Background of the invention

Protein phosphorylation catalyzed by protein kinases is one of the most common modes of regulation of protein function. By adding phosphate groups to substrate proteins, protein kinases alter the activity, localization and overall function of many proteins and influence almost all cellular processes. At least 30% of the human proteome is estimated to be phosphorylated by protein kinases. Protein phosphorylation is particularly prominent in signal transduction. Protein kinases are implicated in a variety of diseases including inflammation, cancer, neurodegenerative disorders, diabetes, infectious diseases, and so on. The human genome is estimated to encode 518 protein kinases. Based on the residue they phosphorylate, protein kinases are classified into 2 major groups: 1) protein tyrosine kinases or PTKs (~ 90 members) and 2) protein serine/threonine kinases (~378 members). The rest are 'atypical' kinases. The kinase domain of all typical protein kinases is highly conserved and consists of two lobes (N-lobe and C-lobe) that surround the nucleotide binding site.

Among the PTKs, a small subfamily known as Janus family kinases (JAKs) consists of four members namely JAK1, JAK2, JAK3, and Tyk2. They are cytoplasmic protein tyrosine kinases that play essential and specific roles in immune cell development and function by participating in the cytokine receptor signal transduction. Binding of cytokines activates the JAKs which in turn phosphorylate and activate a set of transcription factors known as STAT (signal transducers and activators of transcription) proteins. The STAT proteins form homo- or heterodimers and translocate to the nucleus where they induce transcription of genes. The central role of the JAK/STAT pathways in relaying the signals from many cytokine receptors, and the involvement of several cytokines in a range of pathologies such as diseases of the immune system and cancer, makes them attractive targets for drug discovery.

Among the JAKs, JAK3 has particularly selective functions. Unlike the other members of the JAK family, which show wide tissue distribution, JAK3 expression is restricted to the cells of hematopoietic lineage. Unlike the other members of the JAK family which associate with multiple cytokine receptors, JAK3 associates uniquely with yc-chain, the common signaling subunit of receptor complexes for six cytokines namely interleukin
(IL)-2, IL-4, IL-7, IL-9, IL-15 and IL-21. These ILs play a pivotal role in the lymphoid
development and function. JAK3 is inducible in T and B cells and expressed at high levels in
NK cells and normally in thymocytes, platelets, mast cells. JAK3, through its association
with the IL-2 receptor, is critical for lymphocyte survival, differentiation, and function. In
humans, mutations in either JAK3 or yc-chain are associated with rare and inherited disorder
known as severe combined immunodeficiency (SCID) indicating their critical role in the
development and function of lymphocytes. These patients do not have deficits outside the
immune system and hematopoietic stem cell transplants are curative, suggesting very discrete
functions for JAK3.

The SCID phenotype was also observed in JAK3 knockout mice. JAK3 deficiency in
humans results in the lack of T cells and NK cell development; B cells are present but their
function is not normal. Unlike humans, JAK3 knockout mice show the lack of B cells and
have relatively small numbers of T cells. The reason for this difference in the role of JAK3
in B cell development between mice and humans is not clear but it could be due to species-
specific cytokine usage. However, similar to humans, JAK3 knockout mice did not display
any effect on the development of myeloid or erythroid cells confirming the restriction of
JAK3 function to lymphocyte development.

Though initially it was believed that the primary function of JAK3 is regulation of
function of T and B cells through cytokine dependent pathway, recent studies using JAK3
knockout mice and JAK3 specific inhibitors suggest that JAK3 can transduce signals in non-
cytokine-dependent manner in mast cells and that JAK3 plays a key role in mast cell
mediated inflammatory responses. The enzymatic activity of JAK3 is increased by IgE
receptor cross-linking in mast cells.

Other JAK family members Tyk2, JAK1 and JAK2 have functions within and outside
immune cells. Mutations of Tyk2 cause autosomal recessive hyperIgE syndrome and JAK2
gain-of-function mutations (V617F) underlie a subset of disorders collectively referred to as
myeloproliferative diseases. In some contexts, both JAK1 and JAK3 play dual and equal
roles in receptor phosphorylation events indicating potential synergistic effects due to
suppressing both JAK3 and JAK1 signaling.

JAK family members have been implicated in additional conditions including
mutations in JAK2 have been identified. This indicates that inhibitors of JAK in particular
JAK2 may also be of use in the treatment of myeloproliferative disorders. Additionally, the
JAK family, in particular JAK1, JAK2 and JAK3, has been linked to cancers, in particular

JAK1 is a novel target in the immuno-inflammatory disease area. JAK1 heterodimerizes with the other JAKs to transduce cytokine-driven pro-inflammatory signaling. Therefore, inhibition of JAK1 and/or other JAKs is expected to be of therapeutic benefit for a range of inflammatory conditions as well as for other diseases driven by JAK-mediated signal transduction.

Vandeghinste et al. (WO 2005/124342) discovered JAK1 as a target whose inhibition might have therapeutic relevance for several diseases including OA. Knockout of the JAK1 gene in mice demonstrated that JAK1 plays essential and non-redundant roles during development: JAK1-/− mice died within 24h after birth and lymphocyte development was severely impaired. Moreover, JAK1-/− cells were not, or less, reactive to cytokines that use class II cytokine receptors, cytokine receptors that use the gamma-c subunit for signaling and the family of cytokine receptors that use the gpl30 subunit for signaling (Rodig et al, 1998). [0011] Various groups have implicated JAK-STAT signaling in chondrocyte biology. Li et al

JAK1 was initially identified in a screen for novel kinases (Wilks A. F., 1989, Proc. Natl. Acad. Sci. U.S.A. 86:1603-1607). Genetic and biochemical studies have shown that JAK1 is functionally and physically associated with the type I interferon (e.g., IFNalpha), type II interferon (e.g., IFNgamma), IL-2 and IL-6 cytokine receptor complexes (Kisseleeva et al, 2002, gene 285:1-24; Levy et al., 2005, Nat. Rev. Mol. Cell. Biol. 3:651-662; O'Shea et al., 2002, Cell, 109 (suppl.): S121-S131). JAK1 knockout mice die perinatally due to defects in LIF receptor signaling (Kisseleeva et al., 2002, gene 285:1-24; O'Shea et al., 2002, Cell, 109 (suppl.): S121-S131). Characterization of tissues derived from JAK1 knockout mice demonstrated critical roles for this kinase in the IFN, IL-10, IL-2/IL-4, and IL-6 pathways. A humanized monoclonal antibody targeting the IL-6 pathway (Tocilizumab) was recently approved by the European Commission for the treatment of moderate-to-severe rheumatoid arthritis (Scheinecker et al., 2009, Nat. Rev. Drug Discov. 8:273-274).
TYK2 is a potential target for immuno-inflammatory diseases, being validated by human genetics and mouse knock-out studies (Levy D. and Loomis C. (2007)).

TYK2 associates with the type I interferon (e.g., IFNa/β), IL-6, IL-10, IL-12 and IL-23 cytokine receptor complexes (Kisseleva et al., 2002, gene 285:1-24; Watford, W. T. & O'Shea, J. J., 2006, Immunity 25:695-697). Consistent with this, primary cells derived from a TYK2 deficient human are defective in type I interferon, IL-6, IL-10, IL-12 and IL-23 signaling. A fully human monoclonal antibody targeting the shared p40 subunit of the IL-12 and 11-23 cytokines (Ustekinumab) was recently approved by the European Commission for the treatment of moderate-to-severe plaque psoriasis (Krueger et al., 2007, N. Engl. J. Med. 356:580-92; Reich et al., 2009, Nat. Rev. Drug Discov. 8:355-356). In addition, an antibody targeting the IL-12 and IL-23 pathways underwent clinical trials for treating Crohn's Disease (Mannon et al., 2004, N. Engl. J. Med. 351:2069-79).

The role of TYK2 in the biological response to cytokines was first characterized using a mutant human cell line that was resistant to the effects of Type I interferons (IFNs) and the demonstration that IFNa responsiveness could be restored by genetic complementation of TYK2 (Velazquez et al., 1992. Cell 70, 313-322). Further in vitro studies implicated TYK2 in the signaling pathways of multiple other cytokines involved in both innate and adaptive immunity. Analysis of TYK-2 -/- mice however revealed less profound immunological defects than were anticipated (Karaghiosoff et al., 2000. Immunity 13, 549-560; Shimoda et al, 2000. Immunity 13, 561-671). Surprisingly, TYK2 deficient mice display merely reduced responsiveness to IFNa/β and signal normally to interleukin 6 (IL-6) and interleukin 10 (IL-10), both of which activate TYK2 in vitro. In contrast, TYK2 was shown to be essential for IL-12 signaling with the absence of TYK2 resulting in defective STAT4 activation and the failure of T cells from these mice to differentiate into IFNy-producing Th1 cells. Consistent with the involvement of TYK2 in mediating the biological effects of Type I IFNs and IL-12, TYK2/- mice were more susceptible to viral and bacterial infections.

In aggregate, because of its restricted distribution and function within the hematopoietic cells, JAK3 has been viewed as an attractive therapeutic target for the development novel class of immunosuppressive drugs. JAK3 inhibitors would be useful in treating many autoimmune and inflammatory diseases such as, but not limited to rheumatoid arthritis, psoriasis, psoriatic arthritis, transplantation rejection, graft-versus-host disease, multiple sclerosis, inflammatory bowel disease, systemic lupus erythematosus, allergic diseases and asthma, and type 1 diabetes. Since JAK3-SCID patients do not exhibit pathology outside the immune system, in principle, a selective JAK3 inhibitor should have very limited and specific effects. Many of the currently used immunosuppressive drugs such as anti-metabolites, corticosteroids, and the inhibitors of calcineurin and mTOR target widely expressed molecules and hence are associated with adverse effects causing morbidity and mortality as the treatment is chronic. Similarly biologic anti-inflammatory agents such as TNF-alpha blockers are also associated with adverse events such as increase in the rate of serious infections, including tuberculosis and other opportunistic infections, injection site/infusion-related reactions, increased risk of lymphoma, the development of autoantibodies and a higher rate of congestive heart failure (CHF) in patients who already are known to have an increased risk of CHF. As a result, potent and selective JAK3 inhibitors are expected to have significant advantages over current regimens.

The compounds of the present invention may have the ability to crystallize in more than one form, a Characteristic known as polymorphism, and all such polymorphic forms ("polymorphs") are encompassed within the scope of the invention. Polymorphism generally can occur as a response to changes in temperature or pressure or both, and can also result from variations in the crystallization process. Polymorphs can be distinguished by various
physical characteristics, and typically the x-ray diffraction patterns, solubility behavior, and melting point of the compound are used to distinguish polymorphs.

The compounds described herein may contain one or more chiral centers and/or double bonds and therefore, may exist as stereoisomers, such as double-bond isomers (i.e., geometric isomers), regioisomers, enantiomers or diastereomers. Accordingly, the chemical structures depicted herein encompass all possible enantiomers and stereoisomers of the illustrated or identified compounds including the stereoisomerically pure form (e.g., geometrically pure, enantiomerically pure or diastereomerically pure) and enantiomeric and stereoisomeric mixtures. Enantiomeric and stereoisomeric mixtures can be resolved into their component enantiomers or stereoisomers using separation techniques or chiral synthesis techniques well known to the person skilled in the art. The compounds may also exist in several tautomeric forms including the enol form, the keto form and mixtures thereof. Accordingly, the chemical structures depicted herein encompass all possible tautomeric forms of the illustrated or identified compounds.

Compounds may exist in unsolvated forms as well as solvated forms, including hydrated forms and as N-oxides. In general, compounds may be hydrated, solvated or N-Oxides. Certain compounds may exist in multiple crystalline or amorphous forms. Also contemplated within the scope of the invention are congeners, analogs, hydrolysis products, metabolites and precursor or prodrugs of the compound. In general, unless otherwise indicated, all physical forms are equivalent for the uses contemplated herein and are intended to be within the scope of the present invention.

"Prodrug" refers to a derivative of a drug molecule as, for example, esters, carbonates, carbamates, ureas, amides or phosphates that requires a transformation within the body to release the active drug. Prodrugs are frequently, although not necessarily, pharmacologically inactive until converted to the parent drug. Prodrugs may be obtained by bonding a promoiety (defined herein) typically via a functional group, to a drug.

"Promoiety" refers to a group bonded to a drug, typically to a functional group of the drug, via bond(s) that are cleavable under specified conditions of use. The bond(s) between the drug and promoiety may be cleaved by enzymatic or non-enzymatic means. Under the conditions of use, for example following administration to a patient, the bond(s) between the drug and promoiety may be cleaved to release the parent drug. The cleavage of the promoiety may proceed spontaneously, such as via a hydrolysis reaction, or it may be catalyzed or induced by another agent, such as by an enzyme, by light, by acid, or by a change of or exposure to a physical or environmental parameter, such as a change of temperature, pH, etc.
The agent may be endogenous to the conditions of use, such as an enzyme present in the systemic circulation to which the prodrug is administered or the acidic conditions of the stomach or the agent may be supplied exogenously.

"Pharmaceutically acceptable salt" embraces salts with a pharmaceutically acceptable acid or base. Pharmaceutically acceptable acids include both inorganic acids, for example hydrochloric, sulphuric, phosphoric, diphosphoric, hydrobromic, hydroiodic and nitric acid and organic acids, for example citric, fumaric, maleic, malic, mandelic, ascorbic, oxalic, succinic, tartaric, benzoic, acetic, methanesulphonic, ethanesulphonic, benzenesulphonic or p-toluenesulphonic acid. Suitable pharmaceutical excipients include starch, glucose, lactose, sucrose, gelatin, malt, rice, flour, chalk, silica gel, sodium stearate, glycerol monostearate, talc, sodium chloride, dried skim milk, glycerol, propylene, glycol, water, ethanol and the like. The composition, if desired, can also contain minor amounts of wetting or emulsifying agents, or pH buffering agents. These compositions can take the form of solutions, suspensions, emulsions, tablets, pills, capsules, powders, sustained-release formulations and the like. The composition can be formulated as a suppository, with traditional binders and carriers such as triglycerides. Oral formulation can include standard carriers such as pharmaceutical grades of mannitol, lactose, starch, magnesium stearate, sodium saccharine, cellulose, magnesium carbonate, etc. Examples of suitable pharmaceutical carriers are described in "Remington's Pharmaceutical Sciences" by E.W. Martin. Such compositions will contain a therapeutically effective amount of the therapeutic, preferably in purified form, together with a suitable amount of carrier so as to provide the form for proper administration to the patient. The formulation should suit the mode of administration.

"drug or pharmaceutically active agent" includes a drug or pharmaceutical agent that will elicit the biological or medical response of a tissue, system, animal or human that is being sought, for instance, by a researcher or clinician.

"Combined" or "in combination" or "combination" should be understood as a functional coadministration, wherein some or all compounds may be administered separately, in different formulations, different modes of administration (for example subcutaneous, intravenous or oral) and different times of administration. The individual compounds of such combinations may be administered either sequentially in separate pharmaceutical compositions as well as simultaneously in combined pharmaceutical compositions.

"Therapeutically effective amount" is an amount of a compound of Formula (I)/ (la) or a combination of two or more such compounds, which inhibits, totally or partially, the progression of the condition or alleviates, at least partially, one or more symptoms of the condition. A therapeutically effective amount can also be an amount which is prophylactically effective. The amount which is therapeutically effective will depend upon
the patient's size and gender, the condition to be treated, the severity of the condition and the result sought. For a given patient, a therapeutically effective amount can be determined by methods known to those of skill in the art.

The present invention provides compounds of formula (I), their tautomers, polymorphs, stereoisomers, prodrugs, solvates, co-crystals, pharmaceutically acceptable salts, pharmaceutical compositions containing them and methods of treating conditions and diseases that are mediated by JAK activity,

Above mentioned conditions, for the respective functional group transformations, are only to illustrated the type of synthesis. More specific conditions for above transformations are well documented and referred in the literature (R. C. Larock in Comprehensive Organic Transformations, Wiley-VCH Publication; B. M. Trost and I. Fleming Ed. Comprehensive Organic Synthesis, Elsevier Publication)

In the reactions described in the schemes herein above, any reactive group present, such as hydroxyl, amino, carbonyl, imino and the like, may be protected during the reaction by conventional protecting groups such as trimethylsilyl, ter-butyldimethylsilyl, benzyl, acetal, ketal and the like, which are cleaved again after the reaction.

These co-crystals may be prepared from compounds of Formula (I) or (Ia) by known co-crystal forming procedures. Such procedures include grinding, heating, co-subliming, co-melting, or contacting in solution compounds of formula I with the co-crystal former under crystallization conditions and isolating co-crystals thereby formed.

Besides those representative dosage forms described above, pharmaceutically acceptable excipients and carriers are generally known to those skilled in the art and are thus included in the instant invention. Such excipients and carriers are described, for example, in "Remington's Pharmaceutical Sciences" Mack Pub. Co., New Jersey (1991).

The formulations of the invention can be designed for to be short-acting, fast-releasing, long-acting, and sustained-releasing. Thus, the pharmaceutical formulations can also be formulated for controlled release or for slow release.

The pharmaceutical compositions of the present disclosure can also comprise, for example, micelles or liposomes, or some other encapsulated form, or can be administered in an extended release form to provide a prolonged storage and/or delivery effect. Therefore, the pharmaceutical formulations can be compressed into pellets or cylinders and implanted intramuscularly or subcutaneously as depot injections or as implants such as stents. Such implants can employ known materials such as silicones and biodegradable polymers.

The pharmaceutical compositions may contain, for example, from about 0.1% by weight, to about 90% or more by weight, of the active material, depending on the method of administration. Where the compositions comprise dosage units, each unit can contain, for example, from about 0.1 to 500 mg or more of the active ingredient. The dosage as employed for adult human treatment can range, for example, from about 0.1 to 1000 mg per day, depending on the route and frequency of administration.

Specific dosages can be adjusted depending on conditions of the JAK related condition, the age, body weight, general health conditions, sex, and diet of the subject, dose intervals, administration routes, excretion rate, and combinations of drugs. The JAK associated condition can be related to JAK1, JAK2, JAK3, and/or Tyk2. Suitable non-human subjects that can be treated include domestic or wild animals, companion animals, such as dogs, cats and the like; livestock, including horses, cows and other ruminants, pigs, poultry, rabbits and the like; primates, for example monkeys, such as macaques including rhesus monkeys and cynomolgus monkeys, marmosets, tamarins and the like, apes, including chimpanzees and orangutans; and rodents, such as rats, mice, gerbils, guinea pigs and the like.

In one embodiment, the compound is administered in a pharmaceutically acceptable form, optionally in a pharmaceutically acceptable carrier.

JAK3 in particular has been implicated in a variety of biological processes. For example, the proliferation and survival of murine mast cells induced by IL-4 and IL-9 have been shown to be dependent on JAK3 and gamma chain-signaling. Suzuki et al., (2000), Blood 96:2172-2180. JAK3 also plays a crucial role in IgE receptor-mediated mast cell degranulation responses (Malaviya et al., (1999), Biochem. Biophys. Res. Commun. 257:807-813), and inhibition of JAK3 kinase has been shown to prevent type I hypersensitivity reactions, including anaphylaxis (Malaviya et al., (1999), J. Biol. Chem. 274:27028-27038). JAK3 inhibition has also been shown to result in immune suppression for allograft rejection (Kirken, (2001 ), Transpl. Proc. 33:3268-3270). JAK3 kinases have also been implicated in the mechanism involved in early and late stages of rheumatoid arthritis (Muller-Ladner et al., (2000), J. Immunul. 164:3894-3901 ); familial amyotrophic lateral sclerosis (Trieu et al., (2000), Biochem Biophys. Res. Commun. 267:22-25); leukemia (Sudbeck et al., (1999), Clin. Cancer Res. 5:1569-1582); mycosis fungoides, a form of T-cell lymphoma (Nielsen et al., (1997), Prac. Natl. Acad. Sci. USA 94:6764-6769); and abnormal cell growth (Yu et al., (1997), J. Immunol. 159:5206-5210; Catlett-Falcone et al., (1999), Immunity 10:105-1 15).
The JAK kinases, including JAK3, are abundantly expressed in primary leukemic cells from children with acute lymphoblastic leukemia, the most common form of childhood cancer, and studies have correlated STAT activation in certain cells with signals regulating apoptosis. (Demoulin et al., (1996), Mol. Cell. Biol. 16:4710-6; Jurlander et al., (1997), Blood 89:4146-52; Kaneko et al., (1997), Clin. Exp. Immun. 109:185-193; and Nakamura et al., (1996), J. Biol. Chem. 271:19483-8). They are also known to be important to lymphocyte differentiation, function and survival. JAK-3 in particular plays an essential role in the function of lymphocytes, macrophages, and mast cells. Given the importance of this JAK kinase, compounds which modulate the JAK pathway, including those selective for JAK3, can be useful for treating conditions where the function of lymphocytes, macrophages, or mast cells is involved (Kudlac et al., (2004) Am. J. Transplant 4:51-57; Changelian (2003) Science 302:875-878).

Conditions in which targeting of the JAK pathway or modulation of the JAK kinases, are contemplated to be therapeutically useful include, arthritis, asthma, autoimmune diseases, cancers or tumors, diabetes, certain eye diseases, disorders or conditions, inflammation, intestinal inflammations, allergies or conditions, neurodegenerative diseases, psoriasis, transplant rejection, and viral infection.

![Chemical Reaction Diagram]

**Step 1: 3-iodo-5-nitro-pyridin-2-amine (2)**
To a solution of compound 1 (50 g, 359.71 mmol) in H₂SO₄ (2 M, 750 mL) potassium periodate (30.79 g, 143.88 mmol) was added portion-wise at room temperature. Preparation 15: ethyl (lE)-N-cyano-2-methyl-propanimidate (68)
Step 1: ethyl 2-methylpropanimidate hydrochloride (67)
Isobutyronitrile (66) (6.49 mL, 0.072 mol) was taken in dry ether (10 mL) and cooled in an ice-water bath. To this was added ethanol (5.06 mL, 0.086 mol). The resultant solution was stirred for 15 min followed by gradual addition of hydrochloric acid (4.0M in dioxane, 0.144 mol). The reaction was allowed to warm up to room temperature and stirred overnight at room temperature. The reaction mass was then concentrated to a crude residue which upon ether trituration afforded a white solid. The solid was filtered and washed with cold ether to give 6.1 g of desired product. 1HNMR (400MHz, DMSO-\textit{d6}): \( \delta \) 12.06 (br s, 1H), 1.26 (br s, 1H), 4.43 (q, \( J = 6.8 \) Hz, 2H), 2.99 (sept, \( J = 7.1 \) Hz, 1H), 1.33 (t, \( J = 7.0 \) Hz, 3H), 1.16 (d, \( J = 6.8 \) Hz, 6H).

Step 2: ethyl (\textit{IE})-N-cyano-2-methyl-propanimidate (68)
Compound 67 (2.0 g, 0.0132 mol) was taken in dry ethanol (5 mL) followed by addition of cyanamide (0.56g, 0.0132 mol). The reaction mixture was stirred at room temperature. After 3 h, additional cyanamide (0.220 g, 5 mmol) was added. The solid ammonium chloride was filtered and the filtrate evaporated to give oil. This was diluted with dichloromethane and washed with brine. The organic layer was dried over sodium sulphate and concentrated under vacuum to afford the desired product (0.92 g) as oil. 1HNMR (400MHz, DMSO-\textit{d6}): \( \delta \) 4.26 (q, \( J = 6.8 \) Hz, 2H), 3.12 (sept, \( J = 6.8 \) Hz, 1H), 1.27 (t, \( J = 7.2 \) Hz, 3H), 1.18 (d, \( J = 6.8 \) Hz, 6H).

Preparation 16: ethyl (\textit{IE})-N-cyano-3,3,3-trifluoro-propanimidate (71)
The preparation of compound 71 was carried out in a manner similar to that described for the preparation of compound 68. 1H NMR (400 MHz, DMSO-\textit{d6}): 4.38 (q, \( J = 7.1 \) Hz, 2H), 4.07(q, \( J = 10.5 \) Hz, 2H), 1.29 (t, \( J = 7.1 \) Hz, 3H).
Preparation 17: Amide surrogates (72)

Compound 68 or compound 71 (0.24 mmol) was taken in dry MeOH (1 mL), followed by the addition of 42 (0.198 mmol) and triethylamine (0.055 mL, 0.39 mmol). The reaction mixture was then stirred at room temperature under an inert atmosphere overnight. Additional 68 or 71 accordingly (0.24 mmol) was added and the reaction stirred at room temperature for another 4 h. The reaction was then concentrated and residue purified by preparative TLC to afford 72.

The compounds in Table 2 were synthesized according to the above general method.

Amine S36 (B): trans N-cyclopropyl-6-methyl-piperidine-3-carboxamide (119)
Step 1: benzyl 5-acetyl-2-methyl-piperidine-l-carboxylate (I 11)

A solution of compound 110 (2.5 g, 16.53 mmol) in CH$_3$OH (50 mL) and conc. HCl (1.25 mL) was added to a slurry of platinum(IV) oxide (0.2 g) in 10 mL of CH$_3$OH/water (4/1) in a Parr bottle. The mixture was hydrogenated at room temperature under 60 psi of hydrogen gas for 7 h. The mixture was then filtered through celite. The filtrate was concentrated in vacuo, after chasing with 100 mL of toluene, to about 2.5 g of syrup. This residue was dissolved in CH$_2$Cl$_2$ (30 mL) and chilled in an ice bath. To this stirred solution was added DMAP (0.194 g, 1.59 mmol), followed by TEA (6.64 mL, 47.7 mmol) portion wise. A suspension formed when TEA was added. This mixture was chilled to 15 °C. To the resulting suspension was added benzyl chloroformate (2.72 mL, 19 mmol) dropwise over a 15 min period such that the temperature of the mixture was kept at 15-20 °C. After completion of benzyl chloroformate addition, the mixture was stirred chilled with an ice bath for another 30 min and then at ambient temperature for 1 h. This mixture was washed with 100 mL of cold 1N HCl. The organic was concentrated in vacuo. The residue was partitioned between toluene (100 mL), MTBE (100 mL), and water (50 mL). The organic was washed with brine, dried over MgSO$_4$, filtered, and concentrated in vacuo to give an oil (2.5 g) as the crude (NMR showed 3:1 cis/trans ratio of isomers). Isomer was separated by silica gel column chromatography.

\[ ^1H\text{NMR} \ (400 \text{ MHz, CDCl}_3): \delta \ 0.22-0.40 \ (m, 2H), 0.62-0.72 \ (m, 2H), 1.20 \ (m, 3H), 1.32-1.40 \ (m, 1H), 1.65-1.75 \ (m, 1H), 1.82-1.95 \ (m, 1H), 2.10-2.22 \ (m, 1H), 2.46-2.52 \ (m, 1H), 2.66-2.75 \ (m, 1H), 3.12-3.20 \ (dd, J = 15.2, 3.6, 1H), 4.16(d, J = 15.2 Hz, 1H), 4.32-4.42 \ (m, 1H), 5.16 \ (dd, J = 25.6, 12.4 Hz, 2H), 6.84 \ (br s, 1H), 7.32-7.45 \ (m, 5H). \]

**Step 8: C5-N-cyclopropyl-6-methyl-piperidine-3-carboxamide (118)**

A stirred solution of compound 116 (1.7 g, 5.37 mmol) in methanol (30 mL) was purged under vacuum/argon cycles to replace air inside the flask with argon gas by a suction adapter (fitted with a balloon) then added 10% palladium on charcoal (170 mg), the reaction mixture was purged under vacuum/H\(_2\) cycles to replace air inside the flask with hydrogen gas by a suction adapter (fitted with a bladder) and continued stirring at room temperature for 4h. The reaction mixture was filtered through a celite pad, washed with 10% methanol in DCM, and concentrated the solvent under reduced pressure to afford off white solid 0.9 g (92%). Then next step was performed without purification.

\[ ^1H\text{NMR} \ (400 \text{ MHz, DMSO} \ d_6): \delta \ 0.33-0.40 \ (m, 2H), 0.55-0.65 \ (m, 2H), 0.95 \ (d, J = 6.4 \text{ Hz, 3H}), 1.11-1.18 \ (m, 1H), 1.35-1.60 \ (m, 2H), 1.79-1.84 \ (m, 1H), 2.08-2.22 \ (m, 2H), 2.56-2.65 \ (m, 3H), 2.98-3.05 \ (m, 1H), 8.31 \ (br s, 1H). \]

**Step 9: 7ra<£-N-cyclopropyl-6-methyl-piperidine-3-carboxamide (119)**

The preparation of compound 119 was carried out in a manner similar to that described for the preparation of compound 118.

\[ ^1H\text{NMR} \ (400 \text{ MHz, DMSO} \ d_6): \delta \ 0.30-0.40 \ (m, 2H), 0.50-0.60 \ (m, 2H), 0.90-1.00 \ (m, 4H), 1.38-1.60 \ (m, 2H), 1.64-1.74 \ (m, 1H), 1.82 \ (br s, 1H), 1.98-2.08 \ (m, 1H), 2.35-2.50 \ (m, 2H), 2.54-2.62 \ (m, 1H), 2.85-2.92 \ (m, 1H), 7.77 \ (br s, 1H). \]

The compounds in Table 7 were synthesized according to the above general method D

Preparation 29: l-(3H-pyrrolo [3, 2-f] [1, 7] naphthyridin-9-yl) piperidin-3-ol (121)

(Alternate process for Example 54)

Step I: 3H-pyrrolo [3, 2-f] [1, 7] naphthyridin-9-yl trifluoromethanesulfonate (120)

To a suspension of compound 10 (0.12 gm, 0.65 mmol) in pyridine (2 ml), trifluoromethanesulfonic anhydride (0.9 gm, 3.25 mmol) was added at 0°C and the reaction mixture was stirred at room temperature overnight. Water was added into the reaction mixture when a light brown solid separated out. It was filtered and dried to obtain compound 120 (52 mg, 25%) as a brown solid.

Step II: l-(3H-pyrrolo [3, 2-f] [1, 7] naphthyridin-9-yl) piperidin-3-ol (121)

To a suspension of compound 120 (50 mg, 0.16 mmol) in N-methyl pyrrolidinone (2 ml), 3-hydroxy piperidine (160 mg, 1.6 mmol) was added and the reaction mixture was heated at 150°C overnight. Water was added to the reaction mixture. It was further extracted with ethyl acetate, the organic layer was concentrated to obtain a residue which was purified by preparative HPLC to obtain compound 121 (3.3 mg) as a white solid.

**Biological activity**

**Materials**

Recombinant JAK1 (Amino acids 850-1154; NM_002227.2), JAK2 (Amino acids 808-1132; NM_004972.3) and JAK3 (Amino acids 781-1124; NM_000215.3) used in the studies were expressed using Invitrogen's Bac-to-Bac baculovirus expression system according to manufacturer's instructions. Adenosine 5'-triphosphate was obtained from Sigma Aldrich chemicals (Cat # A7699). Poly Glu-Tyr (4:1) sodium salt was obtained from Sigma Aldrich (Cat # P0275). Kinase Glo® Luminescent Kinase assay kit was obtained from Promega (Cat # V6713)

**Methods**

Kinase activity was assessed by Promega Kinase-Glo® Luminescent Kinase Assay kit using 200µg/ml Poly Glu-Tyr (4:1) as substrate and ATP at 1µM concentration. The reactions were carried out in 384 well plates in total reaction volume of 20µL. Reaction mixtures contained 50mM HEPES pH 7.4, 5mM MgCl2, 1mM DTT, 0.01% BSA, 0.01% Tween 20. Kinase was pre-incubated with compounds or 1% DMSO for 5min before addition of substrate and ATP to check for inhibition. Kinase reactions were carried out at room temperature for 90 min. The reactions were stopped by adding 5µl of Kinase Glo® reagent & 10µl of reaction mixture followed by measuring luminescence. The luminescent signal is correlated with the amount of ATP present at the end of kinase reaction and is inversely correlated with the amount of kinase activity.

For each data point, % inhibition is calculated based on uninhibited reaction (without compound) which is considered as 100% activity over no enzyme or substrate controls.

Dose response data is then fit using a four parameter logistic equation using Graph-pad Prism 5 software to determine inhibition constant 50 (IC50).

Using the above protocol the following results are generated:
