The resulting residues were subjected to a silica gel column chromatography to give 2-methyl-3-f luoro-6- (4-methyl-5-oxo-4,5-dihydrorytrazole-1-yl) -benzoic acid methyl ester 2.8 g.

[0857] Reference Preparation example 91

Under ice-cooling, to a mixture of 2-methyl-3-fluoro-6-(4-methyl-5-oxo-4,5-dihydrotetrazole-1-yl)-benzoic acid methyl ester (described in Reference preparation example 90) 2.8 g and tetrahydrofuran 46 mL was added a 1.0 M solution of lithium triethylborohydride in tetrahydrofuran 22.9 mL and the mixtures were stirred at room temperature for one hour. To the reactions solutions was added water, and the mixtures were acidified with 10% hydrochloric acid and were extracted with ethyl acetate. The organic layers were washed with water and saturated saline and were dried over anhydrous magnesium sulfate, and were then concentrated under reduced pressure to give 1-(2-hydroxymethyl-3-methyl-4-fluorophenyl)-4-methyl-1,4-dihydrotetrazole-5-one 2.4 g.

Reference Preparation example 92

To a mixture of 1-(2-hydroxymethyl-3-methyl-4-fluorophenyl)-4-methyl-1,4-dihydrotetrazole-5-one (described in Reference preparation example 91) 2.4 g and chloroform 34 mL was added phosphorus tribromide 5.5 g and the mixtures were stirred at room temperature for twenty hours. To the reaction solutions was added ice water and the mixtures were extracted with ethyl acetate. The organic layers were washed with water and saturated saline and were dried over anhydrous magnesium sulfate, and were then concentrated under reduced pressure. The resulting residues were subjected to a silica gel column chromatography to give 1-(2-bromomethyl-3-methyl-4-fluorophenyl)-4-methyl-1,4-dihydrotetrazole-5-one 2.5 g.

Test example 31

The testing drug solutions to be used in this Test example were prepared by diluting the formulations prepared according to the above-mentioned Formulation examples with an ion-exchange water so that the active ingredient concentration was set to 500 ppm.
Cucumber (Sagami-hanjiro-fushinari) was grown in a polyethylene cup until the first true leaf was developed. Thirty (30) heads of cotton aphid (Aphis gossypii) (including the adults and the larvae) was released onto the leaves of the cabbage and next day, the above-mentioned testing drug solutions 20 mL were spread. After 6 days, the number of the surviving insects was counted and the control value was calculated by the following equation.

Control value (%) = \{1 - (Cb \cdot Tai) / (CaixTb) \} \times 100

wherein the symbols in the formula represent the following descriptions.

Cb: Number of the insects before treatment in untreated area;

Ca: Number of the insects at the time of the observation in untreated area;

Tb: Number of the insects before treatment in treated area;

Tai: Number of the insects at the time of the observation in treated area;

As a result, the present Compounds 18, 39 47 and 96 showed 90% or more as the control value.

Test example 32

The testing drug solutions to be used in this Test example were prepared by diluting the formulations prepared
according to the above-mentioned Formulation examples with an ion-exchange water so that the active ingredient concentration was set to 500 ppm. The above-mentioned drug solutions 0.7 mL were added to an ion-exchange water 100 mL so that the active ingredient concentration was set to 3.5 ppm. Twenty (20) last instar larvae of common house mosquito (Culex pipiens pallens) were released into the solutions and after 8 day, the number of the dead insects was counted.

The mortality of insects was calculated by the following equation.

\[
\text{Mortality of insects (\%)} = \frac{\text{Number of dead insects}}{\text{Number of tested insects}} \times 100
\]

As a result, the present Compounds 38, 64 and 86 showed 100% as the mortality of insects.

After the drug solutions were dried, to a polyethylene cup (diameter 5.5 cm) covered with a filter paper on the bottom, the cabbage cut out from the root was installed and five heads of cabbage moth (*Plutella xylostella*) at the three instar larval stages were released into the cup and the cup was covered with the lid. The cup was held at 25°C and after 5 days, the number of the surviving insects was counted and the mortality of insects was calculated by the following equation.

\[
\text{Mortality of insects (\%) } = \left( \frac{\text{Number of dead insects}}{\text{Number of tested insects}} \right) \times 100
\]

As a result, the experiments treated with the present compounds 45 to 47, 49, 86 and 89 showed 80% as the mortality of insects.

After 6 days, the life and death of the insects of the German cockroach was observed. As a result, the experiment treated with the present compound 77 showed 100% as the mortality of insects.

Comparative Test example

A plastic pot was filled with soils and thereto was seeded barley (cv; Mikamo Golden) and the plants were grown in a greenhouse for 7 days. A control compound, 1-(2-[(1-(4-fluorophenyl)-1H-pyrazole-3-yl)oxymethyl]phenyl)-4-methyl-1, 4-dihydropyrazole-5-one was made to a formulation according to the above-mentioned Formulation examples and was then diluted with water so as to make a predetermined concentration (50 ppm). The dilutions were sprayed to foliar parts so as to adhere adequately on the leaves of the above-mentioned barley. After spraying the dilutions, the plants were air-dried and after 2 days, an aqueous suspension of the spores of barley net blotch fungi (Pyrenophora teres) was spraying-inoculated. After inoculation, the plants were placed in a greenhouse of 23°C during daytime and 20°C during nighttime under a high
humidity for 3 days and were then cultivated in the greenhouse for 7 days, and a lesion area was observed. As a result, the lesion area in plants treated with the control compound, 1-(2-[1-(4-fluorophenyl)-1H-pyrazole-3-yl]oxymethyl)phenyl)-4-methyl-1,4-dihydrotetrazole-5-one showed 70% or more compared to the lesion area in an untreated plant.
