Abstract: The invention provides antibodies against Fibroblast Activation Protein (FAP) and methods of using the same.
Anti-FAP Antibodies and Methods of Use

FIELD OF THE INVENTION

The present invention relates to antibodies specific for Fibroblast Activation Protein (FAP). In addition, the invention relates to polynucleotides encoding such antibodies, and vectors and host cells comprising such polynucleotides. The invention further relates to methods for producing the antibodies and methods of using them in the treatment of disease.

BACKGROUND

Fibroblast Activation Protein (FAP) and anti-FAP antibodies

Human Fibroblast Activation Protein (FAP; GenBank Accession Number AAC51668), also known as Seprase, is a 170 kDa integral membrane serine peptidase (EC 3.4.21.B28). Together with dipeptidyl peptidase IV (also known as CD26; GenBank Accession Number P27487), a closely related cell-surface enzyme, and other peptidases, FAP belongs to the dipeptidyl peptidase IV family (Yu et al., FEBS J 277, 1126-1144 (2010)). It is a homodimer containing two N-glycosylated subunits with a large C-terminal extracellular domain, in which the enzyme's catalytic domain is located (Scanlan et al., Proc Natl Acad Sci USA 91, 5657-5661 (1994)). FAP, in its glycosylated form, has both post-prolyl dipeptidyl peptidase and gelatinase activities (Sun et al., Protein Expr Purif 24, 274-281 (2002)).

Human FAP was originally identified in cultured fibroblasts using the monoclonal antibody (mAb) F19 (described in WO 93/05804, ATCC Number HB 8269). Homologues of the protein were found in several species, including mice (Niedermeyer et al., Int J Cancer 71, 383-389 (1997), Niedermeyer et al., Eur J Biochem 254, 650-654 (1998); GenBank Accession Number AAH19190). FAP has a unique tissue distribution: its expression was found to be highly upregulated on reactive stromal fibroblasts of more than 90% of all primary and metastatic epithelial tumors, including lung, colorectal, bladder, ovarian and breast carcinomas, while it is generally absent from normal adult tissues (Rettig et al., Proc Natl Acad Sci USA 85, 3110-3114 (1988); Garin-Chesa et al., Proc Natl Acad Sci USA 87, 7235-7239 (1990)). Subsequent reports showed that FAP is not only expressed in stromal fibroblasts but also in some types of malignant
cells of epithelial origin, and that FAP expression directly correlates with the malignant phenotype (Jin et al., Anticancer Res 23, 3195-3198 (2003)).

Due to its expression in many common cancers and its restricted expression in normal tissues, FAP has been considered a promising antigenic target for imaging, diagnosis and therapy of a variety of carcinomas. Thus, multiple monoclonal antibodies have been raised against FAP for research, diagnostic and therapeutic purposes.

Sibrotuzumab/BIBH1, a humanized version of the F19 antibody that specifically binds to human FAP (described in WO 99/57151), and further humanized or fully human antibodies against the FAP antigen with F19 epitope specificity (described in Mersmann et al., Int J Cancer 92, 240-248 (2001); Schmidt et al., Eur J Biochem 268, 1730-1738 (2001); WO 01/68708) were developed. The OS4 antibody is another humanized (CDR-grafted) version of the F19 antibody (Wiiest et al., J Biotech 92, 159-168 (2001), while scFv 33 and scFv 36 have a different binding specificity from F19 and are cross-reactive for the human and mouse FAP protein (Brocks et al., Mol Med 7, 461-469 (2001)). More recently, other murine anti-FAP antibodies, as well as chimeric and humanized versions thereof, were developed (WO 2007/077173, Ostermann et al., Clin Cancer Res 14, 4584-4592 (2008)).

Proteases in the tumor stroma, through proteolytic degradation of extracellular matrix (ECM) components, facilitate processes such as angiogenesis and/or tumor cell migration. Moreover, the tumor stroma plays an important role in nutrient and oxygen supply of tumors, as well as in tumor invasion and metastasis. These essential functions make it not only a diagnostic but also a potential therapeutic target.

Evidence for the feasibility of the concept of tumor stroma targeting in vivo using anti-FAP antibodies was obtained in a phase I clinical study with 131I-iodine-labeled F19 antibody, which demonstrated specific enrichment of the antibody in the tumors and detection of metastases (Welt et al., J Clin Oncol 12, 1193-1203 (1994). Similarly, a phase I study with sibrotuzumab demonstrated specific tumor accumulation of the 131I-labeled antibody (Scott et al., Clin Cancer Res 9, 1639-1647 (2003)). An early phase II trial of unconjugated sibrotuzumab in patients with metastatic colorectal cancer, however, was discontinued due to the lack of efficacy of the antibody in inhibiting tumor progression (Hofheinz et al., Onkologie 26, 44-48 (2003)). Also a more recently developed anti-FAP antibody failed to show anti-tumor effects in vivo in unconjugated form (WO 2007/077173).

Thus, there remains a need for enhanced therapeutic approaches, including antibodies with improved efficacy, targeting FAP for the treatment of cancers.
Antibody Glycosylation

The oligosaccharide component can significantly affect properties relevant to the efficacy of a therapeutic glycoprotein, including physical stability, resistance to protease attack, interactions with the immune system, pharmacokinetics, and specific biological activity. Such properties may depend not only on the presence or absence, but also on the specific structures, of oligosaccharides. Some generalizations between oligosaccharide structure and glycoprotein function can be made. For example, certain oligosaccharide structures mediate rapid clearance of the glycoprotein from the bloodstream through interactions with specific carbohydrate binding proteins, while others can be bound by antibodies and trigger undesired immune reactions (Jenkins et al., Nature Biotechnol. 14, 975-81 (1996)).

IgGl type antibodies, the most commonly used antibodies in cancer immunotherapy, are glycoproteins that have a conserved N-linked glycosylation site at Asn 297 in each CH2 domain. The two complex biantennary oligosaccharides attached to Asn 297 are buried between the CH2 domains, forming extensive contacts with the polypeptide backbone, and their presence is essential for the antibody to mediate effector functions such as antibody dependent cell-mediated cytotoxicity (ADCC) (Lifely et al., Glycobiology 5, 813-822 (1995); Jefferis et al., Immunol Rev 163, 59-76 (1998); Wright and Morrison, Trends Biotechnol. 15, 26-32 (1997)). Protein engineering studies have shown that FcγRs interact with the lower hinge region of the IgG CH2 domain. Lund et al., J. Immunol. i57:4963-69 (1996). However, FcγR binding also requires the presence of the oligosaccharides in the CH2 region. Lund et al., J. Immunol. i57:4963-69 (1996); Wright and Morrison, Trends Biotech. i5:26-31 (1997), suggesting that either oligosaccharide and polypeptide both directly contribute to the interaction site or that the oligosaccharide is required to maintain an active CH2 polypeptide conformation. Modification of the oligosaccharide structure can therefore be explored as a means to increase the affinity of the interaction between IgGl and FcγR, and to increase ADCC activity of IgGl.

A way to obtain large increases in the potency of monoclonal antibodies, is to enhance their natural, cell-mediated effector functions by engineering their oligosaccharide component as described in Umana et al., Nat Biotechnol. 17, 176-180 (1999) and U.S. Patent No. 6,602,684 (WO 99/54342), the contents of which are hereby incorporated by reference in their entirety. Umana et al. showed that overexpression of P(1,4)-N-acetylgalcosaminyltransferase III (GnTIII), a glycosyltransferase catalyzing the formation of bisected oligosaccharides, in Chinese hamster ovary (CHO) cells significantly increases the in vitro ADCC activity of antibodies produced in...
those cells. Overexpression of GnTIII in production cell lines leads to antibodies enriched in bisected oligosaccharides, which are generally also non-fucosylated and of the hybrid type. If in addition to GnTIII, mannosidase II (ManII) is overexpressed in production cell lines, antibodies enriched in bisected, non-fucosylated oligosaccharides of the complex type are obtained (Ferrara et al., Biotechn Bioeng 93, 851-861 (2006)). Both types of antibodies show strongly enhanced ADCC, as compared to antibodies with unmodified glycans, but only antibodies in which the majority of the N-glycans are of the complex type are able to induce significant complement-dependent cytotoxicity (Ferrara et al., Biotechn Bioeng 93, 851-861 (2006)). Alterations in the composition of the Asn 297 carbohydrate or its elimination also affect binding of the antibody Fc-domain to Fcy-receptor (FcyR) and complement Clq protein, which is important for ADCC and CDC, respectively (Umana et al., Nat Biotechnol 17, 176-180 (1999); Davies et al., Biotechnol Bioeng 74, 288-294 (2001); Mimura et al., J Biol Chem 276, 45539-45547 (2001); Radaev et al., J Biol Chem 276, 16478-16483 (2001); Shields et al., J Biol Chem 276, 6591-6604 (2001); Shields et al., J Biol Chem 277, 26733-26740 (2002); Simmons et al., J Immunol Methods 263, 133-147 (2002)).

BRIEF SUMMARY OF THE INVENTION

The present invention provides antibodies that specifically bind to Fibroblast Activation Protein (FAP), having a high affinity and/or enhanced effector function.

In one aspect, the invention is directed to an antibody that specifically binds FAP, comprising at least one (i.e. one, two, three, four, five or six) of the complementarity determining regions (CDRs) set forth in SEQ ID NOs 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 45, 47, 49, 51, 53, 55, 57, 59, 61, 63, 65, 67, 69, 71, 73, 75, 77, 79, 81, 83, 85, 87, 89, 91, 93, 95, 97, 99, 101, 103, 105, 107, 109, 111, 113, 115, 117, 119, 121, 123, 125, 127, 129, 131, 133, 135, 137, 139, 141, 143, 145, 147, 149, 151, 153, 155, 157, 159, 161, 163, 165, 167, 169, 171, 173, 175 and 177. In one embodiment, the antibody comprises three heavy chain CDRs (i.e. HCDR1, HCDR2, and HCDR3) and/or three light chain CDRs (i.e. LCDR1, LCDR2, and LCDR3) selected from SEQ ID NOs 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 45, 47, 49, 51, 53, 55, 57, 59, 61, 63, 65, 67, 69, 71, 73, 75, 77, 79, 81, 83, 85, 87, 89, 91, 93, 95, 97, 99, 101, 103, 105, 107, 109, 111, 113, 115, 117, 119, 121, 123, 125, 127, 129, 131, 133, 135, 137, 139, 141, 143, 145, 147, 149, 151, 153, 155, 157, 159, 161, 163, 165, 167, 169, 171, 173, 175 and 177. In a more specific embodiment, the antibody comprises an antibody heavy chain variable region and/or an antibody light chain variable region, particularly
both a heavy and light chain variable region, selected from the heavy and light chain variable region sequences set forth in SEQ ID NOs 193, 195, 197, 199, 201, 203, 205, 207, 209, 211, 213, 215, 217, 219, 221, 223, 225, 227, 229, 231, 233, 235, 237, 239, 241, 243, 245, 247, 249, 251, 253, 255, 257, 259, 261, 263, 265, 267, 269, 271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291, 293, 295, 297, 299, 301, 303, 305, 307, 309 and 311. In one embodiment, the antibody comprises an Fc region, particularly an IgG Fc region. In a further embodiment, the antibody is a full-length antibody, particularly an IgG class antibody. In another embodiment, the antibody comprises a human antibody constant region. In one embodiment, the antibody is human. In one embodiment, the antibody is glycoengineered to have modified oligosaccharides in the Fc region. In one embodiment the antibody has an increased proportion of non-fucosylated and/or bisected oligosaccharides in the Fc region, as compared to a non-glycoengineered antibody. In a further embodiment, the antibody has increased effector function and/or increased Fc receptor binding affinity. In a particular embodiment, the increased effector function is increased antibody-dependent cell-mediated cytotoxicity (ADCC). In another embodiment the antibody binds to FAP with a $K_D$ value of lower than about 1 μM, preferably lower than about 100 nM, most preferably lower than about 1 nM or even lower than about 0.1 nM. In one embodiment, the antibody is affinity matured. In one embodiment, the antibody binds to FAP in human tissues. In one embodiment, the antibody does not induce internalization of FAP.

In other aspects, the invention is also directed to polypeptides, polynucleotides, host cells, and expression vectors related to the antibodies. In a further aspect, the invention relates to methods of making the antibodies. In a further aspect, the invention is directed to methods of using the antibodies, particularly for the treatment of diseases characterized by expression of FAP, such as cancer.

**BRIEF DESCRIPTION OF THE FIGURES**

FIGURE 1 shows Surface Plasmon Resonance (SPR)-based kinetic analyses of affinity-matured anti-FAP Fab fragments. Processed kinetic data sets are presented for clone 19G1 binding to human (hu) FAP (A) and murine (mu) FAP (B), for clone 20G8 binding to hu FAP (C), mu FAP (D) and for clone 4B9 binding to hu FAP (E) and mu FAP (F). Smooth lines represent a global fit of the data to a 1:1 interaction model.

binding to hu FAP (F), mu FAP (G) and Cynomolgus (cyno) FAP (H). Smooth lines represent a
global fit of the data to a 1:1 interaction model.
FIGURE 5 shows SPR-based kinetic analyses of affinity-matured anti-FAP Fab fragments.
Processed kinetic data sets are presented for clone 29B11 binding to hu FAP (A), mu FAP (B),
cyno FAP (C) and for clone 23C10 binding to hu FAP (D), mu FAP (E) and cyno FAP (F).
Smooth lines represent a global fit of the data to a 1:1 interaction model.
FIGURE 6 shows SPR-based kinetic analyses of 3F2 (A), 4G8 (B) and 3D9 (C) anti-FAP
antibodies binding as Fab fragments to human, mouse and cynomolgus FAP. Processed kinetic
data sets are presented, smooth lines represent a global fit of the data to a 1:1 interaction model.
FIGURE 7 shows SPR-based kinetic analyses of 3F2 (A), 4G8 (B) and 3D9 (C) anti-FAP
antibodies binding as human IgG to human, mouse and cynomolgus FAP. Processed kinetic data
sets are presented, smooth lines represent a global fit of the data to a 1:1 interaction model.
FIGURE 8 shows a representative pictures of human samples of (A) non-small cell lung cancer
(NSCLC) immunohistochemically stained for FAP using 2F3 mouse IgG2a antibody, (B) colon
adenocarcinoma immunohistochemically stained for FAP using 2F3 mouse IgG2a antibody, (C)
colon adenocarcinoma immunohistochemically stained for FAP using 3D9 mouse IgG2a
antibody, and (D) colon adenocarcinoma immunohistochemically stained for FAP using 4G8
mouse IgG2a antibody. FAP is detected in the tumor stroma in all samples and by all antibodies
(left panels), while no staining is observed for the isotype control antibody (right panels).
FIGURE 9 shows binding of human IgGl anti-FAP antibodies to FAP expressed on HEK 293
cells stably transfected with human (A) or murine (B) FAP, as determined by FACS.
FIGURE 10 shows binding of human IgGl anti-FAP antibodies to DPPIV (CD26) or HER2
expressed on stably transfected HEK 293 cells, as determined by FACS. Anti-HER2 antibody
trastuzumab and anti-CD26 antibody were used as positive controls. Secondary antibody, control IgG or no antibody at all (cells only) were used as negative controls.

FIGURE 11 shows binding of human IgG1 anti-FAP antibodies to FAP on human fibroblasts (cell line GM05389), as determined by FACS. Secondary antibody or no antibody at all were used as negative controls.

FIGURE 12 shows binding of human IgG1 anti-FAP antibodies to human fibroblasts (cell line GM05389), different human tumor cell lines, or HEK 293 cells stably transfected with human FAP, as determined by FACS.

FIGURE 13 (A) and (B) show expression levels of FAP on the surface of GM05389 lung fibroblasts at different time points after incubation with the anti-FAP human IgG1 antibodies 3F2 or 4G8, as determined by FACS. No significant decrease in FAP expression levels, indicating internalization of FAP, was observed. Secondary antibody alone is shown as negative control.

FIGURE 14 presents representative immunofluorescence images showing plasma membrane staining on GM05389 lung fibroblasts obtained after binding of anti-FAP 4G8 IgG for 45 min at 4°C (A), for 20 min at 37°C (B), for 1 hour at 37°C (C) or for 6 hours at 37°C (D). The anti-CD20 antibody GA101, used as isotype control, shows background staining. EEA1 labels early endosomes. Note the persistence of the FAP surface plasma membrane staining up to 6 hours after anti-FAP 4G8 antibody binding.

IgG antibodies 28H1 (affinity matured) and 4G8, 3F8 (parentals) as wildtype (wt) and
glycoengineered (ge) versions, with HEK293-hFAP as target cells and PBMNCs as effector cells
(F/F FcyRIIIa genotype).

DETAILS DESCRIPTION OF EMBODIMENTS OF THE INVENTION
1. DEFINITIONS
An "acceptor human framework" for the purposes herein is a framework comprising the amino
acid sequence of a light chain variable domain (VL) framework or a heavy chain variable
domain (VH) framework derived from a human immunoglobulin framework or a human
consensus framework, as defined below. An acceptor human framework "derived from" a
human immunoglobulin framework or a human consensus framework may comprise the same
amino acid sequence thereof, or it may contain amino acid sequence changes. In some
embodiments, the number of amino acid changes are 10 or less, 9 or less, 8 or less, 7 or less, 6 or
less, 5 or less, 4 or less, 3 or less, or 2 or less. In some embodiments, the VL acceptor human
framework is identical in sequence to the VL human immunoglobulin framework sequence or
human consensus framework sequence.

"Affinity" refers to the strength of the sum total of noncovalent interactions between a single
binding site of a molecule (e.g., an antibody) and its binding partner (e.g., an antigen). Unless
indicated otherwise, as used herein, "binding affinity" refers to intrinsic binding affinity which
reflects a 1:1 interaction between members of a binding pair (e.g., antibody and antigen). The
affinity of a molecule X for its partner Y can generally be represented by the dissociation
constant ($K_D$), which is the ratio of dissociation and association rate constants ($k_{off}$ and $k_{on}$,
respectively). Thus, equivalent affinities may comprise different rate constants, as long as the
ratio of the rate constants remains the same. Affinity can be measured by common methods
known in the art, including those described herein. Specific illustrative and exemplary
embodiments for measuring binding affinity are described in the following.

An "affinity matured" antibody refers to an antibody with one or more alterations (e.g. amino
acid mutations) in one or more hypervariable regions (HVRs) (e.g. CDRs), compared to a parent
antibody which does not possess such alterations, such alterations resulting in an improvement in
the affinity of the antibody for antigen. Typically, the affinity matured antibody binds to the
same epitope as the parent antibody.

The terms "anti-FAP antibody" and "an antibody that binds to Fibroblast Activation Protein
(FAP)" refer to an antibody that is capable of binding FAP with sufficient affinity such that the
antibody is useful as a diagnostic and/or therapeutic agent in targeting FAP. In one embodiment,
the extent of binding of an anti-FAP antibody to an unrelated, non-FAP protein is less than about
10% of the binding of the antibody to FAP as measured, e.g., by a radioimmunoassay (RIA) or
flow cytometry (FACS). In one embodiment, the extent of binding of an anti-FAP antibody of
the invention to DPPIV, a protein closely related to FAP (also known as CD26; GenBank
Accession Number P27487), is less than about 15%, about 10% or about 5% of the binding of
the antibody to FAP as measured by FACS. In certain embodiments, an antibody that binds to
FAP has a dissociation constant ($K_D$) of $\leq 1 \mu M$, $\leq 100 \text{ nM}$, $\leq 10 \text{ nM}$, $\leq 1 \text{ nM}$, $\leq 0.1 \text{ nM}$, $\leq 0.01
\text{ nM}$, or $\leq 0.001 \text{ nM}$ (e.g. $10^{-8} \text{ M}$ or less, e.g. from $10^{-8} \text{ M}$ to $10^{-13} \text{ M}$, e.g., from $10^{-9} \text{ M}$ to $10^{-13}
\text{ M}$). In certain embodiments, an anti-FAP antibody binds to an epitope of FAP that is conserved
among FAP from different species.
The term "antibody" herein is used in the broadest sense and encompasses various antibody structures, including but not limited to monoclonal antibodies, polyclonal antibodies, multispecific antibodies (e.g. bispecific antibodies), and antibody fragments so long as they exhibit the desired antigen-binding activity. Also included are antibody fragments having an Fc region, and fusion proteins that comprise a region equivalent to the Fc region of an immunoglobulin.

An "antibody fragment" refers to a molecule other than an intact antibody that comprises a portion of an intact antibody that binds the antigen to which the intact antibody binds. Examples of antibody fragments include but are not limited to Fv, Fab, Fab', Fab'-SH, F(ab')₂, single-chain antibody molecules (e.g. scFv), diabodies, and multispecific antibodies formed from antibody fragments.

An "antibody that binds to the same epitope" as a reference antibody refers to an antibody that blocks binding of the reference antibody to its antigen in a competition assay by 50% or more, and conversely, the reference antibody blocks binding of the antibody to its antigen in a competition assay by 50% or more. An exemplary competition assay is provided herein.

The term "antigen binding domain" refers to the part of an antigen binding molecule that comprises the area which specifically binds to and is complementary to part or all of an antigen. Where an antigen is large, an antigen binding molecule may only bind to a particular part of the antigen, which part is termed an epitope. An antigen binding domain may be provided by, for example, one or more antibody variable domains (also called antibody variable regions).

Preferably, an antigen binding domain comprises an antibody light chain variable region (VL) and an antibody heavy chain variable region (VH).

The term "chimeric" antibody refers to an antibody in which a portion of the heavy and/or light chain is derived from a particular source or species, while the remainder of the heavy and/or light chain is derived from a different source or species. For chimeric antibodies, for example, the non-antigen binding components may be derived from a wide variety of species, including primates such as chimpanzees and humans. Humanized antibodies are a particularly preferred form of chimeric antibodies.

The "class" of an antibody refers to the type of constant domain or constant region possessed by its heavy chain. There are five major classes of antibodies: IgA, IgD, IgE, IgG, and IgM, and several of these may be further divided into subclasses (isotypes), e.g., IgGi, IgG₂, IgG₃, IgG₄, IgAi, and IgA₂. The heavy chain constant domains that correspond to the different classes of immunoglobulins are called α, δ, ε, γ, and μ, respectively.
The term "cytotoxic agent" as used herein refers to a substance that inhibits or prevents a cellular function and/or causes cell death or destruction. Cytotoxic agents include, but are not limited to, radioactive isotopes (e.g., $^{211}$At, $^{131}$I, $^{125}$I, $^{90}$Y, $^{186}$Re, $^{188}$Re, $^{153}$Sm, $^{212}$Bi, $^{32}$P, $^{212}$Pb) and radioactive isotopes of Lu); chemotherapeutic agents or drugs (e.g., methotrexate, adriamycin, vinca alkaloids (vincristine, vinblastine, etoposide), doxorubicin, melphalan, mitomycin C, chlorambucil, daunorubicin or other intercalating agents); growth inhibitory agents; enzymes and fragments thereof such as nucleolytic enzymes; antibiotics; toxins such as small molecule toxins or enzymatically active toxins of bacterial, fungal, plant or animal origin, including fragments and/or variants thereof; and the various antitumor or anticancer agents disclosed below.

"Effector functions" refer to those biological activities attributable to the Fc region of an antibody, which vary with the antibody isotype. Examples of antibody effector functions include: Clq binding and complement dependent cytotoxicity (CDC); Fc receptor binding; antibody-dependent cell-mediated cytotoxicity (ADCC); phagocytosis; cytokine secretion; immune-complex-mediated antigen uptake by antigen-presenting cells; down regulation of cell surface receptors (e.g. B cell receptor); and B cell activation.

An "effective amount" of an agent, e.g., a pharmaceutical formulation, refers to an amount effective, at dosages and for periods of time necessary, to achieve the desired therapeutic or prophylactic result.

The term "Fc region" herein is used to define a C-terminal region of an immunoglobulin heavy chain that contains at least a portion of the constant region. The term includes native sequence Fc regions and variant Fc regions. In one embodiment, a human IgG heavy chain Fc region extends from Cys226, or from Pro230, to the carboxyl-terminus of the heavy chain. However, the C-terminal lysine (Lys447) of the Fc region may or may not be present. Unless otherwise specified herein, numbering of amino acid residues in the Fc region or constant region is according to the EU numbering system, also called the EU index, as described in Kabat et al., *Sequences of Proteins of Immunological Interest*, 5th Ed. Public Health Service, National Institutes of Health, Bethesda, MD, 1991.

A "region equivalent to the Fc region of an immunoglobulin" is intended to include naturally occurring allelic variants of the Fc region of an immunoglobulin as well as variants having alterations which produce substitutions, additions, or deletions but which do not decrease substantially the ability of the immunoglobulin to mediate effector functions (such as antibody-dependent cellular cytotoxicity). For example, one or more amino acids can be deleted from the N-terminus or C-terminus of the Fc region of an immunoglobulin without substantial loss of
biological function. Such variants can be selected according to general rules known in the art so as to have minimal effect on activity (see, e.g., Bowie, J. U. et al., Science 247:1306-10 (1990)). "Framework" or "FR" refers to variable domain residues other than hypervariable region (HVR) (or CDR) residues. The FR of a variable domain generally consists of four FR domains: FR1, FR2, FR3, and FR4. Accordingly, the HVR and FR sequences generally appear in the following sequence in VH (or VL): FR1-H1(L1)-FR2-H2(L2)-FR3-H3(L3)-FR4.

The terms "full length antibody," "intact antibody," and "whole antibody" are used herein interchangeably to refer to an antibody having a structure substantially similar to a native antibody structure or having heavy chains that contain an Fc region as defined herein.

The terms "host cell," "host cell line," and "host cell culture" are used interchangeably and refer to cells into which exogenous nucleic acid has been introduced, including the progeny of such cells. Host cells include "transformants" and "transformed cells," which include the primary transformed cell and progeny derived therefrom without regard to the number of passages. Progeny may not be completely identical in nucleic acid content to a parent cell, but may contain mutations. Mutant progeny that have the same function or biological activity as screened or selected for in the originally transformed cell are included herein. In one embodiment, the host cell is engineered to allow the production of an antibody with modified oligosaccharides. In certain embodiments, the host cells have been further manipulated to express increased levels of one or more polypeptides having P(1,4)-N-acetylglucosaminyltransferase III (GnTIII) activity.

Host cells include cultured cells, e.g., mammalian cultured cells, such as CHO cells, BHK cells, NS0 cells, SP2/0 cells, YO myeloma cells, P3X63 mouse myeloma cells, PER cells, PER.C6 cells or hybridoma cells, yeast cells, insect cells, and plant cells, to name only a few, but also cells comprised within a transgenic animal, transgenic plant or cultured plant or animal tissue. A "human antibody" is one which possesses an amino acid sequence which corresponds to that of an antibody produced by a human or a human cell or derived from a non-human source that utilizes human antibody repertoires or other human antibody-encoding sequences. This definition of a human antibody specifically excludes a humanized antibody comprising non-human antigen-binding residues.

A "human consensus framework" is a framework which represents the most commonly occurring amino acid residues in a selection of human immunoglobulin VL or VH framework sequences. Generally, the selection of human immunoglobulin VL or VH sequences is from a subgroup of variable domain sequences. Generally, the subgroup of sequences is a subgroup as in Kabat et al., *Sequences of Proteins of Immunological Interest*, Fifth Edition, NIH Publication
91-3242, Bethesda MD (1991), vols. 1-3. In one embodiment, for the VL, the subgroup is subgroup kappa I as in Kabat et al., supra. In one embodiment, for the VH, the subgroup is subgroup III as in Kabat et al., supra.

A "humanized" antibody refers to a chimeric antibody comprising amino acid residues from non-human HVRs and amino acid residues from human FRs. In certain embodiments, a humanized antibody will comprise substantially all of at least one, and typically two, variable domains, in which all or substantially all of the HVRs (e.g., CDRs) correspond to those of a non-human antibody, and all or substantially all of the FRs correspond to those of a human antibody. A humanized antibody optionally may comprise at least a portion of an antibody constant region derived from a human antibody. A "humanized form" of an antibody, e.g., a non-human antibody, refers to an antibody that has undergone humanization.

The term "hypervariable region" or "HVR", as used herein, refers to each of the regions of an antibody variable domain which are hypervariable in sequence and/or form structurally defined loops ("hypervariable loops"). Generally, native four-chain antibodies comprise six HVRs; three in the VH (H1, H2, H3), and three in the VL (L1, L2, L3). HVRs generally comprise amino acid residues from the hypervariable loops and/or from the "complementarity determining regions" (CDRs), the latter being of highest sequence variability and/or involved in antigen recognition. With the exception of CDR1 in VH, CDRs generally comprise the amino acid residues that form the hypervariable loops. Hypervariable regions (HVRs) are also referred to as complementarity determining regions (CDRs), and these terms are used herein interchangeably in reference to portions of the variable region that form the antigen binding regions. This particular region has been described by Kabat et al., U.S. Dept. of Health and Human Services, "Sequences of Proteins of Immunological Interest" (1983) and by Chothia et al, J. Mol. Biol. 196:901-917 (1987), where the definitions include overlapping or subsets of amino acid residues when compared against each other. Nevertheless, application of either definition to refer to a CDR of an antibody or variants thereof is intended to be within the scope of the term as defined and used herein. The appropriate amino acid residues which encompass the CDRs as defined by each of the above cited references are set forth below in Table 1 as a comparison. The exact residue numbers which encompass a particular CDR will vary depending on the sequence and size of the CDR. Those skilled in the art can routinely determine which residues comprise a particular CDR given the variable region amino acid sequence of the antibody.

TABLE 1. CDR Definitions

V H CDR1  31-35  26-32  26-35  
V H CDR2  50-65  52-58  50-58  
V H CDR3  95-102  95-102  95-102  
V L CDR1  24-34  26-32  24-34  
V L CDR2  50-56  50-52  50-56  
V L CDR3  89-97  91-96  89-97  

1 Numbering of all CDR definitions in Table 1 is according to the numbering conventions set forth by Kabat et al. (see below).

2 'AbM' with a lowercase "b" as used in Table 1 refers to the CDRs as defined by Oxford Molecular's "AbM" antibody modeling software.

Kabat et al. also defined a numbering system for variable region sequences that is applicable to any antibody. One of ordinary skill in the art can unambiguously assign this system of "Kabat numbering" to any variable region sequence, without reliance on any experimental data beyond the sequence itself. As used herein, "Kabat numbering" refers to the numbering system set forth by Kabat et al., U.S. Dept. of Health and Human Services, "Sequence of Proteins of Immunological Interest" (1983). Unless otherwise specified, references to the numbering of specific amino acid residue positions in an antibody variable region are according to the Kabat numbering system.

CDRs also comprise "specificity determining residues," or "SDRs," which are residues that contact antigen. SDRs are contained within regions of the CDRs called abbreviated-CDRs, or α-CDRs. In general, only one-fifth to one-third of the residues in a given CDR participate in antigen binding. The specificity-determining residues in a particular CDR can be identified by, for example, computation of interatomic contacts from three-dimensional modeling and determination of the sequence variability at a given residue position in accordance with the methods described in Padlan et al., *FASEB J.* 9(1):133-139 (1995). Exemplary α-CDRs (α-CDR-L1, α-CDR-L2, α-CDR-L3, a-CDR-H1, a-CDR-H2, and a-CDR-H3) occur at amino acid residues 31-34 of LI, 50-55 of L2, 89-96 of L3, 31-35B of HI, 50-58 of H2, and 95-102 of H3 (see Almagro and Fransson, *Front. Biosci.* 13:1619-1633 (2008).)

An "antibody conjugate" is an antibody conjugated to a cytotoxic agent.

An "individual" or "subject" is a mammal. Mammals include, but are not limited to, domesticated animals (e.g., cows, sheep, cats, dogs, and horses), primates (e.g., humans and non-human primates such as monkeys), rabbits, and rodents (e.g., mice and rats). In certain embodiments, the individual or subject is a human.

An "isolated" antibody is one which has been separated from a component of its natural environment. In some embodiments, an antibody is purified to greater than 95% or 99% purity as determined by, for example, electrophoretic (e.g., SDS-PAGE, isoelectric focusing (IEF),

capillary electrophoresis) or chromatographic (e.g., ion exchange or reverse phase HPLC) methods. For review of methods for assessment of antibody purity, see, e.g., Flatman et al., J. Chromatogr. B 848:79-87 (2007).

An "isolated" polynucleotide refers to a polynucleotide molecule that has been separated from a component of its natural environment. An isolated polynucleotide includes a polynucleotide molecule contained in cells that ordinarily contain the polynucleotide molecule, but the polynucleotide molecule is present extrachromosomally or at a chromosomal location that is different from its natural chromosomal location.

"Isolated polynucleotide encoding an anti-FAP antibody" refers to one or more polynucleotide molecules encoding antibody heavy and light chains (or fragments thereof), including such polynucleotide molecule(s) in a single vector or separate vectors, and such polynucleotide molecule(s) present at one or more locations in a host cell.

The term "monoclonal antibody" as used herein refers to an antibody obtained from a population of substantially homogeneous antibodies, i.e., the individual antibodies comprising the population are identical and/or bind the same epitope, except for possible variant antibodies, e.g., containing naturally occurring mutations or arising during production of a monoclonal antibody preparation, such variants generally being present in minor amounts. In contrast to polyclonal antibody preparations, which typically include different antibodies directed against different determinants (epitopes), each monoclonal antibody of a monoclonal antibody preparation is directed against a single determinant on an antigen. Thus, the modifier "monoclonal" indicates the character of the antibody as being obtained from a substantially homogeneous population of antibodies, and is not to be construed as requiring production of the antibody by any particular method. For example, the monoclonal antibodies to be used in accordance with the present invention may be made by a variety of techniques, including but not limited to the hybridoma method, recombinant DNA methods, phage-display methods, and methods utilizing transgenic animals containing all or part of the human immunoglobulin loci, such methods and other exemplary methods for making monoclonal antibodies being described herein.

A "naked antibody" refers to an antibody that is not conjugated to a heterologous moiety (e.g., a cytotoxic moiety) or radiolabel. The naked antibody may be present in a pharmaceutical formulation.

"Native antibodies" refer to naturally occurring immunoglobulin molecules with varying structures. For example, native IgG antibodies are heterotetrameric glycoproteins of about 150,000 daltons, composed of two identical light chains and two identical heavy chains that are...
disulfide-bonded. From N- to C-terminus, each heavy chain has a variable region (VH), also called a variable heavy domain or a heavy chain variable domain, followed by three constant domains (CH1, CH2, and CH3), also called a heavy chain constant region. Similarly, from N- to C-terminus, each light chain has a variable region (VL), also called a variable light domain or a light chain variable domain, followed by a constant light (CL) domain, also called a light chain constant region. The light chain of an antibody may be assigned to one of two types, called kappa (κ) and lambda (λ), based on the amino acid sequence of its constant domain.

"No substantial cross-reactivity" means that a molecule (e.g., an antibody) does not recognize or specifically bind an antigen different from the actual target antigen of the molecule (e.g. an antigen closely related to the target antigen), particularly when compared to that target antigen. For example, an antibody may bind less than about 10% to less than about 5% to an antigen different from the actual target antigen, or may bind said antigen different from the actual target antigen at an amount selected from the group consisting of less than about 10%, 9%, 8% 7%, 6%, 5%, 4%, 3%, 2%, 1%, 0.5%, 0.2%, or 0.1%, preferably less than about 2%, 1%, or 0.5%, and most preferably less than about 0.2% or 0.1% antigen different from the actual target antigen.

The term "package insert" is used to refer to instructions customarily included in commercial packages of therapeutic products, that contain information about the indications, usage, dosage, administration, combination therapy, contraindications and/or warnings concerning the use of such therapeutic products.

The term "parent" antibody refers to an antibody that is used as the starting point or basis for the preparation of a variant.

"Percent (%) amino acid sequence identity" with respect to a reference polypeptide sequence is defined as the percentage of amino acid residues in a candidate sequence that are identical with the amino acid residues in the reference polypeptide sequence, after aligning the sequences and introducing gaps, if necessary, to achieve the maximum percent sequence identity, and not considering any conservative substitutions as part of the sequence identity. Alignment for purposes of determining percent amino acid sequence identity can be achieved in various ways that are within the skill in the art, for instance, using publicly available computer software such as BLAST, BLAST-2, ALIGN or Megalign (DNASTAR) software. Those skilled in the art can determine appropriate parameters for aligning sequences, including any algorithms needed to achieve maximal alignment over the full length of the sequences being compared. For purposes herein, however, % amino acid sequence identity values are generated using the sequence
comparison computer program ALIGN-2. The ALIGN-2 sequence comparison computer program was authored by Genentech, Inc., and the source code has been filed with user documentation in the U.S. Copyright Office, Washington D.C., 20559, where it is registered under U.S. Copyright Registration No. TXU5 10087. The ALIGN-2 program is publicly available from Genentech, Inc., South San Francisco, California, or may be compiled from the source code. The ALIGN-2 program should be compiled for use on a UNIX operating system, including digital UNIX V4.0D. All sequence comparison parameters are set by the ALIGN-2 program and do not vary.

In situations where ALIGN-2 is employed for amino acid sequence comparisons, the \% amino acid sequence identity of a given amino acid sequence A to, with, or against a given amino acid sequence B (which can alternatively be phrased as a given amino acid sequence A that has or comprises a certain \% amino acid sequence identity to, with, or against a given amino acid sequence B) is calculated as follows:

\[
\text{100 times the fraction } \frac{X}{Y}
\]

where X is the number of amino acid residues scored as identical matches by the sequence alignment program ALIGN-2 in that program's alignment of A and B, and where Y is the total number of amino acid residues in B. It will be appreciated that where the length of amino acid sequence A is not equal to the length of amino acid sequence B, the \% amino acid sequence identity of A to B will not equal the \% amino acid sequence identity of B to A. Unless specifically stated otherwise, all \% amino acid sequence identity values used herein are obtained as described in the immediately preceding paragraph using the ALIGN-2 computer program.

Similarly, by a nucleic acid or polynucleotide having a nucleotide sequence at least, for example, 95\% "identical" to a reference nucleotide sequence of the present invention, it is intended that the nucleotide sequence of the polynucleotide is identical to the reference sequence except that the polynucleotide sequence may include up to five point mutations per each 100 nucleotides of the reference nucleotide sequence. In other words, to obtain a polynucleotide having a nucleotide sequence at least 95\% identical to a reference nucleotide sequence, up to 5\% of the nucleotides in the reference sequence may be deleted or substituted with another nucleotide, or a number of nucleotides up to 5\% of the total nucleotides in the reference sequence may be inserted into the reference sequence. These alterations of the reference sequence may occur at the 5' or 3' terminal positions of the reference nucleotide sequence or anywhere between those terminal positions, interspersed either individually among residues in the reference sequence or in one or
more contiguous groups within the reference sequence. As a practical matter, whether any particular polynucleotide or polypeptide is at least 80%, 85%, 90%, 95%, 96%, 97%, 98% or 99% identical to a nucleotide sequence or polypeptide sequence of the present invention can be determined conventionally using known computer programs, such as the ones listed above.

The term "pharmaceutical formulation" refers to a preparation which is in such form as to permit the biological activity of an active ingredient contained therein to be effective, and which contains no additional components which are unacceptably toxic to a subject to which the formulation would be administered.

A "pharmaceutically acceptable carrier" refers to an ingredient in a pharmaceutical formulation, other than an active ingredient, which is nontoxic to a subject. A pharmaceutically acceptable carrier includes, but is not limited to, a buffer, excipient, stabilizer, or preservative.

The term "Fibroblast Activation Protein (FAP)" as used herein, refers to any native FAP from any vertebrate source, including mammals such as primates (e.g. humans, see GenBank Accession Number AAC51668) and rodents (e.g., mice, see GenBank Accession Number AAH19190), unless otherwise indicated. The term encompasses "full-length," unprocessed FAP as well as any form of FAP that results from processing in the cell. The term also encompasses naturally occurring variants of FAP, e.g., splice variants or allelic variants. Preferably, an anti-FAP antibody of the invention binds to the extracellular domain of FAP. The amino acid sequence of exemplary human, mouse and cynomolgus monkey FAP ectodomains (with a C-terminal poly-lysine and 6x His-tag) are shown in SEQ ID NO: 317, SEQ ID NO: 319, and SEQ ID NO: 321 respectively.

As used herein, "treatment" (and grammatical variations thereof such as "treat" or "treating") refers to clinical intervention in an attempt to alter the natural course of disease of the individual being treated, and can be performed either for prophylaxis or during the course of clinical pathology. Desirable effects of treatment include, but are not limited to, preventing occurrence or recurrence of disease, alleviation of symptoms, diminishment of any direct or indirect pathological consequences of the disease, preventing metastasis, decreasing the rate of disease progression, amelioration or palliation of the disease state, and remission or improved prognosis. In some embodiments, antibodies of the invention are used to delay development of a disease or to slow the progression of a disease.

The term "variable region" or "variable domain" refers to the domain of an antibody heavy or light chain that is involved in binding the antibody to antigen. The variable domains of the heavy chain and light chain (VH and VL, respectively) of a native antibody generally have
similar structures, with each domain comprising four conserved framework regions (FRs) and three hypervariable regions (HVRs). (See, e.g., Kindt et al. *Kuby Immunology*, 6th ed., W.H. Freeman and Co., page 91 (2007).) A single VH or VL domain may be sufficient to confer antigen-binding specificity. Furthermore, antibodies that bind a particular antigen may be isolated using a VH or VL domain from an antibody that binds the antigen to screen a library of complementary VL or VH domains, respectively. See, e.g., Portolano et al., *J. Immunol.* 150:880-887 (1993); Clarkson et al., *Nature* 352:624-628 (1991).

The term "vector," as used herein, refers to a nucleic acid molecule capable of propagating another nucleic acid to which it is linked. The term includes the vector as a self-replicating nucleic acid structure as well as the vector incorporated into the genome of a host cell into which it has been introduced. Certain vectors are capable of directing the expression of nucleic acids to which they are operatively linked. Such vectors are referred to herein as "expression vectors." As used herein, the term "polypeptide having GnTIII activity" refers to polypeptides that are able to catalyze the addition of a N-acetylglucosamine (GlcNAc) residue in β-1-4 linkage to the β-linked mannose of the trimannosyl core of N-linked oligosaccharides. This includes fusion polypeptides exhibiting enzymatic activity similar to, but not necessarily identical to, an activity of P(l,4)-N-acetylglucosaminyltransferase III, also known as P-1,4-mannosyl-glycoprotein 4-beta-N-acetylglucosaminyl-transferase (EC 2.4.1.144), according to the Nomenclature Committee of the International Union of Biochemistry and Molecular Biology (NC-IUBMB), as measured in a particular biological assay, with or without dose dependency. In the case where dose dependency does exist, it need not be identical to that of GnTIII, but rather substantially similar to the dose-dependence in a given activity as compared to the GnTIII (i.e., the candidate polypeptide will exhibit greater activity or not more than about 25-fold less and, preferably, not more than about tenfold less activity, and most preferably, not more than about three-fold less activity relative to the GnTIII).

As used herein, the term "Golgi localization domain" refers to the amino acid sequence of a Golgi resident polypeptide which is responsible for anchoring the polypeptide to a location within the Golgi complex. Generally, localization domains comprise amino terminal "tails" of an enzyme.

As used herein, the terms "engineer, engineered, engineering," particularly with the prefix "glyco-," as well as the term "glycosylation engineering" are considered to include any manipulation of the glycosylation pattern of a naturally occurring or recombinant polypeptide or fragment thereof. Glycosylation engineering includes metabolic engineering of the glycosylation
machinery of a cell, including genetic manipulations of the oligosaccharide synthesis pathways to achieve altered glycosylation of glycoproteins expressed in cells. Furthermore, glycosylation engineering includes the effects of mutations and cell environment on glycosylation. In one embodiment, the glycosylation engineering is an alteration in glycosyltransferase activity. In a particular embodiment, the engineering results in altered glucosaminyltransferase activity and/or fucosyltransferase activity.

As used herein, the term "Fc-mediated cellular cytotoxicity" includes antibody-dependent cell-mediated cytotoxicity (ADCC) and cellular cytotoxicity mediated by a soluble Fc-fusion protein containing a human Fc-region. It is an immune mechanism leading to the lysis of "targeted cells" by "human immune effector cells."

As used herein, the term "human immune effector cells" refers to a population of leukocytes that display Fc receptors on their surfaces, through which they bind to the Fc-region of antibodies or of Fc-fusion proteins and perform effector functions. Such a population may include, but is not limited to, peripheral blood mononuclear cells (PBMC) and/or natural killer (NK) cells.

As used herein, the term "targeted cells" refers to cells to which antigen binding molecules comprising an Fc region (e.g., antibodies or fragments thereof comprising an Fc region) or Fc-fusion proteins specifically bind. The antigen binding molecules or Fc fusion-proteins bind to target cells via the protein part that is N-terminal to the Fc region.

As used herein, the term "increased Fc-mediated cellular cytotoxicity" is defined as either an increase in the number of "targeted cells" that are lysed in a given time, at a given concentration of antibody or of Fc-fusion protein in the medium surrounding the target cells, by the mechanism of Fc-mediated cellular cytotoxicity defined above, and/or a reduction in the concentration of antibody or of Fc-fusion protein, in the medium surrounding the target cells, required to achieve the lysis of a given number of "targeted cells," in a given time, by the mechanism of Fc-mediated cellular cytotoxicity. The increase in Fc-mediated cellular cytotoxicity is relative to the cellular cytotoxicity mediated by the same antigen binding molecule or Fc-fusion protein produced by the same type of host cells, using the same standard production, purification, formulation and storage methods, (which are known to those skilled in the art) but that has not been produced by host cells engineered to have an altered pattern of glycosylation (e.g., to express the glycosyltransferase, GnTIII, or other glycosyltransferases) by the methods described herein.

By "antibody having increased antibody dependent cell-mediated cytotoxicity (ADCC)" is meant an antibody, as that term is defined herein, having increased ADCC as determined by any
suitable method known to those of ordinary skill in the art. One accepted in vitro ADCC assay is as follows:

1) the assay uses target cells that are known to express the target antigen recognized by the antigen-binding region of the antibody;

2) the assay uses human peripheral blood mononuclear cells (PBMCs), isolated from blood of a randomly chosen healthy donor, as effector cells;

3) the assay is carried out according to following protocol:
   i) the PBMCs are isolated using standard density centrifugation procedures and are suspended at 5 x 10^6 cells/ml in RPMI cell culture medium;
   ii) the target cells are grown by standard tissue culture methods, harvested from the exponential growth phase with a viability higher than 90%, washed in RPMI cell culture medium, labeled with 100 micro-Curies of ^51Cr, washed twice with cell culture medium, and resuspended in cell culture medium at a density of 10^5 cells/ml;
   iii) 100 microliters of the final target cell suspension above are transferred to each well of a 96-well microtiter plate;
   iv) the antibody is serially-diluted from 4000 ng/ml to 0.04 ng/ml in cell culture medium and 50 microliters of the resulting antibody solutions are added to the target cells in the 96-well microtiter plate, testing in triplicate various antibody concentrations covering the whole concentration range above;

v) for the maximum release (MR) controls, 3 additional wells in the plate containing the labeled target cells, receive 50 microliters of a 2% (V/V) aqueous solution of non-ionic detergent (Nonidet, Sigma, St. Louis), instead of the antibody solution (point iv above);

vi) for the spontaneous release (SR) controls, 3 additional wells in the plate containing the labeled target cells, receive 50 microliters of RPMI cell culture medium instead of the antibody solution (point iv above);

vii) the 96-well microtiter plate is then centrifuged at 50 x g for 1 minute and incubated for 1 hour at 4°C;

viii) 50 microliters of the PBMC suspension (point i above) are added to each well to yield an effector:target cell ratio of 25:1 and the plates are placed in an incubator under 5% CO_2 atmosphere at 37°C for 4 hours;

ix) the cell-free supernatant from each well is harvested and the experimentally released radioactivity (ER) is quantified using a gamma counter;
x) the percentage of specific lysis is calculated for each antibody concentration according to the formula \((\text{ER-MR})/(\text{MR-SR}) \times 100\), where ER is the average radioactivity quantified (see point ix above) for that antibody concentration, MR is the average radioactivity quantified (see point ix above) for the MR controls (see point v above), and SR is the average radioactivity quantified (see point ix above) for the SR controls (see point vi above);

4) "increased ADCC" is defined as either an increase in the maximum percentage of specific lysis observed within the antibody concentration range tested above, and/or a reduction in the concentration of antibody required to achieve one half of the maximum percentage of specific lysis observed within the antibody concentration range tested above. The increase in ADCC is relative to the ADCC, measured with the above assay, mediated by the same antibody, produced by the same type of host cells, using the same standard production, purification, formulation and storage methods, which are known to those skilled in the art, but that has not been produced by host cells engineered to overexpress GnTIII.

II. COMPOSITIONS AND METHODS

Fibroblast Activation Protein (FAP) is expressed in the majority of tumors but essentially absent from healthy adult tissues, thus antibodies targeting this antigen have great therapeutic potential. The present invention provides antibodies that bind to FAP, in particular antibodies with high affinity and strong effector functions. Antibodies of the invention are useful, e.g., for the diagnosis or treatment of diseases characterized by expression of FAP, such as cancer.

A. Exemplary Anti-FAP Antibodies

The present invention provides for antibodies that specifically bind to Fibroblast Activation Protein (FAP). Particularly, the present invention provides for antibodies that specifically bind FAP, wherein said antibodies are glycoengineered to have increased effector function.

In one embodiment, an anti-FAP antibody of the invention comprises at least one (e.g. one, two, three, four, five, or six) heavy or light chain complementarity determining region (CDR) selected from the group of SEQ ID NO: 3, SEQ ID NO: 5, SEQ ID NO: 7, SEQ ID NO: 9, SEQ ID NO: 11, SEQ ID NO: 13, SEQ ID NO: 15, SEQ ID NO: 17, SEQ ID NO: 19, SEQ ID NO: 21, SEQ ID NO: 23, SEQ ID NO: 25, SEQ ID NO: 27, SEQ ID NO: 29, SEQ ID NO: 31, SEQ ID NO: 33, SEQ ID NO: 35, SEQ ID NO: 37, SEQ ID NO: 39, SEQ ID NO: 41, SEQ ID NO: 43, SEQ ID NO: 45, SEQ ID NO: 47, SEQ ID NO: 49, SEQ ID NO: 51, SEQ ID NO: 53, SEQ ID NO: 55, SEQ ID NO: 57, SEQ ID NO: 59, SEQ ID NO: 61, SEQ ID NO: 63, SEQ ID NO: 65, SEQ
ID NO: 67, SEQ ID NO: 69, SEQ ID NO: 71, SEQ ID NO: 73, SEQ ID NO: 75, SEQ ID NO:
77, SEQ ID NO: 79, SEQ ID NO: 81, SEQ ID NO: 83, SEQ ID NO: 85, SEQ ID NO: 87, SEQ
ID NO: 89, SEQ ID NO: 91, SEQ ID NO: 93, SEQ ID NO: 95, SEQ ID NO: 97, SEQ ID NO:
99, SEQ ID NO: 101, SEQ ID NO: 103, SEQ ID NO: 105, SEQ ID NO: 107, SEQ ID NO: 109,
SEQ ID NO: 111, SEQ ID NO: 113, SEQ ID NO: 115, SEQ ID NO: 117, SEQ ID NO: 119, SEQ
ID NO: 121, SEQ ID NO: 123, SEQ ID NO: 125, SEQ ID NO: 127, SEQ ID NO: 129, SEQ ID
NO: 131, SEQ ID NO: 133, SEQ ID NO: 135, SEQ ID NO: 137, SEQ ID NO: 139, SEQ ID NO:
141, SEQ ID NO: 143, SEQ ID NO: 145, SEQ ID NO: 147, SEQ ID NO: 149, SEQ ID NO: 151,
SEQ ID NO: 153, SEQ ID NO: 155, SEQ ID NO: 157, SEQ ID NO: 159, SEQ ID NO: 161, SEQ
ID NO: 163, SEQ ID NO: 165, SEQ ID NO: 167, SEQ ID NO: 169, SEQ ID NO: 171, SEQ ID
NO: 173, SEQ ID NO: 175, and SEQ ID NO: 177, or a variant or truncated form thereof
containing at least the specificity-determining residues (SDRs) for said CDR.

In one embodiment, said at least one CDR is a heavy chain CDR, particularly a heavy chain
CDR3 selected from the group of SEQ ID NO: 135, SEQ ID NO: 137, SEQ ID NO: 139, and
SEQ ID NO: 141. In another embodiment, the antibody comprises at least one heavy chain CDR
and at least one light chain CDR, particularly a heavy chain CDR3 selected from the group of
SEQ ID NO: 135, SEQ ID NO: 137, SEQ ID NO: 139, and SEQ ID NO: 141, and a light chain
CDR3 selected from the group of SEQ ID NO: 163, SEQ ID NO: 165, SEQ ID NO: 167, SEQ
ID NO: 169, SEQ ID NO: 171, SEQ ID NO: 173, SEQ ID NO: 175 and SEQ ID NO: 177.

In one embodiment, an antibody of the invention comprises at least one, at least two, or all three
heavy chain CDR (HCDR) sequences selected from (a) HCDR1 comprising an amino acid
sequence selected from the group of SEQ ID NO: 3, SEQ ID NO: 5, SEQ ID NO: 7, SEQ ID
NO: 9, SEQ ID NO: 11, SEQ ID NO: 13, SEQ ID NO: 15, SEQ ID NO: 17, SEQ ID NO: 19,
SEQ ID NO: 21, SEQ ID NO: 23, SEQ ID NO: 25, SEQ ID NO: 27, SEQ ID NO: 29, SEQ ID
NO: 31, and SEQ ID NO: 33; (b) HCDR2 comprising an amino acid sequence selected from the
group of SEQ ID NO: 35, SEQ ID NO: 37, SEQ ID NO: 39, SEQ ID NO: 41, SEQ ID NO: 43,
SEQ ID NO: 45, SEQ ID NO: 47, SEQ ID NO: 49, SEQ ID NO: 51, SEQ ID NO: 53, SEQ ID
NO: 55, SEQ ID NO: 57, SEQ ID NO: 59, SEQ ID NO: 61, SEQ ID NO: 63, SEQ ID NO: 65,
SEQ ID NO: 67, SEQ ID NO: 69, SEQ ID NO: 71, SEQ ID NO: 73, SEQ ID NO: 75, SEQ ID
NO: 77, SEQ ID NO: 79, SEQ ID NO: 81, SEQ ID NO: 83, SEQ ID NO: 85, SEQ ID NO: 87,
SEQ ID NO: 89, SEQ ID NO: 91, SEQ ID NO: 93, SEQ ID NO: 95, SEQ ID NO: 97, SEQ ID
NO: 99, SEQ ID NO: 101, SEQ ID NO: 103, SEQ ID NO: 105, SEQ ID NO: 107, SEQ ID NO:
109, SEQ ID NO: 111, SEQ ID NO: 113, SEQ ID NO: 115, SEQ ID NO: 117, SEQ ID NO: 119,
SEQ ID NO: 121, SEQ ID NO: 123, SEQ ID NO: 125, SEQ ID NO: 127, SEQ ID NO: 129, SEQ ID NO: 131, and SEQ ID NO: 133; and (c) HCDR3 comprising an amino acid sequence selected from the group of SEQ ID NO: 135, SEQ ID NO: 137, SEQ ID NO: 139, and SEQ ID NO: 141.

In a further embodiment, the antibody comprises a heavy chain variable region comprising (a) a heavy chain CDR1 selected from the group of SEQ ID NO: 3, SEQ ID NO: 5, SEQ ID NO: 7, SEQ ID NO: 9, SEQ ID NO: 11, SEQ ID NO: 13, SEQ ID NO: 15, SEQ ID NO: 17, SEQ ID NO: 19, SEQ ID NO: 21, SEQ ID NO: 23, SEQ ID NO: 25, SEQ ID NO: 27, SEQ ID NO: 29, SEQ ID NO: 31, and SEQ ID NO: 33; (b) a heavy chain CDR2 selected from the group of SEQ ID NO: 35, SEQ ID NO: 37, SEQ ID NO: 39, SEQ ID NO: 41, SEQ ID NO: 43, SEQ ID NO: 45, SEQ ID NO: 47, SEQ ID NO: 49, SEQ ID NO: 51, SEQ ID NO: 53, SEQ ID NO: 55, SEQ ID NO: 57, SEQ ID NO: 59, SEQ ID NO: 61, SEQ ID NO: 63, SEQ ID NO: 65, SEQ ID NO: 67, SEQ ID NO: 69, SEQ ID NO: 71, SEQ ID NO: 73, SEQ ID NO: 75, SEQ ID NO: 77, SEQ ID NO: 79, SEQ ID NO: 81, SEQ ID NO: 83, SEQ ID NO: 85, SEQ ID NO: 87, SEQ ID NO: 89, SEQ ID NO: 91, SEQ ID NO: 93, SEQ ID NO: 95, SEQ ID NO: 97, SEQ ID NO: 99, SEQ ID NO: 101, SEQ ID NO: 103, SEQ ID NO: 105, SEQ ID NO: 107, SEQ ID NO: 109, SEQ ID NO: 111, SEQ ID NO: 113, SEQ ID NO: 115, SEQ ID NO: 117, SEQ ID NO: 119, SEQ ID NO: 121, SEQ ID NO: 123, SEQ ID NO: 125, SEQ ID NO: 127, SEQ ID NO: 129, SEQ ID NO: 131, and SEQ ID NO: 133; and (c) a heavy chain CDR3 selected from the group of SEQ ID NO: 135, SEQ ID NO: 137, SEQ ID NO: 139, and SEQ ID NO: 141, or variants or truncated forms thereof containing at least the SDRs for said CDRs.

In one embodiment, an antibody of the invention comprises at least one, at least two, or all three light chain CDR (LCDR) sequences selected from (a) LCDR1 comprising an amino acid sequence selected from the group of SEQ ID NO: 143, SEQ ID NO: 145, SEQ ID NO: 147, and SEQ ID NO: 149; (b) LCDR2 comprising an amino acid sequence selected from the group of SEQ ID NO: 151, SEQ ID NO: 153, SEQ ID NO: 155, SEQ ID NO: 157, SEQ ID NO: 159, and SEQ ID NO: 161; and (c) LCDR3 comprising an amino acid sequence selected from the group of SEQ ID NO: 163, SEQ ID NO: 165, SEQ ID NO: 167, SEQ ID NO: 169, SEQ ID NO: 171, SEQ ID NO: 173, SEQ ID NO: 175, and SEQ ID NO: 177. In a further embodiment, the antibody comprises a light chain variable region comprising (a) a light chain CDR1 selected from the group of SEQ ID NO: 143, SEQ ID NO: 145, SEQ ID NO: 147, and SEQ ID NO: 149; (b) a light chain CDR2 selected from the group of SEQ ID NO: 151, SEQ ID NO: 153, SEQ ID NO: 155, SEQ ID NO: 157, SEQ ID NO: 159, and SEQ ID NO: 161; and (c) a light chain CDR3 selected from the group of SEQ ID NO: 163, SEQ ID NO: 165, SEQ ID NO: 167, SEQ ID NO:
169, SEQ ID NO: 171, SEQ ID NO: 173, SEQ ID NO: 175, and SEQ ID NO: 177, or variants or truncated forms thereof containing at least the SDRs for said CDRs.

In a more specific embodiment, an antibody of the invention comprises a heavy chain variable region comprising a heavy chain CDR1 selected from the group of SEQ ID NO: 3, SEQ ID NO: 5, SEQ ID NO: 7, SEQ ID NO: 9, SEQ ID NO: 11, SEQ ID NO: 13, SEQ ID NO: 15, SEQ ID NO: 17, SEQ ID NO: 19, SEQ ID NO: 21, SEQ ID NO: 23, SEQ ID NO: 25, SEQ ID NO: 27, SEQ ID NO: 29, SEQ ID NO: 31, and SEQ ID NO: 33; a heavy chain CDR2 selected from the group of SEQ ID NO: 35, SEQ ID NO: 37, SEQ ID NO: 39, SEQ ID NO: 41, SEQ ID NO: 43, SEQ ID NO: 45, SEQ ID NO: 47, SEQ ID NO: 49, SEQ ID NO: 51, SEQ ID NO: 53, SEQ ID NO: 55, SEQ ID NO: 57, SEQ ID NO: 59, SEQ ID NO: 61, SEQ ID NO: 63, SEQ ID NO: 65, SEQ ID NO: 67, SEQ ID NO: 69, SEQ ID NO: 71, SEQ ID NO: 73, SEQ ID NO: 75, SEQ ID NO: 77, SEQ ID NO: 79, SEQ ID NO: 81, SEQ ID NO: 83, SEQ ID NO: 85, SEQ ID NO: 87, SEQ ID NO: 89, SEQ ID NO: 91, SEQ ID NO: 93, SEQ ID NO: 95, SEQ ID NO: 97, SEQ ID NO: 99, SEQ ID NO: 101, SEQ ID NO: 103, SEQ ID NO: 105, SEQ ID NO: 107, SEQ ID NO: 109, SEQ ID NO: 111, SEQ ID NO: 113, SEQ ID NO: 115, SEQ ID NO: 117, SEQ ID NO: 119, SEQ ID NO: 121, SEQ ID NO: 123, SEQ ID NO: 125, SEQ ID NO: 127, SEQ ID NO: 129, SEQ ID NO: 131, and SEQ ID NO: 133; and a heavy chain CDR3 selected from the group of SEQ ID NO: 135, SEQ ID NO: 137, SEQ ID NO: 139, and SEQ ID NO: 141, and a light chain variable region comprising a light chain CDR1 selected from the group of SEQ ID NO: 143, SEQ ID NO: 145, SEQ ID NO: 147, and SEQ ID NO: 149; a light chain CDR2 selected from the group of SEQ ID NO: 151, SEQ ID NO: 153, SEQ ID NO: 155, SEQ ID NO: 157, SEQ ID NO: 159, and SEQ ID NO: 161; and a light chain CDR3 selected from the group of SEQ ID NO: 163, SEQ ID NO: 165, SEQ ID NO: 167, SEQ ID NO: 169, SEQ ID NO: 171, SEQ ID NO: 173, SEQ ID NO: 175, and SEQ ID NO: 177, or variants or truncated forms thereof containing at least the SDRs for said CDRs.

In another embodiment, an antibody of the invention comprises a heavy chain variable region comprising a heavy chain CDR1 selected from the group of SEQ ID NO: 3, SEQ ID NO: 5, SEQ ID NO: 7, SEQ ID NO: 9, SEQ ID NO: 11, SEQ ID NO: 13, SEQ ID NO: 15, SEQ ID NO: 17, SEQ ID NO: 19, SEQ ID NO: 21, SEQ ID NO: 23, SEQ ID NO: 25, SEQ ID NO: 27, SEQ ID NO: 29, SEQ ID NO: 31, and SEQ ID NO: 33; a heavy chain CDR2 selected from the group of SEQ ID NO: 35, SEQ ID NO: 37, SEQ ID NO: 39, SEQ ID NO: 41, SEQ ID NO: 43, SEQ ID NO: 45, SEQ ID NO: 47, SEQ ID NO: 49, SEQ ID NO: 51, SEQ ID NO: 53, SEQ ID NO: 55, SEQ ID NO: 57, SEQ ID NO: 59, SEQ ID NO: 61, SEQ ID NO: 63, SEQ ID NO: 65, SEQ ID NO:
comprising a light chain CDR1 selected from the group of SEQ ID NO: 143, SEQ ID NO: 145, SEQ ID NO: 147, and SEQ ID NO: 149; a light chain CDR2 selected from the group of SEQ ID NO: 151, SEQ ID NO: 153, SEQ ID NO: 155, SEQ ID NO: 157, SEQ ID NO: 159, and SEQ ID NO: 161; and a light chain CDR3 selected from the group of SEQ ID NO: 163, SEQ ID NO: 165, SEQ ID NO: 167, SEQ ID NO: 169, SEQ ID NO: 171, SEQ ID NO: 173, SEQ ID NO: 175, and SEQ ID NO: 177, wherein at least one of said CDRs is selected from the group of SEQ ID NO: 7, SEQ ID NO: 9, SEQ ID NO: 11, SEQ ID NO: 17, SEQ ID NO: 19, SEQ ID NO: 21, SEQ ID NO: 29, SEQ ID NO: 31, SEQ ID NO: 33, SEQ ID NO: 43, SEQ ID NO: 45, SEQ ID NO: 47, SEQ ID NO: 49, SEQ ID NO: 51, SEQ ID NO: 53, SEQ ID NO: 55, SEQ ID NO: 57, SEQ ID NO: 59, SEQ ID NO: 61, SEQ ID NO: 63, SEQ ID NO: 65, SEQ ID NO: 67, SEQ ID NO: 77, SEQ ID NO: 79, SEQ ID NO: 81, SEQ ID NO: 83, SEQ ID NO: 85, SEQ ID NO: 87, SEQ ID NO: 89, SEQ ID NO: 91, SEQ ID NO: 93, SEQ ID NO: 95, SEQ ID NO: 97, SEQ ID NO: 99, SEQ ID NO: 109, SEQ ID NO: 111, SEQ ID NO: 113, SEQ ID NO: 115, SEQ ID NO: 117, SEQ ID NO: 119, SEQ ID NO: 121, SEQ ID NO: 123, SEQ ID NO: 125, SEQ ID NO: 127, SEQ ID NO: 129, SEQ ID NO: 131, and SEQ ID NO: 133; and a heavy chain CDR3 selected from the group of SEQ ID NO: 135, SEQ ID NO: 137, SEQ ID NO: 139, and SEQ ID NO: 141, and a light chain variable region comprising a light chain CDR1 selected from the group of SEQ ID NO: 3, SEQ ID NO: 5, SEQ ID NO: 7, SEQ ID NO: 9, SEQ ID NO: 11, SEQ ID NO: 13, SEQ ID NO: 15, SEQ ID NO: 17, SEQ ID NO: 19, SEQ ID NO: 21, SEQ ID NO: 23, SEQ ID NO: 25, SEQ ID NO: 27, SEQ ID NO: 29, SEQ ID NO: 31, and SEQ ID NO: 33; a heavy chain CDR2 selected from the group of SEQ ID NO: 35, SEQ ID NO: 37, SEQ ID NO: 39, SEQ ID NO: 41, SEQ ID NO: 43, SEQ ID NO: 45, SEQ ID NO: 47, SEQ ID NO: 49, SEQ ID NO: 51, SEQ ID NO: 53, SEQ ID NO: 55, SEQ ID NO: 57, SEQ ID NO: 59, SEQ ID NO: 61, SEQ ID NO: 63, SEQ ID NO: 65, SEQ ID NO: 67, SEQ ID NO: 69, SEQ ID NO: 71, SEQ ID NO: 73, SEQ ID NO: 75, SEQ ID NO: 77, SEQ ID NO: 79, SEQ ID NO: 81, SEQ ID NO: 83, SEQ ID NO: 85, SEQ ID NO: 87, SEQ ID
NO: 89, SEQ ID NO: 91, SEQ ID NO: 93, SEQ ID NO: 95, SEQ ID NO: 97, SEQ ID NO: 99,
SEQ ID NO: 101, SEQ ID NO: 103, SEQ ID NO: 105, SEQ ID NO: 107, SEQ ID NO: 109, SEQ
ID NO: 111, SEQ ID NO: 113, SEQ ID NO: 115, SEQ ID NO: 117, SEQ ID NO: 119, SEQ ID
NO: 121, SEQ ID NO: 123, SEQ ID NO: 125, SEQ ID NO: 127, SEQ ID NO: 129, SEQ ID NO:
131, and SEQ ID NO: 133; and a heavy chain CDR3 selected from the group of SEQ ID NO:
135, SEQ ID NO: 137, SEQ ID NO: 139, and SEQ ID NO: 141, and a light chain variable region
comprising a light chain CDR1 selected from the group of SEQ ID NO: 143, SEQ ID NO: 145,
SEQ ID NO: 147, and SEQ ID NO: 149; a light chain CDR2 selected from the group of SEQ ID
NO: 151, SEQ ID NO: 153, SEQ ID NO: 155, SEQ ID NO: 157, SEQ ID NO: 159, and SEQ ID
NO: 161; and a light chain CDR3 selected from the group of SEQ ID NO: 163, SEQ ID NO:
165, SEQ ID NO: 167, SEQ ID NO: 169, SEQ ID NO: 171, SEQ ID NO: 173, SEQ ID NO: 175,
and SEQ ID NO: 177, wherein at least one of said CDRs is not a CDR selected from the group of
SEQ ID NO: 3, SEQ ID NO: 5, SEQ ID NO: 13, SEQ ID NO: 15, SEQ ID NO: 23, SEQ ID NO:
25, SEQ ID NO: 27, SEQ ID NO: 35, SEQ ID NO: 37, SEQ ID NO: 39, SEQ ID NO: 41, SEQ
ID NO: 69, SEQ ID NO: 71, SEQ ID NO: 73, SEQ ID NO: 75, SEQ ID NO: 101, SEQ ID NO:
103, SEQ ID NO: 105, SEQ ID NO: 107, SEQ ID NO: 135, SEQ ID NO: 137, SEQ ID NO: 139,
SEQ ID NO: 141, SEQ ID NO: 143, SEQ ID NO: 145, SEQ ID NO: 147, SEQ ID NO: 149, SEQ
ID NO: 151, SEQ ID NO: 153, SEQ ID NO: 155, SEQ ID NO: 157, SEQ ID NO: 159, SEQ ID
NO: 161, SEQ ID NO: 163, SEQ ID NO: 165, SEQ ID NO: 167, SEQ ID NO: 169, SEQ ID NO:
171, SEQ ID NO: 173, and SEQ ID NO: 175.

In another embodiment, an antibody of the invention comprises a heavy chain variable region
comprising a heavy chain CDR1 selected from the group of SEQ ID NO: 3, SEQ ID NO: 5, SEQ
ID NO: 13, SEQ ID NO: 15, SEQ ID NO: 23, SEQ ID NO: 25, and SEQ ID NO: 27; a heavy
chain CDR2 selected from the group of SEQ ID NO: 35, SEQ ID NO: 37, SEQ ID NO: 39, SEQ
ID NO: 41, SEQ ID NO: 69, SEQ ID NO: 71, SEQ ID NO: 73, SEQ ID NO: 75, SEQ ID NO:
101, SEQ ID NO: 103, SEQ ID NO: 105, and SEQ ID NO: 107; and a heavy chain CDR3
selected from the group of SEQ ID NO: 135, SEQ ID NO: 137, SEQ ID NO: 139, and SEQ ID
NO: 141, and a light chain variable region comprising a light chain CDR1 selected from the
group of SEQ ID NO: 143, SEQ ID NO: 145, SEQ ID NO: 147, and SEQ ID NO: 149; a light
chain CDR2 selected from the group of SEQ ID NO: 151, SEQ ID NO: 153, SEQ ID NO: 155,
SEQ ID NO: 157, SEQ ID NO: 159, and SEQ ID NO: 161; and a light chain CDR3 selected
from the group of SEQ ID NO: 163, SEQ ID NO: 165, SEQ ID NO: 167, SEQ ID NO: 169, SEQ
ID NO: 171, SEQ ID NO: 173, and SEQ ID NO: 175, or variants or truncated forms thereof containing at least the SDRs for said CDRs.

In a specific embodiment, an antibody of the invention comprises a heavy chain variable region comprising a heavy chain CDR1 selected from the group of SEQ ID NO: 3, SEQ ID NO: 13, and SEQ ID NO: 23; a heavy chain CDR2 selected from the group of SEQ ID NO: 35, SEQ ID NO: 69, and SEQ ID NO: 101; and the heavy chain CDR3 of SEQ ID NO: 135, and a light chain variable region comprising the light chain CDR1 of SEQ ID NO: 143, the light chain CDR2 of SEQ ID NO: 151, and the light chain CDR3 of SEQ ID NO: 163. In another specific embodiment, an antibody of the invention comprises a heavy chain variable region comprising a heavy chain CDR1 selected from the group of SEQ ID NO: 3, SEQ ID NO: 13, and SEQ ID NO: 23; a heavy chain CDR2 selected from the group of SEQ ID NO: 37, SEQ ID NO: 71, and SEQ ID NO: 103; and the heavy chain CDR3 of SEQ ID NO: 137, and a light chain variable region comprising the light chain CDR1 of SEQ ID NO: 145, the light chain CDR2 of SEQ ID NO: 153, and the light chain CDR3 of SEQ ID NO: 165. In yet another specific embodiment, an antibody of the invention comprises a heavy chain variable region comprising a heavy chain CDR1 selected from the group of SEQ ID NO: 3, SEQ ID NO: 13, and SEQ ID NO: 23; a heavy chain CDR2 selected from the group of SEQ ID NO: 35, SEQ ID NO: 69, and SEQ ID NO: 101; and the heavy chain CDR3 of SEQ ID NO: 137, and a light chain variable region comprising the light chain CDR1 of SEQ ID NO: 147, the light chain CDR2 of SEQ ID NO: 155, and the light chain CDR3 of SEQ ID NO: 167. In another specific embodiment, an antibody of the invention comprises a heavy chain variable region comprising a heavy chain CDR1 selected from the group of SEQ ID NO: 3, SEQ ID NO: 13, and SEQ ID NO: 23; a heavy chain CDR2 selected from the group of SEQ ID NO: 39, SEQ ID NO: 73, and SEQ ID NO: 105; and the heavy chain CDR3 of SEQ ID NO: 135, and a light chain variable region comprising the light chain CDR1 of SEQ ID NO: 145, the light chain CDR2 of SEQ ID NO: 153, and the light chain CDR3 of SEQ ID NO: 169. In another specific embodiment, an antibody of the invention comprises a heavy chain variable region comprising a heavy chain CDR1 selected from the group of SEQ ID NO: 3, SEQ ID NO: 13, and SEQ ID NO: 23; a heavy chain CDR2 selected from the group of SEQ ID NO: 35, SEQ ID NO: 69, and SEQ ID NO: 101; and the heavy chain CDR3 of SEQ ID NO: 137, and a light chain variable region comprising the light chain CDR1 of SEQ ID NO: 149, the light chain CDR2 of SEQ ID NO: 157, and the light chain CDR3 of SEQ ID NO: 167. In another specific embodiment, an antibody of the invention comprises a heavy chain variable region comprising a heavy chain CDR1 selected from the group of SEQ ID NO: 3, SEQ ID NO: 7, SEQ
ID NO: 13, SEQ ID NO: 17, SEQ ID NO: 23, and SEQ ID NO: 29; a heavy chain CDR2
selected from the group of SEQ ID NO: 43, SEQ ID NO: 45, SEQ ID NO: 47, SEQ ID NO: 49,
SEQ ID NO: 51, SEQ ID NO: 53, SEQ ID NO: 55, SEQ ID NO: 57, SEQ ID NO: 59, SEQ ID
NO: 63, SEQ ID NO: 65, SEQ ID NO: 77, SEQ ID NO: 79, SEQ ID NO: 81, SEQ ID NO: 83,
SEQ ID NO: 85, SEQ ID NO: 87, SEQ ID NO: 89, SEQ ID NO: 91, SEQ ID NO: 93, SEQ ID
NO: 97, SEQ ID NO: 109, SEQ ID NO: 111, SEQ ID NO: 113, SEQ ID NO: 115, SEQ ID NO:
117, SEQ ID NO: 119, SEQ ID NO: 121, SEQ ID NO: 123, SEQ ID NO: 125, SEQ ID NO: 129,
and SEQ ID NO: 131; and the heavy chain CDR3 of SEQ ID NO: 135, and a light chain variable
region comprising the light chain CDR1 of SEQ ID NO: 143, the light chain CDR2 of SEQ ID
NO: 151, and the light chain CDR3 of SEQ ID NO: 163. In a further specific embodiment, an
antibody of the invention comprises a heavy chain variable region comprising a heavy chain
CDR1 selected from the group of SEQ ID NO: 9, SEQ ID NO: 11, SEQ ID NO: 19, SEQ ID
NO:21, SEQ ID NO: 31, and SEQ ID NO: 33; a heavy chain CDR2 selected from the group of
SEQ ID NO: 61, SEQ ID NO: 67, SEQ ID NO: 95, SEQ ID NO: 99, SEQ ID NO: 127, and SEQ
ID NO: 133; and the heavy chain CDR3 of SEQ ID NO: 137, and a light chain variable region
comprising the light chain CDR1 of SEQ ID NO: 147, the light chain CDR2 of SEQ ID NO:
155, and the light chain CDR3 of SEQ ID NO: 167. In a further specific embodiment, an
antibody of the invention comprises a heavy chain variable region comprising a heavy chain
CDR1 selected from the group of SEQ ID NO: 3, SEQ ID NO: 13, and SEQ ID NO: 23; a heavy
chain CDR2 selected from the group of SEQ ID NO: 35, SEQ ID NO: 69, and SEQ ID NO: 101;
and the heavy chain CDR3 of SEQ ID NO: 135, and a light chain variable region comprising the
light chain CDR1 of SEQ ID NO: 143, the light chain CDR2 of SEQ ID NO: 151, and the light
chain CDR3 of SEQ ID NO: 177. In a further specific embodiment, an antibody of the invention
comprises a heavy chain variable region comprising a heavy chain CDR1 selected from the
group of SEQ ID NO: 3, SEQ ID NO: 13, and SEQ ID NO: 23; a heavy chain CDR2 selected
from the group of SEQ ID NO: 43, SEQ ID NO: 77, and SEQ ID NO: 109; and the heavy chain
CDR3 of SEQ ID NO: 135, and a light chain variable region comprising the light chain CDR1 of
SEQ ID NO: 143, the light chain CDR2 of SEQ ID NO: 151, and the light chain CDR3 of SEQ
ID NO: 163. In a further specific embodiment, an antibody of the invention comprises a heavy
chain variable region comprising a heavy chain CDR1 selected from the group of SEQ ID NO: 3,
SEQ ID NO: 13, and SEQ ID NO: 23; a heavy chain CDR2 selected from the group of SEQ ID
NO: 45, SEQ ID NO: 79, and SEQ ID NO: 111; and the heavy chain CDR3 of SEQ ID NO: 135,
and a light chain variable region comprising the light chain CDR1 of SEQ ID NO: 143, the light
chain CDR2 of SEQ ID NO: 151, and the light chain CDR3 of SEQ ID NO: 163. In a further specific embodiment, an antibody of the invention comprises a heavy chain variable region comprising a heavy chain CDR1 selected from the group of SEQ ID NO: 3, SEQ ID NO: 13, and SEQ ID NO: 23; a heavy chain CDR2 selected from the group of SEQ ID NO: 65, SEQ ID NO: 89, and SEQ ID NO: 131; and the heavy chain CDR3 of SEQ ID NO: 135, and a light chain variable region comprising the light chain CDR1 of SEQ ID NO: 143, the light chain CDR2 of SEQ ID NO: 151, and the light chain CDR3 of SEQ ID NO: 163. In a further specific embodiment, an antibody of the invention comprises a heavy chain variable region comprising a heavy chain CDR1 selected from the group of SEQ ID NO: 3, SEQ ID NO: 13, and SEQ ID NO: 23; a heavy chain CDR2 selected from the group of SEQ ID NO: 47, SEQ ID NO: 81, and SEQ ID NO: 113; and the heavy chain CDR3 of SEQ ID NO: 135, and a light chain variable region comprising the light chain CDR1 of SEQ ID NO: 143, the light chain CDR2 of SEQ ID NO: 151, and the light chain CDR3 of SEQ ID NO: 163. In a further specific embodiment, an antibody of the invention comprises a heavy chain variable region comprising a heavy chain CDR1 selected from the group of SEQ ID NO: 9, SEQ ID NO: 19, and SEQ ID NO: 31; a heavy chain CDR2 selected from the group of SEQ ID NO: 61, SEQ ID NO: 95, and SEQ ID NO: 127; and the heavy chain CDR3 of SEQ ID NO: 137, and a light chain variable region comprising the light chain CDR1 of SEQ ID NO: 147, the light chain CDR2 of SEQ ID NO: 155, and the light chain CDR3 of SEQ ID NO: 167.

In one embodiment, an antibody of the invention comprises a heavy chain variable region (VH) comprising an amino acid sequence having at least about 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98% or 99% identity to a sequence selected from the group of SEQ ID NO: 197, SEQ ID NO: 201, SEQ ID NO: 203, SEQ ID NO: 207, SEQ ID NO: 211, SEQ ID NO: 215, SEQ ID NO: 219, SEQ ID NO: 223, SEQ ID NO: 227, SEQ ID NO: 231, SEQ ID NO: 235, SEQ ID NO: 239, SEQ ID NO: 243, SEQ ID NO: 247, SEQ ID NO: 251, SEQ ID NO: 255, SEQ ID NO: 259, SEQ ID NO: 263, SEQ ID NO: 267, SEQ ID NO: 271, SEQ ID NO: 275, SEQ ID NO: 279, SEQ ID NO: 283, SEQ ID NO: 287, SEQ ID NO: 291, SEQ ID NO: 295, SEQ ID NO: 299, SEQ ID NO: 303, SEQ ID NO: 307, and SEQ ID NO: 311. In one embodiment, the antibody comprises a heavy chain variable region comprising an amino acid sequence selected from the group of SEQ ID NO: 197, SEQ ID NO: 201, SEQ ID NO: 203, SEQ ID NO: 207, SEQ ID NO: 211, SEQ ID NO: 215, SEQ ID NO: 219, SEQ ID NO: 223, SEQ ID NO: 227, SEQ ID NO: 231, SEQ ID NO: 235, SEQ ID NO: 239, SEQ ID NO: 243, SEQ ID NO: 247, SEQ ID NO: 251, SEQ ID NO: 255, SEQ ID NO: 259, SEQ ID NO: 263, SEQ ID NO: 267, SEQ ID NO: 271, SEQ ID NO: 275, SEQ
In certain embodiments, a VH sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% identity contains substitutions (e.g., conservative substitutions), insertions, or deletions relative to the reference sequence, but an anti-FAP antibody comprising that sequence retains the ability to bind to FAP. In certain embodiments, a total of 1 to 10 amino acids have been substituted, inserted and/or deleted in SEQ ID NO: 197, 201, 203, 207, 211, 215, 219, 223, 227, 231, 235, 239, 243, 247, 251, 255, 259, 263, 267, 271, 275, 279, 283, 287, 291, 295, 299, 303, 307 or 311. In certain embodiments, substitutions, insertions, or deletions occur in regions outside the HVRs or CDRs (i.e., in the FRs). Optionally, an anti-FAP antibody according to the invention comprises the VH sequence in SEQ ID NO: 197, 201, 203, 207, 211, 215, 219, 223, 227, 231, 235, 239, 243, 247, 251, 255, 259, 263, 267, 271, 275, 279, 283, 287, 291, 295, 299, 303, 307 or 311, including post-translational modifications of that sequence. In a particular embodiment, the VH comprises one, two or three heavy chain CDRs selected from the sequences set forth in SEQ ID Nos: 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 45, 47, 49, 51, 53, 55, 57, 59, 61, 63, 65, 67, 69, 71, 73, 75, 77, 79, 81, 83, 85, 87, 89, 91, 93, 95, 97, 99, 101, 103, 105, 107, 109, 111, 113, 115, 117, 119, 121, 123, 125, 127, 129, 131, 133, 135, 137, 139 and 141 for the HCDR1, HCDR2 and HCDR3.

In another embodiment, an antibody of the invention comprises a light chain variable region comprising an amino acid sequence having at least about 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% identity to a sequence selected from the group of SEQ ID NO: 193, SEQ ID NO: 195, SEQ ID NO: 199, SEQ ID NO: 205, SEQ ID NO: 209, SEQ ID NO: 213, SEQ ID NO: 217, SEQ ID NO: 221, SEQ ID NO: 225, SEQ ID NO: 229, SEQ ID NO: 233, SEQ ID NO: 237, SEQ ID NO: 241, SEQ ID NO: 245, SEQ ID NO: 249, SEQ ID NO: 253, SEQ ID NO: 257, SEQ ID NO: 261, SEQ ID NO: 265, SEQ ID NO: 269, SEQ ID NO: 273, SEQ ID NO: 277, SEQ ID NO: 281, SEQ ID NO: 285, SEQ ID NO: 289, SEQ ID NO: 293, SEQ ID NO: 297, SEQ ID NO: 301, SEQ ID NO: 305, and SEQ ID NO: 309. In yet another embodiment, the antibody comprises a light chain variable region comprising an amino acid sequence selected from the group of: SEQ ID NO: 193, SEQ ID NO: 195, SEQ ID NO: 199, SEQ ID NO: 205, SEQ ID NO: 209, SEQ ID NO: 213, SEQ ID NO: 217, SEQ ID NO: 221, SEQ ID NO: 225, SEQ ID NO: 229, SEQ ID NO: 233, SEQ ID NO: 237, SEQ ID NO: 241, SEQ ID NO: 245, SEQ ID NO: 249, SEQ ID NO: 253, SEQ ID NO: 257, SEQ ID NO: 261, SEQ ID NO: 265, SEQ ID NO: 269, SEQ ID NO: 273, SEQ ID NO: 277, SEQ ID NO: 281, SEQ ID NO: 285, SEQ ID NO: 289, SEQ ID NO: 293, SEQ ID NO: 297, SEQ ID NO: 301, SEQ ID NO: 305, and SEQ ID NO: 309.
NO: 273, SEQ ID NO: 277, SEQ ID NO: 281, SEQ ID NO: 285, SEQ ID NO: 289, SEQ ID NO: 293, SEQ ID NO: 297, SEQ ID NO: 301, SEQ ID NO: 305, and SEQ ID NO: 309.

In certain embodiments, a VL sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98% or 99% identity contains substitutions (e.g., conservative substitutions), insertions, or deletions relative to the reference sequence, but an anti-FAP antibody comprising that sequence retains the ability to bind to FAP. In certain embodiments, a total of 1 to 10 amino acids have been substituted, inserted and/or deleted in SEQ ID NO 193, 195, 199, 205, 209, 213, 217, 221, 225, 229, 233, 237, 241, 245, 249, 253, 257, 261, 265, 269, 273, 277, 281, 285, 289, 293, 297, 301, 305 or 309. In certain embodiments, the substitutions, insertions, or deletions occur in regions outside the HVRs or CDRs (i.e., in the FRs). Optionally, an anti-FAP antibody of the invention comprises the VL sequence in SEQ ID NO 193, 195, 199, 205, 209, 213, 217, 221, 225, 229, 233, 237, 241, 245, 249, 253, 257, 261, 265, 269, 273, 277, 281, 285, 289, 293, 297, 301, 305 or 309, including post-translational modifications of that sequence. In a particular embodiment, the VL comprises one, two or three light chain CDRs selected from sequences set forth in SEQ ID NOs 143, 145, 147, 149, 151, 153, 155, 157, 159, 161, 163, 165, 167, 169, 171, 173, 175 and 177 for the LCDR1, LCDR2 and LCDR3.

In another aspect, an anti-FAP antibody is provided, wherein the antibody comprises a VH as in any of the embodiments provided above, and a VL as in any of the embodiments provided above. In one embodiment, the antibody comprises a heavy chain variable region comprising an amino acid sequence that is at least about 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or 100% identical to a sequence selected from the group of SEQ ID NO: 197, SEQ ID NO: 201, SEQ ID NO: 203, SEQ ID NO: 207, SEQ ID NO: 211, SEQ ID NO: 215, SEQ ID NO: 219, SEQ ID NO: 223, SEQ ID NO: 227, SEQ ID NO: 231, SEQ ID NO: 235, SEQ ID NO: 239, SEQ ID NO: 243, SEQ ID NO: 247, SEQ ID NO: 251, SEQ ID NO: 255, SEQ ID NO: 259, SEQ ID NO: 263, SEQ ID NO: 267, SEQ ID NO: 271, SEQ ID NO: 275, SEQ ID NO: 279, SEQ ID NO: 283, SEQ ID NO: 287, SEQ ID NO: 291, SEQ ID NO: 295, SEQ ID NO: 299, SEQ ID NO: 303, SEQ ID NO: 307, and SEQ ID NO: 311, and a light chain variable region comprising an amino acid sequence that is at least about 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or 100% identical to a sequence selected from the group of: SEQ ID NO: 193, SEQ ID NO: 195, SEQ ID NO: 199, SEQ ID NO: 205, SEQ ID NO: 209, SEQ ID NO: 213, SEQ ID NO: 217, SEQ ID NO: 221, SEQ ID NO: 225, SEQ ID NO: 229, SEQ ID NO: 233, SEQ ID NO: 237, SEQ ID NO: 241, SEQ ID NO: 245, SEQ ID NO: 249, SEQ ID NO: 253, SEQ ID NO: 257, SEQ ID NO: 261, SEQ ID NO: 265, SEQ ID NO: 269, SEQ ID NO: 273, SEQ ID NO: 277, SEQ ID NO: 281,

In one embodiment, the antibody comprises a heavy chain variable region comprising an amino acid sequence selected from the group of SEQ ID NO: 197, SEQ ID NO: 201, SEQ ID NO: 203, SEQ ID NO: 207, SEQ ID NO: 211, SEQ ID NO: 215, SEQ ID NO: 219, SEQ ID NO: 223, SEQ ID NO: 227, SEQ ID NO: 231, SEQ ID NO: 235, SEQ ID NO: 239, SEQ ID NO: 243, SEQ ID NO: 247, SEQ ID NO: 251, SEQ ID NO: 255, and SEQ ID NO: 259.

In one embodiment, the antibody comprises a heavy chain variable region comprising an amino acid sequence that is at least about 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or 100% identical to a sequence selected from the group of SEQ ID NO: 197, SEQ ID NO: 201, SEQ ID NO: 203, SEQ ID NO: 207, SEQ ID NO: 211, SEQ ID NO: 215, SEQ ID NO: 219, SEQ ID NO: 223, SEQ ID NO: 227, SEQ ID NO: 231, SEQ ID NO: 235, SEQ ID NO: 239, SEQ ID NO: 243, SEQ ID NO: 247, SEQ ID NO: 251, and SEQ ID NO: 255, and a light chain variable region comprising an amino acid sequence that is at least about 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or 100% identical to a sequence selected from the group of: SEQ ID NO: 193, SEQ ID NO: 195, SEQ ID NO: 199, SEQ ID NO: 205, SEQ ID NO: 209, SEQ ID NO: 213, SEQ ID NO: 217, SEQ ID NO: 221, SEQ ID NO: 225, SEQ ID NO: 229, SEQ ID NO: 233, SEQ ID NO: 237, SEQ ID NO: 241, SEQ ID NO: 245, SEQ ID NO: 249, and SEQ ID NO: 253.

In a specific embodiment, an antibody of the invention comprises a heavy chain variable region comprising the amino acid sequence of SEQ ID NO: 197, and a light chain variable region comprising the amino acid sequence of SEQ ID NO: 193 or SEQ ID NO: 195. In another specific embodiment, an antibodies of the invention comprises a heavy chain variable region comprising the amino acid sequence of SEQ ID NO: 207, and a light chain variable region comprising the amino acid sequence of SEQ ID NO: 201 or SEQ ID NO: 203, and a light chain variable region comprising the amino acid sequence of SEQ ID NO: 199. In yet another specific embodiment an antibody of the invention comprises a heavy chain variable region comprising the amino acid sequence of SEQ ID NO: 207, and a light chain variable region comprising the
amino acid sequence of SEQ ID NO: 205. In another specific embodiment, an antibodies of the invention comprises a heavy chain variable region comprising the amino acid sequence of SEQ ID NO: 211, and a light chain variable region comprising the amino acid sequence of SEQ ID NO: 209. In yet another specific embodiment an antibody of the invention comprises a heavy chain variable region comprising the amino acid sequence of SEQ ID NO: 219, and a light chain variable region comprising the amino acid sequence of SEQ ID NO: 217. In another embodiment, an antibody of the invention comprises a heavy chain variable region comprising an amino acid sequence selected from the group of SEQ ID NO: 259, SEQ ID NO: 263, SEQ ID NO: 267, SEQ ID NO: 271, SEQ ID NO: 275, SEQ ID NO:279, SEQ ID NO:283, SEQ ID NO: 287, SEQ ID NO: 291, SEQ ID NO: 299, SEQ ID NO: 303, SEQ ID NO: 307, and SEQ ID NO: 311, or a light chain variable region comprising the amino acid sequence of SEQ ID NO: 293. In a specific embodiment, the antibodies of the invention comprise a) a heavy chain variable region comprising an amino acid sequence selected from SEQ ID NO: 259, SEQ ID NO: 263, SEQ ID NO: 267, SEQ ID NO: 271, SEQ ID NO: 275, SEQ ID NO: 279, SEQ ID NO: 283, SEQ ID NO: 287, SEQ ID NO: 291, SEQ ID NO: 303, and SEQ ID NO: 307, and a light chain variable region comprising the amino acid sequence of SEQ ID NO: 195, or b) a heavy chain variable region comprising the amino acid sequence or SEQ ID NO: 299 or SEQ ID NO: 311, and a light chain variable region comprising the amino acid sequence of SEQ ID NO: 205, or c) a heavy chain variable region comprising the amino acid sequence or SEQ ID NO: 197, and a light chain variable region comprising the amino acid sequence of SEQ ID NO: 293. In a specific embodiment, an antibody of the invention comprises a heavy chain variable region comprising the amino acid sequence of SEQ ID NO: 259 and a light chain variable region comprising the amino acid sequence of SEQ ID NO: 195. In another specific embodiment, an antibodies of the invention comprises a heavy chain variable region comprising the amino acid sequence of SEQ ID NO: 263 and a light chain variable region comprising the amino acid sequence of SEQ ID NO: 195. In a specific embodiment, an antibody of the invention comprises a heavy chain variable region comprising the amino acid sequence of SEQ ID NO: 307 and a light chain variable region comprising the amino acid sequence of SEQ ID NO: 305. In another specific embodiment, an antibodies of the invention comprises a heavy chain variable region comprising the amino acid sequence of SEQ ID NO: 267 and a light chain variable region comprising the amino acid sequence of SEQ ID NO: 265. In yet another specific embodiment an antibody of the invention comprises a heavy chain variable region comprising the amino acid sequence of SEQ ID NO: 299, and a light chain variable region comprising the amino acid sequence of SEQ ID
NO: 205. In a particular embodiment, the antibody according to any of the above embodiments additionally comprises an Fc region or a region equivalent to the Fc region of an immunoglobulin.

In one embodiment an antibody of the invention comprises an Fc region, particularly a IgG Fc region, most particularly a IgGl Fc region.

In a particular embodiment, the antibody of the invention is a full length antibody, particularly an IgG class antibody, most particularly an IgGl isotype antibody. In another embodiment, the antibody of the invention is an antibody fragment, selected from the group of: an scFv fragment, an Fv fragment, a Fab fragment, and a F(ab')2 fragment. In a further embodiment, the antibody of the invention is an antibody fragment having an Fc region, or a fusion protein that comprises a region equivalent to the Fc region of an immunoglobulin. In one embodiment, the antibody of the invention is a monoclonal antibody.

In one embodiment, an antibody of the invention is chimeric, more specifically humanized. In a particular embodiment, an antibody of the invention is human. In another embodiment, an antibody of the invention comprises a human constant region. In one embodiment the antibody of the invention comprises a human Fc region, particularly a human IgG Fc region, most particularly a human IgGl Fc region.

In one embodiment, an antibody of the invention comprises a heavy chain constant region, wherein said heavy chain constant region is a human IgG constant region, particularly a human IgGl constant region, comprising an Fc region. In a specific embodiment, the antibody comprises a heavy chain constant region comprising the amino acid sequence of SEQ ID NO: 313. In another specific embodiment an antibody of the invention comprises a light chain constant region comprising the amino acid sequence of SEQ ID NO: 315. In yet another specific embodiment, an antibody of the invention comprises a heavy chain constant region comprising the amino acid sequence of SEQ ID NO: 313, and a light chain constant region comprising the amino acid sequence of SEQ ID NO: 315.

In a particular embodiment, the invention provides an antibody that specifically binds to FAP, wherein said antibody comprises a) a heavy chain variable region comprising an amino acid sequence that is at least about 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or 100% identical to a sequence selected from the group of SEQ ID NO: 197, SEQ ID NO: 201, SEQ ID NO: 203, SEQ ID NO: 207, SEQ ID NO: 211, SEQ ID NO: 215, SEQ ID NO: 219, SEQ ID NO: 223, SEQ ID NO: 227, SEQ ID NO: 231, SEQ ID NO: 235, SEQ ID NO: 239, SEQ ID NO: 243, SEQ ID NO: 247, SEQ ID NO: 251, SEQ ID NO: 255, SEQ ID NO: 259, SEQ ID NO: 263, SEQ
ID NO: 267, SEQ ID NO: 271, SEQ ID NO: 275, SEQ ID NO: 279, SEQ ID NO: 283, SEQ ID NO: 287, SEQ ID NO: 291, SEQ ID NO: 295, SEQ ID NO: 299, SEQ ID NO: 303, SEQ ID NO: 307, and SEQ ID NO: 311, or a light chain variable region comprising an amino acid sequence that is at least about 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or 100% identical to a sequence selected from the group of SEQ ID NO: 193, SEQ ID NO: 195, SEQ ID NO: 199, SEQ ID NO: 205, SEQ ID NO: 209, SEQ ID NO: 213, SEQ ID NO: 217, SEQ ID NO: 221, SEQ ID NO: 225, SEQ ID NO: 229, SEQ ID NO: 233, SEQ ID NO: 237, SEQ ID NO: 241, SEQ ID NO: 245, SEQ ID NO: 249, SEQ ID NO: 253, SEQ ID NO: 257, SEQ ID NO: 261, SEQ ID NO: 265, SEQ ID NO: 269, SEQ ID NO: 273, SEQ ID NO: 277, SEQ ID NO: 281, SEQ ID NO: 285, SEQ ID NO: 289, SEQ ID NO: 293, SEQ ID NO: 297, SEQ ID NO: 301, SEQ ID NO: 305, and SEQ ID NO: 309, or a combination thereof, and b) an Fc region or a region equivalent to the Fc region of an immunoglobulin.

In one embodiment, an antibody of the invention comprises an Fc region, wherein said Fc region is a glycoengineered Fc region. In a further embodiment, an antibody of the invention is glycoengineered to have modified oligosaccharides in the Fc region. In a specific embodiment, the antibody has an increased proportion of bisected oligosaccharides in the Fc region, compared to a non-glycoengineered antibody. In a more specific embodiment, at least about 10%, about 15%, about 20%, about 25%, about 30%, about 35%, about 40%, about 45%, about 50%, about 55%, about 60%, about 65%, about 70%, about 75%, about 80%, about 85%, about 90%, about 95%, or about 100%, preferably at least about 50%, more preferably at least about 70%, of the N-linked oligosaccharides in the Fc region of the antibody are bisected. The bisected oligosaccharides may be of the hybrid or complex type.

In another specific embodiment, an antibody of the invention has an increased proportion of non-fucosylated oligosaccharides in the Fc region, compared to a non-glycoengineereed antibody. In a more specific embodiment, at least about 20%, about 25%, about 30%, about 35%, about 40%, about 45%, about 50%, about 55%, about 60%, about 65%, about 70%, about 75%, about 80%, about 85%, about 90%, about 95%, or about 100%, preferably at least about 50%, more preferably at least about 70%, of the N-linked oligosaccharides in the Fc region of the antibody are non-fucosylated. The non-fucosylated oligosaccharides may be of the hybrid or complex type.

In a particular embodiment, an antibody of the invention has an increased proportion of bisected, non-fucosylated oligosaccharides in the Fc region, compared to a non-glycoengineereed antibody. Specifically, the antibody comprises an Fc region in which at least about 10%, about 15%, about
20%, about 25%, about 30%, about 35%, about 40%, about 45%, about 50%, about 55%, about 60%, about 65%, about 70%, about 75%, about 80%, about 85%, about 90%, about 95%, or about 100%, preferably at least about 15%, more preferably at least about 25%, at least about 35% or at least about 50%, of the N-linked oligosaccharides are bisected, non-fucosylated. The bisected, non-fucosylated oligosaccharides may be of the hybrid or complex type.

In one embodiment, an antibody of the invention has increased effector function and/or increased Fc receptor binding affinity. Increased effector function and/or increased Fc receptor binding can result e.g. from glycoengineering and/or affinity maturation of antibodies. In one embodiment, the increased effector function and/or increased Fc receptor binding is a result of glycoengineering of the Fc region of the antibody. In another embodiment, the increased effector function and/or increased Fc receptor binding is a result of a combination of increased affinity and glycoengineering. The increased effector function can include, but is not limited to, one or more of the following: increased Fc-mediated cellular cytotoxicity (including increased antibody-dependent cell-mediated cytotoxicity (ADCC)), increased antibody-dependent cellular phagocytosis (ADCP), increased cytokine secretion, increased immune-complex-mediated antigen uptake by antigen-presenting cells, increased binding to NK cells, increased binding to macrophages, increased binding to monocytes, increased binding to polymorphonuclear cells, increased direct signaling inducing apoptosis, increased crosslinking of target-bound antibodies, increased dendritic cell maturation, or increased T cell priming. In a particular embodiment, the increased effector function is increased ADCC. The increased Fc receptor binding preferably is increased binding to an activating Fc receptor, most preferably FcγRIIIa.

In one embodiment, an antibody of the invention does not cause a clinically significant level of toxicity when administered to an individual in a therapeutically effective amount.

In one embodiment, an antibody of the invention is affinity matured. In a further embodiment, an antibody of the invention binds to the Fibroblast Activation Protein with a dissociation constant (K_D) value lower than about 1 μM to about 0.001 nM, particularly a K_D value lower than about 100 nM, lower than about 10 nM, lower than about 1 nM, or lower than about 0.1 nM. In one embodiment, an antibody of the invention binds to human, mouse and cynomolgus FAP. In one embodiment, an antibody of the invention binds to human and cynomolgus FAP. In a more specific embodiment, an antibody of the invention binds to human, mouse and cynomolgus FAP with a K_D value lower than about 200 nM, lower than about 100 nM, more particularly lower than about 10 nM or lower than about 1 nM, most particularly lower than 0.1 nM. K_D values are
determined by Surface Plasmon Resonance, using the antibodies as Fab or IgG, particularly as IgG.

In one embodiment, an anti-FAP antibody of the invention binds FAP in human tissues. In one embodiment an anti-FAP antibody of the invention is cross-reactive for human and murine FAP. In another embodiment, an antibody of the invention has no substantial cross-reactivity to other members of the dipeptidyl peptidase IV family, in particular to DPPIV/CD26. In one embodiment, an anti-FAP antibody of the invention does not induce internalization of FAP upon binding of said antibody to FAP expressed on the surface of a cell.

In a particular embodiment, the invention provides an antibody that specifically binds to FAP, wherein said antibody comprises a heavy chain variable region comprising an amino acid sequence selected from the group of SEQ ID NO: 197, SEQ ID NO: 201, SEQ ID NO: 203, SEQ ID NO: 207, SEQ ID NO: 211, SEQ ID NO: 215, SEQ ID NO: 219, SEQ ID NO: 223, SEQ ID NO: 227, SEQ ID NO: 231, SEQ ID NO: 235, SEQ ID NO: 239, SEQ ID NO: 243, SEQ ID NO: 247, SEQ ID NO: 251, SEQ ID NO: 255, SEQ ID NO: 259, SEQ ID NO: 263, SEQ ID NO: 267, SEQ ID NO: 271, SEQ ID NO: 275, SEQ ID NO: 279, SEQ ID NO: 283, SEQ ID NO: 287, SEQ ID NO: 291, SEQ ID NO: 295, SEQ ID NO: 299, SEQ ID NO: 303, SEQ ID NO: 307, and SEQ ID NO: 311, a light chain variable region comprising an amino acid sequence selected from the group of SEQ ID NO: 193, SEQ ID NO: 195, SEQ ID NO: 199, SEQ ID NO: 205, SEQ ID NO: 209, SEQ ID NO: 213, SEQ ID NO: 217, SEQ ID NO: 221, SEQ ID NO: 225, SEQ ID NO: 229, SEQ ID NO: 233, SEQ ID NO: 237, SEQ ID NO: 241, SEQ ID NO: 245, SEQ ID NO: 249, SEQ ID NO: 253, SEQ ID NO: 257, SEQ ID NO: 261, SEQ ID NO: 265, SEQ ID NO: 269, SEQ ID NO: 273, SEQ ID NO: 277, SEQ ID NO: 281, SEQ ID NO: 285, SEQ ID NO: 289, SEQ ID NO: 293, SEQ ID NO: 297, SEQ ID NO: 301, SEQ ID NO: 305, and SEQ ID NO: 309, and a human IgG Fc region, and wherein optionally said antibody is glycoengineered to have increased effector function and/or Fc receptor binding affinity. In another particular embodiment, the invention provides an antibody that specifically binds to FAP, wherein said antibody comprises a heavy chain variable region comprising an amino acid sequence selected from the group of SEQ ID NO: 197, SEQ ID NO: 201, SEQ ID NO: 203, SEQ ID NO: 207, SEQ ID NO: 211, SEQ ID NO: 215, SEQ ID NO: 219, SEQ ID NO: 223, SEQ ID NO: 227, SEQ ID NO: 231, SEQ ID NO: 235, SEQ ID NO: 239, SEQ ID NO: 243, SEQ ID NO: 247, SEQ ID NO: 251, SEQ ID NO: 255, SEQ ID NO: 259, SEQ ID NO: 263, SEQ ID NO: 267, SEQ ID NO: 271, SEQ ID NO: 275, SEQ ID NO: 279, SEQ ID NO: 283, SEQ ID NO: 287, SEQ ID NO: 291, SEQ ID NO: 295, SEQ ID NO: 299, SEQ ID NO: 303, SEQ ID NO: 307, and SEQ ID NO: 311, a light chain variable...
region comprising an amino acid sequence selected from the group of SEQ ID NO: 193, SEQ ID NO: 195, SEQ ID NO: 199, SEQ ID NO: 205, SEQ ID NO: 209, SEQ ID NO: 213, SEQ ID NO: 217, SEQ ID NO: 221, SEQ ID NO: 225, SEQ ID NO: 229, SEQ ID NO: 233, SEQ ID NO: 237, SEQ ID NO: 241, SEQ ID NO: 245, SEQ ID NO: 249, SEQ ID NO: 253, SEQ ID NO: 257, SEQ ID NO: 261, SEQ ID NO: 265, SEQ ID NO: 269, SEQ ID NO: 273, SEQ ID NO: 277, SEQ ID NO: 281, SEQ ID NO: 285, SEQ ID NO: 289, SEQ ID NO: 293, SEQ ID NO: 297, SEQ ID NO: 301, SEQ ID NO: 305, and SEQ ID NO: 309, and a human IgG Fc region, and wherein said antibody has an increased proportion of non-fucosylated oligosaccharides and/or an increased proportion of bisected oligosaccharides in said Fc region.

In one aspect, the invention provides for an antibody that specifically bind to FAP, wherein said antibody is derived from a parent antibody comprising the heavy chain CDR1 of SEQ ID NO: 3, the heavy chain CDR2 of SEQ ID NO: 35, a heavy chain CDR3 selected from the group of SEQ ID NO: 135, SEQ ID NO: 137, SEQ ID NO: 139 and SEQ ID NO: 141, the light chain CDR1 of SEQ ID NO: 145, the light chain CDR2 of SEQ ID NO: 153 and a light chain CDR3 selected from the group of SEQ ID NO: 165, SEQ ID NO: 167, SEQ ID NO: 169, SEQ ID NO: 171, SEQ ID NO: 173 and SEQ ID NO: 175, and wherein said antibody comprises at least one amino acid substitution or deletion in at least one heavy or light chain CDR of to the parent antibody. For example, the antibody may comprise at least one, e.g. from about one to about ten (i.e., about 1, 2, 3, 4, 5, 6, 7, 8, 9, or 10), and particularly from about two to about five, substitutions in one or more hypervariable regions or CDRs (i.e., 1, 2, 3, 4, 5, or 6 hypervariable regions or CDRs) of the parent antibody. In certain embodiments, any one or more amino acids of the parent antibody as provided above are substituted or deleted at the following CDR positions:

- Heavy chain CDR1 (SEQ ID NO: 3): positions 2 and 3
- Heavy chain CDR2 (SEQ ID NO: 35): positions 1, 3, 4, 5, 6, 7, 8 and 9
- Light chain CDR1 (SEQ ID NO: 145): positions 7, 8 and 9
- Light chain CDR2 (SEQ ID NO: 153): positions 1, 2, 3, 4 and 5
- Light chain CDR3 (SEQ ID NO 165, 167, 169, 171, 173, or 175): positions 4, 5, 6, and 7

In certain embodiments, the substitutions are conservative substitutions, as provided herein. In certain embodiments, any one or more of the following substitutions or deletions may be made in any combination:

- Heavy chain CDR1 (SEQ ID NO: 3): Y2F, H or S, A3T
- Light chain CDR1 (SEQ ID NO: 145): S7T, S8R or S9N
- Light chain CDR2 (SEQ ID NO: 153): YIN, I or Q, G2V, A3G, S4T or Y, S5R, T or I
- Light chain CDR3 (SEQ ID NO 165, 167, 169, 171, 173, or 175): G4A, Q, N, L or H5I, L, V, Q, N or I6M, I7L

Additionally, the antibodies may also comprise one or more additions, deletions and/or substitutions in one or more framework regions of either the heavy or the light chain, compared to the parent antibody. In one embodiment, said at least one amino acid substitution in at least one CDR contributes to increased binding affinity of the antibody compared to its parent antibody. In another embodiment said antibody has at least about 2-fold to about 10-fold greater affinity for FAP than the parent antibody (when comparing the antibody of the invention and the parent antibody in the same format, e.g. the Fab format). Further, the antibody derived from a parent antibody may incorporate any of the features, singly or in combination, described in the preceding paragraphs in relation to the antibodies of the invention.

The present invention also provides for polynucleotides encoding antibodies that specifically bind to FAP. In one aspect, the invention is directed to an isolated polynucleotide encoding a polypeptide that forms part of an anti-FAP antibody according to the invention as described hereinbefore. In one embodiment, the isolated polynucleotide encodes an antibody heavy chain and/or an antibody light chain that forms part of an anti-FAP antibody according to the invention as described hereinbefore.

In one embodiment, the invention is directed to an isolated polynucleotide comprising a sequence encoding one or more (e.g. one, two, three, four, five, or six) of the heavy or light chain complementarity determining regions (CDRs) set forth in SEQ ID NOs 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 45, 47, 49, 51, 53, 55, 57, 59, 61, 63, 65, 67, 69, 71, 73, 75, 77, 79, 81, 83, 85, 87, 89, 91, 93, 95, 97, 99, 101, 103, 105, 107, 109, 111, 113, 115, 117, 119, 121, 123, 125, 127, 129, 131, 133, 135, 137, 139, 141, 143, 145, 147, 149, 151, 153, 155, 157, 159, 161, 163, 165, 167, 169, 171, 173, 175 and 177, or a variant or truncated form thereof containing at least the specificity-determining residues (SDRs) for said CDR. In another embodiment, the polynucleotide comprises a sequence that encodes three heavy chain CDRs (e.g., HCDR1, HCDR2, and HCDR3) or three light chain CDRs (e.g. LCDR1, LCDR2, and LCDR3) selected from SEQ ID NOs 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 45, 47, 49, 51, 53, 55, 57, 59, 61, 63, 65, 67, 69, 71, 73, 75, 77, 79, 81, 83, 85, 87, 89, 91, 93, 95, 97, 99, 101, 103, 105, 107, 109, 111, 113, 115, 117, 119, 121, 123, 125, 127, 129, 131, 133, 135, 137, 139, 141, 143, 145, 147, 149, 151, 153, 155, 157, 159, 161, 163, 165, 167,
169, 171, 173, 175 and 177, or variants or truncated forms thereof containing at least the SDRs for each of said three complementarity determining regions. In yet another embodiment, the polynucleotide comprises a sequence encoding three heavy chain CDRs (e.g., HCDR1, HCDR2, and HCDR3) and three light chain CDRs (e.g., LCDR1, LCDR2, and LCDR3) selected from

SEQ ID NOs 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 45, 47, 49, 51, 53, 55, 57, 59, 61, 63, 65, 67, 69, 71, 73, 75, 77, 79, 81, 83, 85, 87, 89, 91, 93, 95, 97, 99, 101, 103, 105, 107, 109, 111, 113, 115, 117, 119, 121, 123, 125, 127, 129, 131, 133, 135, 137, 139, 141, 143, 145, 147, 149, 151, 153, 155, 157, 159, 161, 163, 165, 167, 169, 171, 173, 175 and 177. In a particular embodiment the polynucleotide encoding one or more CDRs comprises a sequence that is at least about 90%, 95%, 96%, 97%, 98%, or 100% identical to one or more of the CDR nucleotide sequences shown in SEQ ID NOs 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 24, 26, 28, 30, 32, 34, 36, 38, 40, 42, 44, 46, 48, 50, 52, 54, 56, 58, 60, 62, 64, 66, 68, 70, 72, 74, 76, 78, 80, 82, 84, 86, 88, 90, 92, 94, 96, 98, 100, 102, 104, 106, 108, 110, 112, 114, 116, 118, 120, 122, 124, 126, 128, 130, 132, 134, 136, 138, 140, 142, 144, 146, 148, 150, 152, 154, 156, 158, 160, 162, 164, 166, 168, 170, 172, 174, 176, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191 and 192.

In a further embodiment, the polynucleotide comprises a sequence encoding a heavy chain variable region selected from the group of SEQ ID NO: 197, SEQ ID NO: 201, SEQ ID NO: 203, SEQ ID NO: 207, SEQ ID NO: 211, SEQ ID NO: 215, SEQ ID NO: 219, SEQ ID NO: 223, SEQ ID NO: 227, SEQ ID NO: 231, SEQ ID NO: 235, SEQ ID NO: 239, SEQ ID NO: 243, SEQ ID NO: 247, SEQ ID NO: 251, SEQ ID NO: 255, SEQ ID NO: 259, SEQ ID NO: 263, SEQ ID NO: 267, SEQ ID NO: 271, SEQ ID NO: 275, SEQ ID NO: 279, SEQ ID NO: 283, SEQ ID NO: 287, SEQ ID NO: 291, SEQ ID NO: 295, SEQ ID NO: 299, SEQ ID NO: 303, SEQ ID NO: 307, and SEQ ID NO: 311, and/or a sequence encoding a light chain variable region selected from the group of SEQ ID NO: 193, SEQ ID NO: 195, SEQ ID NO: 199, SEQ ID NO: 205, SEQ ID NO: 209, SEQ ID NO: 213, SEQ ID NO: 217, SEQ ID NO: 221, SEQ ID NO: 225, SEQ ID NO: 229, SEQ ID NO: 233, SEQ ID NO: 237, SEQ ID NO: 241, SEQ ID NO: 245, SEQ ID NO: 249, SEQ ID NO: 253, SEQ ID NO: 257, SEQ ID NO: 261, SEQ ID NO: 265, SEQ ID NO: 269, SEQ ID NO: 273, SEQ ID NO: 277, SEQ ID NO: 281, SEQ ID NO: 285, SEQ ID NO: 289, SEQ ID NO: 293, SEQ ID NO: 297, SEQ ID NO: 301, SEQ ID NO: 305, and SEQ ID NO: 309. In a particular embodiment, the polynucleotide encoding a heavy chain and/or light chain variable region comprises a sequence selected from the group of variable region nucleotide sequences presented in SEQ ID NOs 194, 196, 198, 200, 202, 204, 206, 208, 210, 212, 214, 216, 218, 220, 222, 224,
In a specific embodiment, the polynucleotide comprises a sequence encoding a heavy chain variable region selected from the group of SEQ ID NO: 197, SEQ ID NO: 201, SEQ ID NO: 203, SEQ ID NO: 207, SEQ ID NO: 211, SEQ ID NO: 215, SEQ ID NO: 219, SEQ ID NO: 223, SEQ ID NO: 227, SEQ ID NO: 231, SEQ ID NO: 235, SEQ ID NO: 239, SEQ ID NO: 243, SEQ ID NO: 247, SEQ ID NO: 251, SEQ ID NO: 255, SEQ ID NO: 259, SEQ ID NO: 263, SEQ ID NO: 267, SEQ ID NO: 271, SEQ ID NO: 275, SEQ ID NO: 279, SEQ ID NO: 283, SEQ ID NO: 287, SEQ ID NO: 291, SEQ ID NO: 293, SEQ ID NO: 295, SEQ ID NO: 299, SEQ ID NO: 303, SEQ ID NO: 307, and SEQ ID NO: 311, and a sequence encoding a heavy chain constant region, particularly a human heavy chain constant region. In a particular embodiment, said heavy chain constant region is a human IgG heavy chain constant region, specifically a human IgG1 heavy chain constant region, comprising an Fc region. In a specific embodiment, said heavy chain constant region comprises the sequence of SEQ ID NO: 313. In another specific embodiment, the polynucleotide comprises a sequence encoding a light chain variable region selected from the group of SEQ ID NO: 193, SEQ ID NO: 195, SEQ ID NO: 199, SEQ ID NO: 205, SEQ ID NO: 209, SEQ ID NO: 213, SEQ ID NO: 217, SEQ ID NO: 221, SEQ ID NO: 225, SEQ ID NO: 229, SEQ ID NO: 233, SEQ ID NO: 237, SEQ ID NO: 241, SEQ ID NO: 245, SEQ ID NO: 249, SEQ ID NO: 253, SEQ ID NO: 257, SEQ ID NO: 261, SEQ ID NO: 265, SEQ ID NO: 269, SEQ ID NO: 273, SEQ ID NO: 277, SEQ ID NO: 281, SEQ ID NO: 285, SEQ ID NO: 289, SEQ ID NO: 293, SEQ ID NO: 297, SEQ ID NO: 301, SEQ ID NO: 305, and SEQ ID NO: 309, and a sequence encoding a light chain constant region, particularly a human light chain constant region. In a specific embodiment, said light chain constant region comprises the sequence of SEQ ID NO: 315.

In one embodiment, the invention is directed to a composition that comprises a first isolated polynucleotide encoding a polypeptide comprising an amino acid sequence that is at least about 90%, 95%, 96%, 97%, 98%, 99%, or 100% identical to a sequence selected from the group consisting of SEQ ID NO: 197, SEQ ID NO: 201, SEQ ID NO: 203, SEQ ID NO: 207, SEQ ID NO: 211, SEQ ID NO: 215, SEQ ID NO: 219, SEQ ID NO: 223, SEQ ID NO: 227, SEQ ID NO: 231, SEQ ID NO: 235, SEQ ID NO: 239, SEQ ID NO: 243, SEQ ID NO: 247, SEQ ID NO: 251, SEQ ID NO: 255, SEQ ID NO: 259, SEQ ID NO: 263, SEQ ID NO: 267, SEQ ID NO: 271, SEQ ID NO: 275, SEQ ID NO: 279, SEQ ID NO: 283, SEQ ID NO: 287, SEQ ID NO: 291, SEQ ID NO: 293, SEQ ID NO: 295, SEQ ID NO: 299, SEQ ID NO: 303, SEQ ID NO: 307, and SEQ ID NO: 311, and a sequence encoding a light chain constant region, particularly a human light chain constant region. In a specific embodiment, said light chain constant region comprises the sequence of SEQ ID NO: 315.
NO: 295, SEQ ID NO: 299, SEQ ID NO: 303, SEQ ID NO: 307, and SEQ ID NO: 311, and a second isolated polynucleotide encoding a polypeptide comprising an amino acid sequence that is at least about 90%, 95%, 96%, 97%, 98%, 99%, or 100% identical to a sequence selected from the group consisting of SEQ ID NO: 193, SEQ ID NO: 195, SEQ ID NO: 199, SEQ ID NO: 205, SEQ ID NO: 209, SEQ ID NO: 213, SEQ ID NO: 217, SEQ ID NO: 221, SEQ ID NO: 225, SEQ ID NO: 229, SEQ ID NO: 233, SEQ ID NO: 237, SEQ ID NO: 241, SEQ ID NO: 245, SEQ ID NO: 249, SEQ ID NO: 253, SEQ ID NO: 257, SEQ ID NO: 261, SEQ ID NO: 265, SEQ ID NO: 269, SEQ ID NO: 273, SEQ ID NO: 277, SEQ ID NO: 281, SEQ ID NO: 285, SEQ ID NO: 289, SEQ ID NO: 293, SEQ ID NO: 297, SEQ ID NO: 301, SEQ ID NO: 305, and SEQ ID NO: 309.

In one embodiment, the invention is directed to a composition that comprises a first isolated polynucleotide comprising a sequence that is at least about 90%, 95%, 96%, 97%, 98%, 99%, or 100% identical to a sequence selected from the group consisting of SEQ ID NO: 198, SEQ ID NO: 202, SEQ ID NO: 204, SEQ ID NO: 208, SEQ ID NO: 212, SEQ ID NO: 216, SEQ ID NO: 220, SEQ ID NO: 224, SEQ ID NO: 228, SEQ ID NO: 232, SEQ ID NO: 236, SEQ ID NO: 240, SEQ ID NO: 244, SEQ ID NO: 248, SEQ ID NO: 252, SEQ ID NO: 256, SEQ ID NO: 260, SEQ ID NO: 264, SEQ ID NO: 268, SEQ ID NO: 272, SEQ ID NO: 276, SEQ ID NO: 280, SEQ ID NO: 284, SEQ ID NO: 288, SEQ ID NO: 292, SEQ ID NO: 296, SEQ ID NO: 300, SEQ ID NO: 304, SEQ ID NO: 308, and SEQ ID NO: 312, and a second isolated polynucleotide comprising a sequence that is at least about 90%, 95%, 96%, 97%, 98%, 99%, or 100% identical to a sequence selected from the group consisting of SEQ ID NO: 194, SEQ ID NO: 196, SEQ ID NO: 200, SEQ ID NO: 206, SEQ ID NO: 210, SEQ ID NO: 214, SEQ ID NO: 218, SEQ ID NO: 222, SEQ ID NO: 226, SEQ ID NO: 230, SEQ ID NO: 234, SEQ ID NO: 238, SEQ ID NO: 242, SEQ ID NO: 246, SEQ ID NO: 250, SEQ ID NO: 254, SEQ ID NO: 258, SEQ ID NO: 262, SEQ ID NO: 266, SEQ ID NO: 270, SEQ ID NO: 274, SEQ ID NO: 278, SEQ ID NO: 282, SEQ ID NO: 286, SEQ ID NO: 290, SEQ ID NO: 294, SEQ ID NO: 298, SEQ ID NO: 302, SEQ ID NO: 306, and SEQ ID NO: 310.

In a further aspect, the invention is also directed to isolated polypeptides, encoded by any of the polynucleotides according the invention as described hereinbefore.

In a further aspect, an anti-FAP antibody according to any of the above embodiments may incorporate any of the features, singly or in combination, as described in Sections 1-6 below:
I. Antibody Affinity

In certain embodiments, an antibody provided herein has a dissociation constant ($K_D$) of $\leq 1 \mu M$, $\leq 100 \, nM$, $\leq 10 \, nM$, $\leq 1 \, nM$, $\leq 0.1 \, nM$, $\leq 0.01 \, nM$, or $\leq 0.001 \, nM$ (e.g., $10^{-8} \, M$ or less, e.g. from $10^{-8} \, M$ to $10^{-11} \, M$, e.g., from $10^{-9} \, M$ to $10^{-16} \, M$). Preferably, the antibodies provided herein bind to Fibroblast Activation Protein (FAP), in particular human FAP, with a $K_D$ value lower than 1 nM, as determined by Surface Plasmon Resonance (SPR).

According to one embodiment, $K_D$ is measured using surface plasmon resonance. Such an assay can be performed, for example, using a BIACORE®-T100 machine (GE Healthcare) at 25°C with CM5 chips for antigen immobilization. Briefly, carboxymethylated dextran biosensor chips (CM5, GE Healthcare.) are activated with N-ethyl-N'-(3-dimethylaminopropyl)-carbodiimide hydrochloride (EDC) and N-hydroxysuccinimide (NHS) according to the supplier's instructions. Anti-His antibody (Penta His, Qiagen) is diluted with 10 mM sodium acetate, pH 5, to 40 µg/ml before injection at a flow rate of 10 µl/minute to achieve approximately 9000 response units (RU) of coupled protein. Following the injection of the anti-His antibody, 1 M ethanolamine is injected to block unreacted groups. Subsequently, His-tagged antigen is injected at 10 µl/min at 10 nM for 20 sec (for measurements with Fab fragments) or at 20 nM for 25 s (for measurements with IgG antibodies) and is captured via its His tag by the immobilized anti-His antibody. Protein and DNA sequences of suitable FAP antigen constructs are shown in SEQ ID NOs 317-322. For kinetics measurements, serial dilutions of antibody (two-fold dilutions, range between 6.25 nM to 200 nM for Fab fragments, or five-fold dilutions, range between 3.2 pM to 10 nM for IgG) are injected in 10 mM HEPES, 150 mM NaCl, 3 mM EDTA, 0.05% Surfactant P20, pH 7.4 at 25°C at a flow rate of 90 µl/min. The following parameters are applied: Association time 180 s, dissociation 300 s (for Fab) or 900 s (for IgG), regeneration with 10 mM glycine pH 2 for 60 s between each cycle. Association rates ($k_{on}$) and dissociation rates ($k_{off}$) are calculated using a simple one-to-one Langmuir binding model (BIACORE ®T100 Evaluation Software) by simultaneously fitting the association and dissociation sensorgrams. The equilibrium dissociation constant ($K_D$) is calculated as the ratio $k_{off}/k_{on}$. See, e.g., Chen et al., *J. Mol. Biol.* 293:865-881 (1999).

2. Antibody Fragments

In certain embodiments, an antibody provided herein is an antibody fragment. Antibody fragments include, but are not limited to, Fab, Fab', Fab'-SH, F(ab')2, Fv, and scFv fragments,

Single-chain Fv or scFv fragments comprise a VH domain and a VL domain as a single polypeptide chain. Typically, the VH and VL domains are joined by a linker sequence. For a review of scFv fragments, see, e.g., Plickthun, in The Pharmacology of Monoclonal Antibodies, vol. 113, Rosenberg and Moore eds., (Springer-Verlag, New York), pp. 269-315 (1994); see also WO 93/16185; and U.S. Patent Nos. 5,571,894 and 5,587,458. For discussion of Fab and F(ab')_2 fragments comprising salvage receptor binding epitope residues and having increased in vivo half-life, see U.S. Patent No. 5,869,046.

Diabodies are antibody fragments with two antigen-binding sites that may be bivalent or bispecific. See, for example, EP 404,097; WO 1993/01161; Hudson et al., Nat. Med. 9:129-134 (2003); and Hollinger et al., Proc. Natl. Acad. Sci. USA 90:6444-6448 (1993). Triabodies and tetrabodies are also described in Hudson et al., Nat. Med. 9:129-134 (2003).

A minibody is a bivalent, homodimeric scFv derivative that contains a constant region, typically the CH3 region of an immunoglobulin, preferably IgG, more preferably IgGl, as the dimerisation region. Generally, the constant region is connected to the scFv via a hinge region and/or a linker region. Examples of minibody proteins can be found in Hu et al., Cancer Res. 56:3055-61 (1996).

Single-domain antibodies are antibody fragments comprising all or a portion of the heavy chain variable domain or all or a portion of the light chain variable domain of an antibody. In certain embodiments, a single-domain antibody is a human single-domain antibody (Domantis, Inc., Waltham, MA; see, e.g., U.S. Patent No. 6,248,516 Bl).

Antibody fragments can be made by various techniques, including but not limited to proteolytic digestion of an intact antibody as well as production by recombinant host cells (e.g. E. coli or phage), as described herein.

3. Chimeric and Humanized Antibodies

In certain embodiments, an antibody provided herein is a chimeric antibody. Certain chimeric antibodies are described, e.g., in U.S. Patent No. 4,816,567; and Morrison et al., Proc. Natl. Acad. Sci. USA, 81:6851-6855 (1984)). In one example, a chimeric antibody comprises a non-human variable region (e.g., a variable region derived from a mouse, rat, hamster, rabbit, or non-human primate, such as a monkey) and a human constant region. In a further example, a chimeric antibody is a "class switched" antibody in which the class or subclass has been changed from that of the parent antibody. Chimeric antibodies include antigen-binding fragments thereof.
In certain embodiments, a chimeric antibody is a humanized antibody. Typically, a non-human antibody is humanized to reduce immunogenicity to humans, while retaining the specificity and affinity of the parental non-human antibody. Generally, a humanized antibody comprises one or more variable domains in which HVRs, e.g., CDRs, (or portions thereof) are derived from a non-human antibody, and FRs (or portions thereof) are derived from human antibody sequences. A humanized antibody optionally will also comprise at least a portion of a human constant region. In some embodiments, some FR residues in a humanized antibody are substituted with corresponding residues from a non-human antibody (e.g., the antibody from which the HVR residues are derived), e.g., to restore or improve antibody specificity or affinity. Humanization may be achieved by various methods including, but not limited to (a) grafting the entire non-human variable domains onto human constant regions to generate chimeric antibodies, (b) grafting only the non-human (e.g., donor antibody) CDRs onto human (e.g., recipient antibody) framework and constant regions with or without retention of critical framework residues (e.g., those that are important for retaining good antigen binding affinity or antibody functions), (c) grafting only the non-human specificity-determining regions (SDRs or a-CDRs; the residues critical for the antibody-antigen interaction) onto human framework and constant regions, or (d) transplanting the entire non-human variable domains, but "cloaking" them with a human-like section by replacement of surface residues. Humanized antibodies and methods of making them are reviewed, e.g., in Almagro and Fransson, *Front. Biosci.* 13:1619-1633 (2008), and are further described, e.g., in Riechmann et al., *Nature* 332:323-329 (1988); Queen et al., *Proc. Nat'l Acad. Sci. USA* 86:10029-10033 (1989); US Patent Nos. 5, 821,337, 7,527,791, 6,982,321, and 7,087,409; Jones et al., *Nature* 321:522-525 (1986); Morrison et al., *Proc. Nat'l Acad. Sci. USA* 81:6851-6855 (1984); Morrison and Oi, *Adv. Immunol.* 44:65-92 (1988); Verhoeven et al., *Science* 239:1534-1536 (1988); Padlan, *Molec. Immun.* 31(3): 169-217 (1994); Kashimir et al, *Methods* 36:25-34 (2005) (describing SDR (a-CDR) grafting); Padlan, *Mol. Immunol.* 28:489-498 (1991) (describing "resurfacing"); Dall'Acqua et al., *Methods* 36:43-60 (2005) (describing "FR shuffling"); and Osbourn et al., *Methods* 36:61-68 (2005) and Klimka et al., *Br. J. Cancer* 83:252-260 (2000) (describing the "guided selection" approach to FR shuffling).

Human framework regions that may be used for humanization include but are not limited to: framework regions selected using the "best-fit" method (see, e.g., Sims et al. *J. Immunol.* 151:2296 (1993)); framework regions derived from the consensus sequence of human antibodies of a particular subgroup of light or heavy chain variable regions (see, e.g., Carter et al. *Proc. Natl. Acad. Sci. USA*, 89:4285 (1992); and Presta et al. *J. Immunol.*, 151:2623 (1993)); human

4. **Human Antibodies**

Human antibodies may be prepared by administering an immunogen to a transgenic animal that has been modified to produce intact human antibodies or intact antibodies with human variable regions in response to antigenic challenge. Such animals typically contain all or a portion of the human immunoglobulin loci, which replace the endogenous immunoglobulin loci, or which are present extrachromosomally or integrated randomly into the animal's chromosomes. In such transgenic mice, the endogenous immunoglobulin loci have generally been inactivated. For review of methods for obtaining human antibodies from transgenic animals, see Lonberg, *Nat. Biotech.* 23:1117-1125 (2005). See also, e.g., U.S. Patent Nos. 6,075,181 and 6,150,584 describing XENOMOUSE™ technology; U.S. Patent No. 5,770,429 describing HUMAB® technology; U.S. Patent No. 7,04,1870 describing K-M MOUSE® technology, and U.S. Patent Application Publication No. US 2007/006 1900, describing VELOSIMOUSE® technology).

Human variable regions from intact antibodies generated by such animals may be further modified, e.g., by combining with a different human constant region. Human antibodies can also be made by hybridoma-based methods. Human myeloma and mouse-human heteromyeloma cell lines for the production of human monoclonal antibodies have been described. (See, e.g., Kozbor *J. Immunol.* 133: 3001 (1984); Brodeur et al., *Monoclonal Antibody Production Techniques and Applications*, pp. 51-63 (Marcel Dekker, Inc., New York, 1987); and Boerner et al., *J. Immunol.*, 147: 86 (1991).) Human antibodies generated via human B-cell hybridoma technology are also described in Li et al., *Proc. Natl Acad. Sci. USA*, 103:3557-3562 (2005). Additional methods include those described, for example, in U.S. Patent No. 7,189,826 (describing production of monoclonal human IgM antibodies from hybridoma cell lines) and Ni, *Xiaodai Mianyixue*, 26(4):265-268 (2006) (describing human-human hybridomas). Human hybridoma technology (Trioma technology) is also described in Vollmers and Brandlein,

Human antibodies may also be generated by isolating Fv clone variable domain sequences selected from human-derived phage display libraries. Such variable domain sequences may then be combined with a desired human constant domain. Techniques for selecting human antibodies from antibody libraries are described below.

5. Library-Derived Antibodies

In certain phage display methods, repertoires of VH and VL genes are separately cloned by polymerase chain reaction (PCR) and recombined randomly in phage libraries, which can then be screened for antigen-binding phage as described in Winter et al., Ann. Rev. Immunol., 12: 433-455 (1994). Phage typically display antibody fragments, either as single-chain Fv (scFv) fragments or as Fab fragments. Libraries from immunized sources provide high-affinity antibodies to the immunogen without the requirement of constructing hybridomas.

Alternatively, the naive repertoire can be cloned (e.g., from human) to provide a single source of antibodies to a wide range of non-self and also self antigens without any immunization as described by Griffiths et al., EMBO J, 12: 725-734 (1993). Finally, naive libraries can also be made synthetically by cloning unrearranged V-gene segments from stem cells, and using PCR primers containing random sequence to encode the highly variable CDR3 regions and to accomplish rearrangement in vitro, as described by Hoogenboom and Winter, J. Mol. Biol., 227: 381-388 (1992). Patent publications describing human antibody phage libraries include, for example: US Patent No. 5,750,373, and US Patent Publication Nos. 2005/0079574,

Antibodies or antibody fragments isolated from human antibody libraries are considered human antibodies or human antibody fragments herein.

6. **Multispecific Antibodies**

In certain embodiments, an antibody provided herein is a multispecific antibody, e.g., a bispecific antibody. Multispecific antibodies are monoclonal antibodies that have binding specificities for at least two different sites. In certain embodiments, one of the binding specificities is for FAP and the other is for any other antigen. In certain embodiments, bispecific antibodies may bind to two different epitopes of FAP. Bispecific antibodies may also be used to localize cytotoxic agents to cells which express FAP. Bispecific antibodies can be prepared as full length antibodies or antibody fragments.

Engineered antibodies with three or more functional antigen binding sites, including "Octopus antibodies," are also included herein (see, e.g. US 2006/0025576A1).

The antibody or fragment herein also includes a "Dual Acting FAb" or "DAF" comprising an antigen binding site that binds to FAP as well as another, different antigen (see, US 2008/0069820, for example).

7. **Antibody Variants**

In certain embodiments, amino acid sequence variants of the antibodies provided herein are contemplated. For example, it may be desirable to improve the binding affinity and/or other
biological properties of the antibody. Amino acid sequence variants of an antibody may be prepared by introducing appropriate modifications into the nucleotide sequence encoding the antibody, or by peptide synthesis. Such modifications include, for example, deletions from, and/or insertions into and/or substitutions of residues within the amino acid sequences of the antibody. Any combination of deletion, insertion, and substitution can be made to arrive at the final construct, provided that the final construct possesses the desired characteristics, e.g., antigen-binding.

a) **Substitution, Insertion, and Deletion Variants**

In certain embodiments, antibody variants having one or more amino acid substitutions are provided. Sites of interest for substitutional mutagenesis include the HVRs and FRs. Amino acid substitutions can result in replacing one amino acid with another amino acid having similar structural and/or chemical properties, e.g., conservative amino acid replacements. "Conservative" amino acid substitutions may be made on the basis of similarity in polarity, charge, solubility, hydrophobicity, hydrophilicity, and/or the amphipathic nature of the residues involved. For example, nonpolar (hydrophobic) amino acids include alanine, leucine, isoleucine, valine, phenylalanine, tryptophan, and methionine; polar neutral amino acids include serine, threonine, cysteine, tyrosine, asparagine, and glutamine; positively charged (basic) amino acids include arginine, lysine, and histidine; and negatively charged (acidic) amino acids include aspartic acid and glutamic acid. Conservative substitutions are shown in Table 2 under the heading of "preferred substitutions." More substantial changes are provided in Table 2 under the heading of "exemplary substitutions," and as further described below in reference to amino acid side chain classes. Amino acid substitutions may be introduced into an antibody of interest and the products screened for a desired activity, e.g., retained/improved antigen binding, decreased immunogenicity, or improved ADCC or CDC.

**TABLE 2.**
Amino acids may be grouped according to common side-chain properties:

1. hydrophobic: Norleucine, Met, Ala, Val, Leu, He;
2. neutral hydrophilic: Cys, Ser, Thr, Asn, Gin;
3. acidic: Asp, Glu;
4. basic: His, Lys, Arg;
5. residues that influence chain orientation: Gly, Pro;
6. aromatic: Trp, Tyr, Phe.

Non-conservative substitutions will entail exchanging a member of one of these classes for another class. For example, amino acid substitutions can also result in replacing one amino acid with another amino acid having different structural and/or chemical properties, for example, replacing an amino acid from one group (e.g., polar) with another amino acid from a different group (e.g., basic). The variation allowed may be experimentally determined by systematically making insertions, deletions, or substitutions of amino acids in a polypeptide molecule using recombinant DNA techniques and assaying the resulting recombinant variants for activity.

One type of substitutional variant involves substituting one or more hypervariable region residues of a parent antibody (e.g. a humanized or human antibody). Generally, the resulting variant(s) selected for further study will have modifications (e.g., improvements) in certain biological properties (e.g., increased affinity, reduced immunogenicity) relative to the parent antibody and/or will have substantially retained certain biological properties of the parent antibody. An exemplary substitutional variant is an affinity matured antibody, which may be conveniently generated, e.g., using phage display-based affinity maturation techniques such as those described herein. Briefly, one or more HVR residues are mutated and the variant
antibodies displayed on phage and screened for a particular biological activity (e.g. binding affinity).

Alterations (e.g., substitutions) may be made in HVRs, e.g., to improve antibody affinity. Such alterations may be made in HVR "hotspots," i.e., residues encoded by codons that undergo mutation at high frequency during the somatic maturation process (see, e.g., Chowdhury, *Methods Mol. Biol.* 207:179-196 (2008), and/or SDRs (a-CDRs), with the resulting variant VH or VL being tested for binding affinity. Affinity maturation by constructing and reselecting from secondary libraries has been described, e.g., in Hoogenboom et al. in *Methods in Molecular Biology* 178:1-37 (O’Brien et al., ed., Human Press, Totowa, NJ, (2001).) In some embodiments of affinity maturation, diversity is introduced into the variable genes chosen for maturation by any of a variety of methods (e.g., error-prone PCR, chain shuffling, or oligonucleotide-directed mutagenesis). A secondary library is then created. The library is then screened to identify any antibody variants with the desired affinity. Another method to introduce diversity involves HVR-directed approaches, in which several HVR residues (e.g., 4-6 residues at a time) are randomized. HVR residues involved in antigen binding may be specifically identified, e.g., using alanine scanning mutagenesis or modeling. CDR-H3 and CDR-L3 in particular are often targeted.

In certain embodiments, substitutions, insertions, or deletions may occur within one or more HVRs so long as such alterations do not substantially reduce the ability of the antibody to bind antigen. For example, conservative alterations (e.g., conservative substitutions as provided herein) that do not substantially reduce binding affinity may be made in HVRs. Such alterations may be outside of HVR "hotspots" or SDRs. In certain embodiments of the variant VH and VL sequences provided above, each HVR either is unaltered, or contains no more than one, two or three amino acid substitutions.

A useful method for identification of residues or regions of an antibody that may be targeted for mutagenesis is called "alanine scanning mutagenesis" as described by Cunningham and Wells (1989) *Science*, 244:1081-1085. In this method, a residue or group of target residues (e.g., charged residues such as Arg, Asp, His, Lys, and Glu) are identified and replaced by a neutral or negatively charged amino acid (e.g., alanine or polyalanine) to determine whether the interaction of the antibody with antigen is affected. Further substitutions may be introduced at the amino acid locations demonstrating functional sensitivity to the initial substitutions. Alternatively, or additionally, it may be beneficial to analyze a crystal structure of an antigen-antibody complex to identify contact points between the antibody and antigen. Such contact residues and neighboring
residues may be targeted or eliminated as candidates for substitution. Variants may be screened to determine whether they contain the desired properties. Amino acid sequence insertions include amino- and/or carboxyl-terminal fusions ranging in length from one residue to polypeptides containing a hundred or more residues, as well as intrasequence insertions of single or multiple amino acid residues. Examples of terminal insertions include an antibody with an N-terminal methionyl residue. Other insertional variants of the antibody molecule include the fusion to the N- or C-terminus of the antibody to an enzyme (e.g. for ADEPT) or a polypeptide which increases the serum half-life of the antibody.

b) Glycosylation variants

In some embodiments, modifications of the oligosaccharide in an antibody of the invention may be made in order to create antibody variants with certain improved properties. In one aspect, the present invention provides glycoforms of anti-FAP antibodies having increased effector function, including antibody-dependent cellular cytotoxicity. Glycosylation engineering of antibodies has been previously described. See, e.g., U.S. Patent No. 6,602,684, incorporated herein by reference in its entirety. Methods of producing anti-FAP antibodies from host cells that have altered activity of genes involved in glycosylation are also described herein in detail (see, e.g. section entitled "Recombinant Methods and Compositions" below).

An IgG molecule carries two N-linked oligosaccharides in its Fc region, one on each heavy chain. As any glycoprotein, an antibody is produced as a population of glycoforms which share the same polypeptide backbone but have different oligosaccharides attached to the glycosylation sites. The oligosaccharides normally found in the Fc region of serum IgG are of complex bi-antennary type (Wormald et al., Biochemistry 36:130-38 (1997), with a low level of terminal sialic acid and bisecting N-acetylglucosamine (GlcNAc), and a variable degree of terminal galactosylation and core fucosylation (fucose attached to a GlcNAc residue in the "stem" of the biantennary oligosaccharide structure). Some studies suggest that the minimal carbohydrate structure required for FcyR binding lies within the oligosaccharide core. Lund et al., J. Immunol. 757:4963-69 (1996).

The mouse- or hamster-derived cell lines used in industry and academia for production of antibodies normally attach the required oligosaccharide determinants to Fc sites. IgGs expressed in these cell lines lack, however, the bisecting GlcNAc found in low amounts in serum IgGs. Lifely et al., Glycobiology 318:813-22 (1995). In the N-linked glycosylation pathway, a bisecting GlcNAc is added by GnTIII. Schachter, Biochem. Cell Biol. 64:163-81 (1986).
Umana et al. used a single, antibody-producing CHO cell line that was previously engineered to express, in an externally-regulated fashion, different levels of a cloned GnTIII enzyme gene (Umana, P., et al., Nature Biotechnol. i7:176-180 (1999)). This approach established for the first time a rigorous correlation between expression of a glycosyltransferase (e.g., GnTIII) and the ADCC activity of the modified antibody. Thus, the invention contemplates anti-FAP antibodies, comprising an Fc region or region equivalent to an Fc region having altered glycosylation resulting from changing the expression level of a glycosyltransferase gene in the antibody-producing host cell. In a specific embodiment, the change in gene expression level is an increase in GnTIII activity. Increased GnTIII activity results in an increase in the percentage of bisected oligosaccharides, as well as a decrease in the percentage of fucosylated oligosaccharides, in the Fc region of the antibody. This antibody, or fragment thereof, has increased Fc receptor binding affinity and increased effector function.

Antibodies are provided with bisected oligosaccharides, e.g., in which a biantennary oligosaccharide attached to the Fc region of the antibody is bisected by GlcNAc. Such antibody variants may have reduced fucosylation and/or improved ADCC function. Examples of such antibody variants are described, e.g., in WO 2003/011878 (Jean-Mairet et al.); US Patent No. 6,602,684 (Umana et al.); and US 2005/0123546 (Umana et al.).

In one embodiment, the anti-FAP antibodies of the invention have an increased proportion of bisected oligosaccharides in the Fc region as a result of the modification of their oligosaccharides by the methods of the present invention. In one embodiment, the percentage of bisected N-linked oligosaccharides in the Fc region of the anti-FAP antibodies of the invention is at least about 10% to about 100%, specifically at least about 50%, more specifically, at least about 60%, at least about 70%, at least about 80%, or at least about 90-95% of the total oligosaccharides. The bisected oligosaccharides may be of the hybrid or complex type.

In another embodiment, the anti-FAP antibodies of the invention have an increased proportion of nonfucosylated oligosaccharides in the Fc region as a result of the modification of their oligosaccharides by the methods of the present invention. In one embodiment, the percentage of nonfucosylated oligosaccharides is at least about 20% to about 100%, specifically at least about 50%, at least about 60% to about 70%, and more specifically, at least about 75%. The nonfucosylated oligosaccharides may be of the hybrid or complex type.

The amount of fucose is determined by calculating the average amount of fucose within the sugar chain at Asn297, relative to the sum of all glycostructures attached to Asn 297 (e.g., complex, hybrid and high mannose structures) as measured by MALDI-TOF mass spectrometry,
as described for example in WO 2008/077546. Asn297 refers to the asparagine residue located at about position 297 in the Fc region (EU numbering of Fc region residues); however, Asn297 may also be located about ± 3 amino acids upstream or downstream of position 297, i.e., between positions 294 and 300, due to minor sequence variations in antibodies. The relative amount of fucose is the percentage of fucose-containing structures related to all glycostructures identified in an N-Glycosidase F treated sample (e.g. complex, hybrid and high mannose structures) by MALDI-TOF MS. Such fucosylation variants may have improved ADCC function.

In a particular embodiment, the anti-FAP antibodies of the invention have an increased proportion of bisected, nonfucosylated oligosaccharides in the Fc region. The bisected,
nonfucosylated oligosaccharides may be either hybrid or complex. Specifically, the methods of the present invention may be used to produce anti-FAP antibodies in which at least about 10% to about 100%, specifically at least about 15%, more specifically at least about 20% to about 25%, and more specifically at least about 30% to about 35% of the oligosaccharides in the Fc region of the antigen binding molecule are bisected, nonfucosylated. The anti-FAP antibodies of the present invention may also comprise an Fc region in which at least about 10% to about 100%, specifically at least about 15%, more specifically at least about 20% to about 25%, and more specifically at least about 30% to about 35% of the oligosaccharides in the Fc region of the antibody are bisected hybrid nonfucosylated.

In certain embodiments, an antibody provided herein is altered to increase or decrease the extent to which the antibody is glycosylated. Addition or deletion of glycosylation sites to an antibody may be conveniently accomplished by altering the amino acid sequence such that one or more glycosylation sites is created or removed. Antibody variants with at least one galactose residue in the oligosaccharide attached to the Fc region are also provided. Such antibody variants may have improved CDC function. Such antibody variants are described, e.g., in WO 1997/30087 (Patel et al.); WO 1998/58964 (Raju, S.); and WO 1999/22764 (Raju, S.).

Increases in ADCC or other effector functions of the anti-FAP antibodies of the present invention can also achieved by increasing affinity of the antigen binding molecule for FAP, for example by affinity maturation or other methods of improving affinity (see Tang et al., J. Immunol. 2007, 179:2815-2823), or by amino acid modifications in the Fc region as described below. Combinations of these approaches are also encompassed by the present invention.

c) Fc region variants

In certain embodiments, one or more amino acid modifications may be introduced into the Fc region of an antibody provided herein, thereby generating an Fc region variant. The Fc region variant may comprise a human Fc region sequence (e.g., a human IgG1, IgG2, IgG3 or IgG4 Fc region) comprising an amino acid modification (e.g. a substitution) at one or more amino acid positions.

In certain embodiments, the invention contemplates an antibody variant that possesses some but not all effector functions, which make it a desirable candidate for applications in which the half life of the antibody in vivo is important yet certain effector functions (such as complement and ADCC) are unnecessary or deleterious. In vitro and/or in vivo cytotoxicity assays can be conducted to confirm the reduction/depletion of CDC and/or ADCC activities. For example, Fc
receptor (FcR) binding assays can be conducted to ensure that the antibody lacks FcyR binding (hence likely lacking ADCC activity), but retains FcRn binding ability. The primary cells for mediating ADCC, NK cells, express FcyRIII only, whereas monocytes express FcyRI, FcyRII and FcyRIII. FcR expression on hematopoietic cells is summarized in Table 3 on page 464 of Ravetch and Kinet, *Annu. Rev. Immunol.* 9:457-492 (1991). Non-limiting examples of *in vitro* assays to assess ADCC activity of a molecule of interest is described in U.S. Patent No. 5,500,362 (see, e.g. Hellstrom, I. et al. *Proc. Nat'l Acad. Sci. USA* 83:7059-7063 (1986)) and Hellstrom, I et al., *Proc. Nat'l Acad. Sci. USA* 82:1499-1502 (1985); 5,821,337 (see Bruggemann, M. et al., *J. Exp. Med.* 166:1351-1361 (1987)). Alternatively, non-radioactive methods may be employed (see, for example, ACTITM non-radioactive cytotoxicity assay for flow cytometry (CellTechnology, Inc. Mountain View, CA; and CytoTox 96® non-radioactive cytotoxicity assay (Promega, Madison, WI). Useful effector cells for such assays include peripheral blood mononuclear cells (PBMC) and Natural Killer (NK) cells. Alternatively, or additionally, ADCC activity of the molecule of interest may be assessed *in vivo, e.g.,* in a animal model such as that disclosed in Clynes et al. *Proc. Nat'l Acad. Sci. USA* 95:652-656 (1998). Clq binding assays may also be carried out to confirm that the antibody is unable to bind Clq and hence lacks CDC activity. See, e.g., Clq and C3c binding ELISA in WO 2006/029879 and WO 2005/100402. To assess complement activation, a CDC assay may be performed (see, for example, Gazzano-Santoro et al., *J. Immunol. Methods* 202:163 (1996); Cragg, M.S. et al., *Blood* 101:1045-1052 (2003); and Cragg, M.S. and M.J. Glennie, *Blood* 103:2738-2743 (2004)). FcRn binding and *in vivo* clearance/half life determinations can also be performed using methods known in the art (see, e.g., Petkova, S.B. et al., *Int'l. Immunol.* 18(12): 1759-1769 (2006)). Antibodies with reduced effector function include those with substitution of one or more of Fc region residues 238, 265, 269, 270, 297, 327 and 329 (U.S. Patent No. 6,737,056). Such Fc mutants include Fc mutants with substitutions at two or more of amino acid positions 265, 269, 270, 297 and 327, including the so-called "DANA" Fc mutant with substitution of residues 265 and 297 to alanine (US Patent No. 7,332,581).

Certain antibody variants with improved or diminished binding to FcRs are described. (See, e.g., U.S. Patent No. 6,737,056; WO 2004/056312, and Shields et al., *J. Biol. Chem.* 9(2): 6591-6604 (2001).)

In certain embodiments, an antibody variant comprises an Fc region with one or more amino acid substitutions which improve ADCC, e.g., substitutions at positions 298, 333, and/or 334 of the Fc region (EU numbering of residues).
In some embodiments, alterations are made in the Fc region that result in altered (i.e., either improved or diminished) Clq binding and/or Complement Dependent Cytotoxicity (CDC), e.g., as described in US Patent No. 6,194,551, WO 99/51642, and Iduogie et al. *J. Immunol.* 164: 4178-4184 (2000).

Antibodies with increased half lives and improved binding to the neonatal Fc receptor (FcRn), which is responsible for the transfer of maternal IgGs to the fetus (Guyer et al., *J. Immunol.* 117:587 (1976) and Kim et al., *J. Immunol.* 24:249 (1994)), are described in US2005/0014934A1 (Hinton et al.). Those antibodies comprise an Fc region with one or more substitutions therein which improve binding of the Fc region to FcRn. Such Fc variants include those with substitutions at one or more of Fc region residues: 238, 256, 265, 272, 286, 303, 305, 307, 311, 312, 317, 340, 356, 360, 362, 376, 378, 380, 382, 413, 424 or 434, e.g., substitution of Fc region residue 434 (US Patent No. 7,371,826).

For further examples concerning Fc region variants see also U.S. Pat. Appl. Nos. 60/439,498; 60/456,041; 60/514,549; or WO 2004/063351 (variant Fc regions with increased binding affinity due to amino acid modification); or U.S. Pat. Appl. No. 10/672,280 or WO 2004/099249 (Fc variants with altered binding to FcyR due to amino acid modification), Duncan & Winter, *Nature* 322:738-40 (1988); U.S. Patent No. 5,648,260; U.S. Patent No. 5,624,821; and WO 94/29351.

d) **Cysteine engineered antibody variants**

In certain embodiments, it may be desirable to create cysteine engineered antibodies, e.g., "thioMAbs," in which one or more residues of an antibody are substituted with cysteine residues. In particular embodiments, the substituted residues occur at accessible sites of the antibody. By substituting those residues with cysteine, reactive thiol groups are thereby positioned at accessible sites of the antibody and may be used to conjugate the antibody to other moieties, such as drug moieties or linker-drug moieties, to create an antibody conjugate, as described further herein. In certain embodiments, any one or more of the following residues may be substituted with cysteine: V205 (Kabat numbering) of the light chain; A118 (EU numbering) of the heavy chain; and S400 (EU numbering) of the heavy chain Fc region. Cysteine engineered antibodies may be generated as described, e.g., in U.S. Patent No. 7,521,541.

e) **Antibody Derivatives**

In certain embodiments, an antibody provided herein may be further modified to contain additional nonproteinaceous moieties that are known in the art and readily available. The moieties suitable for derivatization of the antibody include but are not limited to water soluble
polymers. Non-limiting examples of water soluble polymers include, but are not limited to, polyethylene glycol (PEG), copolymers of ethylene glycol/propylene glycol, carboxymethylcellulose, dextran, polyvinyl alcohol, polyvinyl pyrrolidone, poly-1, 3-dioxolane, poly-l,3,6-trioxane, ethylene/maleic anhydride copolymer, polyaminoacids (either homopolymers or random copolymers), and dextran or poly(n-vinyl pyrrolidone)polyethylene glycol, propylene glycol homopolymers, polypropylene oxide/ethylene oxide co-polymers, polyoxypyridylated polyols (e.g., glycerol), polyvinyl alcohol, and mixtures thereof. Polyethylene glycol propionaldehyde may have advantages in manufacturing due to its stability in water. The polymer may be of any molecular weight, and may be branched or unbranched. The number of polymers attached to the antibody may vary, and if more than one polymer are attached, they can be the same or different molecules. In general, the number and/or type of polymers used for derivatization can be determined based on considerations including, but not limited to, the particular properties or functions of the antibody to be improved, whether the antibody derivative will be used in a therapy under defined conditions, etc.

In another embodiment, conjugates of an antibody and nonproteinaceous moiety that may be selectively heated by exposure to radiation are provided. In one embodiment, the nonproteinaceous moiety is a carbon nanotube (Kam et al., Proc. Natl. Acad. Sci. USA 102: 11600-1 1605 (2005)). The radiation may be of any wavelength, and includes, but is not limited to, wavelengths that do not harm ordinary cells, but which heat the nonproteinaceous moiety to a temperature at which cells proximal to the antibody-nonproteinaceous moiety are killed.

### B. Recombinant Methods and Compositions

Antibodies may be produced using recombinant methods and compositions, e.g., as described in U.S. Patent No. 4,816,567. In one embodiment, isolated polynucleotide encoding an anti-FAP antibody described herein is provided. Such polynucleotide may encode an amino acid sequence comprising the VL and/or an amino acid sequence comprising the VH of the antibody (e.g., the light and/or heavy chains of the antibody). In a further embodiment, one or more vectors (e.g., cloning vectors or expression vectors) comprising such polynucleotide are provided. In a further embodiment, a host cell comprising such polynucleotide or such vector is provided. In one such embodiment, a host cell comprises (e.g., has been transformed with): (1) a vector comprising a polynucleotide that encodes an amino acid sequence comprising the VL of the antibody and an amino acid sequence comprising the VH of the antibody (e.g. a polycistronic vector), or (2) a first vector comprising a polynucleotide that encodes an amino acid sequence comprising the VL of the antibody and a second vector comprising a polynucleotide that encodes an amino acid...
sequence comprising the VH of the antibody. In one embodiment, the host cell is a eukaryotic cell, particularly a mammalian cell, e.g. a Chinese Hamster Ovary (CHO), a baby hamster kidney (BHK) cell or lymphoid cell (e.g., Y0, NS0, Sp20 cell). In one embodiment, a method of making an anti-FAP antibody is provided, wherein the method comprises culturing a host cell comprising a polynucleotide encoding the antibody, as provided above, under conditions suitable for expression of the antibody, and optionally recovering the antibody from the host cell (or host cell culture medium).

For recombinant production of an anti-FAP antibody, one or more polynucleotide(s) encoding an antibody, e.g., as described above, are isolated and inserted into one or more vectors for further cloning and/or expression in a host cell. Methods which are well known to those skilled in the art can be used to construct expression vectors containing the coding sequence of an anti-FAP antibody along with appropriate transcriptional/translational control signals. These methods include in vitro recombinant DNA techniques, synthetic techniques and in vivo recombination/genetic recombination. See, for example, the techniques described in Maniatis et al., MOLECULAR CLONING: A LABORATORY MANUAL, Cold Spring Harbor Laboratory, N.Y. (1989) and Ausubel et al., CURRENT PROTOCOLS IN MOLECULAR BIOLOGY, Greene Publishing Associates and Wiley Interscience, N.Y (1989).

In one embodiment, one or several polynucleotides encoding an anti-FAP antibody may be expressed under the control of a constitutive promoter or, alternatively, a regulated expression system. Suitable regulated expression systems include, but are not limited to, a tetracycline-regulated expression system, an ecdysone-inducible expression system, a lac-switch expression system, a glucocorticoid-inducible expression system, a temperature-inducible promoter system, and a metallothionein metal-inducible expression system. If several different polynucleotides encoding an antibody of the present invention are comprised within the host cell system, some of them may be expressed under the control of a constitutive promoter, while others are expressed under the control of a regulated promoter.

Suitable host cells for cloning or expression of antibody-encoding vectors include prokaryotic or eukaryotic cells described herein. For example, antibodies may be produced in bacteria, in particular when glycosylation and Fc effector function are not needed. For expression of antibody fragments and polypeptides in bacteria, see, e.g., U.S. Patent Nos. 5,648,237, 5,789,199, and 5,840,523. (See also Charlton, Methods in Molecular Biology, Vol. 248 (B.K.C. Lo, ed., Humana Press, Totowa, NJ, 2003), pp. 245-254, describing expression of antibody
fragments in *E. coli.* After expression, the antibody may be isolated from the bacterial cell paste in a soluble fraction and can be further purified.

In addition to prokaryotes, eukaryotic microbes such as filamentous fungi or yeast are suitable cloning or expression hosts for antibody-encoding vectors, including fungi and yeast strains whose glycosylation pathways have been "humanized," resulting in the production of an antibody with a partially or fully human glycosylation pattern. See Gerngross, *Nat. Biotech.* 22:1409-1414 (2004), and Li et al., *Nat. Biotech.* 24:210-215 (2006). Such expression systems are also taught in U.S. Pat. Appl. No. 60/344,169 and WO 03/056914 (methods for producing human-like glycoprotein in a non-human eukaryotic host cell).

Suitable host cells for the expression of glycosylated antibody are also derived from multicellular organisms (invertebrates and vertebrates). Examples of invertebrate cells include plant and insect cells. Numerous baculoviral strains have been identified which may be used in conjunction with insect cells, particularly for transfection of *Spodoptera frugiperda* cells. Plant cell cultures can also be utilized as hosts. See, e.g., US Patent Nos. 5,959,177, 6,040,498, 6,420,548, 7,125,978, and 6,417,429 (describing PLANTIBODIES™ technology for producing antibodies in transgenic plants).

Vertebrate cells may also be used as hosts. For example, mammalian cell lines that are adapted to grow in suspension may be useful. Other examples of useful mammalian host cell lines are monkey kidney CV1 line transformed by SV40 (COS-7); human embryonic kidney line (293 or 293T cells as described, e.g., in Graham et al., *J. Gen Virol.* 36:59 (1977)); baby hamster kidney cells (BHK); mouse Sertoli cells (TM4 cells as described, e.g., in Mather, *Biol. Reprod.* 23:243-251 (1980)); monkey kidney cells (CV1); African green monkey kidney cells (VERO-76); human cervical carcinoma cells (HELA); canine kidney cells (MDCK); buffalo rat liver cells (BRL 3A); human lung cells (W138); human liver cells (Hep G2); mouse mammary tumor (MMT 060562); TRI cells, as described, e.g., in Mather et al., *Annals N.Y. Acad. Sci.* 383:44-68 (1982); MRC 5 cells; and FS4 cells. Other useful mammalian host cell lines include Chinese hamster ovary (CHO) cells, including DHFR ´ CHO cells (Urlaub et al., *Proc. Natl. Acad. Sci. USA* 77:4216 (1980)); and myeloma cell lines such as Y0, NS0 and Sp2/0. For a review of certain mammalian host cell lines suitable for antibody production, see, e.g., Yazaki and Wu, *Methods in Molecular Biology. Vol. 248* (B.K.C. Lo, ed., Humana Press, Totowa, NJ), pp. 255-268 (2003).

Stable expression is generally preferred to transient expression because it typically achieves more reproducible results and also is more amenable to large-scale production; however, it is
within the skill of one in the art to determine whether transient expression is better for a particular situation.

The present invention is further directed to a method for modifying the glycosylation profile of the anti-FAP antibodies of the present invention that are produced by a host cell, comprising expressing in said host cell one or more polynucleotide(s) encoding an anti-FAP antibody and one or more polynucleotide(s) encoding a polypeptide with a glycosyltransferase activity, or a vector comprising such polynucleotides. Generally, any type of cultured cell line, including the cell lines discussed above, can be used to generate cell lines for the production of anti-FAP antibodies with altered glycosylation pattern. Preferred cell lines include CHO cells, BHK cells, NS0 cells, SP2/0 cells, YO myeloma cells, P3X63 mouse myeloma cells, PER cells, PER.C6 cells or hybridoma cells, and other mammalian cells. Polypeptides with glycosyltransferase activity include P(1,4)-N-acetylglucosaminyltransferase III (GnTIII), a-mannosidase II (ManII), P(1,4)-galactosyltransferase (GalT), P(1,2)-N-acetylglucosaminyltransferase I (GnTI), and P(1,2)-N-acetylglucosaminyltransferase II (GnTII). In one embodiment, a combination of polynucleotides encoding for polynucleotides with glycosyltransferase activity are expressed in the host cell (e.g., GnTIII and Man II). Likewise, the method also encompasses expression of one or more polynucleotide(s) encoding the anti-FAP antibody in a host cell in which a glycosyltransferase gene has been disrupted or otherwise deactivated (e.g., a host cell in which the activity of the gene encoding al,6 core fucosyltransferase has been knocked out). In a particular embodiment, the anti-FAP antibodies of the present invention can be produced in a host cell that further expresses a polynucleotide encoding a polypeptide having GnTIII activity to modify the glycosylation pattern of said antibodies. In a specific embodiment, the polypeptide having GnTIII activity is a fusion polypeptide comprising the Golgi localization domain of a Golgi resident polypeptide. In another particular embodiment, the expression of the anti-FAP antibody of the present invention in a host cell that expresses a polynucleotide encoding a polypeptide having GnTIII activity results in anti-FAP antibodies with increased Fc receptor binding affinity and/or increased effector function. Accordingly, in one embodiment, the present invention is directed to a host cell comprising (a) one or more isolated polynucleotide(s) comprising a sequence encoding a polypeptide having GnTIII activity; and (b) one or more isolated polynucleotide\(^{\text{a}} \) encoding an anti-FAP antibody of the present invention. In a particular embodiment, the polypeptide having GnTIII activity is a fusion polypeptide comprising the catalytic domain of GnTIII and the Golgi localization domain of a heterologous Golgi resident polypeptide. Particularly, said Golgi localization domain is the Golgi localization
domain of mannosidase II. Methods for generating such fusion polypeptides and using them to
produce antibodies with increased effector functions are disclosed in WO2004/065540, U.S.
Provisional Pat. Appl. No. 60/495,142 and U.S. Pat. Appl. Publ. No. 2004/0241817, the entire
contents of which are expressly incorporated herein by reference. In another embodiment, the
host cell additionally comprises an isolated polynucleotide comprising a sequence encoding a
polypeptide having mannosidase II (ManII) activity. The polynucleotide(s) encoding polypeptide(s), like the polynucleotide(s) encoding the anti-FAP antibody, may be expressed
under the control of a constitutive promoter or, alternately, a regulated expression system. Such
systems are well known in the art, and include the systems discussed above.

The host cells which contain the coding sequence of the anti-FAP antibody and/or the coding
sequence of polypeptides having glycosyltransferase activity, and which express the biologically
active gene products may be identified e.g. by DNA-DNA or DNA-RNA hybridization; the
presence or absence of "marker" gene functions; assessing the level of transcription as measured
by the expression of the respective mRNA transcripts in the host cell; or detection of the gene
product as measured by immunoassay or by its biological activity - methods which are well
known in the art. GnTIII or Man II activity can be detected e.g. by employing a lectin which
binds to biosynthesis products of GnTIII or ManII, respectively. An example for such a lectin is
the E$_4$-PHA lectin which binds preferentially to oligosaccharides containing bisecting GlcNAc.
Biosynthesis products (i.e. specific oligosaccharide structures) of polypeptides having GnTIII or
ManII activity can also be detected by mass spectrometric analysis of oligosaccharides released
from glycoproteins produced by cells expressing said polypeptides. Alternatively, a functional
assay which measures the increased Fc receptor binding or increased effector function mediated
by antibodies produced by the cells engineered with the polynucleotide encoding a polypeptide
having GnTIII activity may be used.

The present invention is also directed to a method for producing an anti-FAP antibody having
modified oligosaccharides, comprising (a) culturing a host cell engineered to express at least one
polynucleotide encoding a polypeptide having glycosyltransferase activity under conditions
which permit the production of an anti-FAP antibody according to the present invention, wherein
said polypeptide having glycosyltransferase activity is expressed in an amount sufficient to
modify the oligosaccharides in the Fc region of said anti-FAP antibody produced by said host
cell; and (b) isolating said anti-FAP antibody. In one embodiment, the polypeptide having
glycosyltransferase activity is GnTIII. In another embodiment, there are two polypeptides
having glycosyltransferase activity. In a particular embodiment, the two peptides having
glycosyltransferase activity are GnTIII and ManII. In another embodiment, the polypeptide having glycosyltransferase activity is a fusion polypeptide comprising the catalytic domain of GnTIII. In a more specific embodiment, the fusion polypeptide further comprises the Golgi localization domain of a Golgi resident polypeptide. Particularly, the Golgi localization domain is the localization domain of mannosidase II or GnTI, most particularly the localization domain of mannosidase II. Alternatively, the Golgi localization domain is selected from the group consisting of: the localization domain of mannosidase I, the localization domain of GnTIII, and the localization domain of α,6 core fucosyltransferase.

In a particular embodiment, the modified anti-FAP antibody produced by the host cell or method described above has an IgG constant region or a fragment thereof comprising the Fc region. In another particular embodiment the anti-FAP antibody is a humanized or human antibody or a fragment thereof comprising an Fc region. The anti-FAP antibody with altered glycosylation produced by the host cell or method described above typically exhibit increased Fc receptor binding affinity and/or increased effector function as a result of the modification of the host cell (e.g., by expression of a glycosyltransferase gene). Preferably, the increased Fc receptor binding affinity is increased binding to an activating Fcy receptor, most preferably the FcyRIIIa receptor. The increased effector function is preferably an increase in one or more of the following: increased antibody-dependent cellular cytotoxicity, increased antibody-dependent cellular phagocytosis (ADCP), increased cytokine secretion, increased immune-complex-mediated antigen uptake by antigen-presenting cells, increased Fc-mediated cellular cytotoxicity, increased binding to NK cells, increased binding to macrophages, increased binding to polymorphonuclear cells (PMNCs), increased binding to monocytes, increased crosslinking of target-bound antibodies, increased direct signaling inducing apoptosis, increased dendritic cell maturation, and increased T cell priming.

C. Assays

Anti-FAP antibodies provided herein may be identified, screened for, or characterized for their physical/chemical properties and/or biological activities by various assays known in the art.

I. Binding assays and other assays

In one aspect, an antibody of the invention is tested for its antigen binding activity, e.g., by known methods such as ELISA, Western blot, etc.

In another aspect, competition assays may be used to identify an antibody that competes with another specific anti-FAP antibody for binding to FAP. In certain embodiments, such a
competing antibody binds to the same epitope (e.g., a linear or a conformational epitope) that is bound by said other specific anti-FAP antibody. Detailed exemplary methods for mapping an epitope to which an antibody binds are provided in Morris (1996) "Epitope Mapping Protocols," in Methods in Molecular Biology vol. 66 (Humana Press, Totowa, NJ).

In an exemplary competition assay, immobilized FAP is incubated in a solution comprising a first labeled antibody that binds to FAP (e.g. the 3F2 antibody described in the Examples) and a second unlabeled antibody that is being tested for its ability to compete with the first antibody for binding to FAP. The second antibody may be present in a hybridoma supernatant. As a control, immobilized FAP is incubated in a solution comprising the first labeled antibody but not the second unlabeled antibody. After incubation under conditions permissive for binding of the first antibody to FAP, excess unbound antibody is removed, and the amount of label associated with immobilized FAP is measured. If the amount of label associated with immobilized FAP is substantially reduced in the test sample relative to the control sample, then that indicates that the second antibody is competing with the first antibody for binding to FAP. See Harlow and Lane (1988) Antibodies: A Laboratory Manual ch.14 (Cold Spring Harbor Laboratory, Cold Spring Harbor, NY).

2. Activity assays

In one aspect, assays are provided for identifying anti-FAP antibodies thereof having biological activity. Biological activity may include, e.g., lysis of targeted cells, antibody-dependent cell-mediated cytotoxicity (ADCC), complement-dependent cytotoxicity (CDC), or induction of apoptosis. Antibodies having such biological activity in vivo and/or in vitro are also provided. In certain embodiments, an antibody of the invention is tested for such biological activity. Exemplary assays for testing ADCC are described hereinafore (see under "Definitions": "antibody having increased ADCC") and in Example 11. Assays for detecting cell lysis (e.g. by measurement of LDH release) or apoptosis (e.g. using the TUNEL assay) are well known in the art. Assays for measuring ADCC or CDC are also described in WO 2004/065540 (see Example 1 therein), the entire content of which is incorporated herein by reference.

D. Antibody conjugates

The invention also provides conjugates comprising an anti-FAP antibody herein conjugated to one or more cytotoxic agents, such as chemotherapeutic agents or drugs, growth inhibitory agents, toxins (e.g., protein toxins, enzymatically active toxins of bacterial, fungal, plant, or animal origin, or fragments thereof), or radioactive isotopes.
In one embodiment, in an antibody-drug conjugate (ADC) an antibody is conjugated to one or more drugs, including but not limited to a maytansinoid (see U.S. Patent Nos. 5,208,020, 5,416,064 and European Patent EP 0 425 235 B1); an auristatin such as monomethylauristatin drug moieties DE and DF (MMAE and MMAF) (see U.S. Patent Nos. 5,635,483 and 5,780,588, and 7,498,298); a dolastatin; a calicheamicin or derivative thereof (see U.S. Patent Nos. 5,712,374, 5,714,586, 5,739,116, 5,767,285, 5,770,701, 5,770,710, 5,773,001, and 5,877,296; Hinman et al., Cancer Res. 53:3336-3342 (1993); and Lode et al., Cancer Res. 58:2925-2928 (1998)); an anthracycline such as daunomycin or doxorubicin (see Kratz et al., Current Med. Chem. 13:477-523 (2006); Jeffrey et al., Bioorganic & Med. Chem. Letters 16:358-362 (2006); Torgov et al., Bioconj. Chem. 16:717-721 (2005); Nagy et al., Proc. Natl. Acad. Sci. USA 97:829-834 (2000); Dubowchik et al., Bioorg. & Med. Chem. Letters 12:1529-1532 (2002); King et al., J. Med. Chem. 45:4336-4343 (2002); and U.S. Patent No. 6,630,579); methotrexate; vindesine; a taxane such as docetaxel, paclitaxel, larotaxel, tesetaxel, and ortataxel; a trichothecene; and CC1065.

In another embodiment, an antibody conjugate comprises an antibody as described herein conjugated to an enzymatically active toxin or fragment thereof, including but not limited to diphtheria A chain, nonbinding active fragments of diphtheria toxin, exotoxin A chain (from Pseudomonas aeruginosa), ricin A chain, abrin A chain, modeccin A chain, alpha-sarcin, Aleurites fordii proteins, dianthin proteins, Phytolaca americana proteins (PAPI, PAPII, and PAP-S), momordica charantia inhibitor, curcin, crotin, sapaonaria officinalis inhibitor, gelonin, mitogellin, restrictocin, phenomycin, enomycin, and the trichotheccenes.

In another embodiment, an antibody conjugate comprises an antibody as described herein conjugated to a radioactive atom to form a radioconjugate. A variety of radioactive isotopes are available for the production of radioconjugates. Examples include At\(^{211}\), I\(^{131}\), I\(^{125}\), Y\(^{90}\), Re\(^{186}\), Re\(^{188}\), Sm\(^{153}\), Bi\(^{212}\), P\(^{32}\), Pb\(^{212}\) and radioactive isotopes of Lu. When the radioconjugate is used for detection, it may comprise a radioactive atom for scintigraphic studies, for example tc99m or 1123, or a spin label for nuclear magnetic resonance (NMR) imaging (also known as magnetic resonance imaging, mri), such as iodine-123 again, iodine-131, indium-III, fluorine-19, carbon-13, nitrogen-15, oxygen-17, gadolinium, manganese or iron.

Conjugates of an antibody and cytotoxic agent may be made using a variety of bifunctional protein coupling agents such as N-succinimidyl-3-(2-pyridyldithio) propionate (SPDP), succinimidyl-4-(N-maleimidomethyl) cyclohexane-1-carboxylate (SMCC), iminothiolane (IT), bifunctional derivatives of imidoesters (such as dimethyl adipimide HC1), active esters (such as
disuccinimidyl suberate), aldehydes (such as glutaraldehyde), bis-azido compounds (such as bis (p-azidobenzoyl) hexanediamine), bis-diazonium derivatives (such as bis-(p-diazoniumbenzoyl)- ethylenediamine), diisocyanates (such as toluene 2,6-diisocyanate), and bis-active fluorine compounds (such as 1,5-difluoro-2,4-dinitrobenzene). For example, a ricin immunotoxin can be prepared as described in Vitetta et al., *Science* 238:1098 (1987). Carbon-14-labeled 1- isothiocyanatobenzyl-3-methyl diethylene triamine pentaacetic acid (MX-DTPA) is an exemplary chelating agent for conjugation of radionucleotide to the antibody. See W094/1 1026. The linker may be a "cleavable linker" facilitating release of a cytotoxic drug in the cell. For example, an acid-labile linker, peptidase-sensitive linker, photolabile linker, dimethyl linker or disulfide-containing linker (Chari et al., *Cancer Res.* 52:127-131 (1992); U.S. Patent No. 5,208,020) may be used.

The antibody conjugates herein expressly contemplate, but are not limited to such conjugates prepared with cross-linker reagents including, but not limited to, BMPS, EMCS, GMBS, HBVS, LC-SMCC, MBS, MPBH, SBAP, SIA, SIAB, SMCC, SMPB, SMPH, sulfo-EMCS, sulfo-GMBS, sulfo-KMUS, sulfo-MBS, sulfo-SIAB, sulfo-SMCC, and sulfo-SMPB, and SVSB (succinimidyl-(4-vinylsulphone)benzoate) which are commercially available (e.g., from Pierce Biotechnology, Inc., Rockford, IL., U.S.A).

**E. Methods and Compositions for Diagnostics and Detection**

In certain embodiments, any of the anti-FAP antibodies provided herein is useful for detecting the presence of FAP in a biological sample. The term "detecting" as used herein encompasses quantitative or qualitative detection. In certain embodiments, a biological sample comprises a cell or tissue, such as cells or tissues from brain, breast, colon, kidney, liver, lung, ovary, pancreas, prostate, skeletal muscle, skin, small intestine, stomach or uterus, including also cells or tissues tumors of these organs.

In one embodiment, an anti-FAP antibody for use in a method of diagnosis or detection is provided. In a further aspect, a method of detecting the presence of FAP in a biological sample is provided. In certain embodiments, the method comprises contacting the biological sample, optionally with a control sample, with an anti-FAP antibody as described herein under conditions permissive for binding of the anti-FAP antibody to FAP, and detecting whether a complex is formed between the anti-FAP antibody and FAP. Such method may be an in *vitro* or in *vivo* method. In one embodiment, an anti-FAP antibody is used to select subjects eligible for therapy with an anti-FAP antibody, e.g. where FAP is a biomarker for selection of patients.
Exemplary disorders that may be diagnosed using an antibody of the invention include disorders associated with the expression of FAP, such as cancer and certain inflammatory conditions. In one aspect, a method of diagnosing disease in a subject is provided, said method comprising administering to said subject an effective amount of a diagnostic agent, wherein said diagnostic agent comprises an anti-FAP antibody as described herein and a label, typically an imaging agent, that allows detection of a complex of said diagnostic agent and FAP. In certain embodiments, labeled anti-FAP antibodies are provided. Labels include, but are not limited to, labels or moieties that are detected directly (such as fluorescent, chromophoric, electron-dense, chemiluminescent, and radioactive labels), as well as moieties, such as enzymes or ligands, that are detected indirectly, e.g., through an enzymatic reaction or molecular interaction. Exemplary labels include, but are not limited to, the radioisotopes \(^{32}\text{P}, \^{14}\text{C}, \^{125}\text{I}, \^{3}\text{H}, \) and \(^{131}\text{I}\), fluorophores such as rare earth chelates or fluorescein and its derivatives, rhodamine and its derivatives, dansyl, umbelliferone, luciferases, e.g., firefly luciferase and bacterial luciferase (U.S. Patent No. 4,737,456), luciferin, 2,3-dihydrophthalazinediones, horseradish peroxidase (HRP), alkaline phosphatase, \(\beta\)-galactosidase, glucoamylase, lysozyme, saccharide oxidases, e.g., glucose oxidase, galactose oxidase, and glucose-6-phosphate dehydrogenase, heterocyclic oxidases such as uricase and xanthine oxidase, coupled with an enzyme that employs hydrogen peroxide to oxidize a dye precursor such as HRP, lactoperoxidase, or microperoxidase, biotin/avidin, spin labels, bacteriophage labels, stable free radicals, and the like.

**F. Pharmaceutical Formulations**

Pharmaceutical formulations of an anti-FAP antibody as described herein are prepared by mixing such antibody having the desired degree of purity with one or more optional pharmaceutically acceptable carriers (Remington's Pharmaceutical Sciences 16th edition, Osol, A. Ed. (1980)), in the form of lyophilized formulations or aqueous solutions. Pharmaceutically acceptable carriers are generally nontoxic to recipients at the dosages and concentrations employed, and include, but are not limited to: buffers such as phosphate, citrate, acetate and other organic acids; antioxidants including ascorbic acid and methionine; preservatives (such as octadecyldimethylbenzyl ammonium chloride; hexamethonium chloride; benzalkonium chloride; benzethonium chloride; phenol, butyl or benzyl alcohol; alkyl parabens such as methyl or propyl paraben; catechol; resorcinol; cyclohexanol; 3-pentanol; and m-cresol); low molecular weight (less than about 10 residues) polypeptides; proteins, such as serum albumin, gelatin, or immunoglobulins; hydrophilic polymers such as polyvinylpyrrolidone; amino acids such as glycine, glutamine,
asparagine, histidine, arginine, or lysine; monosaccharides, disaccharides, and other carbohydrates including glucose, mannose, or dextrins; chelating agents such as EDTA; sugars such as sucrose, mannitol, trehalose or sorbitol; salt-forming counter-ions such as sodium; metal complexes (e.g. Zn-protein complexes); and/or non-ionic surfactants such as polyethylene glycol (PEG). Exemplary pharmaceutically acceptable carriers herein further include interstitial drug dispersion agents such as soluble neutral-active hyaluronidase glycoproteins (sHASEGP), for example, human soluble PH-20 hyaluronidase glycoproteins, such as rHuPH20 (HYLENEX®, Baxter International, Inc.). Certain exemplary sHASEGPs and methods of use, including rHuPH20, are described in US Patent Publication Nos. 2005/0260186 and 2006/0104968. In one aspect, a sHASEGP is combined with one or more additional glycosaminoglycanases such as chondroitinases.

Exemplary lyophilized antibody formulations are described in US Patent No. 6,267,958. Aqueous antibody formulations include those described in US Patent No. 6,171,586 and WO2006/044908, the latter formulations including a histidine-acetate buffer.

The formulation herein may also contain more than one active ingredients as necessary for the particular indication being treated, preferably those with complementary activities that do not adversely affect each other. For example, if the disease to be treated is cancer, it may be desirable to further provide one or more anti-cancer agents, e.g. a chemotherapeutic agent, an inhibitor of tumor cell proliferation, or an activator of tumor cell apoptosis. Such active ingredients are suitably present in combination in amounts that are effective for the purpose intended.

Active ingredients may be entrapped in microcapsules prepared, for example, by coacervation techniques or by interfacial polymerization, for example, hydroxymethylcellulose or gelatin-microcapsules and poly-(methylmethacrylate) microcapsules, respectively, in colloidal drug delivery systems (for example, liposomes, albumin microspheres, microemulsions, nanoparticles and nanocapsules) or in macroemulsions. Such techniques are disclosed in Remington's Pharmaceutical Sciences 16th edition, Osol, A. Ed. (1980).

Sustained-release preparations may be prepared. Suitable examples of sustained-release preparations include semipermeable matrices of solid hydrophobic polymers containing the antibody, which matrices are in the form of shaped articles, e.g. films, or microcapsules. The formulations to be used for in vivo administration are generally sterile. Sterility may be readily accomplished, e.g., by filtration through sterile filtration membranes.
The molecules described herein may be in a variety of dosage forms which include, but are not limited to, liquid solutions or suspensions, tablets, pills, powders, suppositories, polymeric microcapsules or microvesicles, liposomes, and injectable or infusible solutions. The preferred form depends upon the mode of administration and the therapeutic application, but will typically be injectable or infusible solutions.

G. Therapeutic Methods and Compositions

Any of the anti-FAP antibodies or pharmaceutical formulations comprising the anti-FAP antibodies provided herein may be used in therapeutic methods. The anti-FAP antibodies provided herein can be used for treating diseases characterized by FAP expression, particularly by abnormal expression (e.g. overexpression, or expression in a different pattern in the cell) of FAP compared to normal tissue of the same cell type. FAP is abnormally expressed (e.g. overexpressed) in many human tumors compared to non-tumor tissue of the same cell type. Thus, the anti-FAP antibodies provided herein are particularly useful in the prevention of tumor formation, eradication of tumors and inhibition of tumor growth or metastasis. The anti-FAP antibodies provided herein can be used to treat any tumor expressing FAP. Particular malignancies that can be treated by the anti-FAP antibodies provided herein include, for example, lung cancer, colon cancer, gastric cancer, breast cancer, head and neck cancer, skin cancer, liver cancer, kidney cancer, prostate cancer, pancreatic cancer, brain cancer, cancer of the skeletal muscle.

The anti-FAP antibodies disclosed herein can be used to inhibit tumor growth or kill tumor cells. For example, the anti-FAP antibodies can bind to FAP that is on the membrane or cell surface of cancerous cells (tumor cells or cells of the tumor stroma) and elicit, e.g., ADCC or other effector mediated killing of the cancerous cells. The anti-FAP antibodies can alternatively be used in order to block the function of FAP, particularly by physically interfering with its binding of another compound. For example, the antigen binding molecules can be used to block the enzymatic activity of FAP (e.g. serine peptidase, gelatinase, collagenase activity), FAP mediated ECM degradation, and/or FAP mediated cell invasion or migration.

In one aspect, an anti-FAP antibody for use as a medicament is provided. In further aspects, an anti-FAP antibody for use in treating a disease characterized by expression of FAP is provided. In certain embodiments, an anti-FAP antibody for use in a method of treatment is provided. In certain embodiments, the invention provides an anti-FAP antibody for use in a method of treating an individual having a disease characterized by expression of FAP, comprising
administering to the individual an effective amount of the anti-FAP antibody. In one such embodiment, the method further comprises administering to the individual an effective amount of at least one additional therapeutic agent, e.g., as described below. In further embodiments, the invention provides an anti-FAP antibody for use in inducing lysis of a cell. In certain embodiments, the invention provides an anti-FAP antibody for use in a method of inducing lysis of a cell in an individual comprising administering to the individual an effective amount of the anti FAP antibody to induce lysis of a cell. An "individual" according to any of the above embodiments is preferably a human. A "disease characterized by expression of FAP" according to any of the above embodiments is preferably cancer, most preferably a cancer selected from the group of lung cancer, colon cancer, gastric cancer, breast cancer, head and neck cancer, skin cancer, liver cancer, kidney cancer, prostate cancer, pancreatic cancer, brain cancer, cancer of the skeletal muscle. A "cell" according to any of the above embodiments is preferably a cell present in a tumor, such as a tumor cell or a cell of the tumor stroma, most preferably a tumor cell. "FAP expression" according to any of the above embodiments preferably is abnormal expression, such as overexpression or expression in a different pattern in the cell, compared to normal tissue of the same cell type.

In a further aspect, the invention provides for the use of an anti-FAP antibody in the manufacture or preparation of a medicament. In one embodiment, the medicament is for treatment of a disease characterized by expression of FAP. In a further embodiment, the medicament is for use in a method of treating a disease characterized by expression of FAP comprising administering to an individual having a disease characterized by expression of FAP an effective amount of the medicament. In one such embodiment, the method further comprises administering to the individual an effective amount of at least one additional therapeutic agent, e.g., as described below. In a further embodiment, the medicament is for inducing lysis of a cell. In a further embodiment, the medicament is for use in a method of inducing lysis of a cell in an individual comprising administering to the individual an amount effective of the medicament to inducing lysis of a cell. An "individual" according to any of the above embodiments is preferably a human. A "disease characterized by expression of FAP" according to any of the above embodiments is preferably cancer, most preferably a cancer selected from the group of lung cancer, colon cancer, gastric cancer, breast cancer, head and neck cancer, skin cancer, liver cancer, kidney cancer, prostate cancer, pancreatic cancer, brain cancer, cancer of the skeletal muscle. A "cell" according to any of the above embodiments is preferably a cell present in a tumor, such as a tumor cell or a cell of the tumor stroma, most preferably a tumor cell. "FAP
expression" according to any of the above embodiments preferably is abnormal expression, such as overexpression or expression in a different pattern in the cell, compared to normal tissue of the same cell type.

In a further aspect, the invention provides a method for treating a disease characterized by expression of FAP. In one embodiment, the method comprises administering to an individual having such disease characterized by expression of FAP an effective amount of an anti-FAP antibody. In one such embodiment, the method further comprises administering to the individual an effective amount of at least one additional therapeutic agent, as described below. In a further embodiment, the invention provides a method for inducing lysis of a cell in an individual. In one embodiment, the method comprises administering to the individual an effective amount of an anti-FAP antibody to induce lysis of a cell. An "individual" according to any of the above embodiments may be a human. A "disease characterized by expression of FAP" according to any of the above embodiments is preferably cancer, most preferably a cancer selected from the group of lung cancer, colon cancer, gastric cancer, breast cancer, head and neck cancer, skin cancer, liver cancer, kidney cancer, prostate cancer, pancreatic cancer, brain cancer, cancer of the skeletal muscle. A "cell" according to any of the above embodiments is preferably a cell present in a tumor, such as a tumor cell or a cell of the tumor stroma, most preferably a tumor cell. "FAP expression" according to any of the above embodiments preferably is abnormal expression, such as overexpression or expression in a different pattern in the cell, compared to normal tissue of the same cell type.

In a further aspect, the invention provides pharmaceutical formulations comprising any of the anti-FAP antibodies provided herein, e.g., for use in any of the above therapeutic methods. In one embodiment, a pharmaceutical formulation comprises any of the anti-FAP antibodies provided herein and one or more pharmaceutically acceptable carrier. In another embodiment, a pharmaceutical formulation comprises any of the anti-FAP antibodies provided herein and at least one additional therapeutic agent, e.g., as described below.

Antibodies of the invention can be used either alone or in combination with other agents in a therapy. For instance, an antibody of the invention may be co-administered with at least one additional therapeutic agent. In certain embodiments, an additional therapeutic agent is an anti-cancer agent, e.g. a chemotherapeutic agent, an inhibitor of tumor cell proliferation, or an activator of tumor cell apoptosis.

Such combination therapies noted above encompass combined administration (where two or more therapeutic agents are included in the same or separate formulations), and separate
administration, in which case, administration of the antibody of the invention can occur prior to, simultaneously, and/or following, administration of the additional therapeutic agent and/or adjuvant. Antibodies of the invention can also be used in combination with radiation therapy. An antibody of the invention (and any additional therapeutic agent) can be administered by any suitable means, including parenteral, intrapulmonary, and intranasal, and, if desired for local treatment, intralesional administration. Parenteral administration includes intramuscular, intravenous, intraarterial, intraperitoneal, or subcutaneous administration. Intravenous administration is typically preferred. However, the intraperitoneal route is expected to be particularly useful, for example, in the treatment of colorectal tumors. Dosing can be by any suitable route, e.g. by injections, such as intravenous or subcutaneous injections, depending in part on whether the administration is brief or chronic. Various dosing schedules including but not limited to single or multiple administrations over various time-points, bolus administration, and pulse infusion are contemplated herein.

Antibodies of the invention would be formulated, dosed, and administered in a fashion consistent with good medical practice. Factors for consideration in this context include the particular disorder being treated, the particular mammal being treated, the clinical condition of the individual patient, the cause of the disorder, the site of delivery of the agent, the method of administration, the scheduling of administration, and other factors known to medical practitioners. The antibody need not be, but is optionally formulated with one or more agents currently used to prevent or treat the disorder in question. The effective amount of such other agents depends on the amount of antibody present in the formulation, the type of disorder or treatment, and other factors discussed above. These are generally used in the same dosages and with administration routes as described herein, or about from 1 to 99% of the dosages described herein, or in any dosage and by any route that is empirically/clinically determined to be appropriate.

For the prevention or treatment of disease, the appropriate dosage of an antibody of the invention (when used alone or in combination with one or more other additional therapeutic agents) will depend on the type of disease to be treated, the type of antibody, the severity and course of the disease, whether the antibody is administered for preventive or therapeutic purposes, previous therapy, the patient's clinical history and response to the antibody, and the discretion of the attending physician. The antibody is suitably administered to the patient at one time or over a series of treatments. Depending on the type and severity of the disease, about 1 μg/kg to 15 mg/kg (e.g. 0.1mg/kg-10mg/kg) of antibody can be an initial candidate dosage for administration
to the patient, whether, for example, by one or more separate administrations, or by continuous infusion. One typical daily dosage might range from about 1 µg/kg to 100 mg/kg or more, depending on the factors mentioned above. For repeated administrations over several days or longer, depending on the condition, the treatment would generally be sustained until a desired suppression of disease symptoms occurs. One exemplary dosage of the antibody would be in the range from about 0.05 mg/kg to about 10 mg/kg. Thus, one or more doses of about 0.5 mg/kg, 2.0 mg/kg, 4.0 mg/kg or 10 mg/kg (or any combination thereof) may be administered to the patient. Such doses may be administered intermittently, e.g. every week or every three weeks (e.g. such that the patient receives from about two to about twenty, or e.g. about six doses of the antibody). An initial higher loading dose, followed by one or more lower doses may be administered. However, other dosage regimens may be useful. The progress of this therapy is easily monitored by conventional techniques and assays. It is understood that any of the above formulations or therapeutic methods may be carried out using an antibody conjugate of the invention in place of or in addition to an anti-FAP antibody.

H. Articles of Manufacture

In another aspect of the invention, an article of manufacture containing materials useful for the treatment, prevention and/or diagnosis of the disorders described above is provided. The article of manufacture comprises a container and a label or package insert on or associated with the container. Suitable containers include, for example, bottles, vials, syringes, IV solution bags, etc. The containers may be formed from a variety of materials such as glass or plastic. The container holds a composition which is by itself or combined with another composition effective for treating, preventing and/or diagnosing the condition and may have a sterile access port (for example the container may be an intravenous solution bag or a vial having a stopper pierceable by a hypodermic injection needle). At least one active agent in the composition is an antibody of the invention. The label or package insert indicates that the composition is used for treating the condition of choice. Moreover, the article of manufacture may comprise (a) a first container with a composition contained therein, wherein the composition comprises an antibody of the invention; and (b) a second container with a composition contained therein, wherein the composition comprises a further cytotoxic or otherwise therapeutic agent. The article of manufacture in this embodiment of the invention may further comprise a package insert indicating that the compositions can be used to treat a particular condition. Alternatively, or additionally, the article of manufacture may further comprise a second (or third) container comprising a pharmaceutically-acceptable buffer, such as bacteriostatic water for injection.
(BWFI), phosphate-buffered saline, Ringer's solution and dextrose solution. It may further include other materials desirable from a commercial and user standpoint, including other buffers, diluents, filters, needles, and syringes. It is understood that any of the above articles of manufacture may include an antibody conjugate of the invention in place of or in addition to an anti-FAP antibody.

III. EXAMPLES
The following are examples of methods and compositions of the invention. It is understood that various other embodiments may be practiced, given the general description provided above.

Example 1

Recombinant DNA Techniques
Standard methods were used to manipulate DNA as described in Sambrook, J. et al., Molecular cloning: A laboratory manual; Cold Spring Harbor Laboratory Press, Cold Spring Harbor, New York, 1989. The molecular biological reagents were used according to the manufacturer's instructions. DNA sequences were determined by double strand sequencing. In some cases desired gene segments were prepared by Geneart AG (Regensburg, Germany) from synthetic oligonucleotides and PCR products by automated gene synthesis. The gene segments which are flanked by singular restriction endonuclease cleavage sites were cloned into pGA18 (ampR) plasmids. The plasmid DNA was purified from transformed bacteria and concentration determined by UV spectroscopy. The DNA sequence of the subcloned gene fragments was confirmed by DNA sequencing. Gene Segments were designed with suitable restriction sites to allow sub-cloning into the respective expression vectors. General information regarding the nucleotide sequences of human immunoglobulin light and heavy chains is given in: Kabat, E.A. et al., (1991) Sequences of Proteins of Immunological Interest, Fifth Ed., NIH Publication No 91-3242. For expression, all constructs contained a 5'-end DNA sequence coding for a leader peptide which targets proteins for secretion in eukaryotic cells. SEQ ID NOs 323-331 give exemplary leader peptides and polynucleotide sequences encoding them.

Preparation of (glycoengineered) antibodies
The full antibody heavy and light chain DNA sequences have been obtained by subcloning the variable regions in frame with either the constant heavy chain or the constant light chain pre-inserted into the respective recipient mammalian expression vector. The antibody expression was driven by an MPSV promoter and the vector carries a synthetic polyA signal sequence at the 3’ end of the CDS. In addition each vector contains an EBV OriP sequence.

Antibodies are produced by co-transfecting HEK293-EBNA cells with the mammalian antibody expression vectors using a calcium phosphate-transfection. Exponentially growing HEK293-EBNA cells are transfected by the calcium phosphate method. Alternatively, HEK293 cells growing in suspension are transfected by polyethylenimine. For the production of unmodified non-glycoengineered antibody, the cells are transfected only with antibody heavy and light chain expression vectors in a 1:1 ratio.

For the production of the glycoengineered antibody, the cells are co-transfected with two additional plasmids, one for a fusion GnTIII polypeptide expression (a GnT-III expression vector), and one for mannosidase II expression (a Golgi mannosidase II expression vector) at a ratio of 4:4:1:1, respectively. Cells are grown as adherent monolayer cultures in T flasks using DMEM culture medium supplemented with 10% FCS, and are transfected when they are between 50 and 80% confluent. For the transfection of a T150 flask, 15 million cells are seeded 24 hours before transfection in 25 ml DMEM culture medium supplemented with FCS (at 10% V/V final), and cells are placed at 37°C in an incubator with a 5% CO₂ atmosphere overnight.

For each T150 flask to be transfected, a solution of DNA, CaCl₂ and water is prepared by mixing 94 µg total plasmid vector DNA divided equally between the light and heavy chain expression vectors, water to a final volume of 469 µl and 469 µl of a 1M CaCl₂ solution. To this solution, 938 µl of a 50 mM HEPES, 280 mM NaCl, 1.5 mM Na₂HP0₄ solution at pH 7.05 are added, mixed immediately for 10 sec and left to stand at room temperature for 20 sec. The suspension is diluted with 10 ml of DMEM supplemented with 2% FCS, and added to the T150 in place of the existing medium. Then additional 13 ml of transfection medium are added. The cells are incubated at 37°C, 5% CO₂ for about 17 to 20 hours, then medium is replaced with 25 ml DMEM, 10% FCS. The conditioned culture medium is harvested approx. 7 days post-media exchange by centrifugation for 15 min at 210 x g, the solution is sterile filtered (0.22 um filter) and sodium azide in a final concentration of 0.01 % w/v is added, and kept at 4°C.

The secreted wildtype or glycoengineered afucosylated antibodies are purified from cell culture supernatants by affinity chromatography using Protein A (HiTrap ProtA, GE Healthcare) affinity chromatography. Briefly, the column was equilibrated with 20 mM sodium phosphate, 20 mM
sodium citrate pH 7.5, the cell supernatant was loaded, followed by a first wash with 20 mM sodium phosphate, 20 mM sodium citrate pH 7.5, and a second wash with 13.3 mM sodium phosphate, 20 mM sodium citrate, 500 mM sodium chloride pH 5.45. The antibodies were eluted with 20 mM sodium citrate, 100 mM sodium chloride, 100 mM glycine pH 3. In a subsequent size exclusion chromatographic step on a HiLoad Superdex 200 column (GE Healthcare) the buffer was exchanged to 25 mM potassium phosphate, 125 mM sodium chloride, 100 mM glycine solution of pH 6.7 or alternatively 140 mM sodium chloride, 20 mM histidine, pH 6.0 and the pure monomeric IgG antibodies were collected. If required an additional cation exchange chromatography step is included between the two standard purification steps.

The protein concentration of purified protein samples is determined by measuring the optical density (OD) at 280 nm, using the molar extinction coefficient calculated on the basis of the amino acid sequence. Purity and molecular weight of antibodies are analyzed by SDS-PAGE in the presence and absence of a reducing agent (5 mM 1,4-dithiotreitol) and staining with Coomassie (SimpleBlue™ SafeStain from Invitrogen). The NuPAGE® Pre-Cast gel system (Invitrogen, USA) is used according to the manufacturer's instruction (4-20% Tris-Glycine gels or 3-12% Bis-Tris). The aggregate content of antibody samples is analyzed using a Superdex 200 10/300GL analytical size-exclusion column (GE Healthcare, Sweden) in 2 mM MOPS, 150 mM NaCl, 0.02% NaN₃, pH 7.3 running buffer at 25°C. The integrity of the amino acid backbone of reduced antibody light and heavy chains is verified by NanoElectro spray Q-TOF mass spectrometry after removal of N-glycans by enzymatic treatment with Peptide-N Glycosidase F (Roche Molecular Biochemicals).

The results of the purification and analysis of the wild-type and glycoengineered 28H1, 29B11, 3F2 and 4G8 human IgG antibodies are shown in Figures 15 to 22. The yields are given in the following table:

The oligosaccharides attached to the Fc region of the antibodies are analysed by MALDI TOF-MS as described below. Oligosaccharides are enzymatically released from the antibodies by
PNGaseF digestion. The resulting digest solution containing the released oligosaccharides is either prepared directly for MALDI TOF-MS analysis or is further digested with EndoH glycosidase prior to sample preparation for MALDI TOF-MS analysis.

**Analysis of glycostructure of (glycoengineered) antibodies**

For determination of the relative ratios of fucose- and non-fucose (a-fucose) containing oligosaccharide structures, released glycans of purified antibody material are analyzed by MALDI-Tof-mass spectrometry. The antibody sample (about 50 µg) is incubated overnight at 37°C with 5 mU N-Glycosidase F (QAbio; PNGaseF: E-PNG01) in 2 mM Tris, pH 7.0, in order to release the oligosaccharide from the protein backbone. For deamination of glycans acetic acid to a final concentration of 150 mM is added and incubated for 1h at 37°C. For analysis by MALDI TOF mass spectrometry, 2 µL of the sample are mixed on the MALDI target with 2 µL DHB matrix solution (2, 5-dihydroxybenzoic acid [Bruker Daltonics #201346] dissolved in 50% ethanol/5 mM NaCl at 4 mg/ml) and analysed with MALDI TOF Mass Spectrometer Autoflex II instrument [Bruker Daltonics]. Routinely, 50-300 shots are recorded and summed up to a single experiment. The spectra obtained are evaluated by the flex analysis software (Bruker Daltonics) and masses are determined for the each of the peaks detected. Subsequently, the peaks are assigned to fucose or a-fucose (non-fucose) containing carbohydrate structures by comparing the masses calculated and the masses theoretically expected for the respective structures (e.g. complex, hybrid and oligo-or high-mannose, respectively, with and without fucose).

For determination of the ratio of hybrid structures, the antibody samples are digested with N-Glycosidase F and Endo-Glycosidase H [QAbio; EndoH: E-EH02] concomitantly. N-Glycosidase F releases all N-linked glycan structures (complex, hybrid and oligo- and high mannose structures) from the protein backbone and the Endo-Glycosidase H cleaves all the hybrid type glycans additionally between the two N-acetylglucosamine (GlcNAc) residues at the reducing end of the glycan. This digest is subsequently treated and analysed by MALDI TOF mass spectrometry in the same way as described above for the N-Glycosidase F digested sample. By comparing the pattern from the N-Glycosidase F digest and the combined N-glycosidase F / Endo H digest, the degree of reduction of the signals of a specific carbohydrate structure is used to estimate the relative content of hybrid structures. The relative amount of each carbohydrate structure is calculated from the ratio of the peak height of an individual structure and the sum of the peak heights of all oligosaccharides detected. The amount of fucose is the percentage of
fucose-containing structures related to all carbohydrate structures identified in the N-Glycosidase F treated sample (e.g. complex, hybrid and oligo- and high-mannose structures, resp.). The amount of non-fucosylation is the percentage of fucose-lacking structures related to all carbohydrates identified in the N-Glycosidase F treated sample (e.g. complex, hybrid and oligo- and high-mannose structures, resp.).

The degrees of non-fucosylation of the different wild-type and glycoengineered anti-FAP antibodies is given in the following table:

**Example 2**

**Construction of Generic Fab-Libraries**

Generic antibody libraries in the Fab-format were constructed on the basis of human germline genes using the following V-domain pairings: Vk3_20 kappa light chain with VH3_23 heavy chain for the DP47-3 library and Vkl_17 kappa light chain with VH1_69 heavy chain for the DP88-3 library. See SEQ ID NOs 1 and 2.

Both libraries were randomized in CDR3 of the light chain (L3) and CDR3 of the heavy chain (H3) and were assembled from 3 fragments per library by splicing by overlapping extension (SOE) PCR. Fragment 1 comprises the 5’ end of the antibody gene including randomized L3, fragment 2 is a central constant fragment spanning from L3 to H3, whereas fragment 3 comprises randomized H3 and the 3’ portion of the antibody gene.

The following primer combinations were used to generate library fragments for DP47-3 library: fragment 1 (LMB3 - LibLlb_new), fragment 2 (MS63 - MS64), fragment 3 (Lib2H - fdseqlong). See Table 3. The following primer combinations were used to generate library fragments for the DP88-3 library: fragment 1 (LMB3 - RJH_LIB3), fragment 2 (RJH31 - RJH32) and fragment 3 (LIB88_2 - fdseqlong). See Table 4.
The PCR protocol for the production of library fragments included: 5 minutes of initial
denaturation at 94°C; 25 cycles of 1 minute at 94°C, 1 minute at 58°C, and 1 minute at 72°C;
and terminal elongation for 10 minutes at 72 °C. For assembly PCR, equimolar ratios of the 3
fragments were used as template. The assembly PCR protocol included: 3 minutes of initial
denaturation at 94°C; and 5 cycles of 30 seconds at 94°C, 1 minute at 58°C, and 2 minutes at
72°C. At this stage, primers complementary to sequence outside fragments 1-3 were added and
an additional 20 cycles were performed prior to a terminal elongation for 10 min at 72 °C.
After assembly of sufficient amounts of full length randomized Fab constructs, the Fab
constructs were digested with Ncol I Notl for the DP47-3 library and with Ncol I NheI for the
DP88-3 library alongside with similarly treated acceptor phagemid vector. For the DP47-3
library, 22.8 µg of Fab library was ligated with 16.2 µg of phagemid vector. For the DP88-3
library, 30.6 µg of Fab library was ligated with 30.6 µg of phagemid vector.
Purified ligations were used for 68 transformations for the DP47-3 library and 64
transformations for the DP88-3 library, respectively, to obtain final library sizes of 4.2 x 10^{10} for
DP47-3 and 3.3 x 10^{9} for DP88-3. Phagemid particles displaying the Fab libraries were rescued
and purified by PEG/NaCl purification to be used for selections.
Example 3

Selection of anti-FAP clones (primary selections)

Selections were carried out against the ectodomain of human or murine fibroblast activating protein (FAP) which were cloned upstream a poly-lysine and a 6xhis-tag. See SEQ ID NOs: 317 and 319. Prior to selections, the antigens were coated into immunotubes at a concentration of either 10 µg/ml or 5 µg/ml, depending on round of selection. Selections were carried out according to the following protocol: (i) binding of ~ 10^{12} phagemid particles of library DP47-3 to immobilized human or murine FAP for 2 hours; (ii) washing of immunotubes using 5 x 5mL PBS/Tween20 and 5 x 5mL PBS; (iii) elution of phage particles by addition of 1mL 100mM TEA (triethylamine) for 10 minutes and neutralization by the addition of 500 µl 1M Tris/HCl pH 7.4; and (iv) re-infection of log-phase E. coli TGI cells, infection with helperphage VCSM13 and subsequent PEG/NaCl precipitation of phagemid particles to be used in subsequent selection rounds.

Selections have been carried out over three or four rounds using decreasing antigen concentrations of human FAP and in some cases using murine FAP at 5 µg/ml in the final selection round. Specific binders were defined as signals 5 x higher than background and were identified by ELISA. NUNC maxisorp plates were coated with 10 µg/ml of human or murine FAP followed by addition of Fab-containing bacterial supernatants and detection of specifically binding Fabs via their Flag-tags by using an anti-Flag/HRP secondary antibody.

ELISA-positive clones were bacterially expressed as 1 mL cultures in 96-well format and supernatants were subjected to a kinetic screening experiment using BIACORE T100. K_D was measured by surface plasmon resonance using a BIACORE® T100 machine (GE Healthcare) at 25°C with anti-human F(ab')2 fragment specific capture antibody (Jackson ImmunoResearch #109-005-006) immobilized by amine coupling on CM5 chips and subsequent capture of Fabs from bacterial supernatant or from purified Fab preparations. Briefly, carboxymethylated dextran biosensor chips (CM5, GE Healthcare) were activated with N-ethyl-N'-(3-dimethylaminopropyl)-carbodiimide hydrochloride (EDC) and N-hydroxysuccinimide (NHS) according to the supplier's instructions. Anti-human F(ab')2 fragment specific capture antibody was diluted with 10 mM sodium acetate, pH 5.0 at 50 µg/ml before injection at a flow rate of 10 µl/minute to achieve approximately up to 10.000 response units (RU) of coupled capture antibody. Following the injection of the capture antibody, 1 M ethanolamine was injected to block unreacted groups. For kinetic measurements, Fabs from bacterial supernatant or purified Fabs were injected at a flow rate of 10 µl/min for 300 s and a dissociation of 300 s for capture
baseline stabilization. Capture levels were in the range of 100 - 500 RU. In a subsequent step, human or murine FAP analyte was injected either as a single concentration or as a concentration series (depending of clone affinity in a range between 100 nM and 250 pM) diluted in HBS-EP+ (GE Healthcare, 10 mM HEPES, 150 mM NaCl, 3 mM EDTA, 0.05% Surfactant P20, pH 7.4) at 25°C at a flow rate of 50 µl/min. Association time was 120 or 180 s, dissociation time was 300 to 600 s. The surface of the sensorchip is regenerated by injection of glycine pH 1.5 for 30 s at 90 µl/min followed by injection of NaOH for 20s at the same flow rate. Association rates (k_{on}) and dissociation rates (k_{off}) were calculated using a simple one-to-one Langmuir binding model (BIACORE ® T100 Evaluation Software or Scrubber software (BioLogic)) by simultaneously fitting the association and dissociation sensorgrams. The equilibrium dissociation constant (K_D) was calculated as the ratio k_{off}/k_{on}.

Example 4

Construction of Anti-FAP Affinity Maturation Libraries

Three affinity maturation libraries were constructed on basis of pre-selected antibodies from the primary anti-FAP selections. More precisely, they were based on (i) anti-human FAP clone 2D9 (library a.m.FAP2D9) (see SEQ ID NOs: 229 and 231), (ii) anti-murine FAP clone 4B8 (library a.m.FAP4B8) (see SEQ ID NOs: 233 and 235) and (iii) cross-reactive clones 7A1, 13B2, 13C2, 13E8, 14C10 and 17A11 (library a.m.FAPpool) (see SEQ ID NOs: 237 and 239 corresponding to the variable region sequences of 7A1; SEQ ID NOs: 241 and 243 corresponding to the variable region sequences of 13C2; SEQ ID NOs: 245 and 247 corresponding to the variable region sequences of 13E8; SEQ ID NOs: 249 and 251 corresponding to the variable region sequences of 14C10; and SEQ ID NOs: 253 and 255 corresponding to the variable region sequences of 17A11).

Each of these libraries consists of two sublibraries, randomized in either CDR1 and CDR2 of the light chain (L1/L2) or CDR1 and CDR2 of the heavy chain (H1/H2), respectively. These sublibraries were pooled upon transformation. Each of these sublibraries was constructed by four subsequent steps of amplification and assembly.

For L1/L2 libraries, the amplification and assembly protocol included: (i) amplification of fragment 1 (LMB3 - DPK22_CDR1_rand_ba_opt) and fragment 2 (DPK22_CDR1_fo - DPK22_Ck_i34zWI_ba); (ii) assembly of fragments 1 and 2 using outer primers LMB3 and DPK22_Ck_i34zWI_ba to create the template for fragment 3; (iii) amplification of fragment 3 (LMB3 - DPK22_CDR2_rand_ba) and fragment 4 (DPK22_CDR2_fo -
DPK22_Ck_i34zWI_ba); and (iv) final assembly of fragments 3 and 4 using the same outer primers as above. See Table 5 for primer sequences.

For H1/H2 libraries, the amplification and assembly protocol included: (i) amplification of fragment 1 (RJH53 - DP47_CDR1_rand_ba_opt) and fragment 2 (DP47_CDR1_fo - MS52); (ii) assembly of fragments 1 and 2 using outer primers RJH53 and MS52 to create the template for fragment 3; (iii) amplification of fragment 3 (RJH53 - DP47_CDR2_rand_ba) and fragment 4 (DP47_CDR2_fo - MS52); and (iv) final assembly of fragments 3 and 4 using the same outer primers as above. See Table 6 for primer sequences.

Final assembly products have been digested with NcoI Bsi WJ for L1/L2 sublibraries of a.m.FAP2D9 and a.m.FAP4B8, with Muni and Nhel for H1/H2 sublibraries of a.m.FAP2D9 and
a.m.FAP4B8 as well as with NcoI/BamHI for L1/L2 library of a.m.FAPpool and with BspE1/PstI for H1/H2 libraries of a.m.FAPpool, respectively, alongside with similarly treated acceptor vectors based on plasmid preparations of clones 2D9, 4B8 or an equimolar mixture of clones 7A1, 13B2, 13C2, 13E8, 14C10 and 17A11, respectively. The following amounts of digested randomized (partial) V-domains and digested acceptor vector(s) were ligated for the respective libraries (µg V-domain g vector): a.m.FAP2D9 L1/L2 sublibrary (5.7/21.5), a.m.FAP2D9 H1/H2 sublibrary (4.1/15.5), a.m.FAP4B8 L1/L2 sublibrary (6.5/24.5), a.m.FAP4B8 H1/H2 sublibrary (5.7/21.5), a.m.FAPpool L1/L2 sublibrary (4.4/20), a.m.FAPpool H1/H2 sublibrary (3.4/15.5).

Purified ligations of L1/L2 and H1/H2 sublibraries were pooled and used for 60 transformations for each of the 3 affinity maturation libraries, to obtain final library sizes of 6.2 x 10^9 for a.m.FAP2D9, 9.9 x 10^9 for a.m.FAP4B8 and 2.2 x 10^9 for a.m.FAPpool. Phagemid particles displaying these Fab libraries were rescued and purified by PEG/NaCl purification to be used for secondary selections.

**Construction of Additional Anti-FAP Affinity Maturation Libraries (based on clones 3F2, 3D9, 4G8, 4B3 and 2C6)**

Four additional affinity maturation libraries were constructed on the basis of pre-selected cross-reactive antibodies from the first affinity-maturation campaign of anti-FAP antibodies, namely clones 3F2, 3D9, 4G8, 4B3 and 2C6 (see SEQ ID NOs: 195 and 197 corresponding to the variable region sequences of 3F2; SEQ ID NOs: 199 and 201 corresponding to the variable region sequences of 3D9; SEQ ID NOs: 205 and 207 corresponding to the variable region sequences of 4G8; SEQ ID NOs: 209 and 211 corresponding to the variable region sequences of 4B3; SEQ ID NOs: 217 and 219 corresponding to the variable region sequences of 2C6). More precisely, the four libraries were based on 1) anti-FAP clones 3F2, 4G8 and 4B3 (V_H library, randomized in CDRs 1 and 2 of variable heavy chain, i.e. H1/H2 library), 2) anti-FAP clones 3D9 and 2C6 (V_L library, randomized in CDRs 1 and 2 of variable light chain, i.e. L1/L2 library), 3) anti-FAP clone 3F2 (L3 library with soft randomization in CDR3 of light chain, i.e. L3 library) and 4) anti-FAP clone 3F2 (H3 library with soft randomization in CDR3 of heavy chain, i.e. H3 library). The first two libraries were constructed exactly the same way as outlined for the first affinity-maturation campaign of anti-FAP antibodies, for the L1/L2 and H1/H2 libraries, respectively. In contrast, for the L3 and H3 affinity-maturation libraries based on clone 3F2, two new primers were used to introduce soft randomization in L3.
(AM_3F2_DPK22_L3_ba: CACTTTGGTCCCCTGGCCGAACGT CGGGGGAAGCA 
TAATACCCGTCTGACAGTAAATACACTTG with underlined bases being 60% given base and 
40% mixture N (mixture of the four nucleotides A, C, G, and T)) and H3
(AM_3F2_DP47_H3_fo: GGCCGTATATTACTGTGCG AAA GGG TGG TTT GGT GGT
TTT AAC TACTGGGGAAGGAAC with underlined bases being 60% given base and 40% mixture N, bases in italics being 60% given base and 40% G, as well as underlined bases in italics being 60% given base and 40% mixture K (mixture of the two nucleotides G and T)) of the parental clone. Library sizes were as follows: H1/H2 library (1.13 x 10^10), L1/L2 library (5.6 x 10^9), L3 library (2.3 x 10^10) and H3 library (2.64 x 10^10).

Example 5

Selection of Affinity-Matured Anti-FAP Clones

Selections were carried out against the ectodomain of human or murine fibroblast activating protein (FAP) which were cloned 5’ of a poly-lysine and a 6xhis-tag. See SEQ ID NOs: 317 and 319. Prior to selections, the antigens were coated into immunotubes at a concentration of either 10 µg/mL, 5 µg/mL or 0.2 µg/mL, depending on the library and round of selection. Selections were carried out according to the following protocol: (i) binding of ~ 10^{12} phagemid particles of library a.m.FAP2D9, a.m.FAP4B8 or a.m.FAPpool to immobilized human or murine FAP for 2 hours; (ii) washing of immuno tubes using 10 - 20 x 5 mL PBS/Tween20 and 10 - 20 x 5 mL PBS (depending on library and selection round); (iii) elution of phage particles by addition of 1 mL 100m M TEA (triethylamine) for 10 minutes and neutralization by addition of 500 µL 1M Tris/HCl pH 7.4; and (iv) re-infection of log-phase E. coli TGI cells, infection with helperphage VCSM13 and subsequent PEG/NaCl precipitation of phagemid particles to be used in subsequent selection rounds.

Selections were carried out over 2 rounds and conditions were adjusted for each of the 3 libraries individually. In detail, selection parameters were: a.m.FAP2D9 (5 µg/mL human FAP and 20 washes in total for round 1, 1 µg/mL human FAP and 30 washes in total for round 2), a.m.FAP4B8 (1 µg/mL murine FAP and 30 washes in total for round 1, 0.2 µg/mL human FAP and 40 washes in total for round 2) and a.m.FAPpool (5 µg/mL human FAP and 30 washes in total for round 1, 5 µg/mL murine FAP and 30 washes in total for round 2). Specific binders were defined as signals 5 x higher than background and were identified by ELISA. NUNC maxisorp plates were coated with 1 µg/mL or 0.2 µg/mL of human or murine FAP followed by
addition of Fab-containing bacterial supernatants and detection of specifically binding Fabs via their Flag-tags by using an anti-Flag/HRP secondary antibody.

ELISA-positive clones were bacterially expressed as 1 ml cultures in 96-well format and supernatants were subjected to a kinetic screening experiment using BIACORE T100, as described above (see Example 3).

**Additional selection of Affinity-Matured Anti-FAP Clones**

Selections were carried out against the ectodomain of human and murine fibroblast activating protein (FAP) which were cloned upstream a 6x-lysine and a 6x-his tag (see SEQ ID NOs: 317 and 319). Prior to selections, the antigens were coated into immunotubes at a concentration of either 1 μg/ml, 0.2 μg/ml or 0.02 μg/ml, depending on the library and round of selection.

Selections and ELISA-based screenings were carried out as described for the first affinity-maturation campaign of anti-FAP antibodies. Secondary screenings were carried out using a ProteOn XPR36 biosensor (Biorad), and kinetic rate constants and affinities were determined analyzing affinity-purified Fab preparations on the same instrument. $K_d$ was measured by surface plasmon resonance using a ProteOn XPR36 machine (Biorad) at 25°C with anti-human F(ab')2 fragment specific capture antibody (Jackson ImmunoResearch #109-005-006) immobilized on GLM chips and subsequent capture of Fabs from bacterial supernatant or from purified Fab preparations. Briefly, GLM biosensor chips (Biorad) were activated for 5 min with a freshly prepared mixture of N-ethyl-N'-(3-dimethylaminopropyl)-carbodiimide hydrochloride (EDC) and N-hydroxysuccinimide (NHS). Anti-human F(ab')2 fragment specific capture antibody was diluted to 24 μg/ml with 10 mM sodium acetate, pH 5.0 before injection for 5 min to achieve approximately up to 10,000 response units (RU) of coupled capture antibody.

Following the injection of the capture antibody, 1 M ethanolamine was injected for 5 min to block unreacted groups. For kinetic measurements, Fabs from bacterial supernatant were injected at a flow rate of 30 μl/min for 100 s. Capture levels were in the range of 250 RU. In a subsequent step, serial dilutions of human, murine or cynomolgus FAP analyte were injected (two-fold dilution, highest concentration 25 nM) diluted in PBS / 0.005% Tween-20 at 25°C at a flow rate of 50 μl/min. Association time was 240 s, dissociation time 600 to 1800 s. The sensorchip was regenerated by injection of 0.85% H$_3$PO$_4$ for 30 s at 100 μl/min followed by injection of 50 mM NaOH for 30s at the same flow rate. Association rates ($k_{on}$) and dissociation rates ($k_{off}$) were calculated using a simple one-to-one Langmuir binding model (ProteOn manager software
version 2.1) by simultaneously fitting the association and dissociation sensorgrams. The equilibrium dissociation constant ($K_D$) is calculated as the ratio $k_{off}/k_{on}$.

The following affinity-matured clones were identified: 19G1 (see SEQ ID NOs: 257 and 259), 20G8 (see SEQ ID NOs: 281 and 263), 4B9 (see SEQ ID NOs: 265 and 267), 5B8 (see SEQ ID NOs: 269 and 271), 5F1 (see SEQ ID NOs: 273 and 275), 14B3 (see SEQ ID NOs: 277 and 279), 16F1 (see SEQ ID NOs: 281 and 283), 16F8 (see SEQ ID NOs: 285 and 287), 03C9 (see SEQ ID NOs: 289 and 291), 22A3 (see SEQ ID NOs: 301 and 303) and 29B11 (see SEQ ID NOs: 305 and 307) (all these clones were selected from the H1/H2 library and are derived from parental clone 3F2), 02D7 (see SEQ ID NOs: 293 and 295) (selected from the L3 library based on parental clone 3F2), and 28H1 (see SEQ ID NOs: 297 and 299) and 23C10 (see SEQ ID NOs: 309 and 311) (these two clones were selected from the H1/H2 library and are derived from parental clone 4G8).

Figure 1 to 5 show the Surface Plasmon Resonance sensorgrams of selected affinity matured Fabs binding to immobilized FAP and Table 7 gives the respective affinities derived. The selected Fabs span a high affinity range in the pM to nM range and are cross-reactive for human (hu) and murine (mu) FAP, as well as Cynomolgus (cyno) FAP as determined for selected clones. The affinity matured anti-FAP Fabs were converted into the Fab-IL2-Fab format and into IgG antibodies for specificity analysis. Specificity of binding was shown by lack of binding to DPPrV as close homologue of FAP, expressed on HEK293 or CHO cells (see Example 9).

Example 6

IgG Conversion of Fabs Binding FAP

The parental 3F2, 4G8 and 3D9 Fabs and the affinity matured 3F2 and 4G8 Fab derivatives have been converted into a human IgG1 format, a mouse IgG2a format and a human IgG1 format. The full antibody heavy and light chain DNA sequences were obtained either by subcloning the variable regions in frame with the respective constant heavy and the constant light chain regions pre-inserted into different recipient mammalian expression vectors or were recombined by fusing a short sequence stretch homologous to the recipient vectors insertion site. The recombination was performed according to the "In-Fusion Cloning System" from Invitrogen.

In all vectors the antibody expression is driven by an MPSV promoter and all vectors carry a synthetic polyA signal sequence at the 3' end of the CDS. In addition each vector contains an EBV OriP sequence.

Example 7

Biacore Analysis of Anti-FAP IgG antibodies

The affinity of the anti-FAP Fab fragments 3F2, 4G8 and 3D9 as well as of the human IgG1 converted anti-FAP antibodies was subsequently determined and confirmed for human, murine and Cynomolgus FAP by Surface Plasmon Resonance (SPR) analysis at 25°C using a BIACORE® T100 machine (GE Healthcare). For this purpose, human, mouse or Cynomolgus FAP extracellular domain (SEQ ID NOs 317-322) was captured by an immobilized anti-His antibody (Penta His Qiagen 34660) and the antibodies were used as analytes. For immobilization carboxymethylated dextran biosensor chips (CM5, GE Healthcare) were activated with N-ethyl-N'- (3-dimethylaminopropyl)-carbodiimide hydrochloride (EDC) and N-hydroxysuccinimide (NHS) according to the supplier's instructions. The Penta His antibody was diluted with 10 mM sodium acetate, pH 5, to 40 μg/ml before injection at a flow rate of 10 μl/minute to achieve approximately 9000 response units (RU) of coupled protein. Following the injection of the ligand, 1 M ethanolamine was injected to block unreacted groups.

For kinetics measurements, human, mouse or Cynomolgus FAP extracellular domain was injected at 10 μl/min at 10 nM for 20 s (for Fab fragments) or at 20 nM for 25 s (for IgG) and

was captured via its His tag by the immobilized penta His antibody. Serial dilutions of antibody (two-fold dilutions, range between 6.25 nM to 200 nM for Fab fragments or five-fold dilutions, range between 3.2 pM to 10 nM for IgG) were injected in HBS-EP+ (GE Healthcare, 10 mM HEPES, 150 mM NaCl, 3 mM EDTA, 0.05% Surfactant P20, pH 7.4) at 25°C at a flow rate of 90 µl/min. The following parameters were applied: Association time 180 s, dissociation 300 s (for Fab) or 900 s (for IgG), regeneration with 10 mM glycine pH 2 for 60 s between each cycle. Association rates (k_{on}) and dissociation rates (k_{off}) were calculated using a simple one-to-one Langmuir binding model (BIACORE T100 Evaluation Software version 1.1.1) by simultaneously fitting the association and dissociation sensorgrams (model parameters were local Rmax and RI=0). The equilibrium dissociation constant (K_D) was calculated as the ratio k_{off}/k_{on}.

The K_D values of binding are given in Table 8. Figure 6 A-C shows the corresponding SPR-based kinetic analyses for Fab fragments, Figure 7 A-C for IgG antibodies.

Example 8

**Binding of anti-FAP Antibodies 3F2, 4G8 and 3D9 on Human Tumor Tissue Sections**

We performed experiments to detect and compare the expression of FAP in fresh frozen human tumor tissues (breast cancer, colon adenocarcinomas and NSCLC tissues) using the anti-FAP antibodies clones 3F2,4G8 and 3D9 as mouse IgG2a.
One fresh frozen tissue microarray (TMA) (AST 274), containing thirty different tumors with two spots each, was used from the Roche TRS Pathology & Tissue Biomarkers tumorbank. The TMA containing 10 invasive ductal carcinomas of the breast, 10 colorectal adenocarcinomas and 10 non-small cell lung cancers was obtained from Asterand Ltd, Royston, UK.

For the immunohistochemical (IHC) stainings, the following antibodies were used: monoclonal mouse anti-human FAP clone 3F2 (15.8 ng/ml, diluted in Ventana Antibody Diluent), monoclonal mouse anti-human FAP clone 4G8 (1000 ng/ml, diluted in Ventana Antibody Diluent), and monoclonal mouse anti-human FAP clone.3D9 (1000 ng/ml, diluted in Ventana Antibody Diluent). A polyclonal mouse IgG2a, concentration 100µg/mL (Provider: DAKO, X0943, lot #00058066) was used as isotype control.

The stainings were performed according to standard protocols on a Ventana Benchmark XT instrument, using the Ventana Ultra-View detection kit with HRP-system for detection (containing Universal HRP Multimer, and DAB for staining). Counter-staining was done with Hematoxylin II (Ventana, Mayer’s Hematoxylin) and Blueing Reagent (Ventana) for 8 min.

The TMA was analyzed semi-quantitatively and the total FAP expression (staining intensity) as well as the localization of the FAP expression in the tumor tissue was evaluated. With all three anti-FAP antibodies, all the tumor tissue samples (breast cancer, colorectal cancer and lung cancer) that could be evaluated showed a moderate to strong staining FAP signal intensity in the stroma component of the tumor. At least 7 out of 10 samples for each tumor and antibody could be evaluated. The remaining samples could not be evaluated, because tissue cores had folding artifacts, contained only normal tissue, or were missing. As expected, the FAP signal was invariably located in the stroma component of tumors. There was a slight difference in signal intensity between clone 3F2 and clones 3D9 and 4G8. A slightly stronger signal was seen with clones 3D9 and 4G8, the difference was minor, however.

Figure 8 A-D shows representative micrographs of human tumor tissue samples immunohistochemically stained for FAP using the anti-FAP mouse IgG2a 3F2, 3D9 or 4G8, or an isotype control antibody.

Example 9

**Binding of Anti-FAP Antibodies to FAP on Cells**

Binding of human IgGl antibodies 3F2, 4B3 and 4G8 to human and murine FAP expressed on stably transfected HEK293 cells was measured by FACS. Briefly, 150,000 cells per well were incubated with the indicated concentration of the anti-FAP antibodies 3F2, 4B3 and 4G8 in a
round bottom 96-well plate, incubated for 30 min at 4°C, and washed once with PBS/0.1 % BSA. Bound antibody was detected with FITC-conjugated AffiniPure F(ab')2 Fragment goat anti-human F(ab')2 Specific (Jackson Immuno Research Lab #109-096-097, working solution: 1:20 diluted in PBS/0.1% BSA, freshly prepared) after incubation for 30 min at 4°C using a FACS CantoII (Software FACS Diva). The results are shown in Figure 9. EC50 values at half-maximal binding for binding to human and murine FAP were determined and are given in Table 9.

**Specificity of FAP antibodies**

In order to assess the specificity of binding of the phage display derived antibodies, binding to HEK293 cells stably expressing DPPIV (a close homologue of FAP that is expressed on healthy tissues) or HER2 was measured for the anti-FAP human IgGl antibodies 3F2, 4B3 and 4G8. Briefly, 200,000 cells per well (HEK293-DPPIV or HEK293-HER2 as control) were incubated with 30 µg/ml of the anti-FAP antibodies 3F2, 4B3 or 4G8 in a round bottom 96-well plate, incubated for 30 min at 4°C and washed once with PBS/0.1 % BSA. Trastuzumab (anti-HER2 antibody) or a phycoerythrin (PE)-conjugated mouse anti-human anti-CD26/DPPIV antibody (CD26 = DPPIV, mouse IgGl.k, BD Biosciences, #555437, clone M-A261) were used as positive controls. Bound antibody was detected with PE-conjugated AffiniPure F(ab')2 Fragment goat anti-human IgG Fey Specific (Jackson Immuno Research Lab #109-1 16-170, working solution: 1:20 diluted in PBS/0.1% BSA, freshly prepared) after incubation for 30 min at 4°C using a FACS CantoII (Software FACS Diva). The results of this experiment are shown in Figure 10. None of the anti-FAP antibodies showed significant binding to DPPIV or HER2, but signals in the range of the negative controls (secondary antibody alone, isotype control antibody, or no antibody at all).
Binding of anti-FAP antibodies to FAP on human fibroblasts
Binding of human IgG1 antibodies to human FAP expressed on human fibroblast cell line GM05389 (derived from human fetal lung, National Institute of General Medical Sciences, Camden, NJ) was measured by FACS. Briefly, 200,000 cells per well were incubated with 30 µg/ml of the anti-FAP antibodies 3F2 or 4G8 in a round bottom 96-well plate, incubated for 30 min at 4°C and washed once with PBS/0.1% BSA. Bound antibody was detected with FITC-conjugated AffiniPure F(ab')2 Fragment goat anti-human IgG Fey Specific (Jackson Immuno Research Lab #109-096-098, working solution: 1:20 diluted in PBS/0.1% BSA, freshly prepared) after incubation for 30 min at 4°C using a FACS CantoII (Software FACS Diva). The results of this experiment are shown in Figure 11. Both anti-FAP antibodies strongly bind to FAP expressed on human fibroblasts.

Binding of anti-FAP antibodies to FAP on human tumor cells
Binding of human IgG1 antibodies to human FAP expressed on human fibroblasts cell line GM05389 and on stably transfected HEK293 cells was compared to FAP expression on human cancer cell lines ACHN, Colo205, MDA-MB231, MDA-MB435 and KPL4 by FACS. Briefly, 200,000 cells per well were incubated with 10 µg/ml of the anti-FAP antibodies 3F2 or 4G8 in a round bottom 96-well plate, incubated for 30 min at 4°C and washed once with PBS/0.1% BSA. Bound antibody was detected with FITC-conjugated AffiniPure F(ab')2 Fragment goat anti-human F(ab')2 Specific (Jackson Immuno Research Lab #109-096-097, working solution: 1:20 diluted in PBS/0.1% BSA, freshly prepared) after incubation for 30 min at 4°C using a FACS CantoII (Software FACS Diva). The results of this experiment are shown in Figure 12. The data show that the antibodies 3F2 and 4G8 bind specifically to FAP that is strongly overexpressed on fibroblasts and stably transfected HEK293 cells; whereas only weak binding can be detected on ACHN, Colo205, MDA-MB231, MDA-MB435 and KPL4 human tumor cell lines.

Example 10

Analysis of FAP Internalization upon Binding of anti-FAP antibody by FACS
For several FAP antibodies known in the art it is described that they induce FAP internalization upon binding (described e.g. in Baum et al., *J Drug Target* 15, 399-406 (2007); Bauer et al., *Journal of Clinical Oncology*, 2010 ASCO Annual Meeting Proceedings (Post-Meeting Edition),
vol. 28 (May 20 Supplement), abstract no. 13062 (2010); Ostermann et al., Clin Cancer Res 14, 4584-4592 (2008)).

Thus, we analyzed the internalization properties of our antibodies. Briefly, GM05389 cells (human lung fibroblasts,) cultured in EMEM medium + 15% FCS, were detached, washed, counted, checked for viability and seeded at a density of 0.2 mio cells/well in 12 well plates. The next day, FAP antibodies 4G8 and 3F2 (FIGURE 13A) or 4G8 only (FIGURE 13B) were diluted to 10 µg/ml in cold medium, cells were cooled down on ice and the diluted antibodies (0.5 ml/well) or medium alone were added as indicated. Subsequently, cells were incubated for 30 min in the cold room with gentle agitation, followed by addition of 0.5 ml warm medium and further incubation of the cells at 37°C for the indicated time periods. When the different time points were reached, cells were transferred to ice, washed once with cold PBS and incubated with 0.4 ml of the secondary antibody (Alexa Fluor 633-conjugated goat anti-human IgG, Molecular Probes #A-21091, 2 mg/ml, use 1:500) for 30 min at 4°C. Cells were then washed twice with PBS/0.1 % BSA, transferred to a 96 well plate, centrifuged for 4 min at 4°C, 400 x g and cell pellets were resuspended by vortexing. Cells were fixed using 100 µl 2% PFA. For FACS measurement, cells were re-suspended in 200 µl/sample PBS/0.1% BSA and measured with the plate protocol in FACS CantoII (Software FACS Diva). The results of these experiments are presented in Figure 13 A and B, and show that the 4G8 and 3F2 anti-FAP antibodies do not induce internalization of FAP on fibroblasts.

Analysis of FAP Internalization upon Binding of Anti-FAP Antibody by Immunofluorescence

GM05389 cells (human lung fibroblasts) were grown on glass coverslips in EMEM medium + 15 % FCS. Before treatment, cells were washed three times with PBS and starved in EMEM medium + 0.1 % BSA for 2 h. The anti-FAP antibody (4G8 IgG) or an anti-CD20 antibody (GA101, used as isotype control) were diluted in cold EMEM medium to the final concentration of 10 µg/ml. After starvation, cells were cooled on ice, rinsed twice with cold PBS and incubated with the diluted antibodies (0.5 ml/well) for 45 min at 4°C under constant agitation to allow surface binding. Cells were then washed twice with cold PBS and either fixed with cold PFA (TO, paraformaldehyde 4 % in PBS pH 7.4) or further incubated at 37°C for 20 min, 1 h, 3 h and 6 h in EMEM + 10 % FCS. At each time point, cells were washed twice with cold PBS and PFA-fixed for 20 min on ice. After fixation, cells were washed four times with cold PBS, permeabilized with Triton 0.03% and incubated with anti-EEA1 (early endosome marker)
antibody for 45 min at room temperature in blocking buffer (PBS + 10% FCS). Cells were then washed three times with PBS and incubated with fluorescently labeled secondary antibodies (donkey anti-mouse Alexa Fluor 594-conjugated antibody, and goat anti-human Alexa Fluor 488-conjugated antibody) at room temperature for further 45 min. Cells were finally washed and mounted on glass support slides using Immuno Mount mounting medium.

Figure 14 A-D presents representative immunofluorescence images showing FAP plasma membrane staining on GM05389 lung fibroblasts obtained after binding of anti-FAP 4G8 IgG for 45 min at 4°C (A), for 20 min at 37°C (B), for 1 hour at 37°C (C) or for 6 hours at 37°C (D). The anti-CD20 antibody GA101, used as isotype control, shows background staining. EEA1 labels early endosomes. Note the persistence of the FAP surface plasma membrane staining up to 6 hours after anti-FAP 4G8 antibody binding.

Example 11

**Biacore Analysis of Affinity-Matured Anti-FAP IgG Antibodies**

Affinity matured anti-FAP Fab fragments derived from 3F2 and 4G8 were converted into rabbit IgG antibodies. The affinity of the affinity matured 3F2 and 4G8-based rabbit IgG1 converted anti-FAP antibodies to FAP is subsequently determined and confirmed for human, murine and Cynomolgus FAP by SPR analysis at 25°C (Biacore). For this purpose, human, mouse or Cynomolgus FAP extracellular domain (SEQ ID NOs 317-322) is captured by an immobilized anti-His antibody (Penta His Qiagen 34660) and the antibodies are used as analytes. IgGs are diluted 1:5 from 10 nM to 3.2 pM. The following parameters are applied: Association time 180 s, dissociation 900 s, flow 90 µl/min. Regeneration with 10 mM glycine pH 2 for 60 s. The curves were fitted with the 1:1 model to get the K_D values (Rmax local, RI=0).

Example 12

**Binding of Affinity Matured Anti-FAP Antibodies to FAP on Cells**

Binding of affinity matured human IgG1 antibody 28H1 labeled with Alexa-647 (1.89 mg/ml, 1.83 mole dye/mole protein) derived from 4G8 parental antibody to human FAP expressed on stably transfected HEK293 cells was measured by FACS. Briefly, 200,000 cells per well were incubated with the indicated concentration of 2 µg/ml and 10 µg/ml of the parental 4G8 and affinity matured 28H1 anti-FAP antibodies in a round-bottom 96-well plate, incubated for 30 min at 4°C and washed once with PBS/0.1% BSA. Bound antibody was detected after incubation
for 30 min at 4°C using a FACS CantoII (Software FACS Diva). The data show that both antibodies bind strongly to HEK293 cells transfected with human FAP (Figure 23).

Example 13

**Binding of affinity matured anti-FAP antibodies to FAP on human fibroblasts**

Binding of affinity matured human IgG1 antibodies derived from 3F2 to human FAP expressed on human fibroblast cell line GM05389 (derived from human fetal lung, National Institute of General Medical Sciences, Camden, NJ) is measured by FACS. Briefly, 200.000 cells per well are incubated with 30 μg/ml of the affinity matured 3F2 anti-FAP antibody in a round-bottom 96-well plate, incubated for 30 min at 4°C and washed once with PBS/0.1 % BSA. Bound antibody is detected with FITC-conjugated AffiniPure F(ab′)2 Fragment goat anti-human IgG (Jackson Immuno Research Lab #109-096-098, working solution: 1:20 diluted in PBS/0.1% BSA, freshly prepared) after incubation for 30 min at 4°C using a FACSCantoII (Software FACS Diva). EC50 values at half-maximal binding for binding to human and murine FAP are being determined.

Example 14

**Antibody-dependent cell-mediated cytotoxicity mediated by glycoengineered anti-FAP IgG1 antibodies**

Human IgG1 antibodies against FAP derived from 4G8 or 3F2 were glycoengineered by cotransfection with plasmids encoding for GnTIII and ManI as described in Example 1. Subsequently, glycoengineered parental 4G8 and 3F2 and affinity matured 28H1 human IgG1 antibodies were compared in an ADCC assay for their potential to mediate superior antibody mediated cellular cytotoxicity compared to their non-glycoengineered wildtype versions. Briefly, HEK293 cells stably transfected with human FAP as target cells were collected, washed and resuspended in culture medium, stained with freshly prepared Calcein AM (Molecular Probes) at 37°C for 30 min, washed three times, counted and diluted to 300.000 cells/ml. This suspension was transferred to a round-bottom 96-well plate (=30.000 cells/well), the respective antibody dilution was added and incubated for 10 min to facilitate the binding of the tested antibody to the cells prior to contact with effector cells. Effector to target ratio was 25 to 1 for PBMCs. Co-incubation was performed for 4 hours. As readout the release of lactate dehydrogenase (LDH) into supernatant after disintegration of the attacked cells was determined.
LDH from co-culture supernatant was collected and analyzed with a LDH detection Kit (Roche Applied Science). Substrate conversion by the LDH enzyme was measured with an ELISA absorbance reader (SoftMaxPro software, reference wavelengths: 490 nm versus 650 nm). As shown in Figure 24 all anti-FAP antibodies tested were able to induce ADCC on HEK293-hFAP cells. The glycoengineered (ge) versions performed always better than the corresponding wildtype (wt) non-glycoengineered version.

*  *  *

Although the foregoing invention has been described in some detail by way of illustration and example for purposes of clarity of understanding, the descriptions and examples should not be construed as limiting the scope of the invention. The disclosures of all patent and scientific literature cited herein are expressly incorporated in their entirety by reference.
Claims

1. An antibody that specifically binds to Fibroblast Activation Protein (FAP), wherein said antibody is glycoengineered to have increased effector function.

2. An antibody that specifically binds to Fibroblast Activation Protein (FAP), wherein said antibody comprises at least one heavy or light chain complementarity determining region (CDR) selected from the group of SEQ ID NO: 3, SEQ ID NO: 5, SEQ ID NO: 7, SEQ ID NO: 9, SEQ ID NO: 11, SEQ ID NO: 13, SEQ ID NO: 15, SEQ ID NO: 17, SEQ ID NO: 19, SEQ ID NO: 21, SEQ ID NO: 23, SEQ ID NO: 25, SEQ ID NO: 27, SEQ ID NO: 29, SEQ ID NO: 31, SEQ ID NO: 33, SEQ ID NO: 35, SEQ ID NO: 37, SEQ ID NO: 39, SEQ ID NO: 41, SEQ ID NO: 43, SEQ ID NO: 45, SEQ ID NO: 47, SEQ ID NO: 49, SEQ ID NO: 51, SEQ ID NO: 53, SEQ ID NO: 55, SEQ ID NO: 57, SEQ ID NO: 59, SEQ ID NO: 61, SEQ ID NO: 63, SEQ ID NO: 65, SEQ ID NO: 67, SEQ ID NO: 69, SEQ ID NO: 71, SEQ ID NO: 73, SEQ ID NO: 75, SEQ ID NO: 77, SEQ ID NO: 79, SEQ ID NO: 81, SEQ ID NO: 83, SEQ ID NO: 85, SEQ ID NO: 87, SEQ ID NO: 89, SEQ ID NO: 91, SEQ ID NO: 93, SEQ ID NO: 95, SEQ ID NO: 97, SEQ ID NO: 99, SEQ ID NO: 101, SEQ ID NO: 103, SEQ ID NO: 105, SEQ ID NO: 107, SEQ ID NO: 109, SEQ ID NO: 111, SEQ ID NO: 113, SEQ ID NO: 115, SEQ ID NO: 117, SEQ ID NO: 119, SEQ ID NO: 121, SEQ ID NO: 123, SEQ ID NO: 125, SEQ ID NO: 127, SEQ ID NO: 129, SEQ ID NO: 131, SEQ ID NO: 133, SEQ ID NO: 135, SEQ ID NO: 137, SEQ ID NO: 139, SEQ ID NO: 141, SEQ ID NO: 143, SEQ ID NO: 145, SEQ ID NO: 147, SEQ ID NO: 149, SEQ ID NO: 151, SEQ ID NO: 153, SEQ ID NO: 155, SEQ ID NO: 157, SEQ ID NO: 159, SEQ ID NO: 161, SEQ ID NO: 163, SEQ ID NO: 165, SEQ ID NO: 167, SEQ ID NO: 169, SEQ ID NO: 171, SEQ ID NO: 173, SEQ ID NO: 175, and SEQ ID NO: 177, or a combination thereof.

3. The antibody of claim 1 or 2, wherein said antibody comprises a heavy chain variable region comprising
   (a) a heavy chain CDR1 selected from the group of SEQ ID NO: 3, SEQ ID NO: 5, SEQ ID NO: 7, SEQ ID NO: 9, SEQ ID NO: 11, SEQ ID NO: 13, SEQ ID NO: 15, SEQ ID NO: 17, SEQ ID NO: 19, SEQ ID NO: 21, SEQ ID NO: 23, SEQ ID NO: 25, SEQ ID NO: 27, SEQ ID NO: 29, SEQ ID NO: 31, and SEQ ID NO: 33;
(b) a heavy chain CDR2 selected from the group of SEQ ID NO: 35, SEQ ID NO: 37, SEQ ID NO: 39, SEQ ID NO: 41, SEQ ID NO: 43, SEQ ID NO: 45, SEQ ID NO: 47, SEQ ID NO: 49, SEQ ID NO: 51, SEQ ID NO: 53, SEQ ID NO: 55, SEQ ID NO: 57, SEQ ID NO: 59, SEQ ID NO: 61, SEQ ID NO: 63, SEQ ID NO: 65, SEQ ID NO: 67, SEQ ID NO: 69, SEQ ID NO: 71, SEQ ID NO: 73, SEQ ID NO: 75, SEQ ID NO: 77, SEQ ID NO: 79, SEQ ID NO: 81, SEQ ID NO: 83, SEQ ID NO: 85, SEQ ID NO: 87, SEQ ID NO: 89, SEQ ID NO: 91, SEQ ID NO: 93, SEQ ID NO: 95, SEQ ID NO: 97, SEQ ID NO: 99, SEQ ID NO: 101, SEQ ID NO: 103, SEQ ID NO: 105, SEQ ID NO: 107, SEQ ID NO: 109, SEQ ID NO: 111, SEQ ID NO: 113, SEQ ID NO: 115, SEQ ID NO: 117, SEQ ID NO: 119, SEQ ID NO: 121, SEQ ID NO: 123, SEQ ID NO: 125, SEQ ID NO: 127, SEQ ID NO: 129, SEQ ID NO: 131, and SEQ ID NO: 133; and
(c) a heavy chain CDR3 selected from the group of SEQ ID NO: 135, SEQ ID NO: 137, SEQ ID NO: 139, and SEQ ID NO: 141.

4. The antibody of any one of claims 1 to 3, wherein said antibody comprises a light chain variable region comprising
(a) a light chain CDR1 selected from the group of SEQ ID NO: 143, SEQ ID NO: 145, SEQ ID NO: 147, and SEQ ID NO: 149;
(b) a light chain CDR2 selected from the group of SEQ ID NO: 151, SEQ ID NO: 153, SEQ ID NO: 155, SEQ ID NO: 157, SEQ ID NO: 159, and SEQ ID NO: 161; and
(c) a light chain CDR3 selected from the group of SEQ ID NO: 163, SEQ ID NO: 165, SEQ ID NO: 167, SEQ ID NO: 169, SEQ ID NO: 171, SEQ ID NO: 173, SEQ ID NO: 175, and SEQ ID NO: 177.

5. The antibody of any one of claims 1 to 4, wherein said antibody comprises at least one heavy or light chain CDR which is not a CDR selected from the group of SEQ ID NO: 3, SEQ ID NO: 5, SEQ ID NO: 13, SEQ ID NO: 15, SEQ ID NO: 23, SEQ ID NO: 25, SEQ ID NO: 27, SEQ ID NO: 35, SEQ ID NO: 37, SEQ ID NO: 39, SEQ ID NO: 41, SEQ ID NO: 49, SEQ ID NO: 51, SEQ ID NO: 55, SEQ ID NO: 57, SEQ ID NO: 59, SEQ ID NO: 61, SEQ ID NO: 63, SEQ ID NO: 65, SEQ ID NO: 67, SEQ ID NO: 69, SEQ ID NO: 71, SEQ ID NO: 73, SEQ ID NO: 75, SEQ ID NO: 77, SEQ ID NO: 79, SEQ ID NO: 81, SEQ ID NO: 83, SEQ ID NO: 85, SEQ ID NO: 87, SEQ ID NO: 89, SEQ ID NO: 91, SEQ ID NO: 93, SEQ ID NO: 95, SEQ ID NO: 97, SEQ ID NO: 99, SEQ ID NO: 101, SEQ ID NO: 103, SEQ ID NO: 105, SEQ ID NO: 107, SEQ ID NO: 109, SEQ ID NO: 111, SEQ ID NO: 113, SEQ ID NO: 115, SEQ ID NO: 117, SEQ ID NO: 119, SEQ ID NO: 121, SEQ ID NO: 123, SEQ ID NO: 125, SEQ ID NO: 127, SEQ ID NO: 129, SEQ ID NO: 131, and SEQ ID NO: 133; and
(c) a heavy chain CDR3 selected from the group of SEQ ID NO: 135, SEQ ID NO: 137, SEQ ID NO: 139, and SEQ ID NO: 141.

8. The antibody of any one of claims 1 to 7, wherein said antibody comprises at least one heavy or light chain variable region which does not comprise an amino acid sequence selected from the group of SEQ ID NO: 193, SEQ ID NO: 195, SEQ ID NO: 197, SEQ ID NO: 199, SEQ ID NO: 201, SEQ ID NO: 203, SEQ ID NO: 205, SEQ ID NO: 207, SEQ ID NO: 209, SEQ ID NO: 211, SEQ ID NO: 213, SEQ ID NO: 215, SEQ ID NO: 217, SEQ ID NO: 219, SEQ ID NO: 221, SEQ ID NO: 223, SEQ ID NO: 225, SEQ ID NO: 227, SEQ ID NO: 229, SEQ ID NO: 231, SEQ ID NO: 233, SEQ ID NO: 235, SEQ ID NO: 237, SEQ ID NO: 239, SEQ ID NO: 241, SEQ ID NO: 243, SEQ ID NO: 245, SEQ ID NO: 247, SEQ ID NO: 249, SEQ ID NO: 251, SEQ ID NO: 253, and SEQ ID NO: 255.

9. The antibody of any one of claims 1 to 8, wherein said antibody comprises an Fc region or a region equivalent to the Fc region of an immunoglobulin.

10. The antibody of claim 9, wherein said Fc region is an IgG Fc region.

11. The antibody of any one of claims 1 to 10, wherein said antibody is a full-length IgG class antibody.
12. The antibody of any one of claims 1 to 11, wherein said antibody comprises a human
counter region.

13. The antibody of claim 1 to 12, wherein said antibody is a human antibody.

14. The antibody of any one of claims 1 to 13, wherein said antibody comprises a
glycoengineered Fc region.

15. The antibody of claim 14, wherein said antibody has an increased proportion of non-
fucosylated oligosaccharides in said Fc region, as compared to a non-glycoengineered
antibody.

16. The antibody of claims 14 or 15, wherein at least about 20% to about 100% of the N-linked
oligosaccharides in said Fc region are non-fucosylated.

17. The antibody of any one claims 14 to 16, wherein said antibody has an increased
proportion of bisected oligosaccharides in said Fc region, as compared to a non-
glycoengineered antibody.

18. The antibody of any one of claims 14 to 17, wherein at least about 20% to about 100% of
the N-linked oligosaccharides in said Fc region are bisected.

19. The antibody of any one of claims 14 to 18, wherein at least about 20% to about 50% of the
N-linked oligosaccharides in said Fc region are bisected, non-fucosylated.

20. The antibody of any one of claims 1 to 19, wherein said antibody has increased effector
function and/or increased Fc receptor binding affinity.

21. The antibody of claim 20, wherein said increased effector function is increased ADCC.

22. The antibody of any one of claims 1 to 21, wherein said antibody is affinity matured.

23. The antibody of any one of claims 1 to 22, wherein said antibody binds to FAP with a $K_d$
value lower than about 1 $\mu$M.

24. The antibody of any one of claims 1 to 23, wherein said antibody binds FAP in human
tissue.

25. The antibody of any one of claims 1 to 24, wherein said antibody shows no substantial
cross-reactivity for DPPIV/CD26.

26. The antibody of any one of claims 1 to 25, wherein said antibody does not induce
internalization of FAP upon binding to FAP expressed on the surface of a cell.
27. An isolated polynucleotide encoding a polypeptide that forms part of the antibody according to any one of claims 1 to 26.

28. An isolated polypeptide encoded by the polynucleotide of claim 27.

30. A vector comprising the polynucleotide of claim 27.

31. A host cell comprising the polynucleotide of claim 27, the composition of claim 29, or the vector of claim 30.

32. The host cell of claim 31, wherein said host cell has been manipulated to express increased levels of one or more polypeptides having GnTIII activity.

33. The host cell of claim 32, wherein said polypeptide having GnTIII activity is a fusion polypeptide comprising the catalytic domain of GnTIII and the Golgi localization domain of ManII.

34. The host cell of claim 32 or 33, wherein said host cell has been further manipulated to express increased levels of one or more polypeptides having ManII activity.

35. A method of producing an antibody that specifically binds to Fibroblast Activation Protein (FAP), said method comprising
a) culturing the host cell of claim 31 in a medium under conditions allowing the expression of the antibody, and
b) recovering the antibody.

36. A method of producing an antibody that specifically binds to Fibroblast Activation Protein (FAP), said method comprising
a) culturing the host cell of any one of claims 32 to 34 in a medium under conditions allowing the expression of the antibody and the modification of the oligosaccharides present on the Fc region of said antibody by said polypeptide having GnTIII activity, and
b) recovering the antibody

37. An antibody that specifically binds to FAP, wherein said antibody is produced by the method of claim 35 or 36.

38. An antibody conjugate comprising the antibody of any one of claims 1 to 26 and a cytotoxic agent.

39. A pharmaceutical formulation comprising the antibody of any one of claims 1 to 26 and a pharmaceutically acceptable carrier.

40. The pharmaceutical formulation of claim 39, further comprising an additional therapeutic agent.

41. The antibody of any one of claims 1 to 26 for use as a medicament.

42. The antibody of any one of claims 1 to 26 for the treatment of a disease characterized by expression of FAP.

43. The antibody of claim 42, wherein said disease is cancer.

44. The antibody of any one of claims 1 to 26 for use in inducing cell lysis of a tumor cell or a stromal cell of a tumor.

45. Use of the antibody of any one of claims 1 to 26 in the manufacture of a medicament.

46. Use of the antibody of any one of claims 1 to 26 for the manufacture of a medicament for treatment of a disease characterized by expression of FAP.

47. The use of claim 46, wherein said disease is cancer.

48. Use of the antibody of any one of claims 1 to 26 for the manufacture of a medicament for inducing lysis of a tumor cell or a stromal cell of a tumor.
49. A method of treating an individual having a disease characterized by FAP expression, comprising administering to the individual an effective amount of the antibody of any one of claims 1 to 26, or the pharmaceutical formulation of claim 39 or 40.

50. The method of claim 49 further comprising administering an additional therapeutic agent to the individual.

51. The method of claim 49 or 50, wherein said disease is cancer.

52. A method of inducing cell lysis of a tumor cell or a stromal cell of a tumor, said method comprising contacting said tumor cell or stromal cell with the antibody of any one of claims 1 to 26.

53. The method of claim 52, wherein said cell lysis is induced by antibody dependent cytotoxicity of the antibody.

54. A method of diagnosing disease in an individual, said method comprising administering to the individual an effective amount of a diagnostic agent, wherein said diagnostic agent comprises the antibody of any one of claims 1 to 26 and a label that allows detection of a complex of said diagnostic agent and FAP.

55. The invention as described hereinbefore.
