Abstract: The present invention relates in general to the field of inflammation. In particular the present invention relates to the use of natural compounds for the preparation of a product to treat or prevent inflammation. For example an extract of wolfberry was shown to have anti-inflammatory properties. One embodiment of the present invention relates to the use of a primary composition comprising wolfberries or a part thereof for the preparation of a product to treat or prevent inflammation.
Wolfberries and inflammation

The present invention relates in general to the field of inflammation. In particular, the present invention relates to the use of natural compounds for the preparation of a product to treat inflammation. For example, an extract of wolfberry was shown to have anti-inflammatory properties.

Inflammation is the complex biological response of tissues to harmful stimuli, such as pathogens, damaged cells, or irritants. It is generally a protective attempt by the organism to remove the injurious stimuli as well as initiate the healing process for the tissue. However, insufficiently regulated inflammation can lead to several diseases irrespective of the age of the subject.

Ageing is associated with a dysregulation of the immune system, such as a noted decline in cell-mediated immune response concomitant with an increased humoral immune dysfunction (e.g., lower response to vaccine). Aging is furthermore often associated with a status of low-grade inflammation. Consequently, in particular many elderly subjects are at increased risk of infectious and non-infectious diseases that contribute to morbidity and mortality.

Wolfberry is already known for its multiple health benefits, based on its multi-nutrients (e.g., zeaxanthin, vitamins and Lycium barbarum polysaccharides) composition.

However, there remains a need in the art to have available natural compounds that have anti-inflammatory properties.

For example, nutritional intervention such as with n-3 PUFA (poly unsaturated fatty acid) diminished inflammatory cell functions, but also decreased cell-mediated immune response (e.g., lymphocyte proliferation and NK activity), which can lead to potential detrimental effects with regard to the host defence.
Hence it was the object of the present invention to provide the art with an alternative natural compound that has anti-inflammatory properties and that does not have any detrimental effects with regard to the subject's immune defence.

The present inventors were surprised to find that a wolfberry extract has anti-inflammatory properties. Consequently the object of the present invention was achieved by providing the art with a use of a wolfberry extract to prepare a product to treat and/or prevent inflammation. It was also found that the immune response was maintained.

Consequently, one embodiment of the present invention is the use of a primary composition comprising wolfberries or a part thereof and optionally milk or a milk-protein containing carrier for the preparation of a product to treat and/or prevent inflammation.

The product may be intended for oral or topical administration.

The milk or milk protein can be derived from animal or plant origin, or from mixtures thereof. Preferably, the milk is cows milk, lama milk, buffalo milk, goat milk, sheep milk, vegetable milk, in particular soy milk or a mixture thereof. Milk protein is to be understood as a protein fraction obtainable from one or more of the milk types listed above.

Preferably, the primary composition is a miscible composition.

Advantageously, in particular if the primary composition comprises milk or a milk-protein containing carrier, it has a close profile of the essential active components of whole wolfberries, it has a good stability, miscibility and/or dispersibility in aqueous systems.

Moreover, in particular if comprising milk or a milk-protein containing carrier, the primary composition has an enhanced nutritional value, in the form of a better bioavailability and stability. It has a pleasant taste and colour. It can be used
directly or concentrated or dried into powder for several applications into daily-consumed food products or other nutritional uses.

All these features can be achieved if the primary composition is prepared by a process for preparing the primary composition to deliver the essential lipophilic and/or hydrophilic bioactive components of wolfberries comprising the steps of: i) mixing and milling wolfberry material in milk or milk protein-containing liquid medium, ii) optionally separating insoluble fibers to obtain an aqueous suspension iii) optionally pasteurising the resulting suspension iv) optionally add synthetic or natural bioactive components during the processing v) and further optionally drying the suspension to obtain a powder.

Consequently, in one embodiment of the present invention the primary composition is obtainable by a process comprising the steps of : i) mixing and milling wolfberry material in milk or milk protein-containing liquid medium, ii) optionally separating insoluble fibers to obtain an aqueous suspension iii) optionally pasteurising the resulting suspension iv) optionally add synthetic or natural bioactive components during the processing v) and further optionally drying the suspension to obtain a powder.

This process has the major advantage of being natural and cost effective enabling improved delivery of multi-nutrients in the form of a combination of stabilized water- and fat-soluble compounds in their natural compositions, free of organic solvent residues.

In a further aspect, the invention provides a method for increasing miscibility or dispersibility in an aqueous system, stability, and bioavailability of bioactive compounds of wolfberry material using a process as described above, in particular, by using milk or milk proteins, soy milk or milk-like proteins from plants for extracting and delivering the multi-nutrients of functional ingredients of wolfberries.
A primary composition as described above can be used for delivering the multi-
nutrients of functional ingredients of wolfberries with improved bioavailability, miscibility and stability.

The term bioactive compound is to be understood to mean molecules or components showing a biological activity or a health impact when orally or topically applied.

Wolfberries may be used, e.g., in the form of fruits and other parts of the plant. Fruits may be used in the form of fresh, concentrated or dried materials, for example, air or freeze dried material. It is however preferred to use dried ripe fruit.

In a preferred embodiment of the present invention the primary composition comprises at least a part of the essential lipophilic and/or hydrophilic bioactive components of wolfberries.

The essential lipophilic and/or hydrophilic bioactive components are preferably selected from the group consisting of lipids, alkaloids, proteins, carbohydrates, glycoproteins, carotenoids, polyphenol compounds such as flavonoids, vitamins, minerals, or mixtures thereof.

The carotenoids may be selected from the group consisting of carotenes and xanthophylls such as lycopene, carotene, phytofluene, phytoene, canthaxanthin, beta-cryptoxanthin, capsanthin, lutein, zeaxanthin, or those in the form of fatty acid esters, or mixtures thereof.

The glycoproteins are preferably selected from the group consisting of arabinogalactan proteins, in particular *Lycium barbarum* polysaccharide and macromolecules that can be detected by the beta-glucosyl Yariv reagent.

The flavonoids are preferably selected from the group consisting of flavones such as apigenin, luteolin or diosmetin, flavonols such as quercetin, myricetin, kaempferol, flavanones, anthocyanidins such as pelargonidin, malvidin, or isoflavones such as genistein, daidzein, or mixtures thereof.
The primary composition of the present invention may contain at least the essential bioactive components of wolfberries or a part thereof, excluding insoluble fibres, in a milk or milk protein-containing carrier. The milk carrier may be in the form of skimmed milk or whole milk from animal or plant origin (e.g. soy milk, juice or coconut milk, etc.). In a more preferred embodiment, cow's milk or soy milk are used, depending on the primary composition which is desired. The milk-containing carrier may be any edible liquid containing milk proteins such as caseins or whey proteins, for example.

Vegetable oils may optionally be added to the liquid medium.

The wolfberry material may be mixed and milled in said milk or milk protein-containing liquid medium in a respective ratio of about 1:1 to 1:1000, preferably from 1:5 to 1:50. The mixing and milling step may be carried out at a temperature of from 1 to 95°C, preferably from about 20 to 80°C and more preferably from 40 to 80°C. Then, insoluble fibres may be at least partially removed to obtain an aqueous suspension.

This can be done by any conventional method. The resulting primary composition may be further pasteurized and/or dried into a powder by techniques known in the art. The primary composition obtained may also be in liquid or gel form.

The present invention thus provides a primary composition having a similar profile of the important nutrients as the whole fruit, it has a good stability, miscibility and bioavailability. These compositions may be highly dispersible in an aqueous system, if the powder form is chosen. In this case, the powder is dispersible in cold or hot water, for example. It can equally well be added in milk.

The composition may additionally comprise one or more of emulsifiers, stabilizers, antioxidants and other additives. Use is preferably made of emulsifiers compatible in food, such as phospholipids, for example lecithin, polyoxyethylene sorbitan mono- or tristearate, monolaurate, monopalmitate, mono- or trioleate, a mono- or diglyceride.
Use may also be made of any type of stabilizer that is known to be usable in food, in cosmetics or in pharmaceuticals.

Use may be made of any type of antioxidants that is known to be usable in food, in cosmetics or in pharmaceuticals.

Use may be further made of additives, of flavourings, of colorants known to be usable in food, cosmetics or pharmaceuticals.

The emulsifiers, stabilizers, antioxidants and additives may be added in accordance with the intended final use of the primary composition.

The composition may further contain synthetic or natural bioactive ingredients such as amino acids, fatty acids, vitamins, minerals, carotenoids, polyphenols, etc. that can be added preferably either by dry or by wet mixing to said composition before pasteurization and/or drying.

The product prepared by the use of the present invention may be a dietary supplement, a supplement to be used as or in a medicament or a supplement to be used as or in a cream.

In a preferred embodiment of the present invention the product is intended for use by and/or application to humans or pets.

The product can be administered to subjects of any age, in particular infants, children, adolescents, adults and/or elderly. However, the benefits of wolfberries appear to be in particular well suited for adults and the elderly.

According to a preferred embodiment of the present invention the product prepared by the use of the present invention is intended for human consumption in or as a foodstuff. The foodstuff can be consumed enterally - which for the purpose of the present invention includes orally - or parenterally.
Accordingly, the primary composition may be an additive in a foodstuff for oral administration, such as in a nutritional composition, a food supplement, a pet food product, a cosmetic preparation or in a pharmaceutical preparation. The primary composition may also be an additive in a product for topical application such as cosmetics or pharmaceutical products.

Consequently, the product prepared by the use of the present invention may be a nutritional complete formula, a dairy product, a chilled or shelf stable beverage, a product for lactating mothers, a liquid drink, a soup, a dietary supplement, a meal replacement, a nutritional bar, a confectionery, a milk or a fermented milk product, a yoghurt, a milk based powder, an enteral nutrition product, an infant formula, an infant nutritional product, a puree, a cereal product or a fermented cereal based product, an ice-cream, candy, sweets, biscuits, cakes, a chocolate, a cappuccino, a coffee, a culinary product such as mayonnaise, tomato puree or salad dressings, a pet food or a pet beverage. In a preferred embodiment, a food composition for human consumption is supplemented by the above primary composition. The primary composition, which is preferably in the form of a powder, can be dispersed in the above-mentioned foods or drinks in amounts as to have a daily intake in bioactive nutrients as described above, which can be selected depending on the desired effect and target tissue. The amount of the primary composition or food composition to be consumed by the individual to obtain a beneficial effect will also depend upon its size, its type, and its age.

If the product is a nutritional supplement for oral administration it may be present in capsules, gelatin capsules, soft capsules, tablets, sugar-coated tablets, pills, pastes or pastilles, gums, or drinkable solutions or emulsions, a syrup or a gel. The dose of the primary composition may be varied depending on the intended purposes by those of skill in the art but will generally be between about 0.1 to 100 weight-% of the primary composition. Such a supplement might also include a sweetener, a stabilizer, an antioxidant, an additive, a flavouring agent and/or a colorant. A supplement for a cosmetic purpose might additionally comprise a compound active with respect to the skin.
In another embodiment, if the product of the present invention is a pharmaceutical composition it can be administered for prophylactic and/or therapeutic treatments.

In therapeutic applications, compositions are administered in an amount sufficient to at least partially cure or arrest the symptoms of the disease and its complications. An amount adequate to accomplish this is defined as "a therapeutically effective dose". Amounts effective for this purpose will depend on a number of factors known to those of skill in the art such as the severity of the disease and the weight and general state of the patient. In prophylactic applications, compositions according to the invention are administered to a patient susceptible to or otherwise at risk of a particular disease in an amount that is sufficient to at least partially reduce the risk of developing a disease. Such an amount is defined to be "a prophylactic effective dose". Again, the precise amounts depend on a number of patient specific factors such as the patient's state of health and weight.

The compounds of the invention if administered as a pharmaceutical composition are preferably administered with a pharmaceutically acceptable carrier, the nature of the carrier differing with the mode of administration, for example, enteral, oral and topical (including ophthalmic) routes. The desired formulation can be made using a variety of excipients including, for example, pharmaceutical grades of mannitol, lactose, starch, magnesium stearate, sodium saccharin, cellulose, magnesium carbonate.

It will be appreciated that the skilled person will, based on his own knowledge select the appropriate components and galenic form to target the active compound to the tissue of interest, e.g. the skin, colon, stomach, eyes, kidney or liver, taking into account the route of administration.

The invention also relates to a cosmetic composition comprising the primary composition described above. It may be formulated in lotions, shampoos, creams, sun-screens, after-sun creams, anti-ageing creams and/or ointments, for example. This composition which can be used topically additionally comprises a fat or an oil which can be used in cosmetics, for example those mentioned in the CTFA work,
Cosmetic Ingredients Handbook, Washington. It is also possible to add other
cosmetically active ingredients. The composition additionally comprises a
structuring agent and an emulsifier. Other excipients, colorants, fragrances or
opacifiers can also be added to the composition. It will be appreciated that the
present cosmetic products will contain a mixture of different ingredients known to
the skilled person, ensuring a fast penetration of the said substance into the skin
and preventing degradation thereof during storage.

It will be understood that the concept of the present invention may likewise be
applied as an adjuvant therapy assisting in presently used medications. Since the
compounds of the present invention may easily be administered together with
food material special clinical food may be applied containing a high amount of the
said substances.

Administering to a pet or human, a food, a nutritional supplement, a cosmetic or
pharmaceutical composition as described above, results in an improved health, in
particular by at least partially reducing inflammation.

The inflammation that can be treated by applying the product prepared by the use
of the present invention can be selected from the group consisting of acute
inflammations such as sepsis, infections, burns and chronic inflammations such
as inflammatory bowel disease, Crohn's disease, ulcerative colitis, necrotizing
enterocolitis, skin inflammation, such as UV or chemical-induced skin
inflammation, eczema, reactive skin, psoriasis, vitiligo, acne, inflammatory bowel
syndrome, liver inflammation, alcoholic cirrhosis, allergy, atopy, bone
inflammation, rheumatoid arthritis, systemic lupus, Gougerot-Sjögren's syndrome,
Reiter's syndrome, poliomyelitis, dermato-myositis, thyroiditis, Basedow,
Hashimoto, type I diabetes, Addison's disease, auto-immunes hepatitis, celiac
disease, Biermer's disease, multiple sclerosis, myasthenia, encephalomyelitis,
eye inflammation, obesity-associated inflammation, age-related low-grade
inflammation, Blau's syndrome, Alzheimer's disease, cardiovascular diseases,
atherosclerosis, metabolic syndrome, gingivitis and paronditis.
The present inventors have investigated the molecular mechanism of the anti-inflammatory effect primary composition of the present invention. Without wishing to be bound by theory the inventors presently believe that it suppresses the LPS-mediated pro-inflammatory cytokine production by macrophages (Figure 1) and TNF-α- or LPS-induced NF-κB activation (Figure 2) pathway in human intestinal epithelial cells. In preclinical studies, dietary supplementation with the primary composition of the present invention demonstrated strong anti-inflammatory properties in a murine model of acute intestinal inflammation (Figures 3 to 10). In addition, the primary composition of the present invention was further capable of reducing the expression of pro-inflammatory cytokines, such as TNF-α, in the liver of aged mice (Figure 11). Furthermore, dietary supplementation with the primary composition of the present invention enhanced antigen-specific humoral and cell-mediated immune responses in aged mice (Figure 12 and 13, respectively). Thus, primary composition of the present invention was shown to be beneficial in reducing the inflammatory status. At the same time, the primary composition of the present invention further is capable of supporting the immune system.

Consequently, the product prepared by the use of the present invention can be used to reduce the inflammatory status and - simultaneously - to boost the immune system.

Hence, the primary composition of the present invention has the potential to bring the impaired immune and inflammatory response back to homeostasis. By this dual effect, the primary composition of the present invention is, e.g., suitable for the use in products for elderly, clinical and pet nutrition.

In particular the primary composition of the present invention is beneficial in maintaining the immune function during ageing while reducing the age-related low-grade inflammatory status.

Also the primary composition of the present invention can be used in clinical products to control acute or chronic inflammation.
Hence, in one embodiment of the present invention the product prepared by the use of the present invention is used to improve an impaired immune response. It may also be used to enhance an antigen-specific humoral immune response and/or to enhance the cell-mediated immune response.

Additionally, the primary composition and/or the product of the present invention may be used treat or prevent disorders related to oxidative stress. The inventors have shown that the application of the primary composition and/or the product of the present invention can induce a strong increase of anti-oxidant genes such as GPX-1, CAT1 and SOD2 (Figure 9). Consequently, the primary composition and/or the product of the present invention may provide protection against oxidative stress, caused for example by free radicals, such as •O2⁻, the superoxide anion; H₂O₂, hydrogen peroxide; •OH, the hydroxyl radical; ROOH, organic hydroperoxide; RO•, alkoxy radicals; ROO•, peroxy radicals; HOCl, hypochlorous acid; OONO⁻, peroxynitrite; and/or NOv

It is clear to those of skill in the art that it is possible to freely combine any features described herein without departing from the scope of the present invention as originally disclosed.

Further advantages and features of the present invention will be apparent from the following examples and figures.

Figure 1 shows the inhibition of LPS-mediated IL-6 production by LWB in the murine macrophage cell line (RAW cells).

Example 1:

Preparation of a primary composition comprising wolfberhes and milk (LWB, Lacto-Wolfberry)
Dried wolfberry fruits (40 g) and whole milk (300 g) were introduced in a 1-liter container. The mixture was kept to stand for 10 minutes and treated with Polytron (Dispersing and Mixing Technology by KINEMATICA, PT3000) at 26000 rpm for 15 minutes under a nitrogen atmosphere. During the Polytron-treatment the temperature of the mixture was maintained at 80-85 °C by means of water bath and cooled to room temperature afterwards. The resulting mixture was then centrifuged at 2000 G for 10 minutes. The solid residue is discarded. The liquid phase (306 g of orange-yellow milk) was freeze dried. The dried product is finally grinded to give 54 g of orange-yellow powder, which had shown very good water-dispersible property and improved stability of zeaxanthin compared to wolfberry fruit powder.

Example 2:

Reagents
Lacto-Wolfberry (LWB) powder from the pilot batch N°WB03A1506H produced at the NRC (Nestle Research Center; Lausanne) as described above and Wolfberry extract powder (batch N°WB03A1506H) were provided by J. Wang (FS, Lipids & Bioactives). Lipopolysaccharide (LPS) from E. coli serotype 055:B5 was purchased from Sigma (St. Louis, MO). Human breast milk (HM) was collected from different healthy donors at 20 days post partum following ethical committee approval. Keyhole Limpet Haemocyanin (KLH) was purchased from Sigma.

Cell culture
The mouse monocyte/macrophage cell line RAW 264.7 (TIB-71 from ATCC, Manassas, Virginia, USA) was maintained in Dulbecco’s modified Eagle medium (DMEM, Amimed, Bioconcept, Allschwill, Switzerland) supplemented with 10% heat-inactivated FCS (Amimed) and 1% Penicillin/Streptomycin (Invitrogen, Paisley, UK) at 37°C in a 5% CO2/air incubator. Cells were sub-cultured using trypsin/EDTA (Sigma, St-Louis, MO, USA). The human colonic adenocarcinoma cell line HT-29 clone 34 cells (i.e. HT-29 cells stably transfected with a NF- B reporter gene) were maintained in high glucose (4.5 g/l) DMEM (Bioconcept, Allschwill, Switzerland) containing 1% stable L-glutamine and supplemented with
10% heat-inactivated (one hour at 56°C) FCS, 1% penicillin/streptomycin (Sigma, St Louis, MO), 500 µg/ml of G418 (Invitrogen) and 100 µg/ml of Normocin (Inviviogen) at 37°C in a 5% CO₂/air incubator. Culture medium was changed every 2 days until the cell monolayers reached ~ 90% confluence. Cells were sub-cultured using trypsin/EDTA (Sigma).

Quantification of LPS-mediated IL-6 expression
RAW 264.7 cells were seeded at 10⁴ cell/well in 96-flat bottom well plates (Nunc, Roskilde, Denmark) in normal culture medium at 37°C in a 5% CO₂/air incubator. After 3 days of culture (i.e. cells reaching ~ 80% of confluence), cells were stimulated or not with 0.5 µg/ml E. coli LPS (055:B5, Sigma) in the absence or the presence of LWB samples (0.1 - 1% final concentration) for 24 hours in normal culture media. Cell culture supematants were then harvested and used to quantify IL-6 production. Interleukin-6 (IL-6) levels in cell culture supernatant were determined by ELISA (Murine IL-6 Eli-pair, Diaclone, Besangon, France) according to manufacturer’s instructions.

NF-κB activity
HT-29 clone 34 cells were seeded at 10⁴ cell/well in 96-flat bottom well plates (Nunc) in culture maintenance media. After 3-4 days of culture (i.e. cells reaching ~ 80% confluence), cells were washed in phosphate buffer saline (PBS) (Sigma) and then stimulated or not with LPS (10 ng/ml + 5% human milk) or recombinant TNF-α (10 ng/ml; R&D systems, Oxon, England) in the absence or the presence of LWB samples for 24 hours in DMEM containing 1% penicillin/streptomycin. Cell culture supematants were then harvested and stored at +4°C O/N until analysis of NF-κB activity. Following NF-κB activation, HT-29 clone 34 cells secrete alkaline phosphatase (SEAP) in the culture supernatant. SEAP release was measured using a fluorescence detection method (Phospha-Light™ System) following the manufacturer’s instruction (Applied Biosystems, Bedford, USA). Briefly, cell culture supematants were incubated with reaction buffer from Phospha-Light™ System for 20 min in a white 96-well flat bottom polypropylen plate (Greiner) and luminescence was measured using the Spectrafluor Plus
spectrometer (Tecan 8634 Hombrechtikon, Switzerland). Results are expressed as relative luminescence units (RLU).

**TNBS-induced colitis model**

The TNBS colitis model is a model of acute inflammation induced by the chemical product: trinitrobenzene sulphonic acid (TNBS) at the dose of 150 mg/kg. Ten mice per group have been fed with diet containing 1% of LWB (50 mg) seven days before colitis induction and until sacrifice. From day 1 to day 4 after TNBS administration, 50 mg of LWB have been given by gavage to compensate for the lower food intake associated with acute intestinal inflammation. For each animal body weight loss, macroscopic, histological score, COX-2, pSTAT3, pro-inflammatory and anti-oxidant genes expression and anti-oxidant power were assessed. Macroscopic and histological score were performed following the scoring criteria of Wallace (Wallace et al, 1989) and Ameho (Ameho et al, 1997). COX-2, the inducible form of cyclooxygenase, a 72kDa protein, is responsible for the inducible biosynthesis of prostaglandins under acute inflammatory conditions. Stat3 is a key signalling molecule for many cytokines; in particular for pro-inflammatory cytokines as IL-6.

**Study design for assessing immune modulation in aged mice**

Specific pathogen-free male C57BL/6J mice (4-weeks old) were purchased from Charles River Laboratories Inc. (France). Mice were housed under conventional circumstances (12 hours light/dark cycle, temperature 22°C, humidity 56%) and received water and semi-synthetic Kliba 3434 diet *ad libitum*. Until the age of 5 months, mice were maintained at 5 per cage and then they were individually caged. All conditions and handling of the animals were approved by the Nestle and state ethical committees with the agreement of the Swiss Federal Veterinary Advisor. At 21-months old mice were randomised into 2 groups of 10 animals. Control non-supplemented mice (H20, n=10 per age group) and LWB-supplemented mice (LWB, n=10 per age group) received a semi-synthetic diet (AIN-93). LWB was provided as a 0.5% (w/v) solution in the drinking water, which was freshly prepared and changed every other day. During the trial (44 days), all mice were allowed to drink and eat *ad libitum*. The same study design was performed twice and also performed with 8-months old mice (n=8 per group). To
study the in vivo T cell-dependent humoral response (antigen-specific antibody production) aged mice were immunized on day 15 of the trial by subcutaneous injection (100 µl) of an inert antigen Keyhole Limpet Haemocyanin (KLH, Sigma) at 100 µg in 1% Alum (Brenntag Biosector, Fredekkssund, Denmark). The DTH response was used as an in vivo measure of cellular immunity. Measurements of ear thickness (ear swelling) taken prior to, and 24 hours to 8 days following, elicitation allowed for determination of the ability to generate a DTH response. Briefly, 7 days after immunisation of the mice with KLH (i.e. day 22 of trial), DTH responses were elicited by injecting the recall-antigen KLH (10 µl of 0.5 µg/ml) into each mouse’s right ear. The left ears were injected with vehicle alone (saline = PBS) and served as internal controls for each animal. At 24 hours post-elicitation, and during the following 7 days, both the non-elicited (left ear) and the elicited ears (right ear) were measured. DTH responses (KLH-PBS) were expressed as the magnitude of ear swelling, i.e. the change in ear thickness using the following formula: \( \Delta \text{ in ear thickness} = [\text{elicited ear (right, KLH) ear sickness - non-elicited (left, PBS) ear sickness}], \) where \( \Delta \text{ in ear thickness} = [\text{post-elicitation - pre-elicitation ear thickness}] \). Blood samples were collected on days 0, 15, 29 from the tail vein and on day 44 via cardiac puncture. Mice were sacrificed on day 44 of trial. At the autopsy, the liver was removed and a piece was immediately frozen in liquid nitrogen. Samples were stored at +80°C until further analysis.

Quantification of KLH-specific IgG2a antibody levels
Amounts of KLH-specific IgG2a antibodies in the sera were determined by ELISA. Briefly, microtiter plates were coated with KLH (50 µl/well at 100 ng/ml) and incubated at 37°C during 3 hours. Free binding sites were blocked with ELISA buffer for 1 hour at 37°C. Samples were then added and incubated at +4°C overnight. Bound antibodies were reacted 1 hour at 37°C while shaking with a biotin-conjugated goat anti-mouse IgG2a (γ2a chain specific) from Southern Biotechnologies (Birmingham, USA). Plates were read at 450 nm after the addition of the TMB peroxydase substrate from KPL. Anti-KLH IgG2a antibody levels were expressed as means OD₄₅₀nm values.
Genes expression
Liver samples were transferred into 1 ml of RNA lysis buffer (Macherey-Nagel, Düren, Germany) and homogenized using Ribolyzer (Hybaid, Waltham, MA, USA) with the following setting: power at 6 for 20 seconds. RNA extraction was conducted using a commercially available kit (NucleoSpin RNA II Kit; Macherey-Nagel, Düren, Germany). RNA quantification was achieved using the Ribogreen RNA Quantitation Kit (Molecular Probes; Eugene, Oregon USA), and RNA quality was assayed using Agilent RNA 6000 Nano LabChip Kit (Agilent Technologies, Palo Alto, USA). Total RNA (2 µg) was reverse transcribed using Multischbe reverse transcriptase following manufacturer’s instructions (Applied biosystems, Biosystems; Rokreutz, Switzerland). Custom-made low density arrays (LDA) with 48 TaqMan probes (loading capacity: 8 samples per card in technical monoplicates) were purchased from Applied Biosystems (Foster City, USA) and used according to manufacturer instruction’s. Gene expression was calculated using the relative quantification method \( \Delta \Delta Ct \) method with SDS 2.2.2 software (Applied Biosystems). The resulting cycle threshold (Ct) values were exported into MS Excel (Microsoft, USA) for further analysis. Briefly, the \( \Delta Ct \) value (i.e. Ct value of the target gene - Ct value of the GAPDH housekeeping gene) was first calculated and then the relative mRNA expression was determined using the following formula: \( 2^{-\Delta Ct} \times 10^6 \).

General statistical analysis
Data were analysed by means +/- SEM or SD, and the Student's T test (unpaired) or two-way ANOVA when appropriate. Probability values of less than 5% were considered as significant.

Results:
A) In vitro experiments demonstrating anti-inflammatory properties of Lacto-Wolfberry
Solution of Lacto-Wolfberry (LWB) inhibited in vitro the LPS-mediated release of the pro-inflammatory cytokine IL-6 by a murine macrophage cell line (Figure 1) and LPS-mediated NF-κB activation in human intestinal epithelial cells (Figure 2).
B) *In vivo* experiments demonstrating anti-inflammatory and immune-enhancing effects of Lacto-Wolfberry

a. Pathological acute inflammation

Dietary supplementation with LWB demonstrated strong anti-inflammatory properties in a murine model of acute intestinal inflammation. Oral administration of 1% LWB resulted in an improvement of body weight loss (Figure 3), macroscopic and histological lesions (Figure 4 and 5), significant reduction of COX-2 and pSTAT3 expression levels (Figure 6 and 7). In addition, expression of pro-inflammatory genes, such as TNFα, IL-6 and IL-1β and proteins such as KC in the colon were reduced compared to the control group (Figure 8). In parallel, LWB induced a strong increase of anti-oxidant genes such as GPX-1, CAT1 and SOD2 (Figure 9) in the colon and increased anti-oxidant defenses in the plasma (Figure 10).

b. Physiological aged-related low-grade inflammation

Dietary supplementation with LWB (0.5% in drinking water) induced a reduction of expression of inflammation-related genes in the liver of aged mice to levels observed in adult mice (Figure 11: as an example, gene encoding for TNF-α).

c. Immune enhancing effect in aged mice

Dietary supplementation with LWB (0.5% in drinking water) improved both humoral (Figure 12) and cell-mediated immune response (Figure 13) in aged mice.
Claims

1. Use of a primary composition comprising wolfberhes or a part thereof for the preparation of a product to treat and/or prevent inflammation.

2. Use in accordance with claim 1 wherein the primary composition further comprises milk or a milk-protein containing carrier.

3. Use in accordance with one of claims 1-2 wherein the primary composition and/or the product excludes insoluble fibers.

4. Use in accordance with one of claims 1-3 wherein the product is intended for oral, topical, enteral and/or parenteral administration; and/or wherein the product is a dietary supplement, a supplement to be used as or in a medicament or a supplement to be used as or in a cream; and/or wherein the product is intended for use by and/or application to humans or pets.

5. Use in accordance with one of claims 1-4 wherein the product is intended for human consumption in or as a foodstuff, for example as a nutritionally complete formula, a dairy product, a chilled or shelf stable beverage, a product for lactating mothers, a liquid drink, a soup, a dietary supplement, a meal replacement, a nutritional bar, a confectionery, a milk or a fermented milk product, a yoghurt, a milk based powder, an enteral nutrition product, an infant formula, an infant nutritional product, a puree, a cereal product or a fermented cereal based product, an ice-cream, candy, sweets, biscuits, cakes, a chocolate, a cappuccino, a coffee, a culinary product such as mayonnaise, tomato puree or salad dressings, a pet food or a pet beverage.

6. Use in accordance with one of claims 1-5 wherein the product is a tablet, a capsule, a pill, a solution, a suspension, a syrup, a powder, a gel, a cream, a dried oral supplement, a wet oral supplement, a body wash, a tooth paste, a shampoo, a mouth wash, a lipstick, or a personal hygiene product.
7. Use in accordance with one of claims 1-6 wherein the primary composition comprises at least a part of the lipophilic and/or hydrophilic bioactive components of wolfberries, wherein the lipophilic and/or hydrophilic bioactive components are preferably selected from the group consisting of lipids, alkaloid, proteins, carbohydrates, glycoproteins, carotenoids, polyphenols compounds such as flavonoids, vitamins, minerals, or mixtures thereof.

8. Use in accordance with one of claim 7 wherein the glycoproteins are selected from the group consisting of arabinogalactan proteins, in particular *Lycium barbarum* polysaccharide and macromolecules that can be detected by the beta-glucosyl Yariv reagent, or mixtures thereof; and/or wherein the flavonoids are selected from the group consisting of flavones such as apigenin, luteolin or diosmetin, flavonols such as quercetin, myricetin, kaempferol, flavanones, anthocyanidins such as pelargonidin, malvidin, or isoflavones such as genistein, daidzein, or mixtures thereof; and/or wherein the carotenoids are selected from the group consisting of carotenes and xanthophylls such as lycopene, carotene, phytofluene, phytoene, canthaxanthin, beta-cryptoxanthin, capsanthin, lutein, zeaxanthin, or those in the form of fatty acid esters, or mixtures thereof.

9. Use in accordance with one of claims 1-8 wherein the milk is from animal or plant origin, or mixtures thereof; preferably the milk is cows milk, lama milk, buffalo milk, goat milk, sheep milk, vegetable milk, in particular soy milk or a mixture thereof.

10. Use in accordance with one of claims 1-9 wherein the primary composition is obtainable by a process comprising the steps of: i) mixing and milling wolfberry material in milk or milk protein-containing liquid medium, ii) optionally separating insoluble fibers to obtain an aqueous suspension iii) optionally pasteurising the resulting suspension iv) optionally adding synthetic or natural bioactive components during the processing v) and further optionally drying the suspension to obtain a powder.
11. Use in accordance with one of claims 1-10 wherein the inflammation is selected from the group consisting of acute inflammations such as sepsis, infections, burns and chronic inflammations such as inflammatory bowel disease, Crohn's disease, ulcerative colitis, necrotizing enterocolitis, skin inflammation, such as UV or chemical-induced skin inflammation, eczema, reactive skin, psoriasis, vitiligo, acne, inflammatory bowel syndrome, liver inflammation, alcoholic cirrhosis, allergy, atopy, bone inflammation, rheumatoid arthritis, systemic lupus, Gougerot-Sjögren's syndrome, Reiter's syndrome, poliomyelitis, dermatomyositis, thyroiditis, Basedow, Hashimoto, type I diabetes, Addison's disease, auto-immunes hepatitis, celiac disease, Biermer's disease, multiple sclerosis, myasthenia, encephalomyelitis, eye inflammation, obesity-associated inflammation, age-related low-grade inflammation, Blau's syndrome, Alzheimer's disease, cardiovascular diseases, atherosclerosis, metabolic syndrome, gingivitis and periodontitis.

12. Use in accordance with one of claims 1-11 wherein the product simultaneously boosts the immune system, to improve an impaired immune response, to enhance an antigen-specific humoral immune response, and/or to enhance the cell mediated immune response.

13. Use in accordance with one of claims 1-12 wherein the product is intended for use by infants, children, adolescents, adults and/or the elderly.

14. Use in accordance with one of claims 1-13 wherein the product is intended for maintaining the immune function and/or for reducing the inflammatory status.

15. Use in accordance with one of claims 1-14 to treat or prevent disorders related to oxidative stress.

### A. CLASSIFICATION OF SUBJECT MATTER

INV. A61K36/815 A61P29/00

According to International Patent Classification (IPC) or to both national classification and IPC.

### B. RELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

A61K A61P

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

EPO-Internal , WPI Data, PAJ, BIOSIS, EMBASE, MEDLINE, FSTA

### C. DOCUMENTS CONSIDERED TO BE RELEVANT

Special categories of cited documents

'A' document defining the general state of the art which is not considered to be of particular relevance

'E' earlier document but published on or after the international filing date

'L' later document published on or priority claim(s) and which is cited to establish the publication date of another citation or other special reason (as specified)

'O' document referring to an oral disclosure, use exhibition or other means

'P' document published prior to the international filing date but later than the priority date claimed

Date of the actual completion of the international search

5 January 2009

Date of mailing of the international search report

14/01/2009
