caused by HIV infection. Monocytes, macrophages, and related cells, such as kupffer and glial cells, have also been implicated in maintenance of the HIV infection. These cells, like T cells, are targets for viral replication and the level of viral replication is dependent upon the activation state of the cells. [See Rosenberg et al., The Immunopathogenesis of HIV Infection, Advances in Immunology, Vol. 57, 1989]. Monokines, such as TNF, have been shown to activate HIV replication in monocytes and/or macrophages [See Poli et al., Proc. Natl. Acad.
Sci., 87:782-784, 1990], therefore, inhibition of monokine production or activity aids in limiting HIV progression as stated above for T cells.

TNF has also been implicated in various roles with other viral infections, such as the cytomegalovirus (CMV), influenza virus, adenovirus, and the herpes virus for similar reasons as those noted.

TNF is also associated with yeast and fungal infections. Specifically *Candida albicans* has been shown to induce TNF production *in vitro* in human monocytes and natural killer cells. [See Riipi et al., Infection and Immunity, 58(9):2750-54, 1990; and Jafari et al., Journal of Infectious Diseases, 164:389-95, 1991. See also Wasan et al., Antimicrobial Agents and Chemotherapy, 35(10):2046-48, 1991; and Luke et al., Journal of Infectious Diseases, 162:211-214,1990].

The ability to control the adverse effects of TNF is furthered by the use of the compounds which inhibit TNF in mammals who are in need of such use. There remains a need for compounds which are useful in treating TNF-mediated disease states which are exacerbated or caused by the excessive and/or unregulated production of TNF.

**Summary of the Invention**

This invention relates to the novel compounds of the Formula (I), as shown below, useful in the mediation or inhibition of the enzymatic activity (or catalytic activity) of phosphodiesterase IV (PDE IV). The novel compounds of the Formula (I) also have Tumor Necrosis Factor (TNF) inhibitory activity.

This invention also relates to the pharmaceutical compositions comprising a compound of the Formula (I) and a pharmaceutically acceptable carrier or diluent.

The invention also relates to a method of mediation or inhibition of the enzymatic activity (or catalytic activity) of PDE IV in mammals, including humans, which comprises administering to a mammal in need thereof an effective amount of a compound of the Formula (I), as shown below.

The invention further provides a method for the treatment of allergic and inflammatory disease which comprises administering to a mammal, including humans, in need thereof, an effective amount of a compound of the Formula (I).

The invention also provides a method for the treatment of asthma which comprises administering to a mammal, including humans, in need thereof, an effective amount of a compound of the Formula (I).

This invention also relates to a method of inhibiting TNF production in a mammal, including humans, which method comprises administering to a mammal in need of such treatment, an effective TNF inhibiting amount of a compound of the Formula (I). This method may be used for the prophylactic treatment or prevention of certain TNF mediated disease states amenable thereto.
This invention also relates to a method of treating a human afflicted with a human immunodeficiency virus (HIV), which comprises administering to such human an effective TNF inhibiting amount of a compound of the Formula (I).

The compounds of the Formula (I) are also useful in the treatment of additional viral infections, where such viruses are sensitive to upregulation by TNF or will elicit TNF production in vivo.

The compounds of the Formula (I) are also useful in the treatment of yeast and fungal infections, where such yeast and fungi are sensitive to upregulation by TNF or will elicit TNF production in vivo.

The compounds of this invention are represented by Formula (I):

**Detailed Description of the Invention**

This invention relates to the novel compounds of Formula (I), and to pharmaceutical
compositions comprising a compound of Formula (I) and a pharmaceutically acceptable
carrier or diluent. This invention also relates to a method of mediating or inhibiting the
enzymatic activity (or catalytic activity) of PDE IV in a mammal in need thereof and to
inhibiting the production of TNF in a mammal in need thereof, which comprises
administering to said mammal an effective amount of a compound of the Formula (I).
Phosphodiesterase IV inhibitors are useful in the treatment of a variety of allergic and
inflammatory diseases including: asthma, chronic bronchitis, atopic dermatitis, urticaria,
alergic rhinitis, allergic conjunctivitis, vernal conjunctivitis, eosinophilic granuloma,
psoriasis, rheumatoid arthritis, septic shock, ulcerative colitis, Crohn's disease, reperfusion
injury of the myocardium and brain, chronic glomerulonephritis, endotoxic shock and adult
respiratory distress syndrome. In addition, PDE IV inhibitors are useful in the treatment of
nervous system disorders such as depression and multi-infarct dementia.

The compounds of the Formula (I) are also useful in the treatment of viral infections,
where such viruses are sensitive to upregulation by TNF or will elicit TNF production in vivo. The viruses contemplated for treatment herein are those that produce TNF as a result of
infection, or those which are sensitive to inhibition, such as by decreased replication, directly or indirectly, by the TNF inhibitors of the Formula (I). Such viruses include, but are not limited to HIV-1, HIV-2 and HIV-3, cytomegalovirus (CMV), influenza, adenovirus and the Herpes group of viruses, such as, but not limited to, Herpes zoster and Herpes simplex.

This invention more specifically relates to a method of treating a mammal, afflicted with a human immunodeficiency virus (HIV), which comprises administering to such mammal an effective TNF inhibiting amount of a compound of the Formula (I).

The compounds of the Formula (I) may also be used in association with the veterinary treatment of animals, other than in humans, in need of inhibition of TNF production. TNF mediated diseases for treatment, therapeutically or prophylactically, in animals include disease states such as those noted above, but in particular viral infections. Examples of such viruses include, but are not limited to feline immunodeficiency virus (FIV) or other retroviral infection such as equine infectious anemia virus, caprine arthritis virus, visna virus, maedi virus and other lentiviruses.

The compounds of the Formula (I) are also useful in the treatment of yeast and fungal infections, where such yeast and fungi are sensitive to upregulation by TNF or will elicit TNF production in vivo. A preferred disease state for treatment is fungal meningitis. Additionally, the compounds of the Formula (I) may be administered in conjunction with other drugs of choice for systemic yeast and fungal infections. Drugs of choice for fungal infections, include but are not limited to the class of compounds called the polymixin, such as Polymycin B, the class of compounds called the imidazoles, such as clotrimazole, econazole, miconazole, and ketoconazole; the class of compounds called the triazoles, such as fluconazole, and itraconazole, and the class of compound called the Amphotericins, in particular Amphotericin B and liposomal Amphotericin B.

The co-administration of the anti-fungal agent with a compound of the Formula (I) may be in any preferred composition for that compound such as is well known to those skilled in the art, for instance the various Amphotericin B formulations. Co-administration of an anti-fungal agent with a compound of the Formula (I) may mean simultaneous administration or in practice, separate administration of the agents to the mammal but in a consecutive manner. In particular, the compounds of the Formula (I) may be co-administered with a formulation of Amphotericin B, notably for systemic fungal infections. The preferred organism for treatment is the Candida organism. The compounds of the Formula (I) may be co-administered in a similar manner with anti-viral or anti-bacterial agents.

The compounds of the Formula (I) may also be used for inhibiting and/or reducing the toxicity of an anti-fungal, anti-bacterial or anti-viral agent by administering an effective amount of a compound of the Formula (I) to a mammal in need of such treatment. Preferably, a compound of the Formula (I) is administered for inhibiting or reducing the toxicity of the Amphotericin class of compounds, in particular Amphotericin B.
When R₁ for the compounds of the Formula (I) is an alkyl substituted by 1 or more halogens, the halogens are preferably fluorine and chlorine, more preferably a C₁₋₄ alkyl substituted by 1 or more fluorines. The preferred halo-substituted alkyl chain length is one or two carbons, and most preferred are the moieties -CF₃, -CH₂F, -CHF₂, -CF₂CHF₂, -CH₂CF₃, and -CH₂CHF₂. Preferred R₁ substituents for the compounds of the Formula (I) are CH₂-cyclopropyl, CH₂-C₅₋₆ cycloalkyl, C₆₋₁₀ cycloalkyl, C₇₋₁₁ polycycloalkyl, (3- or 4-cyclopentenyl), phenyl, tetrahydrofuran-3-yl, benzyl or C₁₋₂ alkyl optionally substituted by 1 or more fluorines, -(CH₂)₁₋₃ CO(CH₂)₀₋₂CH₃, -(CH₂)₁₋₃ O(CH₂)₀₋₂CH₃, and -(CH₂)₂₋₄OH.

When the R₄ term contains the moiety (CR₄R₅), the R₄ and R₅ terms are independently hydrogen or alkyl. This allows for branching of the individual methylene units as (CR₄R₅)ₙ or (CR₄R₅)ₘ; each repeating methylene unit is independent of the other, e.g., (CR₄R₅)ₙ wherein n is 2 can be -CH₂CH(-CH₃)₂, for instance. The individual hydrogen atoms of the repeating methylene unit or the branching hydrocarbon can optionally be substituted by fluorine independent of each other to yield, for instance, the preferred R₁ substitutions, as noted above.

When R₁ is a C₇₋₁₁ polycycloalkyl, examples are bicyclo[2.2.1]heptyl, bicyclo[2.2.2]octyl, bicyclo[3.2.1]octyl, tricyclo[5.2.1.0²,6]decyl, etc. Additional examples of which are described in Saccamano et al., WO 87/06576, published 5 November 1987, whose disclosure is incorporated herein by reference in its entirety.

Z is preferably C(O)R₈, C(O)OR₈, C(O)NR₈R₈, C(NR₈)NR₈R₈, CN, C(NOR₈)R₈, C(O)NR₈NR₈C(O)R₈, C(NR₈)NR₈R₈, C(NCN)NR₈R₈, C(NCN)SR₈, (1-, 4- or 5-{R₈})₂-imidazolyl, (1-, 4- or 5-{R₈})₃-pyrazolyl, (1-, 2- or 5-{R₈})₄-triazolyl[1,2,3], (1-, 2-, 4- or 5-{R₈})₃-triazolyl[1,2,4], (1- or 2-{R₈})₅-tetrazolyl, (4- or 5-{R₈})₂-oxazolyl, (3- or 4-{R₈})₅-oxazolyl, (3-{R₈})₅-oxadiazolyl[1,2,4], (5-{R₈})₃-oxadiazolyl[1,2,4], (5-{R₈})₂-oxadiazolyl[1,3,4], (5-{R₈})₂-thiadiazolyl[1,3,4], (4- or 5-{R₈})₂-thiazolyl, (4- or 5-{R₈})₂-oxazolidinyl, (4- or 5-{R₈})₂-thiazolidinyl, (1-, 4- or 5-{R₈})₂-imidazolidinyl; most preferred are those compounds wherein the R₈ group of Z is R₄.

X₅ is preferably hydrogen, C₁₋₂ alkyl optionally substituted by one to three fluorines, OR₈, CN, C(O)R₈, C(O)OR₈, C(O)NR₈R₈, or NR₈R₈.

Preferred X groups for Formula (I) are those wherein X is YR₂ and Y is oxygen. The preferred X₂ group for Formula (I) is that wherein X₂ is oxygen. The preferred X₃ group for Formula (I) is that wherein X₃ is hydrogen. Preferred R₂ groups, where applicable, are C₁₋₂ alkyl optionally substituted by 1 or more halogens. The halogen atoms are preferably fluorine and chlorine, more preferably fluorine. More preferred R₂ groups are those wherein R₂ is methyl, or the fluoro-substituted alkyls, specifically a C₁₋₂ alkyl, such as a -CF₃, -CHF₂, or -CH₂CHF₂ moiety. Most preferred are the -CHF₂ and -CH₃ moieties.
Preferred R3 moieties are C(O)NH₂, C≡CR₈, CN, C(Z)H, CH₂OH, CH₂F, CF₂H, and CF₃. More preferred are C≡CH and CN. Z’ is preferably O or NOR₈.

Preferred R7 moieties include optionally substituted -(CH₂)₁-2(cyclopropyl), -(CH₂)₀-2(cyclobutyl), -(CH₂)₀-2(cyclopentyl), -(CH₂)₀-2(cyclohexyl), -(CH₂)₀-2(2-, 3- or 4-pyridyl), -(CH₂)₁-2(2-imidazolyl), -(CH₂)₂(4-morpholinyl), -(CH₂)₂(4-piperazinyl), -(CH₂)₁-2(2-thienyl), -(CH₂)₁-2(4-thiazolyl), and -(CH₂)₀-2phenyl;

Preferred rings when R₁₀ and R₁₁ in the moiety -NR₁₀R₁₁ together with the nitrogen to which they are attached form a 5 to 7 membered ring optionally containing at least one additional heteroatom selected from O/N/ or S include, but are not limited to 1-imidazolyl, 2-(R₈)-1-imidazolyl, 1-pyrazolyl, 3-(R₈)-1-pyrazolyl, 1-triazolyl, 2-triazolyl, 5-(R₈)-1-triazolyl, 5-(R₈)-2-triazolyl, 5-(R₈)-1-tetrazolyl, 5-(R₈)-2-tetrazolyl, 1-tetrazolyl, 2-tetrazolyl, morpholinyl, piperazinyl, 4-(R₈)-1-piperazinyl, or pyrrolyl ring.

Preferred rings when R₁₀ and R₁₄ in the moiety -NR₁₀R₁₄ together with the nitrogen to which they are attached may form a 5 to 7 membered ring optionally containing at least one additional heteroatom selected from O, N, or S include, but are not limited to 1-imidazolyl, 1-pyrazolyl, 1-triazolyl, 2-triazolyl, 1-tetrazolyl, 2-tetrazolyl, morpholinyl, piperazinyl, and pyrrolyl. The respective rings may be additionally substituted, where applicable, on an available nitrogen or carbon by the moiety R₇ as described herein for Formula (I). Illustrations of such carbon substitutions includes, but are not limited to,

2-(R₇)-1-imidazolyl, 4-(R₇)-1-imidazolyl, 5-(R₇)-1-imidazolyl, 3-(R₇)-1-pyrazolyl, 4-(R₇)-1-pyrazolyl, 5-(R₇)-1-pyrazolyl, 4-(R₇)-2-triazolyl, 5-(R₇)-2-triazolyl, 4-(R₇)-1-triazolyl, 5-(R₇)-1-triazolyl, 5-(R₇)-1-tetrazolyl, and 5-(R₇)-2-tetrazolyl.

Applicable nitrogen substitution by R₇ includes, but is not limited to, 1-(R₇)-2-tetrazolyl, 2-(R₇)-1-tetrazolyl, 4-(R₇)-1-piperazinyl. Where applicable, the ring may be substituted one or more times by R₇.

Preferred groups for NR₁₀R₁₄ which contain a heterocyclic ring are 5-(R₁₄)-1-tetrazolyl, 2-(R₁₄)-1-imidazolyl, 5-(R₁₄)-2-tetrazolyl, or 4-(R₁₄)-1-piperazinyl.

Preferred rings for R₁₃ include (2-, 4- or 5-imidazolyl), (3-, 4- or 5-pyrazolyl), (4- or 5-triazolyl[1,2,3]), (3- or 5-triazolyl[1,2,4]), (5-tetrazolyl), (2-, 4- or 5-oxazolyl), (3-, 4- or 5-isoxazolyl), (3- or 5-oxadiazolyl[1,2,4]), (2-oxadiazolyl[1,3,4]), (2-thiadiazolyl[1,3,4]), (2-, 4-, or 5-thiazolyl), (2-, 4-, or 5-thiazolidinyl), or (2-, 4-, or 5-imidazolidinyl).

When the R₇ group is optionally substituted by a heterocyclic ring such as imidazolyl, pyrazolyl, triazolyl, tetrazolyl, or thiazolyl, the heterocyclic ring itself may be optionally substituted by R₈ either on an available nitrogen or carbon atom, such as 1-(R₈)-2-imidazolyl, 1-(R₈)-4-imidazolyl, 1-(R₈)-5-imidazolyl, 1-(R₈)-3-pyrazolyl, 1-(R₈)-4-pyrazolyl, 1-(R₈)-5-pyrazolyl, 1-(R₈)-4-triazolyl, or 1-(R₈)-5-triazolyl. Where applicable, the ring may be substituted one or more times by R₈.
Preferred are those compounds of the Formula (I) wherein R₁ is -CH₂-cyclopropyl, -CH₂-C₅-6 cycloalkyl, -C₄-6 cycloalkyl, tetrahydrofuran-3-yl, (3- or 4-cyclopentenyl), benzyl or -C₁-₂ alkyl optionally substituted by 1 or more fluorines, and -(CH₂)₂-₄ OH; R₂ is methyl or fluoro-substituted alkyl, R₃ is CN or C=CR₈; and X is YR₂.

Most preferred are those compounds wherein R₁ is -CH₂-cyclopropyl, cyclopentyl, methyl or CF₂H; R₃ is CN or C=CH; X is YR₂; Y is oxygen; X₂ is oxygen; X₃ is hydrogen; and R₂ is CF₂H or methyl.

A preferred subgenus of the compounds of the Formula (I) is the compounds of the Formula (Ia)

Some compounds of Formula (I) may exist in both racemic and optically active forms; some may also exist in distinct diastereomeric forms possessing distinct physical and
biological properties. All of these compounds are considered to be within the scope of the present invention. Therefore another aspect of the present invention is the administration of either a racemate, a single enantiomeric form, a single diastereomeric form, or mixtures thereof.

The terms cis and trans denote stereochemistry at the C-1 position of the cyclohexane ring relative to the R3 group at the C-4 position.

The terms "C1-3 alkyl", "C1-4 alkyl", "C1-6 alkyl" or "alkyl" include both straight or branched chain radicals of 1 to 10, unless the chain length is limited thereto, including, but not limited to methyl, ethyl, n-propyl, isopropyl, n-butyl, sec-butyl, isobutyl, tert-butyl, and the like. "Alkenyl" includes both straight or branched chain radicals of 1 to 6 carbon lengths, unless the chain length is limited thereto, including but not limited to vinyl, 1-propenyl, 2-propenyl, 2-propynyl, or 3-methyl-2-propenyl. "Cycloalkyl" or "cycloalkyl alkyl" includes groups of 3-7 carbon atoms, such as cyclopentyl, cyclopropylmethyl, cyclopentyl, or cyclohexyl. " Aryl" or "aralkyl", unless specified otherwise, means an aromatic ring or ring system of 6-10 carbon atoms, such as phenyl, benzyl, phenethyl, or naphthyl. Preferably the aryl is monocyclic, i.e., phenyl. The alkyl chain includes both straight or branched chain radicals of 1 to 4 carbon atoms. "Heteroaryl" as used herein, is meant an aromatic ring system containing one or more heteroatoms, such as imidazolyl, triazolyl, oxazolyl, pyridyl, pyrimidyl, pyrazolyl, pyrrolyl, furanyl, or thiophenyl. "Halo" as used herein is meant all halogens, i.e., chloro, fluoro, bromo, or iodo.

The phrase "inhibiting the production of IL-1" or "inhibiting the production of TNF" means:

a) a decrease of excessive in vivo IL-1 or TNF levels, respectively, in a human to normal levels or below normal levels by inhibition of the in vivo release of IL-1 by all cells, including but not limited to monocytes or macrophages;

b) a down regulation, at the translational or transcriptional level, of excessive in vivo IL-1 or TNF levels, respectively, in a human to normal levels or below normal levels; or

c) a down regulation, by inhibition of the direct synthesis of IL-1 or TNF levels as a postranslational event.

"TNF mediated disease or disease states" means any and all disease states in which TNF plays a role, either by production of TNF itself, or by TNF causing another cytokine to be released, such as but not limited to IL-1 or IL-6. A disease state in which IL-1, for instance is a major component, and whose production or action, is exacerbated or secreted in response to TNF, would therefore be considered a disease state mediated by TNF. As TNF-β (also known as lymphotoxin) has close structural homology with TNF-α (also known as cachectin), and since each induces similar biologic responses and binds to the same cellular receptor, both TNF-α and TNF-β are inhibited by the compounds of the present invention and thus are herein referred to collectively as "TNF" unless specifically delineated otherwise. Preferably TNF-α is inhibited.
"Cytokine" means any secreted polypeptide that affects the functions of cells, and is a molecule which modulates interactions between cells in immune, inflammatory, or hematopoietic responses. A cytokine includes, but is not limited to, monokines and lymphokines regardless of which cells produce them. For instance, a monokine is generally referred to as being produced and secreted by a mononuclear cell, such as a macrophage and/or monocyte, but many other cells produce monokines, such as natural killer cells, fibroblasts, basophils, neutrophils, endothelial cells, brain astrocytes, bone marrow stromal cells, epidermal keratinocytes, and B-lymphocytes. Lymphokines are generally referred to as being produced by lymphocyte cells. Examples of cytokines for the present invention include, but are not limited to, Interleukin-1 (IL-1), Interleukin-6 (IL-6), Interleukin-8 (IL-8), Tumor Necrosis Factor-alpha (TNF-α) and Tumor Necrosis Factor-beta (TNF-β).

The cytokine inhibited by the present invention for use in the treatment of a HIV-infected human must be a cytokine which is implicated in (a) the initiation and/or maintenance of T cell activation and/or activated T cell-mediated HIV gene expression and/or replication, and/or (b) any cytokine-mediated disease associated problem such as cachexia or muscle degeneration. Preferably this cytokine is TNF-α.

All of the compounds of Formula (I) are useful in the method of inhibiting the production of TNF, preferably by macrophages, monocytes or macrophages and monocytes, in a mammal, including humans, in need thereof. All of the compounds of Formula (I) are useful in the method of inhibiting or mediating the enzymatic or catalytic activity of PDE IV and in treatment of disease states mediated thereby.

**METHODS OF PREPARATION:**

Preparing compounds of the Formula (I) can be carried out by one of skill in the art according to the procedures outlined in the Examples, *infra*. The preparation of any remaining compounds of the Formula (I) not described therein may be prepared by the analogous processes disclosed herein which comprise:

a) for compounds of the Formula (I) wherein R₃ is H, CN, OR₉, C₁₋₄ alkyl or C₁₋₄ halosubstituted alkyl, wherein X or X₃ is other than Br, I, NO₂, amino, formyl amine or

\[ S(O)m' \text{ when } m' \text{ is } 1 \text{ or } 2, \text{ wherein } Z \text{ is CHO and the double bond is present, reacting a compound of the Formula (2)} \]

![Formula (2)](image)

wherein R₁ represents R₁ as defined in relation to Formula (I) or a group convertible to R₁ and X and X₃ represent X and X₃ as defined in relation to Formula (I) or a group convertible to X or X₃ and R₃ represents R₃ as defined in relation to Formula (I) or a group convertible to R₃, with nitromethane in a suitable non-reacting solvent in the presence of a base (catalyst)
to provide compounds of the Formula (I) wherein R₃ is H, CN, OR₉, C₁₋₄ alkyl or C₁₋₄ halosubstituted alkyl, wherein X and X₃ are other than Br, I, NO₂, amino, formyl amine or \( S(O)m' \) when \( m' \) is 1 or 2, wherein Z is CH₂NO₂ and the double bond is present; treatment of such compounds with a base, such as sodium methoxide, in the presence of, e.g., buffered titanium trichloride, provides compounds of the Formula (I) wherein R₃ is H, CN, OR₉, C₁₋₄ alkyl or C₁₋₄ halosubstituted alkyl, wherein X or X₃ are other than Br, I, NO₂, amino, formyl amine or \( S(O)m' \) when \( m' \) is 1 or 2 and wherein Z is CHO and the double bond is present. Double bond reduction of such compounds of the Formula (I) provides the corresponding saturated ring Formula (I) compounds; oxidation of the aldehyde function of either these saturated or unsaturated compounds of the Formula (I) provides the corresponding Formula (I) carboxylates (\( Z = COOH \)), which may be converted by standard procedures with proper manipulation of any chemically sensitive functional groups to the corresponding ester, amide, nitrile, oxazolidinone, etc., Z groups of the Formula (I).

Alternatively, reaction of a compound of the Formula (2) with, e.g., toslylmethyl isocyanide and potassium t-butoxide (followed by hydrolysis) or lithium methoxyphenylthiomethylsilylmethane (followed by hydrolysis) provides compounds of the Formula (I) wherein R₃ is H, CN, OR₉, C₁₋₄ alkyl or C₁₋₄ halosubstituted alkyl, wherein X and X₃ are other than Br, I, NO₂, amino, formyl amine or \( S(O)m' \) when \( m' \) is 1 or 2, wherein Z is CO₂R₁₅, the double bond is present, and R₁₅ is H or simple alkyl; these then may be converted by standard procedures with proper manipulation (protection/deprotection) of any chemically sensitive functional groups to the corresponding ester, amide, nitrile, oxazolidinone, etc., Z groups of the Formula (I).

Alternatively, reaction of a compound of the Formula (2) with, e.g., triflic anhydride in the presence of an appropriate tertiary amine base, or with an alkyl lithium at a reduced temperature followed by treatment with N-phenyl trifluorosulphonimide, provides the corresponding enol triflate, which is then reacted with carbon monoxide in the presence of an alcohol or amine and an appropriate palladium catalyst to provide compounds of the Formula (I) wherein R₃ is H, CN, OR₉, C₁₋₄ alkyl or C₁₋₄ halosubstituted alkyl, wherein X and X₃ are other than Br, I, NO₂, amino, formyl amine or \( S(O)m' \) when \( m' \) is 1 or 2, wherein Z is CO₂R₁₅ or CONR₁₀R₁₄, the double bond is present, and R₁₅ is H or simple alkyl; these then may be converted by standard procedures with proper manipulation (protection/deprotection) of any chemically sensitive functional groups to the corresponding ester, amide, nitrile, oxazolidinone, etc., Z groups of the Formula (I).

Alternatively, reaction of a compound of the Formula (2) with, e.g., lithium tris(methylthio)methane at reduced temperature, followed by mercury salt hydrolysis and alcohol treatment provides compounds of the Formula (I) wherein R₃ is H, CN, OR₉, C₁₋₄ alkyl or C₁₋₄ halosubstituted alkyl, wherein X and X₃ are other than Br, I, NO₂, amino, formyl amine or \( S(O)m' \) when \( m' \) is 1 or 2, wherein Z is CO₂R₁₅ and X₅ is OH, the double bond is absent, and R₁₅ is H or simple alkyl. Such compounds may also be obtained by
reaction of a compound of the Formula (2) with trimethylsulfoxonium iodide or trimethylsulfonium iodide and an appropriate base, such as sodium hydride, to provide the exo-epoxide followed by treatment with aqueous potassium hydroxide in, e.g., dimethylsulfoxide and oxidation of the resulting primary alcohol to the carboxyl provides compounds of the Formula (I) wherein R3 is H, CN, OR9, C1-4 alkyl or C1-4 halosubstituted alkyl, wherein X and X3 are other than Br, I, NO2, amino, formyl amine or S(O)m' when m' is 1 or 2, wherein Z is CO2R15 and X5 is OH, the double bond is absent, and R15 is H or simple alkyl; the R5 hydroxyl may be alkylated and these compounds then may be converted by standard procedures with proper manipulation (protection/deprotection) of any chemically sensitive functional groups to the corresponding ester, amide, nitrile, oxazolidinone, etc., Z groups of the Formula (I).

Alternatively, reaction of a compound of the Formula (2) with, e.g., 2-lithio-2-(trimethylsilyl)-1,3-dithiane followed by acidic hydrolysis with a mercury salt, such as mercury (II) chloride, or reaction of a compound of the Formula (2) with, e.g., sodio-[diethyl t-butoxy(cyano)methyl phosphonate] followed by treatment with acetic anhydride and a zinc halide and then followed by treatment with an alkoxide provides compounds of the Formula (I) wherein R3 is H, CN, OR9, C1-4 alkyl or C1-4 halosubstituted alkyl, wherein X and X3 are other than Br, I, NO2, amino, formyl amine or S(O)m' when m' is 1 or 2, wherein Z is CO2R15, the double bond is not present, and R15 is H or simple alkyl and R5 is H; these then may be converted by standard procedures with proper manipulation (protection/deprotection) of any chemically sensitive functional groups to the corresponding ester, amide, nitrile, oxazolidinone, etc., Z groups of the Formula (I).

Preparation of such compounds of the Formula (I) wherein R3 is C(=Z')H proceed in an analogous fashion from the compound of the Formula (2) wherein =Z' is an aldehyde protecting group, such as a dimethylacetal or a dioxolane, followed by aldehyde deprotection and subsequent manipulation by standard procedures known to those of skill in the art to the remaining compounds of the Formula (I) wherein Z' is other than O or R3 is other than H, CN, OR9, C1-4 alkyl or C1-4 halosubstituted alkyl.

With proper manipulation (protection/deprotection) of any chemically sensitive functional groups:

a) Compounds of the Formula (I) wherein X or X3 are formyl amine may be formed at the last step, by formylating a compound wherein X or X3 is NH2, obtained by removal of a protecting group from the amine functionality; such protective groups are well known to those skilled in the art, See Greene, T. and Wuts, P.G.M., Protecting Groups in Organic Synthesis, 2nd Ed., John Wiley and Sons, New York (1991).

c) Compounds of the Formula (I) wherein X or X3 are Br or I may be prepared from a similarly deprotected amine by diazotization of the amine and diazonium displacement.

d) Compounds of the Formula (I) wherein X or X3 are NO2 may be prepared from a similarly deprotected amine by oxidation of the amine to the nitro group.
e) Compounds of the Formula (I) wherein Y is S(O)m' when m' is 1 or 2 may be prepared from the compounds of the Formula (I) wherein Y is S by oxidation of the SR2 moiety under conditions well known those skilled in the art.

Compounds of the Formula (2) may be prepared in turn by the processes described in co-pending application U.S. Serial Number 07/862,083 filed 2 April 1992 and the corresponding continuation-in-part application filed on even date herewith.

It will be recognized that compounds of the Formula (I) may exist in two distinct diastereomeric forms possessing distinct physical and biological properties; such isomers may be separated by standard chromatographic methods.

The following examples and methods are provided to illustrate how the make and use the invention. These materials are not intended to limit the invention in any manner; please refer to the claims appended hereto for determining what has been reserved to the inventors hereunder.

SYNTHETIC EXAMPLES

EXAMPLE 1

Methyl 4-cyano-4-(3-cyclopentyloxy-4-methoxyphenyl)cyclohex-1-ene-1-carboxylate

4-Cyano-4-(3-cyclopentyloxy-4-methoxyphenyl)-1-cyclohexenyl trifluoromethylsulfonate. To a solution of diisopropylamine (1.95 milliliters (hereinafter mL), 13.9 millimoles (hereinafter mmol)) in tetrahydrofuran (12 mL) at 0°C under an argon atmosphere was added n-butyl lithium (5.8 mL of 2.5M solution, 14.15 mmol), the resulting solution was stirred for 25 minutes (hereinafter min) and then was cooled to -78°C. To this was added a solution of 4-cyano-4-(3-cyclopentyloxy-4-methoxyphenyl)cyclohexan-1-one (2 grams (hereinafter g), 6.64 mmol) in tetrahydrofuran (9 mL). The resulting mixture was stirred at -78°C for 2 hours (hereinafter h), at which time N-phenyl-trifluoromethylsulfonimidate (4.98 g, 13.9 mmol) was added. The mixture was allowed to warm slowly to room temperature and after 5h, the mixture was poured into water and extracted with methylene chloride. The organic extract was dried (potassium carbonate) and concentrated under reduced pressure. The residue was purified by flash chromatography, eluting with 4:1 hexanes/ethyl acetate, to afford an oil (1.09 g, 37%).

Methyl 4-cyano-4-(3-cyclopentyloxy-4-methoxyphenyl)cyclohex-1-ene-1-carboxylate. To a solution of 4-cyano-4-(3-cyclopentyloxy-4-methoxyphenyl)-1-cyclohexenyl trifluoromethylsulfonate (1.0 g, 2.24 mmol) in 1:1 methanol/N,N-dimethylformamide (8 mL) were added triethylamine (0.66 mL, 4.72 mmol) and tetrakis(triphenylphosphine)palladium (0.13 g, 0.11 mmol). The resulting mixture was stirred at room temperature in the dark under a carbon monoxide atmosphere for 3h. The mixture was partitioned between water and ethyl acetate, the organic extract was washed three times with water, once with brine, was dried (potassium carbonate) and was evaporated.
Purification by flash chromatography, eluting with 3:1 hexanes/ethyl acetate, provided an off-white solid (0.64 g, 80%): m.p. 128-129°C.

EXAMPLE 2

4-Cyano-4-(3-cyclopentyloxy-4-methoxyphenyl)cyclohex-1-ene-1-carboxylic acid

To a solution of methyl 4-cyano-4-(3-cyclopentyloxy-4-methoxyphenyl)cyclohex-1-ene-1-carboxylate (0.07 g, 0.18 mmol) in methanol (0.5 mL, containing just enough tetrahydrofuran to solubilize the ester) under an argon atmosphere was added a solution of potassium hydroxide (0.03 g, 0.55 mmol) in water (0.4 mL). The resulting mixture was stirred at room temperature for 4 h, then poured into water and extracted with ethyl acetate. The aqueous phase was acidified with 3N hydrochloric acid and extracted twice with ethyl acetate. The organic phase from the acid extraction was dried (sodium sulfate) and concentrated under reduced pressure to provide a viscous oil, which solidified upon standing. The solid was recrystallized from hexanes/methylene chloride (0.05 g, 82%): m.p. 161-163°C.
Analysis Calc. for C_{20}H_{23}NO_{4}: C 68.55, H 6.90, N 4.00; found: C 68.65, H 6.55, N 3.82.

EXAMPLE 3

Methyl cis- and trans-4-cyano-4-(3-cyclopentyloxy-4-methoxyphenyl)cyclohexane-1-carboxylate

Procedure 3A:

To a solution of methyl 4-cyano-4-(3-cyclopentyloxy-4-methoxyphenyl)cyclohex-1-ene-1-carboxylate (0.26 g, 0.73 mmol) in methanol (12 mL) was added 10% palladium on activated carbon (0.15 g) and the resulting mixture was hydrogenated at 50 psi for 5 h. The mixture was filtered through a pad of Celite and concentrated under reduced pressure. The residue was partitioned between methylene chloride and water, the extract was dried (potassium carbonate) and evaporated to a solid which was primarily the cis-ester (0.14 g, 54%): m.p. 94-95°C.

Analysis Calc. for C_{21}H_{27}NO_{4}: C 70.32, H 7.38, N 3.90; found: C 70.33, H 7.59, N 3.81.

Procedure 3B:

2-[4-(3-cyclopentyloxy-4-methoxyphenyl)cyclohexylidene]-1,3-dithiane To a solution of 2-trimethylsilyl-1,3-dithiane (9.25 mL, 48.7 mmol) in dry tetrahydrofuran (80 mL) at 0°C under an argon atmosphere was added rapidly n-butyllithium (2.5 M in hexanes, 19.2 mL, 48 mmol). After 10 min, the mixture was cooled to -78°C and a solution of 4-cyano-4-(3-cyclopentyloxy-4-methoxyphenyl)cyclohexan-1-one (7.53 g, 23 mmol) in
tetrahydrofuran (40 mL) was added. After 10 min, aqueous sodium chloride was added, the mixture was allowed to warm to room temperature and was diluted with water. This mixture was combined with the product of three substantially similar reactions conducted on ketone (3.04, 6.01 and 6.1 g, 48.3 mmol total), the combined mixture was extracted three times with methylene chloride, the extract was dried (magnesium sulfate) and evaporated. Purification by flash chromatography, eluting with 10% ethyl acetate/hexanes, provided a white solid (26 g, 87%): m.p. 115-116°C.

Methyl cis-[4-cyano-4-(3-cyclopentoxy-4-methoxyphenyl)cyclohexane-1-carboxylate] Perchloric acid (70%, 13.8 mL, 160 mmol) and mercuric chloride (34.1 g, 126 mmol) were added to a solution of 2-[4-cyano-4-(3-cyclopentoxy-4-methoxyphenyl)cyclohexylidene]-1,3-dithiane (13 g, 31.3 mmol) in methanol (0.5 L) under an argon atmosphere and the mixture was heated at reflux for 2 h and then was allowed to stir at room temperature for 42 h. The mixture was diluted with methylene chloride, was filtered through Celite and the filtrate was combined with that of a similar reaction conducted concurrently on the same scale. The mixture was neutralized with aqueous sodium bicarbonate, was extracted three times with methylene chloride, the organic extract was washed three times with aqueous sodium sulfite, was dried (magnesium sulfate) and was evaporated. Purification by flash chromatography, eluting with 15% ethyl acetate/hexanes, provided the cis-ester as a white solid (12.4 g, 56%): m.p. 119-120°C, along with an additional quantity of slightly impure product (2.6 g, 12%).

Methyl trans-[4-cyano-4-(3-cyclopentoxy-4-methoxyphenyl)cyclohexane-1-carboxylate] The trans-ester was also isolated from this mixture as a solid (1.04 g, 5%): m.p. 50-51°C.

EXAMPLE 4

Methyl cis- and trans-[4-(3,4-bisdifluoromethoxyphenyl)-4-cyanocyclohexane-1-carboxylate]

Procedure 4A:

2-[4-(3,4-Bisdifluoromethoxyphenyl)-4-cyanocyclohexylidene]-2-tert-butylxoy acetonitrile Sodium hydride (80% dispersion, 0.35 g, 11.7 mmol) was washed three times with pentane, was suspended in tetrahydrofuran (15 mL) at room temperature under an argon atmosphere and diethyl tert-butyl(cyanomethyl)phosphonate (2.66 g, 10.7 mmol) was added. After 0.5 h, a solution of 4-(3,4-bisdifluoromethoxyphenyl)-4-cyanocyclohexan-1-one (1.77 g, 5.34 mmol) in tetrahydrofuran (5 mL) was added and the mixture was heated at reflux for 0.5 h. The mixture was cooled, aqueous sodium chloride and water were added, the mixture was extracted three times with ether, the extract was dried (magnesium sulfate) and
evaporated. Purification by flash chromatography, eluting with 20% ethyl acetate/hexanes, provided the title compound as a white solid (1.18 g, 52%).

Methyl cis- and trans-14-(3,4-bisdifluoromethoxyphenyl)-4-cyanocyclohexane-1-carboxylate A mixture of 2-[4-(3,4-bisdifluoromethoxyphenyl)-4-cyanocyclohexylidene]-2-tert-butoxy acetonitrile (0.25 g, 0.59 mmol) and zinc chloride (0.1 g, 0.7 mmol) in acetic anhydride (1.5 mL) under an argon atmosphere was heated at reflux for 10 min, was cooled, was diluted with water and was extracted three times with ether. The organic extract was washed with water, dried (magnesium sulfate) and evaporated. A solution of this acetate in methanol (6 mL) was treated with a solution of sodium methoxide (25% in methanol, 0.17 mL, 0.71 mmol) and the mixture was stirred under an argon atmosphere for 2h. The mixture was acidified with hydrochloric acid (1N), water was added and the mixture was extracted three times with methylene chloride. The organic extract was dried (magnesium sulfate) and evaporated. Purification by flash chromatography and eluting with 20% ethyl acetate/hexanes provided the trans-isomer as a colorless oil (0.07 g, 30%).

Analysis Calc. for C17H17F4NO4: C 54.40, H 4.57, N 3.73; found: C 54.57, H 4.51, N 3.58.
The cis-isomer was also isolated as a yellow oil (0.1 g, 47%).

Procedure 4B:

Methyl cis-[4-(3,4-bisdifluoromethoxyphenyl)-4-cyanocyclohexane-1-carboxylate] A solution of cis-[4-(3,4-bisdifluoromethoxyphenyl)-4-cyanocyclohexane-1-carboxylic acid

(EXAMPLE 10, 0.07 g, 0.19 mmol) and trimethylsilyl chloride (0.12 mL, 0.95 mmol) in methanol (5 mL) was stirred at room temperature under an argon atmosphere for 24h. The solvent was evaporated and the residue was purified by flash chromatography, eluting with 15% ethyl acetate/hexanes, provided a colorless oil (0.05 g, 63%).

Analysis Calc. for C17H17F4NO4: C 54.40, H 4.57, N 3.73; found: C 54.45, H 4.49, N 3.42.

EXAMPLE 5

cis-[4-Cyano-4-(3-cyclopentyl oxy-4-methoxyphenyl)cyclohexane-1-carboxylic acid] and cis-[4-(3,4-bisdifluoromethoxyphenyl)-4-cyanocyclohexane-1-carboxylic acid]

To a solution of methyl cis-[4-cyano-4-(3-cyclopentyl oxy-4-methoxyphenyl)cyclohexane-1-carboxylate] (0.12 g, 0.34 mmol) in methanol (0.9 mL, containing just enough tetrahydrofuran to solubilize the ester) under an argon atmosphere was added a solution of potassium hydroxide (0.06 g, 0.9 mmol) in water (0.7 mL). The resulting mixture was stirred at room temperature for 1.5h, then poured into water and extracted with ethyl acetate. The aqueous phase was acidified with 10% hydrochloric acid and extracted twice with ethyl acetate. The organic phase from the acid extraction was dried (sodium sulfate) and concentrated under reduced pressure to provide a solid. The solid was purified by flash chromatography, eluting with 4% methanol/chloroform, to provide a white solid (0.05 g, 44%): m.p. 1570C.

**EXAMPLE 7**

\[ \text{trans-[4-Cyano-4-(3-cyclopentyloxy-4-methoxyphenyl)cyclohexane-1-carboxylic acid]} \]

To a solution of methyl trans-[4-cyano-4-(3-cyclopentyloxy-4-methoxyphenyl)cyclohexane-1-carboxylate] (0.68 g, 1.9 mmol) in methanol (8 mL, containing just enough tetrahydrofuran to solubilize the ester) under an argon atmosphere was added water (4 mL) and potassium hydroxide (0.32 g, 5.7 mmol). The resulting mixture was stirred at room temperature for 24h, was acidified with 10% hydrochloric acid and was extracted three times with 10% methanol/methylene chloride. The organic extract was dried (magnesium sulfate) and concentrated under reduced pressure. Purification by flash chromatography, eluting with 4% methanol/methylene chloride, provided a white semi-solid (0.52 g, 80%), which was triturated with ether to yield a white solid (0.43 g): m.p. 157-158°C.

Analysis Calc. for C$_{20}$H$_{25}$NO$_4$: C 69.95, H 7.34, N 4.08; found: C 69.69, H 7.30, N 4.07.

**METHODS OF TREATMENT**

In order to use a compound of Formula (I) or a pharmaceutically acceptable salt thereof for the treatment of humans and other mammals, it is normally formulated in accordance with standard pharmaceutical practice as a pharmaceutical composition. The compounds of Formula (I) or a pharmaceutically acceptable salt thereof can be used in the manufacture of a medicament for the prophylactic or therapeutic treatment of any disease state in a human or other mammal which is mediated by inhibition of PDE IV, such as but not limited to asthma, allergic, or inflammatory diseases. The compounds of Formula (I) are administered in an amount sufficient to treat such a disease in a human or other mammal.

The method of treatment and monitoring for an HIV-infected human manifesting immune dysfunction or cytokine-mediated disease associated problems is taught in Hanaa, WO 90/15534, December 27, 1990. In general, an initial treatment regimen can be copied from that known to be effective in interfering with TNF activity for other TNF mediated disease states by the compounds of Formula (I). Treated individuals will be regularly checked for T cell numbers and T4/T8 ratios and/or measures of viremia such as levels of reverse transcriptase or viral proteins, and/or for progression of monokine-mediated disease associated problems such as cachexia or muscle degeneration. If no effect is seen following the normal treatment regimen, then the amount of the monokine activity interfering agent administered is increased, e.g., by fifty percent per week.
The pharmaceutical composition of the present invention will comprise an effective, non-toxic amount of a compound of Formula (I) and a pharmaceutically acceptable carrier or diluent. The compounds of Formula (I) are administered in conventional dosage forms prepared by combining a compound of Formula (I) in an amount sufficient to produce TNF production inhibiting activity, respectively, with standard pharmaceutical carriers according to conventional procedures. These procedures may involve mixing, granulating, and compressing or dissolving the ingredients as appropriate to the desired preparation.

Thus, if a solid carrier is used, the preparation can be tableted, placed in a hard gelatin capsule in powder or pellet form, or in the form of a troche or lozenge. The amount of solid carrier will vary widely but preferably will be from about 25 mg to about 1 gram. When a liquid carrier is used, the preparation will be in the form of a syrup, emulsion, soft gelatin capsule, sterile injectable liquid such as an ampule or nonaqueous liquid suspension. Where the composition is in the form of a capsule, any routine encapsulation is suitable, for example using the aforementioned carriers in a hard gelatin capsule shell. Where the composition is in the form of a soft gelatin shell capsule any pharmaceutical carrier routinely used for preparing dispersions or suspensions may be considered, for example aqueous gums, celluloses, silicates, or oils and are incorporated in a soft gelatin capsule shell. A syrup formulation will generally consist of a suspension or solution of the compound or salt in a liquid carrier for example, ethanol, glycerine, or water with a flavoring or coloring agent.

The daily dosage regimen for oral administration is suitably about .001 mg/kg to 100 mg/kg, preferably 0.01 mg/Kg to 40 mg/Kg, of a compound of Formula (I) or a pharmaceutically acceptable salt thereof calculated as the free base. The active ingredient may be administered from 1 to 6 times a day, sufficient to exhibit activity.

While it is possible for an active ingredient to be administered neat, it is preferable to present it as a pharmaceutical formulation. The active ingredient may comprise, for topical administration, from 0.001% to 10% w/w, e.g., from 1% to 2% by weight of formulation, although it may comprise as much as 10% w/w but preferably not in excess of 5% w/w and more preferably from 0.1% to 1% w/w of Formulation.

Formulations of the present invention comprise an active ingredient together with one or more acceptable carrier(s) thereof and optionally any other therapeutic ingredient(s). The carrier(s) must be 'acceptable' in the sense of being compatible with the other ingredients of Formulation and not deleterious to the recipient thereof.

It will be recognized by one of skill in the art that the form and character of the pharmaceutically acceptable carrier or diluent is dictated by the amount of active ingredient with which it is to be combined, the route of administration, and other well-known variables.

No toxic effects are expected when these compounds are administered in accordance with the present invention.
UTILITY EXAMPLES

EXAMPLE A

Inhibitory effect of compounds of the Formula (I) on *in vitro* TNF production by human monocytes

The inhibitory effect of compounds of the Formula (I) on *in vitro* TNF production by human monocytes may be determined by the protocol as described in Badger *et al.*, EPO published Application 0 411 754 A2, February 6, 1991, and in Hanna, WO 90/15534, December 27, 1990.

EXAMPLE B

Two models of endotoxic shock have been utilized to determine *in vivo* TNF activity for the compounds of the Formula (I). The protocol used in these models is described in Badger *et al.*, EPO published Application 0 411 754 A2, February 6, 1991, and in Hanna, WO 90/15534, December 27, 1990.

The exemplified compounds herein demonstrated a positive *in vivo* response in reducing serum levels of TNF induced by the injection of endotoxin.

EXAMPLE C

Isolation of PDE Isoenzymes

The phosphodiesterase inhibitory activity and selectivity of the compounds of the Formula (I) can be determined using a battery of five distinct PDE isoenzymes. The tissues used as sources of the different isoenzymes are as follows: 1) PDE I b, porcine aorta; 2) PDE I c, guinea-pig heart; 3) PDE III, guinea-pig heart; 4) PDE IV, human monocyte; and 5) PDE V (also called "Ia"), canine trachealis. PDEs I a, I b, I c and III are partially purified using standard chromatographic techniques [Torphy and Cieslinski, Mol. Pharmacol., 37:206-214, 1990]. PDE IV is purified to kinetic homogeneity by the sequential use of anion-exchange followed by heparin-Sepharose chromatography [Tophy et al., J. Biol. Chem., 267:1798-1804, 1992].

Phosphodiesterase activity is assayed as described in the protocol of Tophy and Cieslinski, Mol. Pharmacol., 37:206-214, 1990. Positive IC50's in the nanomolar to μM range for compounds of the workings examples described herein for Formula (I) have been demonstrated.

EXAMPLE D

The ability of selected PDE IV inhibitors to increase cAMP accumulation in intact tissues is assessed using U-937 cells, a human monocyte cell line that has been shown to contain a large amount of PDE IV. To assess the activity of PDE IV inhibition in intact cells, nondifferentiated U-937 cells (approximately 10^5 cells/reaction tube) were incubated with
various concentrations (0.01-1000 μM) of PDE inhibitors for one minute and 1μM
prostaglandin E2 for an additional four minutes. Five minutes after initiating the reaction,
cells were lysed by the addition of 17.5% perchloric acid, the pH was neutralized by the
addition of 1M potassium carbonate and cAMP content was assessed by RIA. A general
protocol for this assay is described in Brooker et al., Radioimmunassay of cyclic AMP and
examples as described herein for Formula (I) have demonstrated a positive EC50s in the μM
range in the above assay.

3. A pharmaceutical composition comprising a compound of Formula (I) according to claim 1 and a pharmaceutically acceptable excipient.

4. A method for treating an allergic or inflammatory state which method comprises administering to a subject in need thereof an effective amount of a compound of Formula (I) according to claim 1 alone or in combination with a pharmaceutically acceptable excipient.
INTERNATIONAL SEARCH REPORT

A. CLASSIFICATION OF SUBJECT MATTER
   IPC(S) :A61K 31/275; C07C 255/50
   US CL :514/521,525; 558/426
   According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED
   Minimum documentation searched (classification system followed by classification symbols)

   Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

   Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)
   Chemical Abstracts Structure Search

☐ Further documents are listed in the continuation of Box C. ☐ See patent family annex.

* Special categories of cited documents:
  *A* document defining the general state of the art which is not considered to be part of particular relevance
  *E* earlier document published on or after the international filing date
  *L* document which may throw doubt on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
  *O* document referring to an oral disclosure, use, exhibition or other means
  *P* document published prior to the international filing date but later than the priority date claimed
  *T* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
  *X* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
  *Y* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
  *Z* document member of the same patent family

BOX II. OBSERVATIONS WHERE UNITY OF INVENTION WAS LACKING

This ISA found multiple inventions as follows:

I. Claims 1-4, drawn to compounds, compositions and methods of use wherein the compounds of formula I contain a nitrogen-containing heterocyclic group, classified in Classes 544, 546 and 548, subclasses various.

II. Claims 1 and 3-4, drawn to compounds, compositions and methods of use wherein the compounds of formula I contain none of group I compounds, supra and wherein the compounds contain a sulfur-containing heterocyclic group, classified in Class 549, subclasses 1-87.

III. Claims 1 and 3-4, drawn to compounds, compositions and methods of use wherein the compounds of formula I contain none of groups 1-2 compounds, supra, and wherein the compounds contain an oxygen-containing heterocyclic group, classified in Class 549, subclasses 200-+.

IV. Claims 1-4, drawn to compounds, compositions and methods of use wherein the compounds of formula I contain none of groups 1-3 compounds, supra, and wherein the compounds contain a cyano group, classified in Class 558, subclasses 388-410.

V. Claims 1 and 3-4, drawn to compounds, compositions and methods of use wherein the compounds of formula I contain none of groups 1-4 compounds, supra and wherein the compounds contain a CO-CO-OH group, classified in Class 560, subclasses 8-113.

VI. Claims 1 and 3-4, drawn to compounds, compositions and methods of use wherein the compounds of formula I contain none of groups 1-5 compounds, supra, and wherein the compounds contain a CO-CO-OH group, classified in Class 562, subclasses 405-496.

VII. Claims 1 and 3-4, drawn to compounds, compositions and methods of use wherein the compounds of formula I contain none of groups 1-6 compounds, supra, and wherein the compounds contain a CO-N group, classified in Class 564, subclass 32.

VIII. Claims 1 and 3-4, drawn to compounds, compositions and methods of use wherein the compounds of formula I contain none of groups 1-7 compounds, supra, and wherein the compounds contain a CO-C group, classified in Class 564, subclass 123.

IX. Claims 1 and 3-4, drawn to compounds, compositions and methods of use wherein the compounds of formula I contain none of groups 1-8 compounds, supra, and wherein the compounds contain a NH group, classified in Class 564, subclasses 225-299.

X. Claims 1 and 3-4, drawn to compounds, compositions and methods of use wherein the compounds of formula I contain none of groups 1-9 compounds, supra, and wherein the compounds contain a NOH or NOR group, classified in Class 564, subclasses 300-443.

XI. Claims 1 and 3-4, drawn to compounds, compositions and methods of use wherein the compounds of formula I contain none of groups 1-10 compounds, supra, and wherein the compounds contain a R-S-R group, classified in Class 568, subclass 38.

XII. Claims 1 and 3-4, drawn to compounds, compositions and methods of use wherein the compounds of formula I contain none of groups 1-11 compounds, supra, and wherein the compounds contain a COH group, classified in Class 568, subclass 429.

XIII. Claims 1 and 3-4, drawn to compounds, compositions and methods of use wherein the compounds of formula I contain none of groups 1-12 compounds, supra, and wherein the compounds contain a R-O-R group, classified in Class 568, subclass 579.

The application lacks unity of invention under PCT Rules 13.1-13.4 since the claims herein vary in structure so much so as to fail to share a technical feature which defines a contribution over the prior art.
INTERNATIONAL SEARCH REPORT

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:

2. ☐ Claims Nos.: because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

3. ☐ Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows: Please See Extra Sheet.

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. ☑ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

   1,3-4 (each in part which corresponds to groups 4-6 as set forth above) and claim 2 (in its entirety).

4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest ☐ The additional search fees were accompanied by the applicant's protest.

☒ No protest accompanied the payment of additional search fees.
