NOVEL CYCLOALKYL SUBSTITUTED IMIDAZOLES

This invention relates to a novel group of imidazole compounds, processes for the preparation thereof, the use thereof in treating cytokine mediated diseases and pharmaceutical compositions for use in such therapy.

BACKGROUND OF THE INVENTION

Interleukin-1 (IL-1) and Tumor Necrosis Factor (TNF) are biological substances produced by a variety of cells, such as monocytes or macrophages. IL-1 has been demonstrated to mediate a variety of biological activities thought to be important in immunoregulation and other physiological conditions such as inflammation [See, e.g., Dinarello et al., Rev. Infect. Disease, 6, 51 (1984)]. The myriad of known biological activities of IL-1 include the activation of T helper cells, induction of fever, stimulation of prostaglandin or collagenase production, neutrophil chemotaxis, induction of acute phase proteins and the suppression of plasma iron levels.

There are many disease states in which excessive or unregulated IL-1 production is implicated in exacerbating and/or causing the disease. These include rheumatoid arthritis, osteoarthritis, endotoxemia and/or toxic shock syndrome, other acute or chronic inflammatory disease states such as the inflammatory reaction induced by endotoxin or inflammatory bowel disease; tuberculosis, atherosclerosis, muscle degeneration, cachexia, psoriatic arthritis, Reiter's syndrome, rheumatoid arthritis, gout, traumatic arthritis, rubella arthritis, and acute synovitis. Recent evidence also links IL-1 activity to diabetes and pancreatic ß cells.

Dinarello, J. Clinical Immunology, 5 (5), 287-297 (1985), reviews the biological activities which have been attributed to IL-1. It should be noted that some of these effects have been described by others as indirect effects of IL-1.

Excessive or unregulated TNF production has been implicated in mediating or exacerbating a number of diseases including rheumatoid arthritis, rheumatoid spondylitis, osteoarthritis, gouty arthritis and other arthritic conditions; sepsis, septic shock, endotoxic shock, gram negative sepsis, toxic shock syndrome, adult respiratory distress syndrome, cerebral malaria, chronic pulmonary inflammatory disease, silicosis, pulmonary sarcoidosis,
bone resorption diseases, reperfusion injury, graft vs. host reaction, allograft rejections, fever and myalgias due to infection, such as influenza, cachexia secondary to infection or malignancy, cachexia, secondary to acquired immune deficiency syndrome (AIDS), AIDS, ARC (AIDS related complex), keloid formation, scar tissue formation, Crohn's disease, ulcerative colitis, or pyrosis.

AIDS results from the infection of T lymphocytes with Human Immunodeficiency Virus (HIV). At least three types or strains of HIV have been identified, i.e., HIV-1, HIV-2 and HIV-3. As a consequence of HIV infection, T-cell mediated immunity is impaired and infected individuals manifest severe opportunistic infections and/or unusual neoplasms.

HIV entry into the T lymphocyte requires T lymphocyte activation. Other viruses, such as HIV-1, HIV-2 infect T lymphocytes after T Cell activation and such virus protein expression and/or replication is mediated or maintained by such T cell activation. Once an activated T lymphocyte is infected with HIV, the T lymphocyte must continue to be maintained in an activated state to permit HIV gene expression and/or HIV replication.

Monokines, specifically TNF, are implicated in activated T-cell mediated HIV protein expression and/or virus replication by playing a role in maintaining T lymphocyte activation. Therefore, interference with monokine activity such as by inhibition of monokine production, notably TNF, in an HIV-infected individual aids in limiting the maintenance of T cell activation, thereby reducing the progression of HIV infectivity to previously uninfected cells which results in a slowing or elimination of the progression of immune dysfunction caused by HIV infection. Monocytes, macrophages, and related cells, such as kupffer and glial cells, have also been implicated in maintenance of the HIV infection. These cells, like T-cells, are targets for viral replication and the level of viral replication is dependent upon the activation state of the cells. [See Rosenberg et al., The Immunopathogenesis of HIV Infection, Advances in Immunology, Vol. 57, (1989)].

Monokines, such as TNF, have been shown to activate HIV replication in monocytes and/or macrophages [See Poli, et al., Proc. Natl. Acad. Sci., 87:782-784 (1990)], therefore, inhibition of monokine production or activity aids in limiting HIV progression as stated above for T-cells.

TNF has also been implicated in various roles with other viral infections, such as the cytomegalovirus (CMV), influenza virus, and the herpes virus for similar reasons as those noted.

Interleukin-8 (IL-8) is a chemotactic factor first identified and characterized in 1987. IL-8 is produced by several cell types including mononuclear cells, fibroblasts, endothelial cells, and keratinocytes. Its production from endothelial cells is induced by IL-1, TNF, or lipopolysaccharide (LPS). Human IL-8 has been shown to act on Mouse, Guinea Pig, Rat,
and Rabbit Neutrophils

Many different names have been applied to IL-8, such as neutrophil attractant/activation protein-1 (NAP-1), monocyte derived neutrophil chemotactic factor (MDNCF), neutrophil activating factor (NAF), and T-cell lymphocyte chemotactic factor. IL-8 stimulates a number of functions in vitro. It has been shown to have chemotactant properties for neutrophils, T-lymphocytes, and basophils. In addition it induces histamine release from basophils from both normal and atopic individuals as well as lysozomal enzyme release and respiratory burst from neutrophils. IL-8 has also been shown to increase the surface expression of Mac-1 (CD11b/CD18) on neutrophils without de novo protein synthesis, this may contribute to increased adhesion of the neutrophils to vascular endothelial cells. Many diseases are characterized by massive neutrophil infiltration. Conditions associated with an increased in IL-8 production (which is responsible for chemotaxis of neutrophil into the inflammatory site) would benefit by compounds which are suppressive of IL-8 production.

IL-1 and TNF affect a wide variety of cells and tissues and these cytokines as well as other leukocyte derived cytokines are important and critical inflammatory mediators of a wide variety of disease states and conditions. The inhibition of these cytokines is of benefit in controlling, reducing and alleviating many of these disease states.

There remains a need for treatment, in this field, for compounds which are cytokine suppressive anti-inflammatory drugs, i.e. compounds which are capable of inhibiting cytokines, such as IL-1, IL-6, IL-8 and TNF.

SUMMARY OF THE INVENTION

This invention relates to the novel compounds of Formula (I) and pharmaceutical compositions comprising a compound of Formula (I) and a pharmaceutically acceptable diluent or carrier.

This invention relates to a method of treating a CSBP/RK/p38 kinase mediated disease in a mammal in need thereof, which comprises administering to said mammal an effective amount of a compound of Formula (I).

This invention also relates to a method of inhibiting cytokines and the treatment of a cytokine mediated disease, in a mammal in need thereof, which comprises administering to said mammal an effective amount of a compound of Formula (I).

This invention more specifically relates to a method of inhibiting the production of IL-1, IL-8 or TNF in a mammal in need thereto, which comprises administering to said mammal an effective amount of a compound of Formula (I).

Accordingly, the present invention provides for a compound of the Formula:
wherein

R₁ is 4-pyridyl, pyrimidinyl, quinolyl, isoquinolinyl, quinazolin-4-yl, 1-imidazolyl or 1-benzimidazolyl, which ring is substituted with a substituted C₅₋₄ alkoxy or a substituted C₅₋₄ alkylthio group, and is additionally optionally substituted independently by C₅₋₄ alkyl, halogen, hydroxy, C₅₋₄ alkoxy, C₅₋₄ alkylthio, C₅₋₄ alkysulfanyl, CH₂OR₁₂, amino, mono and di- C₆₋₆ alkyl substituted amino, N(R₁₀)C(O)R₉ or an N-heterocyclic ring which ring has from 5 to 7 members and optionally contains an additional heteroatom selected from oxygen, sulfur or NR₁₅;

R₄ is phenyl, naphth-1-yl or naphth-2-yl, or a heteroaryl, which is optionally substituted by one or two substituents, each of which is independently selected, and which, for a 4-phenyl, 4-naphth-1-yl, 5-naphth-2-yl or 6-naphth-2-yl substituent, is halogen, cyano, nitro, -(Z)NR₇R₁₇, -(Z)OR₁₆, -(CR₁₀R₂₀)ₙCOR₁₂, -SR₅, -SOR₅, -OR₁₂, halo-substituted C₅₋₄ alkyl, C₅₋₄ alky, -(Z)R₁₂, -NR₁₀C(Z)R₁₆, or -(CR₁₀R₂₀)ₙNR₁₀R₂₀ and which, for other positions of substitution, is halogen, cyano, -(Z)NR₁₃R₁₄, -(Z)OR₃, -(CR₁₀R₂₀)ₘ⁺COR₃, -S(O)ₘR₃, -OR₃, halo-substituted C₅₋₄ alkyl, -(Z)R₁₂, -(CR₁₀R₂₀)ₘ⁺NR₁₀C(Z)R₃, -NR₁₀S(O)ₘ⁺R₈, -NR₁₀S(O)ₘ⁺NR₁₀R₁₇, -(Z)R₃ or -(CR₁₀R₂₀)ₘ⁺NR₁₃R₁₄;

v is 0, or an integer having a value of 1 or 2;

m is 0, or the integer 1 or 2;

m' is an integer having a value of 1 or 2.

m" is 0, or an integer having a value of 1 to 5;

R₉ is hydrogen, C₅₋₆ alky, C₇₋₇ cycloalkyl, aryl, aryI₅₋₄ alky, heteroaryl, heteroaryI₅₋₄alky, heterocyclyl, or heterocyclyI₅₋₄ alkyl C₅₋₄ alky;

R₂ is an optionally substituted C₅₋₇ cycloalkyl, or C₅₋₇ cycloalkyI₅₋₁₀ alky;

R₃ is heterocyclyl, heterocyclyI₅₋₁₀ alky or R₈;

R₅ is hydrogen, C₅₋₆ alky, C₂₋₄ alkenyl, C₂₋₄ alkynyl or NR₇R₁₇, excluding the moieties -SR₅ being -SNR₇R₁₇ and -SOR₅ being -SOH;

R₇ and R₁₇ is each independently selected from hydrogen or C₅₋₆ alky or R₇ and R₁₇ together with the nitrogen to which they are attached form a heterocyclic ring of 5 to 7 members which ring optionally contains an additional heteroatom selected from oxygen, sulfur or NR₁₅;
R8 is C_{1-10} alkyl, halo-substituted C_{1-10} alkyl, C_{2-10} alkenyl, C_{2-10} alkynyl, C_{3-7}
cycloalkyl, C_{5-7} cycloalkenyl, aryl, arylC_{1-10} alkyl, heteroaryl, heteroarylC_{1-10} alkyl,
(CR_{10}R_{20})_{n}OR_{11}, (CR_{10}R_{20})_{n}S(O)_{m}R_{18}, (CR_{10}R_{20})_{n}NHS(O)_{2}R_{18},
(CR_{10}R_{20})_{n}NR_{13}R_{14}; wherein the aryl, arylalkyl, heteroaryl, heteroaryl alkyl may be
optionally substituted;

n is an integer having a value of 1 to 10;

R9 is hydrogen, -C(Z)R_{11} or optionally substituted C_{1-10} alkyl, S(O)_{2}R_{18}, optionally
substituted aryl or optionally substituted aryl-C_{1-4} alkyl;

R10 and R20 is each independently selected from hydrogen or C_{1-4} alkyl;

R_{11} is hydrogen, or R_{18};

R_{12} is hydrogen or R_{16};

R_{13} and R_{14} is each independently selected from hydrogen or optionally substituted C_{1-4}
alkyl, optionally substituted aryl or optionally substituted aryl-C_{1-4} alkyl, or together
with the nitrogen which they are attached form a heterocyclic ring of 5 to 7 members
which ring optionally contains an additional heteroatom selected from oxygen, sulfur or
NR_{9} ;

R_{15} is hydrogen, C_{1-4} alkyl or C(Z)-C_{1-4} alkyl;

R_{16} is C_{1-4} alkyl, halo-substituted-C_{1-4} alkyl, or C_{3-7} cycloalkyl;

R_{18} is C_{1-10} alkyl, C_{3-7} cycloalkyl, heterocyclyl, aryl, arylC_{1-10} alkyl, heterocyclyl,

heterocyclyl-C_{1-10} alkyl, heteroaryl or heteroarylalkyl;

Z is oxygen, or sulfur;
or a pharmaceutically acceptable salt thereof.

DETAILED DESCRIPTION OF THE INVENTION

The novel compounds of Formula (I) may also be used in association with the
 veterinary treatment of mammals, other than humans, in need of inhibition of cytokine
 inhibition or production. In particular, cytokine mediated diseases for treatment,
 therapeutically or prophylactically, in animals include disease states such as those noted
 herein in the Methods of Treatment section, but in particular viral infections. Examples of
 such viruses include, but are not limited to, lentivirus infections such as, equine infectious
 anaemia virus, caprine arthritis virus, visna virus, or maedi virus or retrovirus infections,
 such as but not limited to feline immunodeficiency virus (FIV), bovine immunodeficiency
 virus, or canine immunodeficiency virus or other retroviral infections.

In Formula (I), suitable R_{1} moieties includes 4-pyridyl, 4-pyrimidinyl, 4-quinolyl,

6-isoquinoliny1, 4-quinazolinyl, 1-imidazolyl and 1-benzimidazolyl, of which the 4-pyridyl,
4-pyrimidinyl and 4-quinolyl are preferred. More preferred is a substituted 4-pyrimidinyl or
a substituted 4-pyridyl moiety, and most preferred is a substituted 4-pyrimidinyl ring. The R1 moieties are substituted at least one time by a substituted C1-4 alkoxy moiety or a substituted C1-4 alkylthio. A preferred ring placement of the R1 substituent on the 4-pyridyl derivative is the 2-position, such as 2-methoxy-4-pyridyl. A preferred ring placement on the 4-pyrimidinyl ring is also at the 2-position, such as in 2-methoxy-pyrimidinyl.

Suitably the C1-4 alkoxy or C1-4 alkylthio moiety is substituted on the alkyl chain by halogen, such as fluorine, chlorine, bromine or iodine; hydroxy, such as hydroxylethoxy; C1-10 alkoxy, such as a methoxymethoxy, S(O)m alkyl, wherein m is 0, 1 or 2; amino, mono & di-substituted amino, such as in the NR7R17 group, i.e. tert-butilaminoethoxy; or where the R7R17 may together with the nitrogen to which they are attached cyclize to form a 5 to 7 membered ring which optionally includes an additional heteroatom selected from O/N/S; C1-10 alkyl, cycloalkyl, or cycloalkyl alkyl group, such as methyl, ethyl, propyl, isopropyl, t-butyl, etc. or cyclopropyl methyl; or halosubstituted C1-10 alkyl, such CF3.

Preferably the R1 substituents are tertbutylaminoethoxy, or hydroxyethoxy.

Suitable additional substituents for the R1 heteroaryl rings are C1-4 alkyl, halo, OH, C1-4 alkoxy, C1-4 alkylthio, C1-4 alkylsulfanyl, CH2OR12, amino, mono and di-C1-6 alkyl substituted amino, N(R10)C(O)Rc, or an N-heterocyclyl ring which ring has from 5 to 7 members and optionally contains an additional heteroatom selected from oxygen, sulfur or NR15. The alkyl group in the mono- and di-C1-6 alkyl substituted moiety may be halo substituted, such as in trifluoro- i.e., trifluoromethyl or trifluoroethyl.

When the R1 optional substituent is N(R10)C(O) Rc, wherein Rc is hydrogen, C1-6 alkyl, C3-7 cycloalkyl, aryl, arylC1-4 alkyl, heteroaryl, heteroarylC1-4alkyl, heterocyclyl, or heterocyclylC1-4alkyl C1-4 alkyl, Rc is preferably C1-6 alkyl; preferably R10 is hydrogen. It is also recognized that the Rc moieties, in particular the C1-6 alkyl group may be optionally substituted, preferably from one to three times, preferably with halogen, such as fluorine, as in trifluoromethyl or trifluoroethyl.

Suitably, R4 is phenyl, naphth-1-yl or naphth-2-yl, or a heteroaryl, which is optionally substituted by one or two substituents. More preferably R4 is a phenyl or naphthyl ring. Suitable substitutions for R4 when this is a 4-phenyl, 4-naphth-1-yl, 5-naphth-2-yl or 6-naphth-2-yl moiety are one or two substituents each of which are independently selected from halogen, -SR5, -SOR5, -OR12, CF3, or -CR10R20, and for other positions of substitution on these rings preferred substitution is halogen, -S(O)mR3, -OR3, CF3, -CR10R20, -NR13R14, -NR10C(Z)R3 and -NR10S(O)mR8. Preferred substituents for the
4-position in phenyl and naphth-1-yl and on the 5-position in naphth-2-yl include halogen, especially fluoro and chloro and -SR₅ and -SOR₅ wherein R₅ is preferably a C₁₋₂ alkyl, more preferably methyl; of which the fluoro and chloro is more preferred, and most especially preferred is fluoro. Preferred substituents for the 3-position in phenyl and naphth-1-yl rings include: halogen, especially fluoro and chloro; -OR₃, especially C₁₋₄ alkoxy; CF₃, NR₁₀R₂₀, such as amino; -NR₁₀C(Z)R₃, especially -NHCO(C₁₋₁₀ alkyl); -NR₁₀S(O)ₙR₈, especially -NHSO₂(C₁₋₁₀ alkyl), and -SR₃ and -SOR₃ wherein R₃ is preferably a C₁₋₂ alkyl, more preferably methyl. When the phenyl ring is disubstituted preferably it is two independent halogen moieties, such as fluoro and chloro, preferably di-chloro and more preferably in the 3, 4-position. It is also preferred that for the 3-position of both the -OR₃ and -ZC(Z)R₃ moieties, R₃ may also include hydrogen.

Preferably, the R₄ moiety is an unsubstituted or substituted phenyl moiety. More preferably, R₄ is phenyl or phenyl substituted at the 4-position with fluoro and/or substituted at the 3-position with fluoro, chloro, C₁₋₄ alkoxy, methane-sulfonamido or acetamido, or R₄ is a phenyl di-substituted at the 3,4-position independently with chloro or fluoro, more preferably chloro. Most preferably, R₄ is a 4-fluorophenyl.

In Formula (I), Z is oxygen, or sulfur, preferably oxygen.

Suitably, R₂ is an optionally substituted C₃₋₇cycloalkyl, or an optionally substituted C₃₋₇cycloalkyl C₁₋₁₀ alkyl. Preferably R₂ is a C₃₋₇cycloalkyl, of which the cycloalkyl group is preferably a C₄₋₇ ring, more preferably a C₄ or C₆ ring, most preferably a C₆ ring, which ring is optionally substituted.

The C₃₋₇cycloalkyl ring may be substituted one to three times independently by halogen, such as fluorine, chlorine, bromine or iodine; hydroxy; C₁₋₁₀ alkoxy, such as methoxy or ethoxy; S(O)ₘ alkyl, wherein m is 0, 1, or 2, such as methyl thio, methylsulfinyl or methyl sulfonyl; S(O)ₘ aryl; cyano; nitro; amino, mono & di-substituted amino, such as in the NR₇R₁₇ group, wherein R₇ and R₁₇ are as defined in Formula (I); or where the R₇R₁₇ may cyclize together with the nitrogen to which they are attached to form a 5 to 7 membered ring which optionally includes an additional heteroatom selected from oxygen, sulfur or NR₁₅ (wherein R₁₅ is as defined for Formula (I)); N(R₁₀)C(O)X₁ (wherein R₁₀ is as defined for Formula (I), and X₁ is C₁₋₄ alkyl, aryl or arylC₁₋₄alkyl); N(R₁₀)C(O) aryl; C₁₋₁₀ alkyl, such as methyl, ethyl, propyl, isopropyl, or t-butyl; optionally substituted C₁₋₁₀ alkyl wherein the substituents are halogen, (such as CF₃), hydroxy, nitro, cyano, amino, mono & di-substituted amino, such as in the NR₇R₁₇ group, S(O)ₘ alkyl and S(O)ₘ aryl, wherein m is 0, 1 or 2; optionally substituted C₁₋₁₀alkylene, such as ethylene or propylene; optionally substituted C₁₋₁₀ alkyne, such as acetylene (ethynyl) or 1-propynyl; C(O)OR₁₁ (wherein R₁₁ is as defined in Formula (I)), such as the
free acid or methyl ester derivative; the group R₈: -C(O)H; =O; =N-OR₁₁; -N(H)-OH (or substituted alkyl or aryl derivatives thereof on the nitrogen or the oxime moiety); -N(OR₆)-C(O)-R₉; oxirane; an optionally substituted aryl, such as phenyl; an optionally substituted arylC₆alkyl, such as benzyl or phenethyl; an optionally substituted heterocyclic C₆alkyl, and further these aryl, arylalkyl, heterocyclic, and heterocyclic alkyl moieties are optionally substituted one to two times by halogen, hydroxy, C₁-₁₀ alkoxy, S(O)ₘ alky1, cyano, nitro, amino, mono & di-substituted amino, such as in the NR₇R₁₇ group, an alkyl, halosubstituted alkyl.

Suitably R₈ is a 1,3-dioxalkylene group of the formula -O-(CH₂)ₜ-O-, wherein t is 1 to 3, preferably t is 2 yielding a 1,3-dioxyethylene moiety.

Suitably R₆ is hydrogen, a pharmaceutically acceptable cation, aroyl or a C₁-₁₀ alkanoyl group.

Suitably R₉ is NR₂₁R₂₂; alkyl₁-₆; halosubstituted alkyl₁-₆; hydroxy substituted alkyl₁-₆; alkenyl₂-₆; aryl or heteroaryl optionally substituted by halogen, alkyl₁-₆, halosubstituted alkyl₁-₆, hydroxyl, or alkoxy₁-₆.

Suitably R₂₁ is H or alkyl₁-₆.

Suitably R₂₂ is H, alkyl₁-₆, aryl, benzyl, heteroaryl, alkyl substituted by halogen or hydroxyl, or phenyl substituted by a member selected from the group consisting of halo, cyano, alkyl₁-₁₂, alkoxy₁-₆, halosubstituted alkyl₁-₆, alkylthio, alkylsulphonyl, or alkylsulfinyl; or R₂₁ and R₂₂ may together with the nitrogen to which they are attached form a ring having 5 to 7 members, which members may be optionally replaced by a heteroatom selected from oxygen, sulfur or nitrogen. The ring may be saturated or contain more than one unsaturated bond. Preferably R₆ is NR₂₁R₂₂, and more preferably R₂₁ and R₂₂ are hydrogen.

A preferred ring placement on the cyclohexyl ring, particularly when it is a C₆ ring, is the 4-position.

When the cyclohexyl ring is disubstituted it is preferably disubstituted at the 4 position, such as in:

![Diagram](image)

wherein R¹' and R²' are independently the optional substituents indicated above for R₂. Preferably, R¹' and R²' are hydrogen, hydroxy, alkyl, substituted alkyl, optionally substituted alkynyl, aryl, arylalkyl, NR₇R₁₇, and N(R₁₀)C(O)R₁₁. Suitably, alkyl is C₆₄
alkyl, such as methyl, ethyl, or isopropyl; NR7R17 and NR7R17 alkyl, such as amino, methylamino, aminomethyl, aminoethyl; substituted alkyl such as in cyanomethyl, cyanoethyl, nitroethyl, pyrrolidinyl; optionally substituted alkynyl, such as propynyl or ethynyl; aryl such as in phenyl; arylalkyl, such as in benzyl; or together R1' and R2' are a keto functionality.

As used herein, "optionally substituted" unless specifically defined herein, shall mean such groups as halogen, such as fluorine, chlorine, bromine or iodine; hydroxy; hydroxy substituted C1-10alkyl; C1-10 alkoxy, such as methoxy or ethoxy; S(O)m alkyl, wherein m is 0, 1 or 2, such as methyl thio, methylsulfinyl or methyl sulfonyl; amino, mono & di-substituted amino, such as in the NR7R17 group; or where the R7R17 may together with the nitrogen to which they are attached cyclize to form a 5 to 7 membered ring which optionally includes an additional heteroatom selected from O/N/S; C1-10 alkyl, cycloalkyl, or cycloalkyl alkyl group, such as methyl, ethyl, propyl, isopropyl, t-butyl, etc. or cyclopropyl methyl; halosubstituted C1-10 alkyl, such CF3; halosubstituted C1-10 alkoxy; an optionally substituted aryl, such as phenyl, or an optionally substituted arylalkyl, such as benzyl or phenethyl, wherein these aryl moieties may also be substituted one to two times by halogen; hydroxy; hydroxy substituted alkyl; C1-10 alkoxy; S(O)m alkyl; amino, mono & di-substituted amino, such as in the NR7R17 group; alkyl, or CF3.

Suitable pharmaceutically acceptable salts are well known to those skilled in the art and include basic salts of inorganic and organic acids, such as hydrochloric acid, hydrobromic acid, sulphuric acid, phosphoric acid, methane sulphonlic acid, ethane sulphonic acid, acetic acid, malic acid, tartaric acid, citric acid, lactic acid, oxalic acid, succinic acid, fumaric acid, maleic acid, benzoic acid, salicylic acid, phenylacetic acid and mandelic acid. In addition, pharmaceutically acceptable salts of compounds of Formula (I) may also be formed with a pharmaceutically acceptable cation, for instance, if a substituent group comprises a carboxy moiety. Suitable pharmaceutically acceptable cations are well known to those skilled in the art and include alkaline, alkaline earth, ammonium and quaternary ammonium cations.

The following terms, as used herein, refer to:
• "halo" or "halogens", include the halogens: chloro, fluoro, bromo and iodo.
• "C1-10alkyl" or "alkyl" - both straight and branched chain radicals of 1 to 10 carbon atoms, unless the chain length is otherwise limited, including, but not limited to,

- The term "cycloalkyl" is used herein to mean cyclic radicals, preferably of 3 to 8 carbons, including but not limited to cyclopropyl, cyclopentyl, cyclohexyl, and the like.
- The term "cycloalkenyl" is used herein to mean cyclic radicals, preferably of 5 to 8 carbons, which have at least one bond including but not limited to cyclopentenyl, cyclohexenyl, and the like.
- The term "alkenyl" is used herein at all occurrences to mean straight or branched chain radical of 2-10 carbon atoms, unless the chain length is limited thereto, including, but not limited to ethenyl, 1-propenyl, 2-propenyl, 2-methyl-1-propenyl, 1-butenyl, 2-butenyl and the like.
  - "aryl" - phenyl and naphthyl;
  - "heteroaryl" (on its own or in any combination, such as "heteroaryloxy", or "heteroaryl alkyl") - a 5-10 membered aromatic ring system in which one or more rings contain one or more heteroatoms selected from the group consisting of N, O or S, such as, but not limited, to pyrrole, pyrazole, furan, thiophene, quinoline, isoquinoline, quinazolinyl, pyridine, pyrimidine, oxazole, thiazole, thiadiazole, triazole, imidazole, or benzimidazole.
  - "heterocyclic" (on its own or in any combination, such as "heterocyclalkyl") - a saturated or partially unsaturated 4-10 membered ring system in which one or more rings contain one or more heteroatoms selected from the group consisting of N, O, or S; such as, but not limited to, pyrrolidine, piperidine, piperazine, morpholine, tetrahydropyran, or imidazolidine.
- The term "aralkyl" or "heteroarylalkyl" or "heterocyclicalkyl" is used herein to mean C₁-₄ alkyl as defined above attached to an aryl, heteroaryl or heterocyclic moiety as also defined herein unless otherwise indicate.
  - "sulfinyl" - the oxide S (O) of the corresponding sulfide, the term "thio" refers to the sulfide, and the term "sulfonyl" refers to the fully oxidized S(O)₂ moiety.
  - "aryloyl" - a C(O)Ar, wherein Ar is as phenyl, naphthyl, or aryl alkyl derivative such as defined above, such group include but are note limited to benzyl and phenethyl.
  - "alkanoyl" - a C(O)C₁-₁₀ alkyl wherein the alkyl is as defined above.

It is recognized that the compounds of the present invention may exist as stereoisomers, regioisomers, or diastereomers. These compounds may contain one or more asymmetric carbon atoms and may exist in racemic and optically active forms. All of these compounds are included within the scope of the present invention.
Exemplified compounds of Formula (I) include:

5-[2-(2-Hydroxyethoxy)pyrimidin-4-yl]-4-(4-fluorophenyl)-1-(4-oxocyclohexyl)-imidazole;
5-[2-(2-Hydroxyethoxy)pyrimidin-4-yl]-4-(4-fluorophenyl)-1-(4-hydroxy cyclohexyl)-imidazole;
5-[2-(2-tert-Butylamino)ethoxy]pyrimidin-4-yl]-4-(4-fluorophenyl)-1-(4-oxocyclohexyl)-imidazole;
5-[2-(2-tert-Butylamino)ethoxy]pyrimidin-4-yl]-4-(4-fluorophenyl)-1-(4-hydroxy-cyclohexyl)imidazole;

or a pharmaceutically acceptable salt thereof.

The compounds of Formula (I) may be obtained by applying synthetic procedures, some of which are illustrated in Schemes I to XI below. The synthesis provided for in these Schemes is applicable for the producing compounds of Formula (I) having a variety of different R₁, R₂, and R₄ groups which are reacted, employing optional substituents which are suitably protected, to achieve compatibility with the reactions outlined herein. Subsequent deprotection, in those cases, then affords compounds of the nature generally disclosed. Once the imidazole nucleus has been established, further compounds of Formula (I) may be prepared by applying standard techniques for functional group interconversion, well known in the art.

For instance: -C(O)NR₁₃R₁₄ from -CO₂CH₃ by heating with or without catalytic metal cyanide, e.g. NaCN, and HNR₁₃R₁₄ in CH₃OH; -OC(O)R₃ from -OH with e.g., ClC(O)R₃ in pyridine; -NR₁₀C(S)NR₁₃R₁₄ from -NHR₁₀ with an alkylisothiocyanate or thiocyanic acid; NR₆C(O)OR₆ from -NHR₆ with the alkyl chloroformate;
NR₁₀C(O)NR₁₃R₁₄ from -NHR₁₀ by treatment with an isocyanate, e.g. HN= =C=O or R₁₀N=N=C=O; -NR₁₀C(O)R₈ from -NHR₁₀ by treatment with Cl-C(O)R₃ in pyridine;
-C(=NR₁₀)NR₁₃R₁₄ from -C(NR₁₃R₁₄)SR₃ with H₃NR₃+OAc⁻ by heating in alcohol;
-C(NR₁₃R₁₄)SR₃ from -C(S)NR₁₃R₁₄ with R₆-I in an inert solvent, e.g. acetone;
-C(S)NR₁₃R₁₄ (where R₁₃ or R₁₄ is not hydrogen) from -C(S)NH₂ with
HNR₁₃R₁₄-C(=NCN)-NR₁₃R₁₄ from -C(=NR₁₃R₁₄)-SR₃ with NH₂CN by heating in anhydrous alcohol, alternatively from -C(=NH)-NR₁₃R₁₄ by treatment with BrCN and NaOEt in EtOH; -NR₁₀C(=NCN)SR₈ from -NHR₁₀ by treatment with (R₈S)₂C=NCN;
-NR₁₀SO₂R₃ from -NHR₁₀ by treatment with ClSO₂R₃ by heating in pyridine;
NR₁₀C(S)R₃ from -NR₁₀C(O)R₈ by treatment with Lawesson's reagent [2,4-bis(4-methoxyphenyl)-1,3,2,4-dithiadiposophetane-2,4-disulfide]; -NR₁₀SO₂CF₃ from -NHR₆
with triflic anhydride and base wherein R₃, R₆, R₁₀, R₁₃ and R₁₄ are as defined in Formula (I) herein.

In a further aspect the present invention provides for compounds of the Formula (II) having the structure:

\[
\text{Ar} - \text{S(O)}_p \\
\text{R₄} - \text{NC}
\]

(II)

wherein \( p \) is 0, or 2; \( R₄ \) is as defined for Formula (I) and \( \text{Ar} \) is an optionally substituted aryl as defined herein. Suitably, \( \text{Ar} \) is phenyl optionally substituted by \( C_1\text{-}_{10} \text{alkyl}, C_1\text{-}_{10} \text{alkoxy or halo.} \) Preferably \( \text{Ar} \) is phenyl or 4-methylphenyl, i.e. a tosyl derivative. Compounds of Formula (II) are believed novel, provided than when \( \text{Ar} \) is tosyl, and \( p \) is 0 or 2, then \( R₄ \) is not an unsubstituted phenyl.

Precursors of the groups \( R₁, R₂ \) and \( R₄ \) can be other \( R₁, R₂ \) and \( R₄ \) groups which can be interconverted by applying standard techniques for functional group interconversion. For example a compound of the formula (I) wherein \( R₂ \) is halo-substituted \( C_1\text{-}_{10} \text{alkyl} \) can be converted to the corresponding \( C_1\text{-}_{10} \text{alkylN₃} \) derivative by reacting with a suitable azide salt, and thereafter if desired can be reduced to the corresponding \( C_1\text{-}_{10} \text{alkylNH₂} \) compound, which in turn can be reacted with \( R₁₈S(0)₂X \) wherein \( X \) is halo (e.g., chloro) to yield the corresponding \( C_1\text{-}_{10} \text{alkylNHS(0)₂R₁₈} \) compound.

Alternatively a compound of the formula (I) where \( R₂ \) is halo-substituted \( C_1\text{-}_{10} \text{alkyl} \) can be reacted with an amine \( R₁₃R₁₄NH \) to yield the corresponding \( C_1\text{-}_{10} \text{alkylNR₁₃R₁₄} \) compound, or can be reacted with an alkali metal salt of \( R₁₈SH \) to yield the corresponding \( C_1\text{-}_{10} \text{alkylSR₁₈} \) compound.
Referring to Scheme I the compounds of Formula (I) are suitably prepared by reacting a compound of the Formula (II) with a compound of the Formula (III) wherein p is 0 or 2, R₁, R₂ and R₄ are as defined herein, for Formula (I), or are precursors of the groups R₁, R₂ and R₄, and Ar is an optionally substituted phenyl group, and thereafter if necessary converting a precursor of R₁, R₂ and R₄ to a group R₁, R₂ and R₄. It is recognized that R₂NH₂ which is reacted with R₁CHO to form the imine, Formula (III) the R₂ moiety when it contains a reactive functional group, such as a primary or secondary amine, an alcohol, or
thiol compound the group must be suitably protected. Suitable protecting groups may be found in, Protecting Groups in Organic Synthesis, Greene T W, Wiley-Interscience, New York, 1981, whose disclosure is incorporated herein by reference. For instance, when R₂ contains as a substituent group a heterocyclic ring, such as a piperidine ring, the nitrogen is protected with groups such as t-Boc, CO₂R₁₈, or a substituted arylalkyl moiety.

Suitably, the reaction is performed at ambient temperature or with cooling (e.g. -50° to 10°) or heating in an inert solvent such as methylene chloride, DMF, tetrahydrofuran, toluene, acetonitrile, or dimethoxyethane in the presence of an appropriate base such as 1,8-diazabicyclo [5.4.0.] undec-7-ene (DBU) or a guanidine base such as 1,5,7-triaza-bicyclo [4.4.0] dec-5-ene (TBD). The intermediates of formula (II) have been found to be very stable and capable of storage for a long time. Preferably, p is 2.

Reaction a compound of the Formula (II) wherein p = 2, with a compound of the Formula (III)-Scheme I gives consistently higher yields of compounds of Formula (I) than when p=0. In addition, the reaction of Formula (II) compounds wherein p = 2 is more environmentally and economically attractive. When p=0, the preferred solvent used is methylene chloride, which is environmentally unattractive for large scale processing, and the preferred base, TBD, is also expensive, and produces some byproducts and impurities, than when using the commercially attractive synthesis (p=2) as further described herein.

As noted, Scheme I utilizes the 1,3-dipolar cycloadditions of an anion of a substituted aryl thiomethylisocyanide (when p=0) to an imine. More specifically, this reaction requires a strong base, such as an amine base, to be used for the deprotonation step. The commercially available TBD is preferred although t-butoxide, Li⁺ or Na⁺, or K⁺ hexamethyldisilazide may also be used. While methylene chloride is the preferred solvent, other halogenated solvents, such as chloroform or carbon tetrachloride; ethers, such as THF, DME, DMF, diethylether, t-butyl methyl ether; as well as acetonitrile, toluene or mixtures thereof can be utilized. The reaction may take place from about -20°C to about; 40°C, preferably from about 0°C to about 23°C, more preferably from about 0°C to about 10°C, and most preferably about 4°C for reactions involving an R₁ group of pyrimidine. For compounds wherein R₁ is pyridine, it is recognized that varying the reactions conditions of both temperature and solvent may be necessary, such as decreasing temperatures to about -50°C or changing the solvent to THF.

In a further process, compounds of Formula (I) may be prepared by coupling a suitable derivative of a compound of Formula (IX):
wherein \( T_1 \) is hydrogen and \( T_4 \) is \( R_4 \), or alternatively \( T_1 \) is \( R_1 \) and \( T_4 \) is \( H \) in which \( R_1 \), \( R_2 \) and \( R_4 \) are as hereinbefore defined; with: (i) when \( T_1 \) is hydrogen, a suitable derivative of the heteroaryl ring \( R_1 H \), under ring coupling conditions, to effect coupling of the heteroaryl ring \( R_1 \) to the imidazole nucleus at position 5; (ii) when \( T_4 \) is hydrogen, a suitable derivative of the aryl ring \( R_4 H \), under ring coupling conditions, to effect coupling of the aryl ring \( R_4 \) to the imidazole nucleus at position 4.

Such aryl/heteroaryl coupling reactions are well known to those skilled in the art. In general, an organometallic synthetic equivalent of an anion of one component is coupled with a reactive derivative of the second component, in the presence of a suitable catalyst. The anion equivalent may be formed from either the imidazole of Formula (IX), in which case the aryl/heteroaryl compound provides the reactive derivative, or the aryl/heteroaryl compound in which case the imidazole provides the reactive derivative. Accordingly, suitable derivatives of the compound of Formula (IX) or the aryl/heteroaryl rings include organometallic derivatives such as organomagnesium, organozinc, organostannane and boronic acid derivatives and suitable reactive derivatives include the bromo, iodo, fluoroxybenzene and trifluoromethanesulphonate derivatives. Suitable procedures are described in WO 91/19497, the disclosure of which is incorporated by reference herein.

Suitable organomagnesium and organozinc derivatives of a compound of Formula (IX) may be reacted with a halogen, fluoroxybenzene or triflate derivative of the heteroaryl or aryl ring, in the presence of a ring coupling catalyst, such as a palladium (O) or palladium (II) catalyst, following the procedure of Kumada et al., Tetrahedron Letters, 22, 5319 (1981). Suitable such catalysts include tetraakis-(triphenylphosphine)palladium and \( \text{PdCl}_2[1,4\text{-bis-(diphenylphosphino)-butane}] \), optionally in the presence of lithium chloride and a base, such as triethylamine. In addition, a nickel (II) catalyst, such as \( \text{Ni(II)Cl}_2(1,2\text{-biphenylphosphino})\text{ethane} \), may also be used for coupling an aryl ring, following the procedure of Pridgen et al., J. Org. Chem, 1982, 47, 4319. Suitable reaction solvents include hexamethylphosphor-amide. When the heteroaryl ring is 4-pyridyl, suitable derivatives include 4-bromo- and 4-ido-pyridine and the fluoroxybenzene and triflate esters of 4-hydroxy pyridine. Similarly, suitable derivatives for when the aryl ring is phenyl include the bromo, fluoroxybenzene, triflate and, preferably, the iodo-derivatives. Suitable organomagnesium and organozinc derivatives may be obtained by treating a compound of
Formula (IX) or the bromo derivative thereof with an alkyllithium compound to yield the corresponding lithium reagent by deprotonation or transmetallation, respectively. This lithium intermediate may then be treated with an excess of a magnesium halide or zinc halide to yield the corresponding organometallic reagent.

A trialkyltin derivative of the compound of Formula (IX) may be treated with a bromide, fluorosulfonate, triflate, or, preferably, iodide derivative of an aryl or heteroaryl ring compound, in an inert solvent such as tetrahydrofuran, preferably containing 10% hexamethylphosphoramide, in the presence of a suitable coupling catalyst, such as a palladium (0) catalyst, for instance \textit{tetrakis}(triphenylphosphine)-palladium, by the method described in by Stille, J. Amer. Chem. Soc, 1987, \textbf{109}, 5478, US Patents 4,719,218 and 5,002,942, or by using a palladium (II) catalyst in the presence of lithium chloride optionally with an added base such as triethylamine, in an inert solvent such as dimethyl formamide. Trialkyltin derivatives may be conveniently obtained by metallation of the corresponding compound of Formula (IX) with a liithiating agent, such as s-butyl-lithium or n-butyllithium, in an ethereal solvent, such as tetrahydrofuran, or treatment of the bromo derivative of the corresponding compound of Formula (IX) with an alkyl lithium, followed, in each case, by treatment with a trialkyltin halide. Alternatively, the bromo-derivative of a compound of Formula (IX) may be treated with a suitable heteroaryl or aryl trialkyl tin compound in the presence of a catalyst such as \textit{tetrakis}(triphenyl-phosphine)-palladium, under conditions similar to those described above.

Boronic acid derivatives are also useful. Hence, a suitable derivative of a compound of Formula (IX), such as the bromo, iodo, triflate or fluorosulphonate derivative, may be reacted with a heteroaryl- or aryl-boronic acid, in the presence of a palladium catalyst such as \textit{tetrakis}(triphenylphosphine)-palladium or PdCl\textsubscript{2}[1,4-bis-(diphenyl-phosphino)-butane] in the presence of a base such as sodium bicarbonate, under reflux conditions, in a solvent such as dimethoxyethane (see Fischer and Haviniga, Rec. Trav. Chim. Pays Bas, \textbf{84}, 439, 1965, Snieckus, V., Tetrahedron Lett., \textbf{29}, 2135, 1988 and Terashimia, M., Chem. Pharm. Bull., \textbf{11}, 4755, 1985). Non-aqueous conditions, for instance, a solvent such as DMF, at a temperature of about 100°C, in the presence of a Pd(II) catalyst may also be employed (see Thompson W J \textit{et al}, J Org Chem, \textbf{49}, 5237, 1984). Suitable boronic acid derivatives may be prepared by treating the magnesium or lithium derivative with a trialkylborate ester, such as triethyl, tri-\textit{iso}-propyl or tributylborate, according to standard procedures.

In such coupling reactions, it will be readily appreciated that due regard must be exercised with respect to functional groups present in the compounds of Formula (IX).

Thus, in general, amino and sulfur substituents should be non-oxidised or protected.
Compounds of Formula (IX) are imidazoles and may be obtained by any of the procedures herein before described for preparing compounds of Formula (I). In particular, an \( \alpha \)-halo-ketone or other suitably activated ketones \( R_4 COCH_2 Hal \) (for compounds of Formula (IX) in which \( T_1 \) is hydrogen) or \( R_1 COCH_2 Hal \) (for compounds of Formula (IX) in which \( T_4 \) is hydrogen) may be reacted with an amidine of the formula \( R_2 NH-C=NH \), wherein \( R_2 \) is as defined in Formula (I), or a salt thereof, in an inert solvent such as a halogenated hydrocarbon solvent, for instance chloroform, at a moderately elevated temperature, and, if necessary, in the presence of a suitable condensation agent such as a base. The preparation of suitable \( \alpha \)-halo-ketones is described in WO 91/19497. Suitable reactive esters include esters of strong organic acids such as a lower alkane sulphonic or aryl sulphonic acid, for instance, methane or \( p \)-toluene sulphonlic acid. The amidine is preferably used as the salt, suitably the hydrochloride salt, which may then be converted into the free amidine \textit{in situ}, by employing a two phase system in which the reactive ester is in an inert organic solvent such as chloroform, and the salt is in an aqueous phase to which a solution of an aqueous base is slowly added, in dimolar amount, with vigorous stirring. Suitable amidines may be obtained by standard methods, see for instance, Garigipati R., Tetrahedron Letters, 190, 31, 1989.

Compounds of Formula (I) may also be prepared by a process which comprises reacting a compound of Formula (IX), wherein \( T_1 \) is hydrogen, with an N-acyl heteroaryl salt, according to the method disclosed in US patent 4,803,279; US patent 4,719,218 and US patent 5,002,942, to give an intermediate in which the heteroaryl ring is attached to the imidazole nucleus and is present as a 1,4-dihydro derivative thereof, which intermediate may then be subjected to oxidative-deacetylation conditions (Scheme II). The heteroaryl salt, for instance a pyridinium salt, may be either preformed or, more preferably, prepared \textit{in situ} by adding a substituted carbonyl halide (such as an acyl halide, an aroyl halide, an arylalkyl halofomate ester, or, preferably, an alkyl halofomate ester, such as acetyl bromide, benzoylchloride, benzyl chlorofomate, or, preferably, ethyl chlorofomate) to a solution of the compound of Formula (IX) in the heteroaryl compound \( R_1 H \) or in an inert solvent such as methylene chloride to which the heteroaryl compound has been added. Suitable deacetyling and oxidising conditions are described in U.S. Patent Nos. 4,803,279, 4,719,218 and 5,002,942, which references are hereby incorporated by reference in their entirety. Suitable oxidizing systems include sulfur in an inert solvent or solvent mixture, such as decalin, decalin and diglyme, \( p \)-cymene, xylene or mesitylene, under reflux conditions, or, preferably, potassium \( t \)-butoxide in \( t \)-butanol with dry air or oxygen.
In a further process, illustrated in Scheme III below, compounds of Formula (I) may be prepared by treating a compound of Formula (X) thermally or with the aid of a cyclising agent such as phosphorus oxychloride or phosphorus pentachloride (see Engel and Steglich, Liebigs Ann Chem, 1978, 1916 and Strzyбйny et al., J Org Chem, 1963, 28, 3381). Compounds of Formula (X) may be obtained, for instance, by acylating the corresponding α-keto-amine with an activated formate derivative such as the corresponding anhydride, under standard acylating conditions followed by formation of the imine with R₂NH₂. The aminoketone may be derived from the parent ketone by oxamination and reduction and the requisite ketone may in turn be prepared by decarboxylation of the beta-ketoester obtained from the condensation of an aryl (heteroaryl) acetic ester with the R₁COX component.

In Scheme IV illustrated below, two (2) different routes which use ketone (formula XI) for preparing a compound of Formula (I). A heterocyclic ketone (XI) is prepared by adding the anion of the alkyl heterocycle such as 4-methyl-quinoline (prepared by treatment thereof with an alkyl lithium, such as n-butyl lithium) to an N-alkyl-O-alkoxybenzamidine, ester, or any other suitably activated derivative of the same oxidation state. Alternatively, the anion may be condensed with a benzaldehyde, to give an alcohol which is then oxidised to the ketone (XI).
In a further process, N-substituted compounds of Formula (I) may be prepared by treating the anion of an amide of Formula (XII):

$$R_1CH_2NR_2COH$$

(XII)

wherein R₁ and R₂ with:

(a) a nitrile of the Formula (XIII):

$$R_4CN$$

(XIII)

wherein R₄ is as hereinbefore defined, or

(b) an excess of an acyl halide, for instance an acyl chloride, of the Formula (XIV):

$$R_4COHal$$

(XIV)

wherein R₄ is as hereinbefore defined and Hal is halogen, or a corresponding anhydride, to give a bis-acylated intermediate which is then treated with a source of ammonia, such as ammonium acetate.

One variation of this approach is illustrated in Scheme V above. A primary amine (R₂NH₂) is treated with a halomethyl heterocycle of Formula R₁CH₂X to give the secondary amine which is then converted to the amide by standard techniques. Alternatively the amide may be prepared as illustrated in scheme V by alkylation of the formamide with R₁CH₂X. Deprotonation of this amide with a strong amide base, such as lithium di-iso-propyl amide or sodium bis-(trimethylsilyl)amide, followed by addition of an
excess of an aroyl chloride yields the bis-acylated compound which is then closed to an imidazole compound of Formula (I), by heating in acetic acid containing ammonium acetate. Alternatively, the anion of the amide may be reacted with a substituted aryl nitrile to produce the imidazole of Formula (I) directly.

The following description and schemes are further exemplification of the process as previously described above in Scheme I. Various pyrimidine aldehyde derivatives 6, 7 and 8 as depicted in Scheme VI below, can be prepared by modification of the procedures of Bredereck et al. (Chem. Ber. 1964, 97, 3407) whose disclosure is incorporated by reference herein. These pyrimidine aldehydes are then utilized as intermediates in the synthesis as further described herein. The unprotected amino aldehyde derivative, e.g. 8, can be somewhat unstable. Use of an acetolysis procedure, as described in Scheme VI, wherein the aldehyde 7 is isolated as the acetamide derivative, (compound 3 is converted to 7, via the intermediate 4) and leads to a more stable compound for use in the cycloaddition reaction to make compounds of Formula (I).

General acetolysis conditions, for such a reaction are employed and are well known to those of skill in the art. Suitable conditions are exemplified, for instance in Example 83. In greater detail, the reaction employs heating the 2-amino pyrimidine dialkoxy acetal with acetic anhydride in the presence of a catalytic amount of concentrated sulfuric acid, which simultaneously acetylates the amine and leads to the exchange of one of the alkoxy groups for an acetoxy group. The resultant compound is converted to the aldehyde by deacetylation with a catalytic amount of an alkoxide salt and the corresponding alcohol solvent, e.g. Na+ methoxide and methanol. Alternatively, higher yields can be obtained by first acetylating the amine with acetic anhydride and then affecting exchange by subsequent addition of concentrated sulfuric acid.
SCHEME VI

The reaction of imines with tosylmethyl isonitriles was first reported by van Leusen (van Leusen, et al., J. Org. Chem. 1977, 42, 1153.) Reported were the following conditions: tert butyl amine(tBuNH₂) in dimethoxymethane (DME), K₂CO₃ in MeOH, and NaH in DME. Upon re-examination of these conditions each was found produce low yields. A second pathway involving amine exchange to produce the t-buty1 imine followed by reaction with the isocyanide to produce a 1-tBu imidazole was also operating. This will likely occur using any primary amine as a base. The secondary amines, while not preferred may be used, but may also decompose the isonitrile slowly. Reactions will likely require about 3 equivalents of amine to go to completion, resulting in approximately 50% isolated yields. Hindered secondary amines (diisopropylamine) while usable are very slow and generally not too effective. Use of tertiary and aromatic amines, such as pyridine, and triethylamine gave no reaction under certain test conditions, but more basic types such as
DBU, and 4-dimethylamino pyridine (DMAP) while slow, did produce some yields and hence may be suitable for use herein.

As depicted in Schemes VII and VIII below, the pyrimidine aldehydes of Scheme VI, can be condensed with a primary amine, to generate an imine, which may suitably be isolated or reacted in situ, with the desired isonitrile in the presence of a variety of suitable bases, and solvents as described herein to afford the 5-(4-pyrimidinyl)-imidazoles, wherein R₂ and R₄ are as defined herein for Formula (I) compounds.

One preferred method for preparing compounds of Formula (I) is shown below in Scheme VII. The imines, prepared and isolated in a separate step where often tars, which were hard to handle. The black color was also often carried over into the final product. The yields, for making the imines varied, and environmentally less-acceptable solvents, such as CH₂Cl₂ were often used in their preparation.

This reaction, wherein p=2 requires a suitable base for the reaction to proceed. The reaction requires a base strong enough to deprotonate the isonitrile. Suitable bases include an amine, a carbonate, a hydride, or an alkyl or aryl lithium reagent; or mixtures thereof. Bases include, but are not limited to, potassium carbonate, sodium carbonate, primary and secondary amines, such as t-butylamine, diisopropyl amine, morpholine, piperidine, pyrrolidine, and other non-nucleophilic bases, such as DBU, DMAP and 1,4-diazabicyclo[2.2.2]octane (DABCO).

Suitable solvents for use herein, include but are not limited to N,N-dimethylformamide (DMF), MeCN, halogenated solvents, such as methylene chloride or chloroform, tetrahydrofuran (THF), dimethylsulfoxide (DMSO), alcohols, such as methanol or ethanol, benzene, toluene, DME or EtOAc. Preferably the solvent is DMF, DME, THF, or MeCN, more preferably DMF. Product isolation may generally be accomplished by adding water and filtering the product as a clean compound. The mixture is non-nucleophilic, thus no isonitrile decomposition occurs.

\[
\begin{align*}

X = O/S
\end{align*}
\]

**SCHEME VII**
While not convenient for large scale work, addition of NaH, instead of t-butylamine, to the isonitrile, perhaps with temperatures lower than 25 °C (in THF) are likely needed. Additionally, BuLi has also been reported to be an effective base for deprotonating tosyl benzylisonitriles at -50 °C. (DiSanto, et al., Synth. Commun. 1995, 25, 795).

Various temperature conditions may be utilized depending upon the preferred base. For instance, tBuNH<sub>2</sub>/DME, K<sub>2</sub>CO<sub>3</sub>/MeOH, K<sub>2</sub>CO<sub>3</sub> in DMF, at temperatures above 40°C, the yields may drop to about 20% but little difference is expected between 0°C and 25°C. Consequently, temperature ranges below 0 °C, and above 80 °C are contemplated as also being within the scope of this invention. Preferably, the temperature ranges are from about 0°C to about 25°C. For purposes herein, room temperature, which is depicted as 25°C, but it is recognized that this may vary from 20°C to 30°C.

As shown in Scheme VIII below, the imine is preferably formed in situ in a solvent. This preferred synthesis, is a process which occurs as a one-pot synthesis. Suitably, when the primary amine is utilized as a salt, such as in the dihydrochloride salt in the Examples, the reaction may further include a base, such as potassium carbonate prior to the addition of the isonitrile. Alternatively, the piperidine nitrogen may be required to be protected as shown below. Reaction conditions, such as solvents, bases, temperatures, etc. are similar to those illustrated and discussed above for the isolated imine as shown in Scheme VIII. One skilled in the art would readily recognize that under some circumstances, the in situ formation of the imine may require dehydrating conditions, or may require acid catalysis.

\[ \text{Scheme VIII} \]
Another method for preparing compounds of Formula (I) is shown below in Scheme VIIIa. To avoid the difficulty associated with isolating the pyrimidine aldehyde 8, it is possible to hydrolyze the acetal 3 to aldehyde 8 as described herein. The aldehyde 8, formed in situ, can be treated sequentially with a primary amine, ethyl acetate, and NaHCO\textsubscript{3} to form the corresponding imine in situ, which is extracted into the ethyl acetate. Addition of the isonitrile, a carbonate base and DMF allows for the formation of the 5-(4-pyrimidinyl)-imidazoles, wherein R\textsubscript{2} and R\textsubscript{4} are as defined herein for Formula (I) compounds.

While it is recognized that Schemes VII, VIII, and VIII(a) are shown using a piperidine ring in the R\textsubscript{2} position this is for illustration purposes only and any suitable R\textsubscript{2} as defined herein may be utilized.

**SCHEME VIIIa**

The preferred method of synthesis for compounds of Formula (I) also provides for a suitable and reliable method for introduction of an S(O)\textsubscript{malkyl} moiety on the pyrimidine.
(R₁ group) by using, for instance, the 2-methylthio pyrimidine aldehyde derivative, as is also described in the Examples section.

In scheme IX below (X=S Methyl), compound 1, while a final product may also be used as a precursor, as previously noted to make further compounds of formula (I). In this particular instance the methylthio moiety is oxidized to the methyl sulfinyl moiety which may additionally be further modified to a substituted amino group.

![Scheme IX](image)

**SCHEME IX**

Another embodiment of the present invention is the novel hydrolysis of 2-thiomethylpyrimidine acetal to 2-thiomethylpyrimidine aldehyde, as shown in Scheme X below. Hydrolysis of the acetal to aldehyde using various known reaction conditions, such as formic acid, did not produce a satisfactory yield of the aldehyde, <13% was obtained. The preferred synthesis involves the use of AcOH (fresh) as solvent and concentrated H₂SO₄ under heating conditions, preferably a catalytic amount of sulfuric acid. Heating conditions include temperatures from about 60 to 85°C, preferably from about 70°C to about 80°C as higher temperatures show a darkening of the reaction mixture. After the reaction is completed the mixture is cooled to about room temperature and the acetic acid is removed. An alternative procedure to this involves heating the acetal in 3N HCl at 40°C for about 18 hours, cooling and extracting the bicarbonate neutralized solution into EtOAc.
The final 2-aminopyrimidin-4-yl imidazole compounds of Formula (I), as well as similar pyridine containing compounds can be prepared by one of three methods: 1) direct reaction of the 2-aminopyrimidine imine with the isonitrile; 2) condensation of the 2-acetamidopyrimidine imine with the isonitrile followed by removal of the acetamido group and 3) oxidation of the 2-methylthiopyrimidine derivative to the corresponding sulfoxide followed by displacement with the desired amine.

While these schemes herein are presented, for instance, with an optionally substituted piperidine moiety for the resultant R2 position, or a 4-fluoro phenyl for R4, any suitable R2 moiety or R4 moiety may be added in this manner if it can be prepared on the primary amine. Similarly, any suitable R4 can be added via the isonitrile route.

The compounds of Formula (II), in Scheme I, may be prepared by the methods of Van Leusen et al., supra. For example a compound of the Formula (II) may be prepared by dehydrating a compound of the Formula (IV)-Scheme I, wherein Ar, R4 and p are as defined herein.

Suitable dehydrating agents include phosphorus oxychloride, oxalyl chloride, thionyl chloride, phosgene, or tosyl chloride in the presence of a suitable base such as triethylamine or diisopropylethylamine, or similar bases, etc. such as pyridine. Suitable solvents are dimethoxy ether, tetrahydrofuran, or halogenated solvents, preferably THF. The reaction is most efficient when the reaction temperatures are kept between -10°C and 0°C. At lower temperatures incomplete reaction occurs and at higher temperatures, the solution turns dark and the product yield drops.

The compounds of formula (IV)-Scheme I may be prepared by reacting a compound of the formula (V)-Scheme I, R4CHO where R4 is as defined herein, with ArS(O)pH and formamide with or without water removal, preferably under dehydrating conditions, at ambient or elevated temperature e.g. 30° to 150°, conveniently at reflux, optionally in the presence of an acid catalyst. Alternatively trimethylsilylchloride can be used in place of the
acid catalyst. Examples of acid catalysts include camphor-10-sulphonic acid, formic acid, p-toluenesulphonic acid, hydrogen chloride or sulphuric acid.

An optimal method of making an isonitrile of Formula (II) is illustrated below, in Scheme XI.

![Scheme XI](image)

The conversion of the substituted aldehyde to the tosylbenzyl formamide may be accomplished by heating the aldehyde, 1-Scheme XI, with an acid, such as p-toluene-sulphonic acid, formic acid or camphorsulphonic acid; with formamide and p-toluene-sulfinic acid [under reaction conditions of about 60°C for about 24 hours]. Preferably, no solvent is used. The reaction, may give poor yields (< 30%) when solvents, such as DMF, DMSO, toluene, acetonitrile, or excess formamide are used. Temperatures less than 60°C are generally poor at producing the desired product, and temperatures in excess of 60°C may produce a product which decomposes, or obtain a benzylic bis-formamide, 2-Scheme XI.

In Example 23 (a), described in WO 95/02591, Adams et al., synthesizes 4-Fluorophenyltosylmethyformamide, a compound of Formula (IV) -Scheme I, wherein p = 2. This procedure differs from that presently described herein by the following conditions, using the sodium salt of toluene sulfinic acid, neat which process results in uneven heating, lower yields and lower reproducability then the present invention, as described herein which uses sulfinic acid and allows for use of non-aqueous conditions.

Conditions for making α-(p-Toluenesulfonfyl)-4-fluorobenzyllisonitrile as described in Example 23 (b), of WO 95/02591, Adams et al., used as a solvent MeCl to extract the product and DME as solvent. The present invention improves upon this process by utilizing less expensive solvents, such as THF and EtOAc to extract. Further higher yields are
obtained by recrystallizing with an alcohol, such as 1-propanol, although other alcohols, such as methanol, ethanol and butanols are acceptable. Previously, the compound was partially purified using chromatography techniques, and hazardous solvents for additional purifications.

Another embodiment of the present invention is the synthesis of the tosyl benzyl formamide compound, achieved by reacting the bisformamide intermediate, 2-Scheme XI, with p-toluenesulfonic acid. In this preferred route, preparation of the bis-formamide from the aldehyde is accomplished by heating the aldehyde with formamide, in a suitable solvent with acid catalysis. Suitable solvents are toluene, acetonitrile, DMF, and DMSO or mixtures thereof. Acid catalysts, are those well known in the art, and include but are not limited to hydrogen chloride, p-toluenesulfonic acid, camphorsulfonic acid, and other anhydrous acids. The reaction can be conducted at temperatures ranging from about 25°C to 110°C, preferably about 50°C, suitably for about 4 to about 5 hours, longer reaction times are also acceptable. Product decomposition and lower yields may be observed at higher temperatures (>70°C) at prolonged reactions times. Complete conversion of the product generally requires water removal from the reaction mixture.

Preferred conditions for converting a bis-formamide derivative to the tosyl benzyl formamide are accomplished by heating the bisformamide in a suitable solvent with an acid catalyst and p-toluenesulfonic acid. Solvents for use in this reaction include but are not limited to toluene, and acetonitrile or mixtures thereof. Additional mixtures of these solvents with DMF, or DMSO may also be used but may result in lower yields. Temperatures may range from about 30°C to about 100°C. Temperatures lower than 40°C and higher than 60°C are not preferred as the yield and rate decreases. Preferably the range is from about 40 to 60°C, most preferably about 50°C. The optimal time is about 4 to 5 hours, although it may be longer. Preferably, acids used include but are not limited to, toluenesulfonic acid, camphorsulfonic acid, and hydrogen chloride and other anhydrous acids. Most preferably the bisformamide is heated in toluene:acetonitrile in a 1:1 ratio, with p-toluenesulfonic acid and hydrogen chloride.

Another embodiment of the present invention is the preferred synthetic route for synthesis of the tosylbenzyl formamide compound which is accomplished using a one-pot procedure. This process first converts the aldehyde to the bis-formamide derivative and subsequently reacts the bis-formamide derivative with toluenesulfonic acid. This procedure combines the optimized conditions into a single, efficient process. High yields, >90% of the aryl benzylformamide may be obtained in such a manner.
Preferred reaction conditions employ a catalyst, such as trimethylsilyl chloride (TMSCl), in a preferred solvent, toluene:acetonitrile, preferably in a 1:1 ratio. A reagent, such as TMSCl, is preferred which reacts with water produced therein and at the same time produces hydrogen chloride to catalyze the reaction. Also preferred is use of hydrogen chloride and p-toluenesulfonic acid. Therefore, three suitable reaction conditions for use herein include 1) use of a dehydrating agent which also provides hydrogen chloride, such as TMSCl; or by 2) use of a suitable dehydrating agent and a suitable source of acid source, such as but not limited to, camphorsulfonic acid, hydrogen chloride or toluenesulfonic acid; and 3) alternative dehydrating conditions, such as the azeotropic removal of water, and using an acid catalyst and p-toluene sulfonic acid.

Compounds of the formula (II) where p is 2 may also be prepared by reacting in the presence of a strong base a compound of the formula (VI) - Scheme I, \( R_4\text{CH}_2\text{NC} \) with a compound of the formula (VII)-Scheme I, \( \text{ArSO}_2\text{L}_1 \) wherein \( R_4 \) and \( \text{Ar} \) are as defined herein and \( \text{L}_1 \) is a leaving group such as halo, e.g. fluoro. Suitable strong bases include, but are not limited to, alkylolithiums such as butyl lithium or lithium diisopropylamide (van Leusen et al., Tetrahedron Letters, No. 23, 2367-68 (1972)).

The compounds of formula (VI)-Scheme I may be prepared by reacting a compound of the formula (VIII)-Scheme I, \( R_4\text{CH}_2\text{NH}_2 \) with an alkyl formate (e.g. ethylformate) to yield an intermediate amide which can be converted to the desired isonitrile by reacting with well known dehydrating agent, such as but not limited to oxalyl chloride, phosphorus oxychloride or tosyl chloride in the presence of a suitable base such as triethylamine.

Alternatively a compound of the formula (VIII) - Scheme I may be converted to a compound of the formula (VI)- Scheme I by reaction with chloroform and sodium hydroxide in aqueous dichloromethane under phase transfer catalysis.

The compounds of the formula (III) - Scheme I may be prepared by reacting a compound of the formula \( \text{R}_1\text{CHO} \) with a primary amine \( \text{R}_2\text{NH}_2 \).

The amino compounds of the formula (VIII) - Scheme I are known or can be prepared from the corresponding alcohols, oximes or amides using standard functional group interconversions.
SCHEME XII

Cycloalkanones such as 1-Scheme XII (available from Aldrich Chemical Co., Milwaukee, Wi) may be converted to cycloalkylamines such as 2-Scheme XII by conventional procedures for reductive amination such as oxime formation with hydroxylamine in H₂O followed by reduction of the oxime to the amine by standard conditions such as catalytic hydrogenation with Raney Ni in an H₂ atmosphere. The resulting cycloalkylamines such as 2-Scheme XII may be reacted with aryl aldehydes such as 2-aminopyrimidinyl-4-carboxaldehyde in non-hydroxylic organic solvents to form imines such as 3-Scheme XII. Depending on the degree of activation of the aldehydes towards imine formation, catalytic acid (such as toluenesulfonic acid) and dehydrating conditions (such as azeotropic removal of water in refluxing benzene) may or may not be needed.
Imines such as 3-Scheme XII may be converted to 1,4 diaryl imidazoles alkylated with cycloalkyl groups by reaction with isonitriles such as 4-fluorophenyl-tolylthiomethylisocyanide in the presence of a base such as 1,5,7-triazabicyclo[4.4.0]-dec-5-ene (TBD) in organic solvents such as CH₂Cl₂. In this way 3-Scheme XII was converted to 5-Scheme XII. Cycloalkyl ketal substituted imidazoles such as 5-Scheme XII are hydrolyzed with aqueous acids (such as aqueous HCl) followed by neutralization with base (such as aqueous Na₂CO₃) to afford ketones such as 6-Scheme VI. 6-Scheme XII is converted to the oxime 7-Scheme XII with hydroxylamine in H₂O. 7-Scheme XII is converted to the hydroxylamine 8-Scheme XII by reduction with sodium cyano borohydride in methanol. 8-Scheme X is converted to the hydroxyureas 9-Scheme XII by the procedure of Adams et al (WO 91/14674 published 3 October 1991).

\[ \text{SCHEME XIII} \]

In the above noted Scheme, the alcohol 10-Scheme XIII may be prepared by reducing the ketone of 6-Scheme 13 with a suitable reducing agent, such as NaBH₄.
Scheme XIV

This compound, alcohol 10-Scheme XIII, and related alcohols can also be prepared in their own right as shown in Scheme XIV above, and in Scheme XV, below.
In formula XI below, R₁ may be an optionally substituted alkyl, aryl or a heteroaryl group and R₂ is either an OH, NH₂ or SH, or R₁ and R₂ together can form a C₃-7 cycloalkyl ring, such as, for example a pyrrolidine or piperidine ring. Some representative examples of such compounds are illustrated in scheme XVI below.

\[
\text{Scheme XVI}
\]

The ketone 1 can be reacted with any organometallic reagent (R₁M) to afford the corresponding alcohol 2 (wherein R₁ can be hydrogen or any optionally substituted alkyl aryl, arylalkyl, heterocyclic, heterocyclic alkyl, etc. moiety). The alcohol 2 can be converted to the neopentyl amine 3, by using the classical Ritter reaction well known by those of skill in the art. The amine 3 can be acylated or sulfonlated. The ketone 1 can be transformed into an spirooxirane 4 by reagents such as dimethylsulfonium methyldide and dimethyl sulfoxonium methyldide. The oxirane 4 can be ring opened with a plethora of nucleophiles such as hydroxides, thiolates, amines, organometallic reagents (such as the well known organo-cuprate or organo-aluminum reagents, etc.).
SCHEME XVII

The ketone 1-Scheme XVII may also be subjected to reductive amination by any primary or secondary amines to afford amines 6-Scheme XVIII.

R₁ and R₂ can be any alkyl or aryl group, R₁ and R₂ can also be a part of a ring

X = O/S

SCHEME XVIII
Suitable protecting groups for use with hydroxyl groups and the imidazole nitrogen are well known in the art and described in many references, for instance, Protecting Groups in Organic Synthesis, Greene T W, Wiley-Interscience, New York, 1981. Suitable examples of hydroxyl protecting groups include silyl ethers, such as t-butyldimethyl or t-butyldiphenyl, and alkyl ethers, such as methyl connected by an alkyl chain of variable link, (CR10R20)n. Suitable examples of imidazole nitrogen protecting groups include tetrahydropyranyl.

Pharmaceutically acid addition salts of compounds of Formula (I) may be obtained in known manner, for example by treatment thereof with an appropriate amount of acid in the presence of a suitable solvent.

METHODS OF TREATMENT
The compounds of Formula (I) or a pharmaceutically acceptable salt thereof can be used in the manufacture of a medicament for the prophylactic or therapeutic treatment of any disease state in a human, or other mammal, which is exacerbated or caused by excessive or unregulated cytokine production by such mammal's cell, such as but not limited to monocytes and/or macrophages.

Compounds of Formula (I) are capable of inhibiting proinflammatory cytokines, such as IL-1, IL-6, IL-8 and TNF and are therefore of use in therapy. IL-1, IL-6, IL-8 and TNF affect a wide variety of cells and tissues and these cytokines, as well as other leukocyte-derived cytokines, are important and critical inflammatory mediators of a wide variety of disease states and conditions. The inhibition of these pro-inflammatory cytokines is of benefit in controlling, reducing and alleviating many of these disease states.

Compounds of Formula (I) are capable of inhibiting inducible proinflammatory proteins, such as COX-2, also referred to by many other names such as prostaglandin endoperoxide synthase-2 (PGHS-2) and are therefore of use in therapy. These proinflammatory lipid mediators of the cyclooxygenase (CO) pathway are produced by the inducible COX-2 enzyme. Regulation, therefore of COX-2 which is responsible for the these products derived from arachidonic acid, such as prostaglandins affect a wide variety of cells and tissues are important and critical inflammatory mediators of a wide variety of disease states and conditions. Expression of COX-1 is not effected by compounds of Formula (I). This selective inhibition of COX-2 may alleviate or spare ulcerogenic liability associated with inhibition of COX-1 thereby inhibiting prostaglandins essential for cytoprotective effects. Thus inhibition of these pro-inflammatory mediators is of benefit in controlling, reducing and alleviating many of these disease states. Most notably these inflammatory mediators, in particular prostaglandins, have been implicated in pain, such as
in the sensitization of pain receptors, or edema. This aspect of pain management therefore includes treatment of neuromuscular pain, headache, cancer pain, and arthritis pain. Compounds of Formula (I) or a pharmaceutically acceptable salt thereof, are of use in the prophylaxis or therapy in a human, or other mammal, by inhibition of the synthesis of the COX-2 enzyme.

Accordingly, the present invention provides a method of inhibiting the synthesis of COX-2 which comprises administering an effective amount of a compound of Formula (I) or a pharmaceutically acceptable salt thereof. The present invention also provides for a method of prophylaxis treatment in a human, or other mammal, by inhibition of the synthesis of the COX-2 enzyme.

Accordingly, the present invention provides a method of treating a cytokine-mediated disease which comprises administering an effective cytokine-interfering amount of a compound of Formula (I) or a pharmaceutically acceptable salt thereof.

In particular, compounds of Formula (I) or a pharmaceutically acceptable salt thereof are of use in the prophylaxis or therapy of any disease state in a human, or other mammal, which is exacerbated by or caused by excessive or unregulated IL-1, IL-8 or TNF production by such mammal's cell, such as, but not limited to, monocytes and/or macrophages.

Accordingly, in another aspect, this invention relates to a method of inhibiting the production of IL-1 in a mammal in need thereof which comprises administering to said mammal an effective amount of a compound of Formula (I) or a pharmaceutically acceptable salt thereof.

There are many disease states in which excessive or unregulated IL-1 production is implicated in exacerbating and/or causing the disease. These include rheumatoid arthritis, osteoarthritis, stroke, endotoxemia and/or toxic shock syndrome, other acute or chronic inflammatory disease states such as the inflammatory reaction induced by endotoxin or inflammatory bowel disease, tuberculosis, atherosclerosis, muscle degeneration, multiple sclerosis, cachexia, bone resorption, psoriatic arthritis, Reiter's syndrome, rheumatoid arthritis, gout, traumatic arthritis, rubella arthritis and acute synovitis. Recent evidence also links IL-1 activity to diabetes, pancreatic β cells and Alzheimer's disease.

In a further aspect, this invention relates to a method of inhibiting the production of TNF in a mammal in need thereof which comprises administering to said mammal an effective amount of a compound of Formula (I) or a pharmaceutically acceptable salt thereof.

Excessive or unregulated TNF production has been implicated in mediating or exacerbating a number of diseases including rheumatoid arthritis, rheumatoid spondylitis,
osteoarthritis, gouty arthritis and other arthritic conditions, sepsis, septic shock, endotoxic shock, gram negative sepsis, toxic shock syndrome, adult respiratory distress syndrome, stroke, cerebral malaria, chronic pulmonary inflammatory disease, silicosis, pulmonary sarcoidosis, bone resorption diseases, such as osteoporosis, reperfusion injury, graft vs. host reaction, allograft rejections, fever and myalgias due to infection, such as influenza, cachexia secondary to infection or malignancy, cachexia secondary to acquired immune deficiency syndrome (AIDS), AIDS, ARC (AIDS related complex), keloid formation, scar tissue formation, Crohn's disease, ulcerative colitis and pyresis.

Compounds of Formula (I) are also useful in the treatment of viral infections, where such viruses are sensitive to upregulation by TNF or will elicit TNF production in vivo. The viruses contemplated for treatment herein are those that produce TNF as a result of infection, or those which are sensitive to inhibition, such as by decreased replication, directly or indirectly, by the TNF inhibiting-compounds of Formula (I). Such viruses include, but are not limited to HIV-1, HIV-2 and HIV-3, Cytomegalovirus (CMV), Influenza, adenovirus and the Herpes group of viruses, such as but not limited to, Herpes Zoster and Herpes Simplex. Accordingly, in a further aspect, this invention relates to a method of treating a mammal afflicted with a human immunodeficiency virus (HIV) which comprises administering to such mammal an effective TNF inhibiting amount of a compound of Formula (I) or a pharmaceutically acceptable salt thereof.

Compounds of Formula (I) may also be used in association with the veterinary treatment of mammals, other than in humans, in need of inhibition of TNF production. TNF mediated diseases for treatment, therapeutically or prophylactically, in animals include disease states such as those noted above, but in particular viral infections. Examples of such viruses include, but are not limited to, lentivirus infections such as, equine infectious anaemia virus, caprine arthritis virus, visna virus, or maedi virus or retrovirus infections, such as but not limited to feline immunodeficiency virus (FIV), bovine immunodeficiency virus, or canine immunodeficiency virus or other retroviral infections.

The compounds of Formula (I) may also be used topically in the treatment or prophylaxis of topical disease states mediated by or exacerbated by excessive cytokine production, such as by IL-1 or TNF respectively, such as inflamed joints, eczema, psoriasis and other inflammatory skin conditions such as sunburn; inflammatory eye conditions including conjunctivitis; pyresis, pain and other conditions associated with inflammation.

Compounds of Formula (I) have also been shown to inhibit the production of IL-8 (Interleukin-8, NAP). Accordingly, in a further aspect, this invention relates to a method of inhibiting the production of IL-8 in a mammal in need thereof which comprises
administering to said mammal an effective amount of a compound of Formula (I) or a pharmaceutically acceptable salt thereof.

There are many disease states in which excessive or unregulated IL-8 production is implicated in exacerbating and/or causing the disease. These diseases are characterized by massive neutrophil infiltration such as, psoriasis, inflammatory bowel disease, asthma, cardiac and renal reperfusion injury, adult respiratory distress syndrome, thrombosis and glomerulonephritis. All of these diseases are associated with increased IL-8 production which is responsible for the chemotaxis of neutrophils into the inflammatory site. In contrast to other inflammatory cytokines (IL-1, TNF, and IL-6), IL-8 has the unique property of promoting neutrophil chemotaxis and activation. Therefore, the inhibition of IL-8 production would lead to a direct reduction in the neutrophil infiltration.

The compounds of Formula (I) are administered in an amount sufficient to inhibit cytokine, in particular IL-1, IL-6, IL-8 or TNF, production such that it is regulated down to normal levels, or in some case to subnormal levels, so as to ameliorate or prevent the disease state. Abnormal levels of IL-1, IL-6, IL-8 or TNF, for instance in the context of the present invention, constitute: (i) levels of free (not cell bound) IL-1, IL-6, IL-8 or TNF greater than or equal to 1 picogram per ml; (ii) any cell associated IL-1, IL-6, IL-8 or TNF; or (iii) the presence of IL-1, IL-6, IL-8 or TNF mRNA above basal levels in cells or tissues in which IL-1, IL-6, IL-8 or TNF, respectively, is produced.

The discovery that the compounds of Formula (I) are inhibitors of cytokines, specifically IL-1, IL-6, IL-8 and TNF is based upon the effects of the compounds of Formulas (I) on the production of the IL-1, IL-8 and TNF in in vitro assays which are described herein.

As used herein, the term "inhibiting the production of IL-1 (IL-6, IL-8 or TNF)"

refers to:

a) a decrease of excessive in vivo levels of the cytokine (IL-1, IL-6, IL-8 or TNF) in a human to normal or sub-normal levels by inhibition of the in vivo release of the cytokine by all cells, including but not limited to monocytes or macrophages;

b) a down regulation, at the genomic level, of excessive in vivo levels of the cytokine (IL-1, IL-6, IL-8 or TNF) in a human to normal or sub-normal levels;

c) a down regulation, by inhibition of the direct synthesis of the cytokine (IL-1, IL-6, IL-8 or TNF) as a posttranslational event; or

d) a down regulation, at the translational level, of excessive in vivo levels of the cytokine (IL-1, IL-6, IL-8 or TNF) in a human to normal or sub-normal levels.
As used herein, the term "TNF mediated disease or disease state" refers to any and all disease states in which TNF plays a role, either by production of TNF itself, or by TNF causing another monokine to be released, such as but not limited to IL-1, IL-6 or IL-8. A disease state in which, for instance, IL-1 is a major component, and whose production or action, is exacerbated or secreted in response to TNF, would therefore be considered a disease state mediated by TNF.

As used herein, the term "cytokine" refers to any secreted polypeptide that affects the functions of cells and is a molecule which modulates interactions between cells in the immune, inflammatory or hematopoietic response. A cytokine includes, but is not limited to, monokines and lymphokines, regardless of which cells produce them. For instance, a monokine is generally referred to as being produced and secreted by a mononuclear cell, such as a macrophage and/or monocyte. Many other cells however also produce monokines, such as natural killer cells, fibroblasts, basophils, neutrophils, endothelial cells, brain astrocytes, bone marrow stromal cells, epideral keratinocytes and B-lymphocytes. Lymphokines are generally referred to as being produced by lymphocyte cells. Examples of cytokines include, but are not limited to, Interleukin-1 (IL-1), Interleukin-6 (IL-6), Interleukin-8 (IL-8), Tumor Necrosis Factor-alpha (TNF-α) and Tumor Necrosis Factor beta (TNF-β).

As used herein, the term "cytokine interfering" or "cytokine suppressive amount" refers to an effective amount of a compound of Formula (I) which will cause a decrease in the in vivo levels of the cytokine to normal or sub-normal levels, when given to a patient for the prophylaxis or treatment of a disease state which is exacerbated by, or caused by, excessive or unregulated cytokine production.

As used herein, the cytokine referred to in the phrase "inhibition of a cytokine, for use in the treatment of a HIV-infected human" is a cytokine which is implicated in (a) the initiation and/or maintenance of T cell activation and/or activated T cell-mediated HIV gene expression and/or replication and/or (b) any cytokine-mediated disease associated problem such as cachexia or muscle degeneration.

As TNF-β (also known as lymphotoxin) has close structural homology with TNF-α (also known as cachectin) and since each induces similar biologic responses and binds to the same cellular receptor, both TNF-α and TNF-β are inhibited by the compounds of the present invention and thus are herein referred to collectively as "TNF" unless specifically delineated otherwise.

A new member of the MAP kinase family, alternatively termed CSBP, p38, or RK, has been identified independently by several laboratories recently. Activation of this novel
protein kinase via dual phosphorylation has been observed in different cell systems upon stimulation by a wide spectrum of stimuli, such as physicochemical stress and treatment with lipopolysaccharide or proinflammatory cytokines such as interleukin-1 and tumor necrosis factor. The cytokine biosynthesis inhibitors, of the present invention, compounds of Formula (I), have been determined to be potent and selective inhibitors of CSBP/p38/RK kinase activity. These inhibitors are of aid in determining the signalling pathways involvement in inflammatory responses. In particular, for the first time a definitive signal transduction pathway can be prescribed to the action of lipopolysaccharide in cytokine production in macrophages.

The cytokine inhibitors were subsequently tested in a number of animal models for anti-inflammatory activity. Model systems were chosen that were relatively insensitive to cyclooxygenase inhibitors in order to reveal the unique activities of cytokine suppressive agents. The inhibitors exhibited significant activity in many such in vivo studies. Most notable are its effectiveness in the collagen-induced arthritis model and inhibition of TNF production in the endotoxic shock model. In the latter study, the reduction in plasma level of TNF correlated with survival and protection from endotoxic shock related mortality. Also of great importance are the compounds effectiveness in inhibiting bone resorption in a rat fetal long bone organ culture system. Griswold et al., (1988) *Arthritis Rheum.* 31:1406-1412; Badger, et al., (1989) *Circ. Shock* 27, 51-61; Votta et al.. (1994)*in vitro. Bone* 15, 533-538; Lee et al., (1993). B *Ann. N. Y. Acad. Sci.* 696, 149-170.

In order to use a compound of Formula (I) or a pharmaceutically acceptable salt thereof in therapy, it will normally be Formulated into a pharmaceutical composition in accordance with standard pharmaceutical practice. This invention, therefore, also relates to a pharmaceutical composition comprising an effective, non-toxic amount of a compound of Formula (I) and a pharmaceutically acceptable carrier or diluent.

Compounds of Formula (I), pharmaceutically acceptable salts thereof and pharmaceutical compositions incorporating such may conveniently be administered by any of the routes conventionally used for drug administration, for instance, orally, topically, parenterally or by inhalation. The compounds of Formula (I) may be administered in conventional dosage forms prepared by combining a compound of Formula (I) with standard pharmaceutical carriers according to conventional procedures. The compounds of Formula (I) may also be administered in conventional dosages in combination with a known, second therapeutically active compound. These procedures may involve mixing, granulating and compressing or dissolving the ingredients as appropriate to the desired preparation. It will be appreciated that the form and character of the pharmaceutically acceptable character or diluent is dictated by the amount of active ingredient with which it is
to be combined, the route of administration and other well-known variables. The carrier(s) must be "acceptable" in the sense of being compatible with the other ingredients of the Formulation and not deleterious to the recipient thereof.

The pharmaceutical carrier employed may be, for example, either a solid or liquid.

Exemplary of solid carriers are lactose, terra alba, sucrose, talc, gelatin, agar, pectin, acacia, magnesium stearate, stearic acid and the like. Exemplary of liquid carriers are syrup, peanut oil, olive oil, water and the like. Similarly, the carrier or diluent may include time delay material well known to the art, such as glyceryl mono-stearate or glyceryl distearate alone or with a wax.

A wide variety of pharmaceutical forms can be employed. Thus, if a solid carrier is used, the preparation can be tableted, placed in a hard gelatin capsule in powder or pellet form or in the form of a troche or lozenge. The amount of solid carrier will vary widely but preferably will be from about 25mg. to about 1g. When a liquid carrier is used, the preparation will be in the form of a syrup, emulsion, soft gelatin capsule, sterile injectable liquid such as an ampule or nonaqueous liquid suspension.

Compounds of Formula (I) may be administered topically, that is by non-systemic administration. This includes the application of a compound of Formula (I) externally to the epidermis or the buccal cavity and the instillation of such a compound into the ear, eye and nose, such that the compound does not significantly enter the blood stream. In contrast, systemic administration refers to oral, intravenous, intraperitoneal and intramuscular administration.

Formulations suitable for topical administration include liquid or semi-liquid preparations suitable for penetration through the skin to the site of inflammation such as liniments, lotions, creams, ointments or pastes, and drops suitable for administration to the eye, ear or nose. The active ingredient may comprise, for topical administration, from 0.001% to 10% w/w, for instance from 1% to 2% by weight of the Formulation. It may however comprise as much as 10% w/w but preferably will comprise less than 5% w/w, more preferably from 0.1% to 1% w/w of the Formulation.

Lotions according to the present invention include those suitable for application to the skin or eye. An eye lotion may comprise a sterile aqueous solution optionally containing a bactericide and may be prepared by methods similar to those for the preparation of drops. Lotions or liniments for application to the skin may also include an agent to hasten drying and to cool the skin, such as an alcohol or acetone, and/or a moisturizer such as glycerol or an oil such as castor oil or arachis oil.

Creams, ointments or pastes according to the present invention are semi-solid Formulations of the active ingredient for external application. They may be made by
mixing the active ingredient in finely-divided or powdered form, alone or in solution or suspension in an aqueous or non-aqueous fluid, with the aid of suitable machinery, with a greasy or non-greasy base. The base may comprise hydrocarbons such as hard, soft or liquid paraffin, glycerol, beeswax, a metallic soap; a mucilage; an oil of natural origin such as almond, corn, arachis, castor or olive oil; wool fat or its derivatives or a fatty acid such as steric or oleic acid together with an alcohol such as propylene glycol or a macrogel. The Formulation may incorporate any suitable surface active agent such as an anionic, cationic or non-ionic surfactant such as a sorbitan ester or a polyoxyethylene derivative thereof. Suspending agents such as natural gums, cellulose derivatives or inorganic materials such as siliceous silicas, and other ingredients such as lanolin, may also be included.

Drops according to the present invention may comprise sterile aqueous or oily solutions or suspensions and may be prepared by dissolving the active ingredient in a suitable aqueous solution of a bactericidal and/or fungicidal agent and/or any other suitable preservative, and preferably including a surface active agent. The resulting solution may then be clarified by filtration, transferred to a suitable container which is then sealed and sterilized by autoclaving or maintaining at 98-100°C for half an hour. Alternatively, the solution may be sterilized by filtration and transferred to the container by an aseptic technique. Examples of bactericidal and fungicidal agents suitable for inclusion in the drops are phenylmercuric nitrate or acetate (0.002%), benzalkonium chloride (0.01%) and chlorhexidine acetate (0.01%). Suitable solvents for the preparation of an oily solution include glycerol, diluted alcohol and propylene glycol.

Compounds of formula (I) may be administered parenterally, that is by intravenous, intramuscular, subcutaneous intranasal, intrarectal, intravaginal or intraperitoneal administration. The subcutaneous and intramuscular forms of parenteral administration are generally preferred. Appropriate dosage forms for such administration may be prepared by conventional techniques. Compounds of Formula (I) may also be administered by inhalation, that is by intranasal and oral inhalation administration. Appropriate dosage forms for such administration, such as an aerosol Formulation or a metered dose inhaler, may be prepared by conventional techniques.

For all methods of use disclosed herein for the compounds of Formula (I), the daily oral dosage regimen will preferably be from about 0.1 to about 80 mg/kg of total body weight, preferably from about 0.2 to 30 mg/kg, more preferably from about 0.5 mg to 15mg. The daily parenteral dosage regimen about 0.1 to about 80 mg/kg of total body weight, preferably from about 0.2 to about 30 mg/kg, and more preferably from about 0.5 mg to 15mg/kg. The daily topical dosage regimen will preferably be from 0.1 mg to 150 mg, administered one to four, preferably two or three times daily. The daily inhalation dosage
regimen will preferably be from about 0.01 mg/kg to about 1 mg/kg per day. It will also be recognized by one of skill in the art that the optimal quantity and spacing of individual dosages of a compound of Formula (I) or a pharmaceutically acceptable salt thereof will be determined by the nature and extent of the condition being treated, the form, route and site of administration, and the particular patient being treated, and that such optimums can be determined by conventional techniques. It will also be appreciated by one of skill in the art that the optimal course of treatment, i.e., the number of doses of a compound of Formula (I) or a pharmaceutically acceptable salt thereof given per day for a defined number of days, can be ascertained by those skilled in the art using conventional course of treatment
determination tests.

The invention will now be described by reference to the following biological examples which are merely illustrative and are not to be construed as a limitation of the scope of the present invention.

15 **BIOLOGICAL EXAMPLES**

The cytokine-inhibiting effects of compounds of the present invention were determined by the following *in vitro* assays:

**Interleukin - 1 (IL-1)**

Human peripheral blood monocytes are isolated and purified from either fresh blood preparations from volunteer donors, or from blood bank buffy coats, according to the procedure of Colotta *et al.*, J Immunol, 132, 936 (1984). These monocytes (1x10⁶) are plated in 24-well plates at a concentration of 1-2 million/ml per well. The cells are allowed to adhere for 2 hours, after which time non-adherent cells are removed by gentle washing. Test compounds are then added to the cells for about 1 hour before the addition of lipopolysaccharide (50 ng/ml), and the cultures are incubated at 37°C for an additional 24 hours. At the end of this period, culture supernatants are removed and clarified of cells and all debris. Culture supernatants are then immediately assayed for IL-1 biological activity, either by the method of Simon *et al.*, J. Immunol. Methods, 84, 85, (1985) (based on ability of IL-1 to stimulate a Interleukin 2 producing cell line (EL-4) to secrete IL-2, in concert with A23187 ionophore) or the method of Lee *et al.*, J. ImmunoTherapy, 6 (1), 1-12 (1990) (ELISA assay).

**Tumour Necrosis Factor (TNF):**

Human peripheral blood monocytes are isolated and purified from either blood bank buffy coats or plateletpheresis residues, according to the procedure of Colotta, R. *et al.*, J Immunol, 132(2), 936 (1984). The monocytes are plated at a density of 1x10⁶ cells/ml
medium/well in 24-well multi-dishes. The cells are allowed to adhere for 1 hour after which time the supernatant is aspirated and fresh medium (1 ml, RPMI-1640, Whitaker Biomedical Products, Whitaker, CA) containing 1% fetal calf serum plus penicillin and streptomycin (10 units/ml) added. The cells are incubated for 45 minutes in the presence or absence of a test compound at 1nM-10mM dose ranges (compounds are solubilized in dimethyl sulfoxide/ethanol, such that the final solvent concentration in the culture medium is 0.5% dimethyl sulfoxide/0.5% ethanol). Bacterial lipopoly-saccharide (E. coli 055:B5 [LPS] from Sigma Chemicals Co.) is then added (100 ng/ml in 10 ml phosphate buffered saline) and cultures incubated for 16-18 hours at 37°C in a 5% CO_2 incubator. At the end of the incubation period, culture supernatants are removed from the cells, centrifuged at 3000 rpm to remove cell debris. The supernatant is then assayed for TNF activity using either a radio-immuno or an ELISA assay, as described in WO 92/10190 and by Becker et al., J Immunol, 1991, 147, 4307.

IL-1 and TNF inhibitory activity does not seem to correlate with the property of the compounds of Formula (I) in mediating arachidonic acid metabolism inhibition. Further the ability to inhibit production of prostaglandin and/or leukotriene synthesis, by nonsteroidal anti-inflammatory drugs with potent cyclooxygenase and/or lipoxygenase inhibitory activity does not mean that the compound will necessarily also inhibit TNF or IL-1 production, at non-toxic doses.

**In vivo TNF assay:**

While the above indicated assay in an in vitro assay, the compounds of Formula (I) may also be tested in an in vivo system such as described in:

(1) "Differentiation In Vivo of Classical Non-Steroidal Antiinflammatory Drugs from Cytokine Suppressive Antiinflammatory Drugs and Other Pharmacological Classes Using Mouse Tumour Necrosis Factor Alpha Production", Griswold et al., Drugs Under Exp. and Clinical Res.,XIX (6), 243-248 (1993); or in

(2) Boehm, et al., 1-substituted 4-aryl-5-pyridinylimidazoles - a new class of cytokine suppressive drugs with low 5-lipoxygenase and cyclooxygenase inhibitory potency. Journal Of Medicinal Chemistry 39, 3929-3937 (1996) whose disclosures are incorporated by reference herein in their entirety.

**Interleukin -8 (IL-8):**

Primary human umbilical cord endothelial cells (HUVEC) (Cell Systems, Kirland, Wa) are maintained in culture medium supplemented with 15% fetal bovine serum and 1% CS-HBGF consisting of aFGF and heparin. The cells are then diluted 20-fold before being
plated (250μl) into gelating coated 96-well plates. Prior to use, culture medium are replaced with fresh medium (200μl). Buffer or test compound (25μl, at concentrations between 1 and 10μM) is then added to each well in quadruplicate wells and the plates incubated for 6h in a humidified incubator at 37°C in an atmosphere of 5% CO₂. At the end of the incubation period, supernatant is removed and assayed for IL-8 concentration using an IL-8 ELISA kit obtained from R&D Systems (Minneapolis, MN). All data is presented as mean value (ng/ml) of multiple samples based on the standard curve. IC₅₀'s where appropriate are generated by non-linear regression analysis.

10 **Cytokine Specific Binding Protein Assay**

A radiocompetitive binding assay was developed to provide a highly reproducible primary screen for structure-activity studies. This assay provides many advantages over the conventional bioassays which utilize freshly isolated human monocytes as a source of cytokines and ELISA assays to quantify them. Besides being a much more facile assay, the binding assay has been extensively validated to highly correlate with the results of the bioassay. A specific and reproducible cytokine inhibitor binding assay was developed using soluble cystosolic fraction from THP.1 cells and a radiolabeled compound. Patent Application USSN 08/123175 Lee et al., filed September 1993, USSN; Lee et al., PCT 94/10529 filed 16 September 1994 and Lee et al., *Nature* 300, n(72), 739-746 (Dec. 1994) whose disclosures are incorporated by reference herein in its entirety describes the above noted method for screening drugs to identify compounds which interact with and bind to the cytokine specific binding protein (hereinafter CSBP). However, for purposes herein the binding protein may be in isolated form in solution, or in immobilized form, or may be genetically engineered to be expressed on the surface of recombinant host cells such as in phage display system or as fusion proteins. Alternatively, whole cells or cytosolic fractions comprising the CSBP may be employed in the screening protocol. Regardless of the form of the binding protein, a plurality of compounds are contacted with the binding protein under conditions sufficient to form a compound/ binding protein complex and compound capable of forming, enhancing or interfering with said complexes are detected.

Representative final compounds of Formula (I), Examples 5 to 11 have all demonstrated positive inhibitory activity in this binding assay.
**CSBP KINASE ASSAY:**

This assay measures the CSBP-catalyzed transfer of $^{32}P$ from [a-$^{32}P$]ATP to threonine residue in an epidermal growth factor receptor (EGFR)-derived peptide (T669) with the following sequence: KRELVEPLTPSGEAPNQALLR (residues 661-681). (See Gallagher et al., "Regulation of Stress Induced Cytokine Production by Pyridinyl Imidazoles: Inhibition of CSPB Kinase", BioOrganic & Medicinal Chemistry, to be published 1996).

Kinase reactions (total volume 30 ul) contain: 25 mM Hepes buffer, pH 7.5; 10 mM MgCl$_2$; 170 uM ATP$^1$; 10 uM Na ortho vanadate; 0.4 mM T669 peptide; and 20-80 ng of yeast-expressed purified CSBP2 (see Lee et al., Nature 300, n(72), 739-746 (Dec. 1994)). Compounds (5 ul from [6X] stock$^2$) are pre-incubated with the enzyme and peptide for 20 min on ice prior to starting the reactions with $^{32}P$/MgATP. Reactions are incubated at 30°C for 10 min and stopped by adding 10 ul of 0.3 M phosphoric acid. $^{32}P$-labeled peptide is separated on phosphocellulose (Wattman, p81) filters by spotting 30 ul reaction mixture. Filters are washed 3 times with 75 mM phosphoric acid followed by 2 washes with H$_2$O, and counted for $^{32}P$.

1. The Km of CSBP for ATP was determined to be 170 uM. Therefore, compounds screened at the Km value of ATP.
2. Compounds are usually dissolved in DMSO and are diluted in 25 mM Hepes buffer to get final concentration of DMSO of 0.17%.

**Prostaglandin endoperoxide synthase-2 (PGHS-2) assay:**

The following assay describes a method for determining the inhibitory effects of compounds of Formula (I) on human PGHS-2 protein expression in LPS stimulated human monocytes.

**Method:** Human peripheral blood monocytes were isolated from buffy coats by centrifugation through Ficoll and Percoll gradients. Cells were seeded at 2 X 10$^6$/well in 24 well plates and allowed to adhere for 1 hour in RPMI supplemented with 1% human AB serum, 20mM L-glutamine, Penicillin-Streptomycin and 10mM HEPES. Compounds were added at various concentrations and incubated at 37°C for 10 minutes. LPS was added at 50 ng/well (to induce enzyme expression) and incubated overnight at 37°C. The supernatant was removed and cells washed once in cold PBS. The cells were lysed in 100µl of cold lysis buffer(50mM Tris/HCl pH 7.5, 150mM NaCl, 1% NP40, 0.5% sodium deoxycholate, 0.1% SDS, 300ug/ml DNase; 0.1% TRITON X-100, 1mM PMSF, 1mM leupeptin, 1mM pepstatin). The lysate was centrifuged (10,000 X g for 10 min. at 4°C) to remove debris and the soluble fraction was subjected to SDS PAGE. analysis (12% gel).
Protein separated on the gel were transferred onto nitrocellulose membrane by electrophoretic means for 2 hours at 60 volts. The membrane was pretreated for one hour in PBS/0.1% Tween 20 with 5% non-fat dry milk. After washing 3 times in PBS/Tween buffer, the membrane was incubated with a 1:2000 dilution of a monospecific antiserum to PGHS-2 or a 1:1000 dilution of an antiserum to PGHs-1 in PBS/Tween with 1% BSA for one hour with continuous shaking. The membrane was washed 3X in PBS/Tween and then incubated with a 1:3000 dilution of horseradish peroxidase conjugated donkey antiserum to rabbit Ig (Amersham) in PBS/Tween with 1% BSA for one hour with continuous shaking. The membrane was then washed 3X in PBS/Tween and the ECL immunodetection system (Amersham) was used to detect the level of expression of prostaglandin endoperoxide synthases-2.

RESULTS:  The following compounds were tested and found to be active (inhibited LPS induced PGHS-2 protein expression in rank order potency similar to that for inhibiting cytokine production as noted in assays indicated):

6-(4-Fluorophenyl)-2,3-dihydro-5-(4-pyridinyl)imidazo[2,1-b]thiazole and Dexamethasone

Several compounds were tested and found to be inactive (up to 10uM):

2-(4-Methylsulfinylphenyl)-3-(4-pyridyl)-6,7-dihydro-(5H)-pyrrolo[1,2-a]imidazole, rolipram, phenidone and NDGA.

None of the compounds tested was found to inhibit PGHS-1 or cPLA2 protein levels in similar experiments.

SYNTHETIC EXAMPLES

The invention will now be described by reference to the following examples which are merely illustrative and are not to be construed as a limitation of the scope of the present invention. All temperatures are given in degrees centigrade, all solvents are highest available purity and all reactions run under anhydrous conditions in an argon atmosphere unless otherwise indicated.

In the Examples, all temperatures are in degrees Centigrade (°C). Mass spectra were performed upon a VG Zab mass spectrometer using fast atom bombardment, unless otherwise indicated. 1H-NMR (hereinafter "NMR") spectra were recorded at 250 MHz using a Bruker AM 250 or Am 400 spectrometer. Multiplicities indicated are: s=singlet, d=doublet, t=triplet, q=quartet, m=multiplet and br indicates a broad signal. Sat. indicates a saturated solution, eq indicates the proportion of a molar equivalent of reagent relative to the principal reactant.

Flash chromatography is run over Merck Silica gel 60 (230 - 400 mesh).
Example 1

1-(4-Oxocyclohexyl)-4-(4-fluorophenyl)-5-((2-methoxy)pyrimidin-4-yllimidazole

a) 4-Fluorophenyl-tolylsulfonomethylformamide

To a suspension of p-toluenesulfonic acid sodium salt (30 g) in H₂O (100 mL) was added methyl t-butyl ether (50 mL) followed by dropwise addition of conc. HCl (15 mL). After stirring 5 min., the organic phase was removed and the aqueous phase was extracted with methyl t-butyl ether. The organic phase was dried (Na₂SO₄) and concentrated to near dryness. Hexane was added and the free acid was filtered.

The p-toluenesulfonic acid (22 g, 140.6 mmol), p-fluorobenzaldehyde (22 mL, 206 mmol), formamide (20 mL, 503 mmol) and camphor sulphonic acid (4 g, 17.3 mmol) were combined and stirred at 60°C 18 h. The resulting solid was broken up and stirred with a mixture of MeOH (35 mL) and hexane (82 mL) then filtered. The solid was resuspended in MeOH/hexane (1:3, 200 mL) and stirred vigorously to break up remaining chunks. Filtration afforded the title compound (27 g, 62 % yield). ¹H NMR (400 MHz, CDCl₃): δ 8.13 (s, 1H), 7.71 (d, 2H), 7.43 (dd, 2H), 7.32 (d, 2H), 7.08 (t, 2H), 6.34 (d, 1H), 2.45 (s, 3H).

b) 4-Fluorophenyl-tolylsulfonomethylisocyanide

The compound in the previous step (2.01g, 6.25 mmol) in ethylene glycol dimethylether (DME) (32 mL) was cooled to -10°C. POCl₃ (1.52 mL, 16.3 mmol) was added followed by the dropwise addition of triethylamine (4.6 mL, 32.6 mmol) in DME (3mL) keeping the internal temperature below -5°C. The mixture was gradually warmed over 1 h., quenched in H₂O and extracted with EtOAc. The organic phase was washed with sat. aqueous NaHCO₃, dried (Na₂SO₄), and concentrated. The resulting residue was triturated with petroleum ether and filtered to afford the title compound (1.7 g, 90% yield). ¹H NMR (CDCl₃): δ 7.63 (d, 2H), 7.33 (m, 4H), 7.10 (t, 2H), 5.60 (s, 1H), 2.50 (s, 3H)

c) 2-N-Methylthiopyrimidine-4-carboxaldehyde dimethyl acetal

Pyrvaldehyde dimethyl acetal (60 mL, 459 mmol) and N,N-dimethyl formamide dimethyl acetal (60 mL, 459 mmol) were stirred together at 100°C for 18 h. The mixture was cooled.

Methanol (300 mL), thiourea (69.6 g) and sodium methoxide (231 mL, 25 wt% in MeOH) were added to the above mixture and stirred at 70°C for 2 h. After cooling, iodomethane (144 mL) was added dropwise and the mixture was stirred 3 h. at room temp. After diluting with EtOAc and H₂O, the organic phase was separated, dried (Na₂SO₄), and concentrated to yield the title compound as a brown oil (75.5 g, 82% yield). ¹H NMR (CDCl₃): δ 8.17 (d, 1H), 6.77 (d, 1H), 5.15 (s, 1H), 3.40 (s, 6H).

d) 2-Methylthiopyrimidine-4-carboxaldehyde

- 48 -
A mixture of the compound from the previous step (10.04 g, 55 mmol) in 3N HCl (45 mL) was stirred at 47°C for 24 h. After cooling EtOAc was added followed by the addition of solid NaHCO₃. The aqueous phase was extracted with EtOAc (4 x 100 mL). The organic phases were combined, dried (Na₂SO₄), and concentrated to afford the title compound as a yellow foam. ¹H NMR (CDCl₃): δ 9.95 (s, 1H), 8.77 (d, 1H), 7.43 (d, 1H), 2.63 (s, 3H).
e) 1-Amino-4-(1,3-dioxycyclopentyl)cyclohexane

To a mixture of 1,4-cyclohexanedione monoethylene ketal (27.6 g, 177 mmol) and hydroxylamine hydrochloride (49.2 g, 708 mmol) in H₂O (250 mL) was added portionwise Na₂CO₃ (49.2 g, 547 mmol). After stirring 1 h, the mixture was extracted with EtOAc. The organic phase was dried (Na₂SO₄) and concentrated affording 4-(1,3-dioxycyclopentyl)-cyclohexanone oxime (27.5 g, 90% yield).

The oxime (27.5 g, 161 mmol), Raney Ni (ca 13.5 mL as a suspension in EtOH) and EtOH (200 mL) were combined and shaken at 50 psi H₂ for 4 h. The catalyst was filtered off and the filtrate was concentrated to afford the title compound as a colorless oil (23.6 g, 93% yield). ¹H NMR (CDCl₃): δ 2.64 (m, 1H), 1.75 - 1.25 (m, 12 H).
f) 2-Methylthiopyrimidine-4-carboxaldehyde(4-ethylen ketal cyclohexyl)imine

A mixture of 2-methylthiopyrimidine-4-carboxaldehyde (9.5 g, 6.9 mmol) prepared in example 1(d) and 1-amino-4-(1,3-dioxycyclopentyl)cyclohexane (10.8 g, 6.9 mmol) from the previous step were stirred in DMF (150 mL) 18 h. The title compound was used without any purification. ¹H NMR (CDCl₃): δ 8.51 (d, 1H), 8.21 (s, 1H), 7.53 (d, 1H), 3.93, (s, 4H), 3.40 (m, 1H), 2.55 (s, 3H), 1.94 - 1.70 (m, 6H), 1.61 (m, 2H).
g) 1-(4-Ethylene ketal cyclohexyl)imidazole-4-(4-fluorophenyl)-5-[2-methylthio]pyrimidine-4-yl imidazole

To the crude product from the previous example in DMF cooled to 0°C was added 4-fluorophenyl-tolylsulfonyl methylisocyanide prepared in example 1 (b) (26 g, 90 mmol) and K₂CO₃ (15.7 g, 113.6 mmol). The mixture was stirred at 0°C for 3 h then gradually warmed to room temp. and stirred for 18 h. EtOAc was added and the mixture was filtered washing the solid with EtOAc. H₂O was added to the filtrate and the organic phase was separated, dried (Na₂SO₄), and concentrated. The mixture was evaporated to near dryness and filtered washing with 1:1 EtOAc/hexane to afford the title compound as pale yellow crystals. ¹H NMR (CDCl₃): δ 8.33 (d, 1H), 7.81 (s, 1H), 7.43 (q, 2H), 7.12 (t, 2H), 6.78 (d, 1H), 4.74 (m, 1H), 4.00 (s, 4H), 2.59 (s, 3H), 2.18 (dd, 2H), 2.04 (dq, 2H), 1.89 (dd, 2H), 1.70 (dt, 2H).
h) 1-(4-Ethylene ketal cyclohexyl) 1,4-(4-fluorophenyl)-5-[2-methylsulfoxy]pyrimidine-4-yl imidazole
To a solution of the compound from the previous step (0.20 g, 0.48 mmol) in THF (2 mL) and MeOH (1 mL) at 0°C was added oxone monopersulfate (0.36 g, 0.56 mmol) dissolved in H₂O (2 mL). The mixture was stirred for 0.5 h, then poured into 10% NaOH and extracted with EtOAc. The organic phase was dried (Na₂SO₄) and concentrated. The resulting residue was triturated with Et₂O and filtered affording the title compound as a white solid (0.089 g, 45% yield). ¹H NMR (CDCl₃): δ 8.36 (d, 1H), 7.82 (s, 1H), 7.42 (q, 2H), 7.02 (t, 2H), 6.79 (d, 1H), 4.80 (m, 1H), 4.00 (s, 3H), 2.20 (m, 2H), 2.06 (m, 3H), 1.89 (m, 2H), 1.70 (m, 5H).

i) 1-(4-Ethylene ketal cyclohexyl)-4-(4-fluorophenyl)-5-[(2-methoxy)pyrimidin-4-yl]imidazole

Sodium methoxide (5.17 mL, 22.6 mmol, 25 wt% in MeOH) was added to dry THF (33 mL) followed by the compound from the previous example (5 g, 11.3 mmol). The mixture was stirred at room temp 2 h, then layered with EtOAc and diluted with H₂O. The organic phase was dried (Na₂SO₄) and concentrated. The residue was purified by flash chromatography (silica gel, 5% MeOH/CH₂Cl₂). The resulting residue was triturated with EtOAc/hexane(1:1) to give the title compound as a white solid (3.57 g, 77% yield). ¹H NMR (CDCl₃): δ 8.34 (d, 1H), 7.81 (s, 1H), 7.40 (q, 2H), 7.00 (t, 2H), 6.78 (d, 1H), 4.79 (m, 1H), 4.05 (s, 3H), 3.99 (s, 4H), 2.17 (m, 2H), 2.05 (s, 2H), 1.90 (m, 2H), 1.69 (dt, 2H).

j) 1-(4-Oxocyclohexyl)-4-(4-fluorophenyl)-5-[(2-methoxy)pyrimidin-4-yl]imidazole

A mixture of the compound from the previous step (10.73 g, 26.23 mmol) in 3N HCl (150 mL) was stirred 36 h, then neutralized with saturated aqueous Na₂CO₃ and filtered. The solid was washed with water and the aqueous mixture was extracted with EtOAc. The organic phase was dried (Na₂SO₄) and concentrated giving the title compound as white crystals. mp 212 - 214°C.

Example 2

trans-1-(4-Hydroxycyclohexyl)-4-(4-fluorophenyl)-5-[(2-methoxy)pyrimidin-4-yl]imidazole

To a solution of the compound in example 1(j) (0.099 g, 0.27 mmol) in MeOH/THF (1 mL, 1:1) was added NaBH₄ solution [1 mL, 1M sln. made by combining 10 g, Na BH₄, MeOH (2.5 mL), and 25% NaOMe in MeOH (0.2 mL)]. After stirring 10 min., the mixture was quenched with saturated Na₂CO₃ and the solvent was evaporated. The residue was recrystallized from MeOH/H₂O to afford the title compound as white needles (0.063 g, 63% yield). mp 188 - 190°C.

- 50 -
Example 3

1-(4-Oxocyclohexyl)-4-(4-fluorophenyl)-5-[2-(isoproxy)pyrimidin-4-yl]imidazole

a) 1-(4-Ethylene ketal cyclohexyl)-4-(4-fluorophenyl)-5-[2-(isoproxy)pyrimidin-4-yl]imidazole

A mixture of sodium metal (0.161 g, .7 mmol) and isopropanol (30 mL) was stirred with gentle heat until the sodium metal dissolved. Added was a suspension of 1-(4-ethylene ketal cyclohexyl)-4-(4-fluorophenyl)-5-[[(2-methylsulfoxyl)pyrimidin-4-yl]imidazole prepared in example 1(h) (0.3 g, .7 mmol) in isopropanol (10 mL) and the mixture was stirred 2 h. at 90°C. The mixture was cooled and diluted with H2O and extracted with EtOAc. The organic phase was dried (Na2SO4) and concentrated. Crystalization from EtOH/H2O afforded the title compound (0.15 g, 49% yield). 1H NMR (CDCl3): δ 8.35 (d, 1H), 7.81 (s, 1H), 7.43 (q, 2H), 7.01 (t, 2H), 6.73 (d, 1H), 5.30 (m, 1H), 4.77 (m, 1H), 3.99 (s, 4H), 2.16 (m, 2H), 2.05 (dq, 2H), 1.90 (d, 2H), 1.68 (dt, 2H), 1.45 (d, 6H).

b) 1-(4-Oxocyclohexyl)-4-(4-fluorophenyl)-5-[2-(isoproxy)pyrimidin-4-yl]imidazole

Following the procedure of example 1(j) except using the compound from the previous step afforded the title compound as white crystals. mp 161 - 163°C.

Example 4

1-(4-Oxocyclohexyl)-4-(4-fluorophenyl)-5-[2-(2-hydroxyethoxy)pyrimidin-4-yl]imidazole

a) 1-(4-Ethylene ketal cyclohexyl)-4-(4-fluorophenyl)-5-[2-(2-hydroxyethoxy)pyrimidin-4-yl]imidazole

Following the procedure of example 3(a) except using ethylene glycol and stirring at room temp. for 3 days afforded the title compound as a white solid. 1H NMR (CDCl3): δ 8.36 (d, 1H), 7.86 (s, 1H), 7.41 (q, 2H), 7.02 (t, 2H), 6.80 (d, 1H), 4.77 (m, 1H), 4.54 (t, 2H), 4.01 (m, 2H), 3.98 (s, 4H), 2.19 (m, 2H), 2.07 (m, 2H), 1.90 (d, 2H), 1.70 (dt, 2H).

b) 1-(4-Oxocyclohexyl)-4-(4-fluorophenyl)-5-[2-(2-hydroxyethoxy)pyrimidin-4-yl]imidazole

Following the procedure of example 1(j) except using the compound from the previous step and triturating the residue with EtOAc/hexane afforded the title compound as a white solid. mp 203 - 205°C.

Example 5

1-(4-Hydroxycyclohexyl)-4-(4-fluorophenyl)-5-[2-(2-hydroxyethoxy)pyrimidin-4-yl]imidazole

Following the procedure of example 2 except using the compound in example 4(b) and triturating the residue with EtOAc afforded the title compound. mp 191 - 193°C.
Example 6

1-(4-Oxocyclohexyl)-4-(4-fluorophenyl)-5-[(2-(2-tert-butylamino)ethoxy)pyrimidin-4-y]imidazole

a) 1-(4-Ethylene ketal cyclohexyl)-4-(4-fluorophenyl)-5-[(2-(2-tert-butylamino)ethoxy)pyrimidin-4-y]imidazole

To a suspension of NaH (0.11 g, 2.92 mmol, 60% susp. in mineral oil) in dry THF (5 mL) was added 2-(N-tert-butylamino)ethanol (0.34 g, 2.92 mmol). When gas evolution ceased, 1-(4-ethylene ketal cyclohexyl)-4-(4-fluorophenyl)-5-[(2-methylsulfoxi)pyrimidin-4-y]imidazole prepared in example 1(h) (1.46 mmol) suspended in dry THF (8 mL) was added and the mixture was stirred for .5 h. then diluted with H₂O and extracted with EtOAc. The organic phase was dried (Na₂SO₄) and concentrated. The residue was triturated with EtOAc/hexane to afford the title compound as a white solid. § H NMR (CDCl₃): δ 8.35 (d, 1H), 7.81 (s, 1H), 7.41 (q,2H), 7.00 (t, 2H), 6.79 (d, 1H), 4.75 (m, 1H), 4.50 (t, 2H), 4.00 (s, 4H), 3.01 (t, 2H), 2.15 (m, 2H), 2.03 (dd, 2H), 1.88 (m, 2H), 1.69 (m, 2H), 1.16 (s, 9H).

b) 1-(4-Oxocyclohexyl)-4-(4-fluorophenyl)-5-[(2-(2-tert-butylamino)ethoxy)pyrimidin-4-y]imidazole

Following the procedure of example 1(j) except using the compound in the previous step and recrystalizing with EtOAc/hexane afforded the title compound as white needles. mp 235 - 237°C.

Example 7

1-(4-Hydroxycyclohexyl)-4-(4-fluorophenyl)-5-[(2-(2-tert-butylamino)ethoxy)pyrimidin-4-y]imidazole

Following the procedure of example 2 except using the compound in example 6(b) afforded the title compound as a white solid. mp 165 - 170°C.

Example 8

1-(4-Hydroxycyclohexyl)-4-(4-fluorophenyl)-5-[(2-isopropoxy)pyrimidin-4-y]imidazole

Following the procedure of example 2 except using the compound in example 3(b) afforded the title compound. mp 208 - 211°C.

Example 9

trans-1-(4-Hydroxycyclohexyl)-4-(4-fluorophenyl)-5-[(2-(methoxyethoxy)pyrimidin-4-y]imidazole

a) 1-(4-Ethylene ketal cyclohexyl)-4-(4-fluorophenyl)-5-[(2-(2-methoxyethoxy)pyrimidin-4-y]imidazole
Following the procedure of example 6(a) except using methoxyethanol afforded the title compound as a solid. \(^1\)H NMR (CDCl\(_3\)): \(\delta\) 8.35 (d, 1H), 7.81 (s, 1H), 7.41 (q, 2H), 7.02 (t, 2H), 6.78 (d, 1H), 4.77 (m, 1H), 4.55 (t, 2H), 4.00 (s, 4H), 3.81 (t, 2H), 3.45 (s, 3H), 2.18 (m, 2H), 2.04 (dq, 2H), 1.88 (m, 2H), 1.70 (m, 2H).

b) 1-(4-Oxycyclohexyl)-4-(4-fluorophenyl)-5-[(2-(methoxy)ethoxy)pyrimidin-4-yl]imidazole

Following the procedure of example 1(j) except using the compound from the previous step afforded the title compound as a white solid. \(^1\)H NMR (CDCl\(_3\)): \(\delta\) 8.35 (d, 1H), 7.78 (s, 1H), 7.42 (q, 2H), 7.03 (t, 2H), 6.79 (d, 1H), 5.30 (m, 1H), 4.59 (t, 2H), 3.81 (t, 2H), 3.45 (s, 3H), 2.55 (m, 6H), 2.20 (m, 2H).

c) trans-1-(4-Hydroxycyclohexyl)-4-(4-fluorophenyl)-5-[(2-(methoxy)ethoxy)pyrimidin-4-yl]imidazole

Following the procedure of example 2 except using the compound from the previous step afforded the title compound. mp 185 - 186°C.

Example 10

1-[(4-Hydroxy)-4-hydroxymethylcyclohexyl]-4-(4-fluorophenyl)-5-[(2-methoxy)pyrimidin-4-yl]imidazole

a) 1-(4-Oxiranylcyclohexyl)-4-(4-fluorophenyl)-5-[(2-methoxy)pyrimidin-4-yl]imidazole

Added to a mixture of sodium hydride (0.05 g, 0.88 mmol) in DMSO (1 mL) was trimethyl sulfoxonium iodide (0.29 g, 1.3 mmol). After stirring the resultant mixture 1.5 h. (when gas evolution ceases), 1-(4-oxycyclohexyl)-4-(4-fluorophenyl)-5-[(2-methoxy)pyrimidin-4-yl]imidazole from example 1(j) (0.322 g, 0.88 mmol) suspended in dry THF (4 mL) was added and the mixture was stirred 4h. The mixture was poured into H\(_2\)O and extracted with EtOAc. The organic phase was dried (Na\(_2\)SO\(_4\)) and concentrated. The resulting residue was suspended in EtOAc/hexane (1:1) and filtered. The solid was purified by flash chromatography (silica gel 2% MeOH/CH\(_2\)Cl\(_2\)) to afford the title compound as white crystals (0.18 g, 53% yield) \(^1\)H NMR (CDCl\(_3\)): \(\delta\) 8.35 (d, 1H), 7.85 (s, 1H), 7.43 (q, 2H), 7.02 (t, 2H), 6.80 (d, 1H), 4.86 (m, 1H), 4.09 (s, 3H), 2.76 (s, 2H), 2.26 (m, 2H), 2.20 - 2.02 (m, 4H), 1.43 (d, 2H).

b) 1-[(4-Hydroxy)-4-hydroxymethylcyclohexyl]-4-(4-fluorophenyl)-5-[(2-methoxy)pyrimidin-4-yl]imidazole

The compound from the previous step (0.178 g, 0.47 mmol) was stirred in 88% formic acid (6 mL) 1 h. The mixture was concentrated and the residue was dissolved in methanol
(5 mL). Thiethylamine (.26 mL, 1.88 mmol) was added and the mixture was stirred 18 h. and was concentrated. The residue was purified by flash chromatography (silica gel, 5% - 10% MeOH/CH₂Cl₂). The product was triturated with EtOAc/hexane (1:1) and recrystallized from EtOH/H₂O to afford the title compound as a white solid (.065 g, 35% yield). mp 225 - 226°C.

**Example 11**

1-(4-Oxocyclohexyl)-4-(4-fluorophenyl)-5-[[2-(N,N-dimethylamino)ethoxy]pyrimidin-4-y]imidazole

a) 1-(4-Ethylene ketal cyclohexyl)-4-(4-fluorophenyl)-5-[[2-(N,N-dimethylamino)ethoxy]pyrimidin-4-y]imidazole

Following the procedure of example 6(a) except using 2-dimethylamino ethanol afforded the title compound as a white solid. ¹H NMR (CDCl₃): δ 8.35 (d, 1H), 7.82 (s, 1H), 7.42 (q, 2H), 7.01 (t, 2H), 6.77 (d, 1H), 4.77 (m, 1H), 4.50 (t, 2H), 4.00 (s, 4H), 2.80 (t, 2H), 2.37 (s, 6H), 2.17 (d, 2H), 2.05 (dq, 2H), 1.89 (m, 2H), 1.67 (dt, 2H).

b) 1-(4-Oxocyclohexyl)-4-(4-fluorophenyl)-5-[[2-(N,N-dimethylamino)ethoxy]pyrimidin-4-y]imidazole

Following the procedure of example 1(j) except using the compound from the previous step afforded the title compound as white needles. mp 84 - 86°C.

All publications, including but not limited to patents and patent applications, cited in this specification are herein incorporated by reference as if each individual publication were specifically and individually indicated to be incorporated by reference herein as though fully set forth.

The above description fully discloses the invention including preferred embodiments thereof. Modifications and improvements of the embodiments specifically disclosed herein are within the scope of the following claims. Without further elaboration, it is believed that one skilled in the art can, using the preceding description, utilize the present invention to its fullest extent. Therefore the Examples herein are to be construed as merely illustrative and not a limitation of the scope of the present invention in any way. The embodiments of the invention in which an exclusive property or privilege is claimed are defined as follows.
What is Claimed Is:

1. A compound of the Formula

![Chemical Structure Image]

wherein

R₁ is 4-pyridyl, pyrimidinyl, quinolyl, isoquinoliny, quinazolin-4-yl, 1-imidazolyl or 1-benzimidazolyl, which ring is substituted with a substituted C₁₋₄ alkoxy or a substituted C₁₋₄ alkylthio group, and is additionally optionally substituted independently by C₁₋₄ alkyl, halogen, hydroxyl, C₁₋₄ alkoxy, C₁₋₄ alkylthio, C₁₋₄ alkysulfinyl, CH₂OR₁₂, amino, mono and di- C₁₋₆ alkyl substituted amino, N(R₁₀)C(O)R₈ or an N-heterocyclic ring which ring has from 5 to 7 members and optionally contains an additional heteroatom selected from oxygen, sulfur or NR₁₅;

R₄ is phenyl, naphth-1-yl or naphth-2-yl, or a heteroaryl, which is optionally substituted by one or two substituents, each of which is independently selected, and which, for a 4-phenyl, 4-naphth-1-yl, 5-naphth-2-yl or 6-naphth-2-yl substituent, is halogen, cyano, nitro, -C(Z)NR₇R₁₇, -C(Z)OR₁₆, -(CR₁₀R₂₀)νCOR₁₂, -SR₅, -SOR₅, -OR₁₂, halo-substituted-C₁₋₄ alkyl, C₁₋₄ alkyl, -ZC(Z)R₁₂, -NR₁₀C(Z)R₁₆, or -(CR₁₀R₂₀)νNR₁₀R₂₀ and which, for other positions of substitution, is halogen, cyano, -C(Z)NR₁₃R₁₄, -C(Z)OR₃, -(CR₁₀R₂₀)m⁺COR₃, -S(O)mR₃, -OR₃, halo-substituted-C₁₋₄ alkyl, -C₁₋₄ alkyl, -(CR₁₀R₂₀)m⁺NR₁₀C(Z)R₃, -NR₁₀S(O)mR₈, -NR₁₀S(O)m⁺NR₇R₁₇, -ZC(Z)R₃ or -(CR₁₀R₂₀)m⁺NR₁₃R₁₄;

v is 0, or an integer having a value of 1 or 2;

m is 0, or the integer 1 or 2;

m' is an integer having a value of 1 or 2,

m" is 0, or an integer having a value of 1 to 5;

R₈ is hydrogen, C₁₋₆ alkyl, C₃₋₇ cycloalkyl, aryl, arylC₁₋₄ alkyl, heteroaryl, heteroarylC₁₋₄ alkyl, heterocyclyl, or heterocyclylC₁₋₄ alkyl C₁₋₄ alkyl

R₂ is an optionally substituted C₃₋₇ cycloalkyl, or C₃₋₇ cycloalkylC₁₋₁₀ alkyl;

R₃ is heterocyclyl, heterocyclylC₁₋₁₀ alkyl or R₈;

R₅ is hydrogen, C₁₋₄ alkyl, C₂₋₄ alkenyl, C₂₋₄ alkynyl or NR₇R₁₇, excluding the moieties -SR₅ being -SNR₇R₁₇ and -SOR₅ being -SOH;
R7 and R17 is each independently selected from hydrogen or C1-4 alkyl or R7 and R17
together with the nitrogen to which they are attached form a heterocyclic ring of 5 to 7
members which ring optionally contains an additional heteroatom selected from oxygen,
sulfur or NR15;

5  R8 is C1-10 alkyl, halo-substituted C1-10 alkyl, C2-10 alkenyl, C2-10 alkynyl, C3-7
cycloalkyl, C5-7 cycloalkenyl, aryl, arylC1-10 alkyl, heteroaryl, heteroarylC1-10 alkyl,
(CR10R20)nOR11, (CR10R20)nS(O)mR18, (CR10R20)nNHS(O)2R18,
(CR10R20)nNR13R14; wherein the aryl, arylalkyl, heteroaryl, heteroaryl alkyl may be
optionally substituted;

10 n is an integer having a value of 1 to 10;
R9 is hydrogen, -(Z)R11 or optionally substituted C1-10 alkyl, S(O)2R18, optionally
substituted aryl or optionally substituted aryl-C1-4 alkyl;
R10 and R20 is each independently selected from hydrogen or C1-4 alkyl;
R11 is hydrogen, or R18;

15 R12 is hydrogen or R16;
R13 and R14 is each independently selected from hydrogen or optionally substituted C1-4
alkyl, optionally substituted aryl or optionally substituted aryl-C1-4 alkyl, or together
with the nitrogen which they are attached form a heterocyclic ring of 5 to 7 members
which ring optionally contains an additional heteroatom selected from oxygen, sulfur or

20 NR9;
R15 is hydrogen, C1-4 alkyl or C(Z)-C1-4 alkyl;
R16 is C1-4 alkyl, halo-substituted-C1-4 alkyl, or C3-7 cycloalkyl;
R18 is C1-10 alkyl, C3-7 cycloalkyl, heterocyclyl, aryl, arylC1-10 alkyl, heterocyclyl,
heterocyclyl-C1-10alkyl, heteroaryl or heteroarylalkyl; and

25 Z is oxygen or sulfur;
or a pharmaceutically acceptable salt thereof.

2. The compound according to Claim 1 wherein R1 is a substituted 4-pyridyl or 4-
pyrimidinyl.

30 3. The compound according to Claim 2 wherein the substituent is a substituted C1-4
alkoxy.

4. The compound according to Claim 2 wherein R4 is an optionally substituted phenyl.

35
5. The compound according to Claim 4 wherein the phenyl is substituted one or more times independently by halogen, -SR₅, -S(O)R₅, -OR₁₂, halo-substituted-C₁-₄ alkyl, or C₁-₄ alkyl.

6. The compound according to Claim 1 wherein R₂ is selected from optionally substituted C₄ to C₆ cycloalkyl, or optionally substituted C₄ or C₆ cycloalkylC₁-₄ alkyl.

7. The compound according to Claim 6 wherein the cycloalkyl ring may substituted one to three times independently by halogen; hydroxy; C₁-₁₀ alkoxy; S(O)mC₁-₁₀alkyl, wherein m is 0, 1, or 2; amino; cyano, nitro; NR₇R₁₇ group; C₁-₁₀ alkyl; substituted alkyl wherein the substituents are selected from halogen, hydroxy, nitro, cyano, NR₇R₁₇, S(O)mC₁-₄ alkyl, C(O)OR₁₁; -O-(CH₂)sO-, and s is 1 to 3; -C(O)H; =O; =N-OR₁₁; -N(R₁₀)-OH; -N(OH)-C(O)-R₄; optionally substituted aryl; or optionally substituted arylalkyl; N(R₁₀)C(O)X₁; C(O)OR₁₁; optionally substituted alkylene; or optionally substituted C₁-₁₀alkynyl;

wherein R₅ is hydrogen, a pharmaceutically acceptable cation, aroyl or a C₁-₁₀ alkanoyl group;

Rd is NR₂₁R₂₂; alkylation 1-6; halo-substituted alkyl 1-6; hydroxy substituted alkyl 1-6; alkenyl 2-6; aryl or heteroaryl optionally substituted by halogen, alkyl 1-6, halosubstituted alkyl 1-6, hydroxy, or alkoxy 1-6;

R₂₁ is hydrogen or alkyl 1-6; and

R₂₂ is hydrogen, alkyl 1-6, aryl, benzyl, heteroaryl, alkyl substituted by halogen or hydroxy, or phenyl substituted by a member selected from the group consisting of halo, cyano, alkyl 1-₁₂, alkoxy 1-6, halosubstituted alkyl 1-₆, alkylthio, alkylsulphonyl, or alkylsulfinyl; or R₂₁ and R₂₂ may together with the nitrogen to which they are attached form a ring having 5 to 7 members, which members may be optionally replaced by a heteroatom selected from oxygen, sulfur or nitrogen; and

X₁ is C₁-₄ alkyl, aryl or arylC₁-₄alkyl; N(R₁₀)C(O) aryl.

8. The compound according to Claim 7 wherein the optional substituents are hydroxy, aryl, arylalkyl, alkyl, alkynyl, NR₇R₁₇, NR₇R₁₇ C₁-₆ alkyl, =O, =NOR₁₁, -NH(OH), -N(OH)-C(O)-NH₂, cyanoalkyl, nitroalkyl, or -O-(CH₂)₂O-.

9. The compound according to Claim 1 which is:

5-[2-(2-Hydroxyethoxy)pyrimidin-4-yl]-4-(4-fluorophenyl)-1-(4-oxocyclohexyl)-imidazole;
5-[2-(2-Hydroxyethoxy)]pyrimidin-4-yl]-4-(4-fluorophenyl)-1-(4-hydroxy cyclohexyl)-imidazole;
5-[2-(2-tert-Butylamino)ethoxypyrimidin-4-yl]-4-(4-fluorophenyl)-1-(4-oxocyclohexyl)-imidazole;
5-[2-(2-tert-Butylamino)ethoxypyrimidin-4-yl]-4-(4-fluorophenyl)-1-(4-hydroxy-cyclohexyl)imidazole;

or a pharmaceutically acceptable salt thereof.

10. A pharmaceutical composition comprising a compound according to Claim 1 and a pharmaceutically acceptable carrier or diluent.

11. A method of treating a CSBP/RK/p38 kinase mediated disease, in a mammal in need thereof, which comprises administering to said mammal an effective amount of a compound of Formula (I) according to any of Claims 1 to 9.

12. The method according to claim 11 wherein the mammal is afflicted with a CSBP/RK/p38 kinase mediated disease which is psoriatic arthritis, Reiter's syndrome, rheumatoid arthritis, gout, traumatic arthritis, rubella arthritis and acute synovitis, rheumatoid arthritis, rheumatoid spondylitis, osteoarthritis, gouty arthritis and other arthritic condition, sepsis, septic shock, endotoxic shock, gram negative sepsis, toxic shock syndrome, Alzheimer's disease, stroke, neurotrauma, asthma, adult respiratory distress syndrome, cerebral malaria, chronic pulmonary inflammatory disease, silicosis, pulmonary sarcososis, bone resorption disease, osteoporosis, restenosis, cardiac and renal reperfusion injury, thrombosis, glomerulonephritis, diabetes, graft vs. host reaction, allograft rejection, inflammatory bowel disease, Crohn's disease, ulcerative colitis, multiple sclerosis, muscle degeneration, eczema, contact dermititis, psoriasis, sunburn, or conjunctivitis.

13. The method according to Claim 12 wherein the disease state is mediated by IL-1, IL-6, IL-8, or TNF.

14. The method according to Claim 12 wherein the cytokine mediated disease state is asthma, osteoporosis or arthritis.

15. A method of treating inflammation in a mammal in need thereof, which comprises administering to said mammal an effective amount of a compound of Formula (I) according to any of Claims 1 to 9.
16. A method of treating osteoporosis in a mammal in need thereof, which comprises administering to said mammal an effective amount of a compound of Formula (I) according to any of Claims 1 to 9.

17. A method of inhibiting the synthesis of prostaglandin endoperoxide synthase-2 (PGHS-2) in a mammal in need thereof, which comprises administering to said mammal an effective amount of a compound of Formula (I) according to Claim 1.

18. The method according to Claim 17 wherein inhibition of PGHS-2 is used in the prophylaxis or therapeutic treatment of edema, fever, algesia, neuromuscular pain, headache, cancer pain, or arthritic pain.

19. A process for preparing a compound of Formula (I) as defined in Claim 1 which comprises reacting a compound of the Formula (II):

\[ \text{Ar} \equiv \text{S(O)}_p \]
\[ \text{R}_4 \quad \text{NC} \]

with a compound of the Formula (III):

\[ \text{R}_1 \equiv \text{NR}_2 \]
\[ \text{H} \]

wherein \( p \) is 0 or 2; and a base strong enough to deprotonate the isonitrile moiety of Formula (II); and \( \text{R}_1, \text{R}_2 \) and \( \text{R}_4 \) are as defined in Claim 1 or are precursors of the groups \( \text{R}_1, \text{R}_2 \) and \( \text{R}_4 \) and \( \text{Ar} \) is an optionally substituted phenyl group, and thereafter if necessary, converting a precursor of \( \text{R}_1, \text{R}_2 \) and \( \text{R}_4 \) to a group \( \text{R}_1, \text{R}_2 \) and \( \text{R}_4 \).

20. The process according to Claim 19 wherein the reaction, when \( p=0 \), utilizes TBD as a base.
21. The process according to Claim 19 wherein the reaction, when \( p=2 \), the base is an amine, a carbonates, a hydride, or an alkyl or aryl lithium reagent.

22. The process according to Claim 19 wherein the imine of Formula (III), is isolated prior to reaction with Formula (II).

23. The process according to Claim 19 wherein the imine of Formula (III), is formed in situ prior to reaction with Formula (II).

24. The process according to Claim 23 wherein the imine is formed in situ by reacting an aldehyde of the formula \( R_1\text{CHO} \), wherein \( R_1 \) is as defined for Formula (I), with a primary amine of the formula \( R_2\text{NH}_2 \), wherein \( R_2 \) is as defined for Formula (I).

25. The process according to Claim 23 wherein formation of the imine in situ utilizes dehydrating conditions.

26. The process according to Claim 25 wherein the solvent is \( N,N\)-dimethyl-formamide (DMF), halogenated solvents, tetrahydrofuran (THF), dimethylsulfoxide (DMSO), alcohols, benzene, or toluene, or DME.

27. The process according to Claim 19 wherein the aldehyde \( R_1\text{CHO} \) is a pyrimidine aldehyde of the formula:

\[
\begin{align*}
\text{N} & \quad \text{N} \\
\text{X} & \quad \text{X} \\
\text{CHO} & \quad \text{CHO}
\end{align*}
\]

wherein

\( X \) is \( \text{NHR}_n \) and \( X_1 \) is defined as the optional substituent group(s) on the \( R_1 \) moiety in Formula (I) according to Claim 1, to yield a compound of Formula (I) or a pharmaceutically acceptable salt thereof.

28. The process according to Claim 19 wherein the primary amine \( R_2\text{NH}_2 \) is a \( C_3-7 \) cycloalkyl amine, \( C_3-7 \) cycloalkyl \( C_1-10 \) alkyl amine, all of which may be optionally substituted.
29. The process according to Claim 28 wherein R₂ moiety is 4-hydroxycyclohexyl, 4-hydroxycyclohexyl, 4-ketocyclohexyl, 4-oxiranlycyclohexyl, 4-methyl-4-hydroxy cyclohexyl, 4-isopropyl-4-hydroxy cyclohexyl, 4-pyrrolineyl-cyclohexyl, 4-methyl-4-aminocyclohexyl, 4-methyl-4-acetamidocyclohexyl, 4-phenyl-4-hydroxy cyclohexyl, 4-benzyl-4-hydroxy cyclohexyl, 1-propenyl-4-hydroxy, 4-hydroxy-4-amino-cyclohexyl, 4-aminomethyl-4-hydroxy cyclohexyl or 4-(1,3-dioxycyclopentyl) cyclohexyl.

30. The method according to Claim 19 wherein the compound is:

5-[2-(2-Hydroxyethoxy)pyrimidin-4-y1]-4-(4-fluorophenyl)-1-(4-oxocyclohexyl)-imidazol;

5-[2-(2-Hydroxyethoxy)pyrimidin-4-y1]-4-(4-fluorophenyl)-1-(4-hydroxy cyclohexyl)-imidazol;

5-[2-(2-tert-Butylamino)ethoxy]pyrimidin-4-y1]-4-(4-fluorophenyl)-1-(4-oxocyclohexyl)-imidazol;

5-[2-(2-tert-Butylamino)ethoxy]pyrimidin-4-y1]-4-(4-fluorophenyl)-1-(4-hydroxy cyclohexyl)imidazol;

or a pharmaceutically acceptable salt thereof.
**INTERNATIONAL SEARCH REPORT**

**A. CLASSIFICATION OF SUBJECT MATTER**

IPC(6) : A61K 31/505; C09D 403/04
US CL : 514/274; 544/316
According to International Patent Classification (IPC) or to both national classification and IPC

**B. FIELDS SEARCHED**

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 514/274; 544/316

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic database consulted during the international search (name of database and, where practicable, search terms used)

CAS ONLINE

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. □ Claims Nos.:
   because they relate to subject matter not required to be searched by this Authority, namely:

2. ☒ Claims Nos.: 1-29 (in part)
   because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

   Please See Extra Sheet.

3. □ Claims Nos.:
   because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. □ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2. □ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. □ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4. □ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest □ The additional search fees were accompanied by the applicant's protest.

□ No protest accompanied the payment of additional search fees.
BOX I. OBSERVATIONS WHERE CLAIMS WERE FOUND UNSEARCHABLE

2. Where no meaningful search could be carried out, specifically:

The multitude of variables and their permutations and combinations (e.g. R1, R2, R3, R4, R5, etc.) result in claimed subject matter that is so broad in scope that it is rendered virtually incomprehensible and thus no meaningful search can be given. Note also that the claimed subject matter lacks a significant structural element qualifying as the special technical feature that clearly defines a contribution over the art. The subject matter claimed contains an imidazole group which does not define a contribution over the prior art. Therefore, the first discernable invention as found in Example 1, (the compound therein, the pharmaceutical composition therewith, the method of preparation thereof and the method of treating psoriatic arthritis therewith) has been searched.
