DESCRIPTION

Pharmaceutical Composition for Antagonizing CCR5 comprising Anilide Derivative

5 Technical Field

The present invention relates to a pharmaceutical composition for antagonizing CCR5 comprising an anilide derivative.

10 Background Art

Recently, HIV (human immunodeficiency virus) protease inhibitors are developed for method of the treatment of AIDS (acquired immunological deficient syndrome) and use of the protease inhibitors in combination with conventional two HIV reverse transcriptase inhibitors provides with a further progress of the treatment of AIDS. However, these drugs and their combination use are not sufficient for the eradication of AIDS, and development of new anti-AIDS drugs having different activity and mechanism are sought for.

As a receptor from which HIV invades to a target cell, CD4 is so far known, and recently CCR5 as a second receptor of macrophage-tropic HIV and CXCR4 as a second receptor of T cell-tropic HIV, each of which is G protein-coupled chemokine receptor having seven transmembrane domains, are respectively found out. These chemokine receptors are thought to play an essential role in establishment and spread of HIV infection. In fact, it is reported that a person who is resistant to HIV infection in spite of several exposures retains mutation of homo deletion of CCR5 gene. Therefore, a CCR5 antagonist is expected to be a new anti-HIV drug. However, so far, there has been no report that a CCR5 antagonist is developed as a therapeutic agent of AIDS.

In order to investigate an anti-AIDS drug having CCR5 antagonistic activity, it is necessary to clone CCR5 gene from human tissue derived cDNA library, to ligate said gene
with a vector for expression in animal cells, to introduce said gene into animal cells and to obtain cells expressing CCR5. In addition, with using this transformant, it is necessary to screen a compound which strongly inhibits binding of CC chemokine RANTES, natural ligand, to CCR5 (which strongly antagonizes CCR5). However, so far there has been no report on a low molecule compound having CCR5 antagonistic activity. The present invention is to provide a pharmaceutical composition which is useful for the treatment or prophylaxis of infectious disease of HIV and, in particular, AIDS and which comprises an anilide derivative having CCR5 antagonistic activity.

Disclosure of Invention

The present inventors diligently made extensive studies on compounds having CCR5 antagonistic activity and, as a result, they found that an anilide derivative of the following formula (I') or a salt thereof [hereinafter, referred to as Compound (I')] unexpectedly possesses potent CCR5 antagonistic activity and clinically desirable pharmaceutical effect (e.g. remarkable inhibition of HIV infection to human peripheral mononuclear cells, etc.). detail by means of the following Test Example, Reference
Example and Working Example, which are mere examples of the

Test Example

(1) Cloning of human CCR5 chemokine receptor

Cloning of CCR5 gene was carried out by PCR (polymerase chain
reaction) from human spleen cDNA. With using 0.5ng of
spleen cDNA (Toyobo, QUICK-Clone cDNA) as template, PCR was
performed in DNA Thermal Cycler 480 (Perkin-Elmer) (reaction
conditions: 30 cycles of 95°C for 1 minute, 60°C for 1 minute,
and 75°C for 5 minutes) by adding primer set, 5'-CAGGATCCGATG
GATTATCAAGTGTCAAGTCCAA-3' (25pmol) and 5'-TCTAGATCACAAGGCC
CACAGATATTTCTGCTCC-3' (25pmol), which were designed
referring to nucleotide sequence of CCR5 gene reported by
Samson et al. (Biochemistry, 35(11), 3362-3367 (1996)) and
by using TaKaRa EX Taq (Takara Shuzo). The resultant PCR
product was subjected to agarose gel electrophoresis to
collect about 1.0kb DNA fragment, which was subjected to
Original TA Cloning Kit (Funakoshi) to carry out cloning
of CCR5 gene.

(2) Preparation of plasmid for expression of human CCR5

The plasmid obtained in the above (1) was digested with
restriction enzymes XbaI (Takara Shuzo) and BamHI (Takara Shuzo) and subjected to agarose gel electrophoresis to collect about 1.0kb DNA fragment. The DNA fragment was mixed with plasmid pcDNA3.1 (Funakoshi) for expression in animal cells, said plasmid being digested with XbaI and BamHI, and they were ligated with DNA Ligation Kit Ver.2 (Takara Shuzo). The resulting plasmid was subjected to transformation of competent cell of E. coli JM109 (Takara Shuzo) to obtain plasmid pCKR5.

(3) Introduction of plasmid for expression of human CCR5 into CHO-K1 cell and Expression of said plasmid in CHO-K1 cell

CHO-K1 cells were grown in 750ml of tissue culture flask (Becton Dickinson) using Ham's F12 medium (Nihon Pharmaceutical) containing 10% fetal calf serum (Life Tech Oriental) and took off with 0.5g/L trypsin-0.2g/L EDTA (Life Tech Oriental). The cells were washed with PBS (Life Tech Oriental), centrifuged (1000rpm, 5 minutes), and suspended in PBS. With using Gene Pulser (Bio-Rad Laboratories), DNA was introduced into the cells under the conditions shown below. That is, to the cuvette of 0.4cm gap were added 8 ×10⁶ cells and 10μg of plasmid pCKR5 for expression of human CCR5, and electroporation was carried out under 0.25kV of voltage and 960μF of capacitance. The cells were transferred into Ham's F12 medium (Nihon Pharmaceutical) containing 10% fetal calf serum, and cultivated for 24 hours. The cells were again took off and centrifuged, and suspended in Ham's F12 medium (Nihon Pharmaceutical) containing 10% fetal calf serum and 500μg/ml of geneticin (Life Tech Oriental). The suspension was diluted to give 10⁶ cells/ml of the suspension, which was inoculated on 96 well plate (Becton Dickinson) to give geneticin resistant cells. The resulting geneticin resistant cells were cultivated in 96 well plate (Becton Dickinson), and cells expressing CCR5 were selected from the geneticin resistant cells. That is, in assay buffer (Ham's F12 medium containing 0.5% BSA and
20mM HEPES (Wako Pure Chemical, pH 7.2) to which was added 200pM of $[^{125}]$I-RANTES (Amersham) as ligand, binding reaction was carried out at room temperature for 40 minutes, and the buffer was washed with cooled PBS. To the buffer was added 50 µl/well of 1M NaOH, and the mixture was stirred. Radioactivity was determined with γ-counter to select CHO/CCR5 cells which specifically bind to the ligand.

(4) Evaluation of Test Compounds based on CCR5 antagonistic activity

The CHO/CCR5 were inoculated on 96 well microplate (5×10^4 cells/well) and cultivated for 24 hours. The medium was removed by means of suction, and to each well was added assay buffer containing Test Compound (1 µM) and then 100pM of $[^{125}]$I-RANTES (Amersham) as ligand. Binding assay was carried out at room temperature for 30 minutes, and assay buffer was removed by means of suction. Each well was washed twice with cooled PBS, and 200 µl of Microscint-20 (Packard Instrument, Inc.) was added to each well. Radio-activity was determined with Top-Count Micro Scintillation Counter (Packard Instrument, Inc.).

According to the method described above, inhibition rate of Test Compound (whose number is referred to in the following Examples) to CCR5 binding.

The results are shown in Table 1.

(5) Inhibitory effect on HIV-1 infection to MAGI-CCR5 cell

The plasmid where β-galactosidase gene was ligated downstream of HIV-1 LTR was introduced into CD4 positive HeLa cell, to which human CCR5 was further introduced to obtain transformant MAGI-CCR5. By using said transformant MAGI-CCR5, degree of HIV-1 infection was calculated from β-galactosidase activity (blue color due to decomposition of 5-bromo-4-chloro-3-indolyl-β-D-galactopyranoside). Specifically, MAGI-CCR5 cells were suspended in DMEM medium containing 10% serum to prepare 5 x 10^4 cells/ml suspension.

To each well of 96 well plate was inoculated 200 μl of the suspension, and the cells were cultivated at 37°C overnight. The medium was removed by means of suction, and to the residue was added 100 μl of the above medium containing 1.6 μM of Test Compound 96 or 0.064 μM of Test Compound 248 and 100 μl of the above medium containing 300 PFU of HIV-1 BA-L cells. The cells were cultivated at 37°C for 2 days. The medium was removed by means of suction. To the residue was added 200 μl of cell fixative (PBS containing 1% formaldehyde and 0.2% glutaraldehyde), and the mixture was allowed to stand at room temperature for 5 minutes and washed twice with PBS. To the mixture was added 100 μl of staining solution (PBS containing 4 μM potassium ferrocyanide, 4 μM potassium ferricyanide, 2 μM MgCl₂ and 0.4 mg/ml X-gal), and the mixture was allowed to stand at 37°C for 50 minutes and washed twice with PBS. The number of blue cells was counted by microscope and defined as the number of cells infected with HIV-1. According to this method, inhibition rate on HIV-1 infection was determined and found that Compounds 96 and 248 respectively show 92% and 100% inhibition on HIV-1 infection.

(6) Inhibitory effect on HIV-1 infection to human PBMC
From normal person human peripheral blood mononuclear cells (PBMC) were separated, and the cells were stimulated with 10μg/ml of PHA (Phytohemagglutinin) and 20U/ml of interleukin-2 (IL-2) for 3 days. The cells were suspended in RPMI-1640 medium containing 20% serum to prepare 1×10^6/ml suspension. To the suspension were infected HIV-1 BA-L cells (20ng as an amount of p24 antigen), and viruses were absorbed at 37°C for 2 hours. The cells were washed and suspended in RPMI-1640 medium containing 20% serum and IL-2 20U/ml to prepare 1×10^5/ml suspension. To the PBMC suspension was added the same amount of a solution which contains 2.0 μM of Test Compound 96 or 0.32 μM of Test Compound 248, and the cells were cultivated at 37°C for 7 days in carbon dioxide gas incubator. The amount of p24 antigen in supernatant of the cultivated medium was determined by enzyme-linked immunosorbent assay (ELISA) and defined as degree of HIV-1 infection. According to this method, inhibition rate on HIV-1 infection was determined and found that Compounds 96 and 248 respectively show 96% and 74% inhibition on HIV-1 infection.
