Title: 1, 2, 4 -TRIAZOLE DERIVATIVES AS SEROTONERGIC MODULATORS

Abstract: The invention relates to novel 5-hydroxytryptamine (5-HT) receptor modulator compounds of formula (I); wherein A, B, R₁-R₈, T, W, X, Y, Z and m are defined herein, to pharmaceutical compositions comprising these compounds and to their use in the treatment of conditions associated with 5-HT action.
NOVEL SEROTONERGIC MODULATORS

The invention relates to novel 5-hydroxytryptamine (5-HT) receptor agonist compounds, to pharmaceutical compositions comprising these compounds and to the use of the compounds for the treatment of conditions associated with 5-HT action.

The 5-HT\textsubscript{1A} receptor is a 5-HT receptor subtype consisting of a 421 amino acid protein with a molecular weight of about 42,000 Daltons. 5-HT\textsubscript{1A} receptors are located presynaptically in the raphe nuclei, where they act as cell body autoreceptors to inhibit the firing rate of 5-HT neurons, and are located postsynaptically in limbic and cortical regions, where they also attenuate firing activity. Recent studies have indicated that 5-HT\textsubscript{1A} agonists and partial agonists are particularly relevant to the treatment of anxiety and depression.

Currently, the majority of 5-HT\textsubscript{1A} agonists are azapirones, e.g. Buspirone (disclosed in US 4,182,763), Gepirone, Zalospirone, Ipsapirone and Tandospirone. However, despite their apparent efficacy, these compounds can cause unpleasant side effects, such as dizziness, fatigue, nausea, nervousness, light-headedness and restlessness. Furthermore, the azapirones also suffer from rapid metabolism leading to a very short elimination half-life (~2-3h), which necessitates a twice daily dosing regime.

In addition, US 4,487,773 discloses phenoxyalkyl substituted-1,2,4-triazolones having anti-depressant properties (including 3\textsuperscript{H}-1,2,4-triazole-3-one, 5-[3-[4-(3-chlorophenyl)-1-piperazinyl]propyl]-4-ethyl-2,4-dihydro which is described as an intermediate), and WO 2004/069794 discloses arylpiperazinyl sulphonamide compounds, and uses thereof for treating diseases including those mediated directly or indirectly by 5-HT receptors. Khadse, B.G. \textit{et al} (1976) Bull Haff Instt 4(2), 1-4 discloses 3-mercapto-4-(p-chlorophenyl)-5[N-(p-chlorophenyl)-N-piperazinomethyl]-1,2,4-triazole as an example of an antibacterial agent.
Papakonstantinou-Garoufalia, S.S. et al (1998) J. Pharm. Pharmacol. 50, 117-124 discloses 4-(2,4-dichlorophenyl)-5-[4-(4-nitrophenyl-l-piperazinyl)methyl]-4\textsubscript{H}-1,2,4-triazole-3-thiol, 4-(2,4-dichlorophenyl)-5-[4-(4-methoxyphenyl-1-piperazinyl)methyl]-4\textsubscript{H}-1,2,4-triazole-3-thiol and 4-(2,4-dichlorophenyl)-5-[4-(2-methoxyphenyl)-1-piperazinyl)methyl]-4\textsubscript{H}-1,2,4-triazole-3-thiol as potential antiviral agents.

Certain triazolone intermediates are also listed in chemical abstract databases with no associated with reference or uses, for example: 3\textsubscript{H}-1,2,4-triazole-3-thione, 2,4-dihydro-5-[2-[4-(2-methoxyphenyl)-1-piperazinyl]ethyl]-4-phenyl (CAS Registry No. RN 418780-84-4), 3\textsubscript{H}-1,2,4-triazole-3-thione, 5-[2-[4-chlorophenyl)-1-piperazinyl]ethyl]-2,4-dihydro-4-phenyl (CAS Registry No. 418785-15-6) and 3\textsubscript{H}-1,2,4-triazole-3-thione, 5-[4-[3-chloro-5-(trifluoromethyl)-2-pyridinyl]-1-piperazinyl]methyl-2,4-dihydro-4-phenyl (CAS Registry No. 338979-15-0).

It is therefore an object of the invention to provide further 5-HT\textsubscript{1A} agonist compounds.

According to a first aspect of the invention there is provided a compound of formula (I) or a pharmaceutically acceptable salt, solvate or hydrate thereof:

![Chemical Structure](image-url)
wherein each $R_1$ independently represents halogen, $-CF_1$, $-NO_2$, $C_{1-6}$ alkoxy, $-NR_6^6COR_7^7$ or $-NR_6^6SO_2^7R_7^7$.

$3H-1,2,4$-triazole-3-thione, $5-[2-[4$-chlorophenyl]-l$-piperazinyl]ethyl]-2,4$-dihydro-$4$-phenyl;

$3H-1,2,4$-triazole-3-thione, $5-[4-[3$-chloro-5$-(trifluoromethyl)-2$-pyridinyl]-l$-piperazinyl]methyl$-2,4$-dihydro-$4$-phenyl;

Advantageously, the compounds of formula (I) have been found to be 5-HT agonists, for example 5-HT$_{1A}$, 5-HT$_{1D}$, 5-HT$_{1E}$, or 5-HT$_{1F}$ agonists, for instance 5-HT$_{1A}$ agonists, that can be used for the treatment of disorders or conditions associated with 5-HT action. In addition to exhibiting 5-HT$_{1A}$ receptor agonist activity, certain compounds of formula (I) also exhibit dopamine D2 receptor antagonist activity.

In particular, it has been discovered that certain compounds are very active at the 5-HT$_{1A}$ receptor, and are not metabolised rapidly. Thus, certain compounds demonstrate an increased stability half life in cell based experiments, which may allow for reduced dosing requirements for disorders or conditions associated with 5-HT action.

Furthermore, certain compounds of formula (I) are highly selective for 5-HT receptors, with little or no affinity for other receptors, such as α-adrenergic and dopamine D2 receptors, thus reducing the risk of biological side effects. In one embodiment, certain compounds of formula (I) have greater than 10 fold selectivity for the 5-HT$_{1A}$ receptor with respect to the α-adrenergic and dopamine D2 receptor. In a further embodiment, certain compounds of formula (I) have greater than 50 fold selectivity for the 5-HT$_{1A}$ receptor with respect to the α-adrenergic and dopamine D2 receptor. In a yet further embodiment, certain compounds of formula (I) have greater than 100 fold selectivity for the 5-HT$_{1A}$ receptor with respect to the α-adrenergic and dopamine D2 receptor. In a still yet further embodiment, certain compounds of formula (I) have greater than 1000 fold selectivity for the 5-HT$_{1A}$ receptor with respect to the dopamine D2 receptor.

The subject invention also includes isotopically labelled compounds, which are identical to those recited in formula (I) and following, but for the fact that one or more atoms are replaced by an atom having an atomic mass or mass number different from the atomic mass or mass number most commonly found in nature. Examples of isotopes that can be incorporated into compounds of the invention include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorous, fluorine, iodine, and chlorine, such as 3H, 13C, 14C, 19F, 125I and 125I. Examples of such incorporation may be for compounds of formula (I) wherein R' represents 19F or -OCH219F or R3 represents -CH219F.
Compounds of the present invention and pharmaceutically acceptable salts of said compounds that contain the aforementioned isotopes and/or other isotopes of other atoms are within the scope of the present invention. Isotopically-labeled compounds of the present invention, for example those into which radioactive isotopes such as $^3$H, $^{14}$C are incorporated, are useful in drug and/or substrate tissue distribution assays. Tritiated, i.e., $^3$H, and carbon-14, i.e., $^{14}$C, isotopes are particularly preferred for their ease of preparation and detectability. $^{11}$C and $^8$F isotopes are particularly useful in PET (positron emission tomography), and $^{125}$I isotopes are particularly useful in SPECT (single photon emission computerized tomography). PET and SPECT are useful in brain imaging. Further, substitution with heavier isotopes such as deuterium, i.e., $^2$H, can afford certain therapeutic advantages resulting from greater metabolic stability, for example increased in vivo half-life or reduced dosage requirements and, hence, may be preferred in some circumstances. Isotopically labelled compounds of formula (I) and following of this invention can generally be prepared by carrying out the procedures disclosed in the Schemes and/or in the Examples below, by substituting a readily available isotopically labelled reagent for a non-isotopically labelled reagent.

Methods of Synthesis

It will be appreciated that the compounds of formula (I) may be synthesised via a variety of different routes using commercially available starting materials and/or starting materials prepared by conventional methods.

According to a further aspect of the invention, there is provided a process for preparing a compound of formula (I), which comprises:

(a) preparing a compound of formula (I) wherein R$^1$ represents C$_6$ alkoxy and R$^1$ represents hydrogen which comprises ring closure of a compound of formula (II):
or:
(b) preparing a compound of formula (I) wherein m represents 1, R\(^1\) represents -NR\(^6\)COR\(^7\) and R' represents hydrogen which comprises reacting a compound of formula (III):

with a compound of formula L\(^1\)COR\(^7\),
wherein L' represents a suitable leaving group such as chlorine, and R\(^2\), R\(^5\), R\(^6\), R\(^7\),-A-B-, T, X, Y, Z and W are as defined for formula (I); and optionally thereafter
(c) interconversion of a compound of formula (I) to a further compound of formula (I); and optionally thereafter
(d) deprotection of a protected derivative of formula (I).
Step (a) typically comprises treatment of a compound of formula (II) with a strong alkali (e.g. 2M NaOH).

Step (b) typically comprises acylation of the amine of a compound of formula (III) to form an amide, e.g. using an acid halide, e.g. chlorine, in the presence of pyrimidine.

Step (c) may be performed using conventional interconversion procedures such as epimerisation, oxidation, reduction, alkylation, nucleophilic or electrophilic aromatic substitution, ester hydrolysis, amide bond formation or transition metal mediated coupling reactions. Examples of transition metal mediated coupling reactions useful as interconversion procedures include the following: Palladium catalysed coupling reactions between organic electrophiles, such as aryl halides, and organometallic reagents, for example boronic acids (Suzuki cross-coupling reactions); Palladium catalysed amination and amidation reactions between organic electrophiles, such as aryl halides, and nucleophiles, such as amines and amides; Copper catalysed amidation reactions between organic electrophiles (such as aryl halides) and nucleophiles such as amides; and Copper mediated coupling reactions between phenols and boronic acids.

One example of an interconversion is where compounds of formula (I) wherein \( R^1 \) represents hydrogen may be converted to compounds of formula (I) wherein \( R^1 \) represents \( C_{1-6} \) alkyl, for example using an alkylating agent, such as iodomethane, in the presence of a solvent, e.g. acetonitrile, and a base, e.g. PS-BEMP.

In step (d), examples of protecting groups and the means for their removal can be found in T. W. Greene 'Protective Groups in Organic Synthesis' (J. Wiley and Sons, 1991). Suitable amine protecting groups include sulfonyl (e.g. tosyl), acyl (e.g. acetyl, \( 2',2',2'' \)-trichloroethoxycarbonyl, benzyloxy carbonyl or \( t \)-butoxycarbonyl) and arylalkyl (e.g. benzyl), which may be removed by
hydrolysis (e.g. using an acid such as hydrochloric acid in dioxan or trifluoroacetic acid in dichloromethane) or reductively (e.g. hydrogenolysis of a benzyl group or reductive removal of a 2',2',2'-trichloroethoxycarbonyl group using zinc in acetic acid) as appropriate. Other suitable amine protecting groups include trifluoroacetyl (COCF₃) which may be removed by base catalysed hydrolysis or a solid phase resin bound benzyl group, such as a Merrifield resin bound 2,6-dimethoxybenzyl group (Ellman linker), which may be removed by acid catalysed hydrolysis, for example with trifluoroacetic acid.

In one embodiment, compounds of formula (II) may be prepared in accordance with the following Scheme 1, wherein R², R⁴, R⁵, -A-B-, T, X, Y, Z, W and m as defined for formula (I):

These excipients may be for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example corn starch or alginic acid; binding agents, for example, starch, gelatin or acacia; and lubricating agents, for example magnesium stearate, stearic acid or talc.

The tablets may be uncoated or they may be coated by known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate may be employed. They may also be coated by the techniques described in U.S. Patent Nos. 4,356,108; 4,166,452; and 4,265,874, incorporated herein by reference, to form osmotic therapeutic tablets for controlled release.

Formulations for oral use may also be presented as hard gelatine capsules where the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatine capsules wherein the active ingredient is mixed with water or an oil medium, for example peanut oil, liquid paraffin, or olive oil.

Aqueous suspensions may contain the active compounds in admixture with excipients suitable for the manufacture of aqueous suspensions. Such excipients are suspending agents, for example sodium carboxymethylcellulose, methylcellulose, hydroxypropylmethylcellulose, sodium alginate, polyvinylpyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents may be a naturally-occurring phosphatide such as lecithin, or condensation products of an alkylene oxide with fatty acids, for example polyoxyethylene stearate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example, heptadecaethyl-eneoxycetanol, or

The oily suspensions may contain a thickening agent, for example beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as those set forth above, and flavouring agents may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an anti-oxidant such as ascorbic acid.

Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water provide the active compound in admixture with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients, for example, sweetening, flavouring, and colouring agents may also be present.

The pharmaceutical compositions of the present invention may also be in the form of oil-in-water emulsions. The oily phase may be a vegetable oil, for example, olive oil or arachis oil, or a mineral oil, for example a liquid paraffin, or a mixture thereof. Suitable emulsifying agents may be naturally-occurring gums, for example gum acacia or gum tragacanth, naturally-occurring phosphatides, for example soy bean, lecithin, and esters or partial esters derived from fatty acids and hexitol anhydrides, for example sorbitan monooleate, and condensation products of said partial esters with ethylene oxide, for example...
polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening and flavouring agents.

Syrups and elixirs may be formulated with sweetening agents, for example glycerol, propylene glycol, sorbitol or sucrose. Such formulations may also contain a demulcent, a preservative and flavouring and colouring agents. The pharmaceutical compositions may be in the form of a sterile injectable aqueous or oleaginous suspension. This suspension may be formulated according to known methods using suitable dispersing or wetting agents and suspending agents described above. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution, and isotonic sodium chloride solution. In addition, sterile, fixed oils are conveniently employed as a solvent or suspending medium. For this purpose, any bland fixed oil may be employed using synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

Parenteral administration may be performed by subcutaneous, intramuscular, intraperitoneal or intravenous injection by means of a syringe, optionally a pen-like syringe. Alternatively, parenteral administration can be performed by means of an infusion pump. A further option is a composition which may be a solution or suspension for the administration of the prolactin receptor antagonist in the form of a nasal or pulmonal spray. As a still further option, the pharmaceutical compositions containing the compound of the invention can also be adapted to transdermal administration, e.g. by needle-free injection or from a patch, optionally an iontophoretic patch, or transmucosal, e.g. buccal, administration.

Pharmaceutical compositions for parenteral administration include sterile aqueous and non-aqueous injectable solutions, dispersions, suspensions or
emulsions as well as sterile powders to be reconstituted in sterile injectable solutions or dispersions prior to use.

The term "aqueous composition" is defined as a composition comprising at least 50 % w/w water. Likewise, the term "aqueous solution" is defined as a solution comprising at least 50 %w/w water, and the term "aqueous suspension" is defined as a suspension comprising at least 50 %w/w water. Such aqueous solutions should be suitably buffered if necessary and the liquid diluent first rendered isotonic with sufficient saline or glucose. The aqueous solutions are particularly suitable for intravenous, intramuscular, subcutaneous and intraperitoneal administration. The sterile aqueous media employed are all readily available by standard techniques known to those skilled in the art. Depot injectable formulations are also contemplated as being within the scope of the present invention.

When the compounds of the invention or composition thereof is used in combination with a second therapeutic agent active against the same disease state, they may conveniently be administered alone or in combination, in either single or multiple doses, sequentially or simultaneously, by the same route of administration, or by a different route.

**Effective Dosages**

The compounds of the invention, or compositions thereof, will generally be used in an amount effective to achieve the intended result, for example in an amount effective to treat or prevent the particular disease being treated. The compound(s) may be administered therapeutically to achieve therapeutic benefit. By therapeutic benefit is meant eradication or amelioration of the underlying disorder being treated and/or eradication or amelioration of one or more of the systems associated with the underlying disorder. Therapeutic benefit also includes halting or slowing the progression of the disease, regardless of whether improvement is realised.
The exact dosage will depend upon the frequency and mode of administration, the sex, age, weight and general condition of the subject treated, the nature and severity of the condition treated and any concomitant diseases to be treated and other factors evident to those skilled in the art. Determination of the effective dosage is well within the capabilities of those skilled in the art.

When a compound of the invention or a pharmaceutically acceptable salt, solvate or prodrug thereof is used in combination with a second therapeutic agent active against the same disease state the dose of each compound may differ from that when the compound is used alone. Appropriate doses will be readily appreciated by those skilled in the art.

Efficacy analysis
Selected compounds were tested for 5HT$_{1A}$ agonist activity using a GTP$\gamma$S assay.

GTP$\gamma$S binding for 5HT1A was determined according to the procedures of Adlersberg et al. J Neurosci. Res. 2000, 61(6): 674-685. Compounds were incubated for 30 minutes at 30°C in 20mM HEPES, pH7.4, 100mM NaCl, 10mM MgCl2, 1mM DTT, 1mM EDTA with human CHO cells Chinese hamster. Quantitation of bound [$^{35}$S] GTP$\gamma$S was determined with agonist significance criteria of > 50% increase in bound [$^{35}$S] GTP$\gamma$S relative to serotonin response.

The compounds of Examples 10, 21, 28, 33, 41 and 42 were shown to exhibit EC50s with potency greater than 200nM.

Stability analysis
Metabolic stability of selected compounds in human liver microsomes was assessed using the procedure described by Kuhnz and Gieschen, Drug Metab. Dispos. 1998, 26: 1120-1127. Compounds (1µM) were measured by LC/MS following 0 and 60 minute incubations with human liver microsomes (0.3mg/mL) at pH7.4 and 37°C

The compounds of Examples 13, 17 and 26 demonstrated half lives of at least 1 hour in both rat and human liver microsomes.
