PEPTIDOMIMETIC COMPOUNDS AND ANTIBODY-DRUG CONJUGATES THEREOF

CROSS REFERENCE TO RELATED APPLICATIONS

This application claims benefit under 35 U.S.C. §119 to provisional U.S. Application No. 61/916680, filed December 16, 2013, the contents of which are hereby incorporated by reference in their entirety.

FIELD OF INVENTION

This invention relates to novel peptidomimetic compounds which are useful as linkers of antibody-drug conjugates (ADC). This invention also relates to ADCs containing peptidomimetic linkers and anthracycline derivatives. This invention also relates to methods of treating diseases in humans.

BACKGROUND OF THE INVENTION

The use of monoclonal antibodies (mABs) to deliver anticancer drugs directly to tumor cells has attracted a great deal of focus in recent years. Two new antibody-drug conjugates have been approved by the FDA for the treatment of cancer. Adcetris® (brentuximab vedotin) is a CD30-directed antibody-drug conjugate (ADC) indicated for the treatment of relapsed or refractory Hodgkin lymphoma and systemic anaplastic large cell lymphoma (ALCL). Kadcyla® (ado-trastuzumab emtansine), is a new therapy approved for patients with HER2-positive, late-stage (metastatic) breast cancer. To obtain a therapeutic both potent anti-tumor activity and acceptable therapeutic index in an ADC, several aspects of design may be optimized. Particularly, it is well known that the chemical structure of the linker can have significant impact on both the efficacy and the safety of ADC (Ducry & Stump, Bioconjugate Chem., 2010, 21, 5-13). Choosing the right linker influences proper drug delivery to the intended cellular compartment of cancer cells. Linkers can be generally divided into two categories: cleavable (such as peptide, hydrzone, or disulfide) or non-cleavable (such as thioether). Peptide linkers, such as Valine-Citrulline (Val-Cit), that can be hydrolyzed by lysosomal enzymes (such as Cathepsin B) have been used to connect the drug with the antibody (US62 14345). They have been particularly useful, due in part to their relative stability in systemic circulation and the ability to efficiently release the drug in tumor. ADCs containing the Val-Cit linker have been shown to be relatively stable in vivo (t1/2 for drug release ~7 days (Doronina et al 2008), Bioconjugate Chem., 19, 1960-1963). However, the chemical space represented by natural peptides is limited; therefore, it is desirable to have a
variety of non-peptide linkers which act like peptides and can be effectively cleaved by lysosomal proteases. The greater diversity of non-peptide structures may yield novel, beneficial properties that are not afforded by the peptide linkers. Provided herein are different types of non-peptide linkers for ADC that can be cleaved by lysosomal enzymes.

SUMMARY OF THE INVENTION

This invention relates to antibody-drug conjugates represented by Formula (I)

\[ \text{Ab—} (L—D)_n \]

Ab is an antibody;
L is a peptidomimetic linker represented by the following formula

\[ \text{—Str—(PM)—Sp—} \]

wherein

Str is a stretcher unit covalently attached to Ab;
Sp is a bond or spacer unit covalently attached to a drug moiety;
PM is a non-peptide chemical moiety selected from the group consisting of:

\[
\begin{align*}
\text{O} & \quad \text{W} & \quad \text{O} \\
\text{R}^1 & & \\
\end{align*}
\]

\[
\begin{align*}
\text{O} & \quad \text{R}^2 & \quad \text{R}^3 & \quad \text{O} \\
\text{N} & \quad \text{Y} & \quad \text{N} & \quad \text{R}^1 \\
\end{align*}
\]

and

\[
\begin{align*}
\text{O} & \quad \text{R}^5 & \quad \text{R}^4 & \quad \text{O} \\
\text{N} & \quad \text{R}^1 & \quad \text{N} & \quad \text{R}^1 \\
\end{align*}
\]

W is \(-\text{NH-heterocycloalkyl- or heterocycloalkyl};\)
Y is heteroaryl, aryl, -C(0)Ci-Calkylene, Ci-Calkylene-NH₂, Ci-Calkylene-NH-CH₃, Ci-Calkylene-NH-CH₂C₆alkylene-N-(CH₃)₂, Ci-Calkylene-NH₃, each R¹ is independently C₁-C₁₀alkyl, Q-doalkenyl, (C₁-C₁₀alkyl)NH(NH)NH₂ or (Q-C₁₀alkyl)NH(O)NH₂;
5  R³ and R² are each independently H, C₁-C₁₀alkyl, C₁-C₁₀alkenyl, arylalkyl or heteroarylalkyl, or R³ and R² together may form a C₃-C₇cycloalkyl;
R⁴ and R⁵ are each independently Ci-Ci₉alkyl, Ci-Ci₉alkenyl, arylalkyl, heteroarylalkyl, (d-C₁₀alkyl)OCH₂⁻, or R⁴ and R⁵ may form a C₃-C₇cycloalkyl ring;
p is an integer from 1 to 8;
10  D is a drug moiety of Formula (IA) or (IB)

wherein R¹¹ is hydrogen atom, hydroxy or methoxy group and R²² is a Ci-C₄ alkoxy group.
This invention also relates to pharmaceutical compositions of antibody-drug conjugates of Formula (I).
This invention also relates to a method of treating cancer, use of antibody-drug conjugates of
Formula (I) in therapy, and use of antibody-drug conjugates of Formula (I) in manufacturing a
medicament for treating cancer.
This invention also relates to method of preparing antibody-drug conjugates of Formula (I).
BRIEF DESCRIPTION OF THE FIGURES

Figure 1 shows efficacy comparison of CD33 ADCs (CD33 PNU ADC3-2 and ADC2-2) in SCID mice with HL-60 human acute myeloid leukemia tumors.

Figure 2 shows efficacy comparison of CD33 ADCs (CD33 PNU ADC4-2 and ADC2-2) in SCID mice with HL-60 human acute myeloid leukemia tumors.

DETAILED DESCRIPTION OF THE INVENTION

Provided herein are different types of non-peptide linkers for ADC that are cleavable by lysosomal enzymes. For example, the amide bond in the middle of a dipeptide (e.g. Val-Cit) was replaced with an amide mimic; and/or entire amino acid (e.g., valine amino acid in Val-Cit dipeptide) was replaced with a non-amino acid moiety (e.g., cycloalkyl dicarbonyl structures (for example, ring size = 4 or 5)).

This invention relates to antibody-conjugates of Formula (I).

This invention also relates to antibody-conjugates of Formula (I), wherein (IA) is:

![Chemical structure of (IA)]

and (IB) is:

![Chemical structure of (IB)]
This invention also relates to antibody-conjugates of Formula (I), wherein \( Y \) is heteroaryl; \( R^4 \) and \( R^5 \) together form a cyclobutyl ring.

This invention also relates to antibody-conjugates of Formula (I), wherein \( Y \) is a moiety selected from the group consisting of

\[
\begin{align*}
\text{N} & \quad \text{N} \\
\text{N} & \quad \text{N}
\end{align*}
\]

AND

\[
\begin{align*}
\text{N} & \quad \text{N}
\end{align*}
\]

This invention also relates to antibody-conjugates of Formula (I), wherein \( \text{Str} \) is a chemical moiety represented by the following formula:

\[
\begin{align*}
\text{(Ab)}
\end{align*}
\]

wherein \( R^6 \) is selected from the group consisting of \( \text{Cl}-\text{C}_{10}\text{alkylene}, \text{Cl}-\text{C}_{10}\text{alkenyl}, \text{C}_{3}-\text{Qcycloalkyl}, (\text{C}_{1}-\text{C}_{3}\text{alkylene})\text{O}-, \) and \( \text{C}_{1}-\text{C}_{9}\text{alkylene-C(O)}\text{N}(\text{R}^6)-\text{C}_{2}-\text{C}_{6}\text{alkylene}, \) where each alkylene may be substituted by one to five substituents selected from the group consisting of halo, trifluoromethyl, difluoromethyl, amino, alkylamino, cyano, sulfonyl, sulfonamide, sulfoxide, hydroxy, alkoxy, ester, carboxylic acid, alkylthio, aryalkyl, \( \text{C}_{3}-\text{C}_{5}\text{cycloalkyl}, \text{C}_{4}-\text{C}_{6}\text{heterocycloalkyl}, \) heteroaryalkyl and heteroaryl each \( R^4 \) is independently \( \text{H} \) or \( \text{Cl}-\text{C}_{9}\text{alkyl}; \) \( S_p \) is \( \text{---Ar---R}^b \text{---}, \) wherein \( \text{Ar} \) is aryl or heteroaryl, \( R^b \) is \( \text{(Cl-Cl}_{9}\text{alkylene})\text{O}-, \) or \( S_p \) is the following formula

\[
\begin{align*}
\text{(Ab)}
\end{align*}
\]

wherein

- each \( n \) is independently 1-6;
- \( X \) is \( \text{N}, \text{CH}_2 \) or a bond; and
- each \( R^d \) is independently \( \text{H} \) or \( \text{C}_{1}-\text{C}_{3}\text{alkyl}. \)
This invention also relates to antibody-conjugates of Formula (I), wherein Str has the formula:

\[
\text{(Ab)}
\]

wherein \(R^7\) is selected from \(\text{Ci-Ci}_1\text{alkylene}, \text{Ci-Ci}_1\text{alkenyl}, (\text{Ci-Ci}_1\text{alkylene})\text{O-}, \text{N}(R^1)^{-}(\text{C}_2\text{C}_6\text{alkylene})-\text{N}(R^1)^{-}\) and \(\text{N}(R^1)^{-}(\text{C}_2\text{C}_6\text{alkylene})\); where each \(R^6\) is independently \(\text{H}\) or \(\text{Ci-C}_6\text{alkyl}\); \(Sp\) is \(-\text{A}-\text{R}^8\), wherein \(\text{Ar}\) is aryl or heteroaryl, \(\text{R}^8\) is \((\text{Ci-Ci}_1\text{alkylene})\text{O-}\) or \(\text{Sp}\) is the following formula

\[
\begin{align*}
\text{Ar} & \quad \text{R}^8 \\
\text{R}^9 & \quad \text{R}^8 \\
\end{align*}
\]

wherein

- each \(n\) is independently 1-6;
- \(X\) is \(\text{N}, \text{CH}_2\) or a bond; and
- each \(\text{R}^d\) is independently \(\text{H}\) or \(\text{Ci-Ci}_3\text{alkyl}\).

This invention also relates to antibody-conjugates of Formula (I), wherein

\[
\begin{align*}
\text{L} & \quad \text{non-peptide chemical moiety represented by the following formula} \\
\end{align*}
\]

\[
\begin{align*}
\text{R}^1 & \quad \text{d-C}_1\text{alkyl}, \text{Ci-C}_1\text{alkenyl}, (\text{C}_1\text{C}_4\text{alkyl})\text{NH}-(\text{NH})\text{NH}_2 \text{ or (C}_1\text{C}_4\text{alkyl})\text{NH}-(\text{NH})\text{NH}_2; \\
\text{R}^3 \text{ and R}^2 \text{ are each independently H, C}_1\text{C}_1\text{alkyl.}
\end{align*}
\]

This invention also relates to antibody-conjugates of Formula (I), wherein

\[
\begin{align*}
\text{L} & \quad \text{non-peptide chemical moiety represented by the following formula}
\end{align*}
\]
This invention also relates to antibody-conjugates of Formula (I),

wherein

L is non-peptide chemical moiety represented by the following formula:

\[
\text{Str} \quad \text{W} \quad \text{Sp}
\]

This invention also relates to antibody-conjugates of Formula (I) represented by the following formula:

\[
\begin{array}{c}
\text{Ab} \\
\text{Str} \\
\text{Y} \\
\text{Sp} \\
\end{array}
\]

wherein

Str is a chemical moiety represented by the following formula:

\[
\text{Ab}
\]
wherein \( R^6 \) is selected from the group consisting of \( \text{Ci-C}_\text{i-alkylene} \), and \( \text{Cl} \).

\( \text{Ci}_\text{i-alkylene}-\text{C(O)N(R^5)}\text{-C}\text{2-C}_\text{6-alkylene} \), where each alkylene may be substituted by one to five substituents selected from the group consisting of halo, trifluoromethyl, difluoromethyl, amino, alkylamino, cyano, sulfonamide, sulfoxide, hydroxy, alkoxy, ester, carboxylic acid, alkylthio, aryl, arylalkyl, \( \text{C}_3\text{-C}_8\text{cycloalkyl} \), \( \text{C}_4\text{-C}_7\text{heterocycloalkyl} \), heteroarylalkyl and heteroaryl each \( R^2 \) is independently \( \text{H} \) or \( \text{Ci-C}_\text{i-alkyl} \); 

\( p \) is 1, 2, 3 or 4.

This invention also relates to antibody-conjugates of Formula (I) represented by the following formula:

\[
\text{(I)(B1)}
\]

wherein

\( \text{Str} \) is a chemical moiety represented by the following formula:

\[
\text{(Ab)}
\]

wherein \( R^6 \) is selected from the group consisting of \( \text{Ci-C}_\text{i-alkylene} \), and \( \text{Cl} \).

\( \text{Ci}_\text{i-alkylene}-\text{C(O)N(R^5)}\text{-C}\text{2-C}_\text{6-alkylene} \), where each alkylene may be substituted by one to five substituents selected from the group consisting of halo, trifluoromethyl, difluoromethyl, amino, alkylamino, cyano, sulfonamide, sulfoxide, hydroxy, alkoxy, ester, carboxylic acid, alkylthio, aryl, arylalkyl, \( \text{C}_3\text{-C}_8\text{cycloalkyl} \), \( \text{C}_4\text{-C}_7\text{heterocycloalkyl} \), heteroarylalkyl and heteroaryl each \( R^2 \) is independently \( \text{H} \) or \( \text{Ci-C}_\text{i-alkyl} \); 

\( \text{Sp} \) is \( -\text{A}_\text{r}--\text{R^b}-- \), wherein \( \text{Ar} \) is aryl or heteroaryl, \( \text{R^b} \) is \( \text{(Ci-C}_\text{i-alkylene})\text{O-} \) or 

\( \text{Sp} \) is the following formula
wherein
each \( n \) is independently 1-6;
5
\( X \) is \( \text{N, CH}_2 \) or a bond;
each \( \text{Rd} \) is independently \( \text{H or C}_1-\text{C}_3 \text{alkyl} \);and
p is 1, 2, 3 or 4.
This invention also relates to any one of the above antibody-conjugates, wherein \( Y \) is heteroaryl,
aryl or alkenyl; \( \text{R6} \) is \( \text{C}_1-\text{C}_6 \text{alkylene} \).
10
This invention also relates to antibody-drug conjugates of Formula (I) represented by the following
formula:

\[
\text{(I)(C1)}
\]

wherein
\( \text{Str} \) is a chemical moiety represented by the following formula:

\[
\text{(Ab)}
\]

wherein \( \text{R6} \) is selected from the group consisting of \( \text{C}_1-\text{C}_6 \text{alkylene} \), and \( \text{C}_1 \).
20
\( \text{C}_1(\text{alkylene})\cdot \text{C}(\text{O})\cdot \text{N}(\text{R}^7)\cdot \text{C}_2-\text{C}_6 \text{alkylene} \), where each alkylene may be substituted by one to five
substituents selected from the group consisting of halo, trifluoromethyl, difluoromethyl, amino,
alkylamino, cyano, sulfonyl, sulfonamide, sulfoxide, hydroxy, alkoxy, ester, carboxylic acid,
alkylthio, aryl, arylalkyl, C₃₋₄cycloalkyl, C₄₋₇heterocycloalkyl, aryl, arylalkyl, heteroarylalkyl
and heteroaryl, each Rᵢ is independently H or C₁₋₃alkyl;
Sp is —Ar—Rᵇ—, wherein Ar is aryl or heteroaryl, Rᵇ is (C₁₋₃alkylene)O- or
Sp is the following formula

wherein
each n is independently 1-6;
X is N, CH₂ or a bond;
each Rd is independently H or C₁₋₃alkyl; and
p is 1, 2, 3 or 4.

This invention also relates to any one of the above antibody-conjugates, wherein Y is

This invention also relates to any one of the above antibody-conjugates, wherein Y is

This invention also relates to any one of the above antibody-conjugates, wherein Y is

This invention also relates to any one of the above antibody-conjugates, wherein
Str is a chemical moiety represented by the following formula:

(Ab)
R\(^6\) is Cl-C\(_3\)alkylene;
Sp is —Ar—R\(^b—\), wherein Ar is aryl or heteroaryl, R\(^b\) is (Cl-C\(_3\)alkylene)O- or Sp is the following formula

wherein
each n is independently 1-6;
X is N, CH\(_2\) or a bond; and
each Rd is independently H or Cl-C\(_3\)alkyl.

This invention also relates to any one of the above antibody-conjugates (I), (I)(A1), represented by the following formula:

wherein
R\(^1\) is C\(_1\)-C\(_6\)alkyl-NH\(_2\), (C\(_1\)-C\(_6\)alkyl)NHC(NH)NH\(_2\) or (C\(_1\)-C\(_6\)alkyl)NHC(0)NH\(_2\)
p is 1, 2, 3 or 4;
Sp is the following formula
wherein
each n is independently 1-6;
X is N, CH₂ or a bond; and
each Rᵩ is independently H or Cᵢ-C₃alkyl.

This invention also relates to any one of the above antibody-conjugates (I), (I)(B1), represented by the following formula:

![Chemical Structure Diagram]

wherein
p is 1, 2, 3 or 4;
R¹ is d-Cᵢ₆alkyl-NH₂, (C₁-C₆alkyl)NH(NH)NH₂ or (C₁-C₆alkyl)NH(O)NH₂;
R⁴ and R⁵ are each independently Cᵢ-C₇alkyl, wherein said alkyl are unsubstituted, or R⁴ and R⁵ may form a C₃-C₇cycloalkyl ring; and

Sp is the following formula

![Chemical Structure Diagram]

wherein
each n is independently 1-6;
X is N, CH₂ or a bond; and
each Rᵩ is independently H or Cᵢ-C₃alkyl.

This invention also relates to any one of the above antibody-conjugates (I) and (I)(C1), represented by the following formula:
wherein
p is 1, 2, 3 or 4;
R¹ is d-C₆ alkyl-NH₂, (C₁-C₆ alkyl)NHC(NH)NH₂ or (C₁-C₆ alkyl)NHC(0)NH₂;  
Sp is the following formula

wherein
each n is independently 1-6;
X is N, CH₂ or a bond; and
each Rd is independently H or C₁-C₃ alkyl.

This invention also relates to antibody-conjugates of formula (I), which is represented by the following formula:

wherein
p is 1, 2, 3 or 4;
R¹ is C₁-C₆ alkyl-NH₂, (C₁-C₆ alkyl)NHC(NH)NH₂ or (C₁-C₆ alkyl)NHC(0)NH₂; and
Sp is the following formula

\[
\begin{align*}
&\text{Sp} = \text{the following formula} \\
&\text{wherein} \\
&\text{each } n \text{ is independently 1-6;} \\
&\text{X is } N, \text{ CH}_2 \text{ or a bond; and} \\
&\text{each } R^d \text{ is independently } H \text{ or } \text{C}_3\text{alkyl.}
\end{align*}
\]

This invention also relates to antibody-drug conjugates of (I)(B3), wherein

\[
\begin{align*}
\text{Str} \text{ is a chemical moiety represented by the following formula:}
\end{align*}
\]

\[
\begin{align*}
R^6 \text{ is } \text{C}_1\text{-C}_4\text{alkylene which may be substituted with 1-3 groups selected from aryl and heteroaryl;} \\
\end{align*}
\]

This invention also relates to antibody-drug conjugates of (I)(B3) wherein \( R^1 \) is

\[
(CH_2)_3\text{NHC}(0)\text{NH}_2.
\]

This invention also relates to antibody-drug conjugates of (I)(B3) wherein \( R^1 \) is \((\text{CH}_2)_4\text{NH}_2.
\]

This invention also relates to antibody-drug conjugates of (I), (I)(B1), (I)(B2) and (I)(B3), wherein

\[
R^1 \text{ is } (\text{C}_1\text{-C}_6\text{alkyl})\text{NHC(NH)NH}_2.
\]

This invention also relates to antibody-drug conjugates of formula (I), which is represented by the following formula:
wherein,
Ab is an antibody that binds to a target selected from Her2, CLL, CD33, CD22 and NaPi2b;
P is 1-4; and
Sp is the following formula

![Chemical Structure](image)

wherein
each \( n \) is independently 1-6;
\( X \) is \( N, CH_2 \) or a bond; and
each \( R^d \) is independently \( H \) or \( C_3 \) alkyl.

This invention also relates to antibody-drug conjugates of formula (I), which is represented by the
following formula:
wherein,

Ab is an antibody that binds to a target selected from Her2, CLl, CD33, CD22 and NaPi2b;

P is 1-4; and

Sp is the following formula

wherein
each n is independently 1-6;

This invention also relates to non-peptide compounds of Formula (I)(B)(LD1):

wherein

Str is a stretcher unit which can be covalently attached to an antibody;

Sp is a bond or a spacer unit covalently attached to a drug moiety;

$R^1$ is $C_1$-$C_{10}$alkyl, $(C_1$-$C_{10}$alkyl)NHC(NH)NH$_2$ or $(C_1$-$C_{10}$alkyl)NHC(O)NH$_2$;

$R^4$ and $R^5$ are each independently $C_1$-$C_{10}$alkyl, arylalkyl, heteroarylalkyl, $(C_1$-$C_{10}$alkyl)OCH$_2$-, or

$R^4$ and $R^5$ may form a $C_3$-$C_7$cycloalkyl ring;
D is a drug moiety of Formula (IA) or (IB)

wherein R\textsubscript{11} is hydrogen atom, hydroxy or methoxy group and R\textsuperscript{22} is a C\textsubscript{7} alkoxy group, or a pharmaceutically acceptable salt thereof.

This invention also relates to non-peptide compounds represented by the following formula

wherein R\textsubscript{6} is C\textsubscript{i}-C\textsubscript{i} alkylene; R\textsuperscript{4} and R\textsuperscript{5} together form a C\textsubscript{3}-C\textsubscript{7} cycloalkyl ring.

This invention also relates to non-peptide compounds represented by the following formula
wherein

\( R^1 \) is d-C\(_{3-7}\)alkyl-NH, (Ci-C\(_{3-7}\)alkyl)NHC(NH)NH\(_2\) or (Ci-C\(_{3-7}\)alkyl)NHC(0)NH\(_2\);

5 \( R^4 \) and \( R^5 \) are each independently Ci-C\(_{3-7}\)alkyl, wherein said alkyl are unsubstituted, or \( R^4 \) and \( R^5 \) may form a C\(_3-7\)cycloalkyl ring; and

\( Sp \) is the following formula

\[
\begin{array}{c}
\text{(I)(B)(LD3)} \\
\end{array}
\]

wherein

each \( n \) is independently 1-6;

\( X \) is N, CH\(_2\) or a bond; and

each \( R^d \) is independently H or Ci-C\(_{3-7}\)alkyl.

15 This invention also relates to non-peptide compounds of Formula:

\[
\begin{array}{c}
\text{(I)(A)(LD1)} \\
\end{array}
\]

wherein

\( Str \) is a stretcher unit which can be covalently attached to an antibody;

20 \( Sp \) is an optional spacer unit covalently attached to a drug moiety;

\( Y \) is heteroaryl, aryl, -C(0)Ci-C\(_{3-7}\)alkylene, Ci-C\(_{3-7}\)alkylene-NH\(_2\), Ci-C\(_{3-7}\)alkylene-NH-CH\(_3\), Ci-C\(_{3-7}\)alkylene-N-(CH\(_3\))\(_2\), Ci-C\(_{3-7}\)alkenyl or Ci-C\(_{3-7}\)alkylenyl;

\( R^1 \) is C\(_1-7\)alkyl, (Ci-C\(_{3-7}\)alkyl)NHC(NH)NH\(_2\) or (Ci-C\(_{3-7}\)alkyl)NHC(0)NH\(_2\);

\( R^3 \) and \( R^2 \) are each independently H, Ci-C\(_{3-7}\)alkyl, arylalkyl or heteroaryalkyl, or \( R^3 \) and \( R^2 \) together may form a C\(_3-7\)cycloalkyl;
D is a drug moiety of Formula (IA) or (IB)

wherein $R_1$ is hydrogen atom, hydroxy or methoxy group and $R_2$ is a $C_1$-$C_4$ alkoxy group, or a pharmaceutically acceptable salt thereof.

This invention also relates to non-peptide compounds represented by the following formula:

wherein

$R^1$ is $C_1$-$C_6$ alkyl, $(C_1$-$C_6$ alkyl)NHC(NH$_2$)NH$_2$ or $(C_1$-$C_6$ alkyl)NHC(OMe)NH$_2$;

$R^3$ and $R^2$ are each independently H, $C_1$-$C_6$ alkyl, arylalkyl or heteroarylalkyl, or $R^3$ and $R^2$ together may form a $C_3$-$C_7$ cycloalkyl;

$R_6$ is CVQalkylene; and

Sp is the following formula
wherein
each \( n \) is independently 1-6;
\( X \) is \( \text{N, CH}_2 \) or a bond; and
each \( R^d \) is independently \( \text{H or Ci-C}_3 \)alkyl.

This invention also relates to non-peptide compounds represented by the following formula:

wherein
\( R^1 \) is \( \text{C}_1-\text{C}_10 \)alkyl, \( (\text{C}_1-\text{C}_10 \)alkyl)\( \text{NHCH(NH)} \text{NH}_2 \) or \( (\text{C}_1-\text{C}_10 \)alkyl)\( \text{NHCO} \text{NH}_2 \);
\( R^3 \) and \( R^2 \) are each independently \( \text{H, Ci-C}_1 \)alkyl, arylalkyl or heteroarylalkyl, or \( R^3 \) and \( R^2 \) together may form a \( \text{C}_3-\text{C}_7 \)cycloalkyl;
\( R^6 \) is \( \text{Ci-C}_1 \)alkylene; and
\( \text{Sp} \) is the following formula

wherein
each \( n \) is independently 1-6;
\( X \) is \( \text{N, CH}_2 \) or a bond; and
each \( R^d \) is independently \( \text{H or Ci-C}_3 \)alkyl.
This invention also relates to any of the above non-peptide linker drug compounds, wherein Str has the following formula:

![Chemical Structure 1]

wherein $R^6$ is selected from the group consisting of $\text{Ci-C}_1\text{alkylene}$, $\text{C}_3\text{-C}_6\text{cycloalkyl}$, 0-$(\text{Ci-C}_1\text{alkylene})$, and $\text{Ci-C}_1\text{alkylene}-\text{C(O)}(\text{R}^4)-\text{C}_1\text{-C}_6\text{alkylene}$, where each alkylene may be substituted by one to five substituents selected from the group consisting of halo, trifluoromethyl, difluoromethyl, amino, alkylamino, cyano, sulfonyl, sulfonamide, sulfoxide, hydroxy, alkoxy, ester, carboxylic acid, alkylthio, aryl, arylalkyl, $\text{C}_3\text{-C}_6\text{cycloalkyl}$, $\text{C}_4\text{-C}_7\text{heterocycloalkyl}$ aryl, arylalkyl, heteroarylalkyl and heteroaryl; each $R^4$ is independently $\text{H}$ or $\text{Ci-C}_1\text{alkyl}$; $Sp$ is $\text{—Ar—R}^b$-, wherein $Ar$ is aryl or heteroaryl, $R^b$ is $(\text{Ci-C}_1\text{alkylene})O$- or $Sp$ is the following formula:

![Chemical Structure 2]

wherein

each $n$ is independently 1-6;

$X$ is $\text{N}$, $\text{CH}_2$ or a bond; and

each $R^d$ is independently $\text{H}$ or $\text{C}_1\text{-C}_3\text{alkyl}$.

This invention also relates to non-peptide linker drug compounds, wherein $R^6$ is $\text{Ci-C}_1\text{alkylene}$, $Sp$ is $\text{—Ar—R}^b$-, wherein $Ar$ is aryl $R^b$ is $(\text{Ci-C}_1\text{alkylene})O$-.

This invention also relates to non-peptide linker drug compounds, wherein Str has the formula:

![Chemical Structure 3]
wherein \( R^7 \) is selected from \( \text{Ci-Ci}_0 \text{alkylene}, \text{Ci-Ci}_0 \text{alkylene-O}, \text{N}(R^7)-(\text{C}_2-\text{C}_6 \text{alkylene})-\text{N}(R^5) \) and \( \text{N}(R^7)-(\text{C}_2-\text{C}_6 \text{alkylene}) \); where each \( R^5 \) is independently \( \text{H} \) or \( \text{Ci-C}_6 \text{alkyl} \);

\( \text{Sp} \) is \(-\text{Ar}-\text{R}^b\), wherein \( \text{Ar} \) is aryl or heteroaryl, \( \text{R}^b \) is \((\text{Ci-C}_io \text{alkylene})\text{O-}\) or \( \text{Sp} \) is the following formula

\[
\begin{align*}
\text{O} & \quad \text{N} \quad \text{O} \\
\text{(CH}_2\text{n)} & \quad \text{N} \quad \text{(CH}_2\text{n)} \\
\text{Rd} & \quad \text{Rd}
\end{align*}
\]

wherein

- each \( n \) is independently 1-6;
- \( X \) is \( \text{N}, \text{CH}_2 \) or a bond; and

- each \( \text{Rd} \) is independently \( \text{H} \) or \( \text{Ci-C}_3 \text{alkyl} \).

This invention also relates to non-peptide linker drug compounds, wherein \( \text{R}^6 \) is \( \text{Ci-C}_io \text{alkylene}, \)

\( \text{Sp} \) is the following formula

\[
\begin{align*}
\text{O} & \quad \text{N} \quad \text{O} \\
\text{(CH}_2\text{n)} & \quad \text{N} \quad \text{(CH}_2\text{n)} \\
\text{Rd} & \quad \text{Rd}
\end{align*}
\]

wherein

- each \( n \) is independently 1-6;
- \( X \) is \( \text{N}, \text{CH}_2 \) or a bond; and

- each \( \text{Rd} \) is independently \( \text{H} \) or \( \text{Ci-C}_3 \text{alkyl} \).

This invention also relates to any one of the above antibody-drug conjugates, wherein \( p \) is 2.

This invention also relates to linker drug compounds (IA)(LD1) and (IB)(LD1) wherein (IA) is
This invention also relates to any one of the above antibody-drug conjugates, wherein the antibody binds to one or more of polypeptides selected from the group consisting of:

- CLL1;
- BMPR1B;
- E16;
- STEAP1;
- 0772P;
- MPF;
- NaPi2b;
- Sema 5b;
- PSCA hlg;
- ETBR;
- MSG783;
- STEAP2;
- TrpM4;
- CPJPTO;
- CD21;
CD79b; FcRH2; HER2; NCA; MDP; IL20Ra; Brevican; EphB2R; ASLG659; PSCA; GEDA; BAFF-R; CD22; CD79a; CXCR5; HLA-DOB; P2X5; CD72; LY64; FcRH1; IRTA2; TENB2; PMEL17; TMEFF1; GDNF-Ral; Ly6E; TMEM46; Ly6G6D; LGR5; RET; LY6K; GPR19; GPR54; ASPHD1; Tyrosinase; TMEM118; GPR172A;
MUC16 and CD33.

This invention also relates to methods of treating a disease in a human in need thereof, comprising administering to said human an effective amount of an Antibody-drug conjugate of claim 1.

This invention also relates to pharmaceutical compositions comprising a compound of claim 1 and a pharmaceutically acceptable carrier thereof.

This invention also relates to any one of the above antibody-drug conjugates, wherein the antibody binds to one or more of polypeptides selected from the group consisting of: CLL1; STEAP1; NaPi2b; STEAP2; TrpM4; CRIPTO; CD21; CD79b; FcRH2; HER2; CD22; CD79a; CD72; LY64; Ly6E; MUC16; and CD33.

This invention also relates to any one of the above antibody-drug conjugates, wherein the antibody binds to CD33.

This invention also relates to any one of the above antibody-drug conjugates, wherein the antibody binds to CD22.

This invention also relates to any one of the above antibody-drug conjugates, wherein the antibody binds to NaPi2b.

This invention also relates to any one of the above antibody-drug conjugates, wherein the antibody binds to CLL1.
This invention also relates to any one of the above antibody-drug conjugates, wherein the antibody binds to Her2.

This invention also relates to any one of the above antibody-drug conjugates, wherein the antibody binds to CD33 and the anti-CD33 antibody comprise an HVR-L1 comprising the amino acid sequence of SEQ ID NO:11, an HVR-L2 comprising the amino acid sequence of SEQ ID NO:12, an HVR-L3 comprising the amino acid sequence of SEQ ID NO:13, an HVR-H1 comprising the amino acid sequence of SEQ ID NO: 14, an HVR-H2 comprising the amino acid sequence of SEQ ID NO: 15, and an HVR-H3 comprising the amino acid sequence of SEQ ID NO: 16.

This invention also relates to any one of the above antibody-drug conjugates, wherein the antibody binds to CD33 and the anti-CD33 antibody comprises a VL domain comprising the amino acid sequence of SEQ ID NO: 17 and a VH domain comprising the amino acid sequence of SEQ ID NO:18.

In some embodiments, the antibody of the antibody-drug conjugate binds CD33. In some embodiments, the antibody of the antibody-drug conjugate comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:22; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:23; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:24; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:19; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:20; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:21.

In some embodiments, the antibody comprises a VH as in any of the embodiments provided above, and a VL as in any of the embodiments provided above. In one embodiment, the antibody comprises the VL and VH sequences in SEQ ID NO:25 and SEQ ID NO:26, respectively, including post-translational modifications of those sequences.

This invention also relates to any one of the above antibody-drug conjugates, wherein the antibody binds to NaPi2b.

This invention also relates to any one of the above antibody-drug conjugates, wherein the antibody binds to NaPi2b and the NaPi2b antibody comprise an HVR-L1 comprising the amino acid sequence of SEQ ID NO: 1, an HVR-L2 comprising the amino acid sequence of SEQ ID NO:2, an HVR-L3 comprising the amino acid sequence of SEQ ID NO:3, an HVR-H1 comprising
the amino acid sequence of SEQ ID NO:4, an HVR-H2 comprising the amino acid sequence of
SEQ ID NO:5, and an HVR-H3 comprising the amino acid sequence of SEQ ID NO: 6.

This invention also relates to any one of the above antibody-drug conjugates, wherein the
antibody binds to NaPi2b and the NaPi2b antibody comprise s a VL domain comprising the amino
acid sequence of SEQ ID NO:7 and a VH domain comprising the amino acid sequence of SEQ ID
NO:8.

This invention also relates to any one of the above antibody-drug conjugates, wherein the
antibody binds to NaPi2b and the NaPi2b antibody comprises an amino acid sequence of SEQ ID
NO:9 and an amino acid sequence of SEQ ID NO: 10.

This invention also relates to any one of the above antibody-drug conjugates, wherein the
antibody binds to CD22.

This invention also relates to any one of the above antibody-drug conjugates, wherein the
antibody binds to CD22 and the CD22 antibody comprise an HVR-L1 comprising the amino acid
sequence of SEQ ID NO:41, an HVR-L2 comprising the amino acid sequence of SEQ ID NO:42,
an HVR-L3 comprising the amino acid sequence of SEQ ID NO:43, an HVR-H1 comprising the
amino acid sequence of SEQ ID NO:44, an HVR-H2 comprising the amino acid sequence of SEQ
ID NO:45, and an HVR-H3 comprising the amino acid sequence of SEQ ID NO: 46.

This invention also relates to any one of the above antibody-drug conjugates, wherein the
antibody binds to CD22 and the CD22 antibody comprise s a VL domain comprising the amino
acid sequence of SEQ ID NO:47 and a VH domain comprising the amino acid sequence of SEQ
ID NO:48.

This invention also relates to any one of the above antibody-drug conjugates, wherein the
antibody binds to CD22 and the CD22 antibody comprises an amino acid sequence of SEQ ID
NO:49 and an amino acid sequence of SEQ ID NO: 50.

DEFINITIONS

Unless stated otherwise, the following terms and phrases as used herein are intended to have the
following meanings: when trade names are used herein, applicants intend to independently include
the trade name product formulation, the generic drug, and the active pharmaceutical ingredient(s)
of the trade name product.
The term "peptidomimetic" or PM as used herein means a non-peptide chemical moiety. Peptides are short chains of amino acid monomers linked by peptide (amide) bonds, the covalent chemical bonds formed when the carboxyl group of one amino acid reacts with the amino group of another. The shortest peptides are dipeptides, consisting of 2 amino acids joined by a single peptide bond, followed by tripeptides, tetrapeptides, etc. A peptidomimetic chemical moiety includes non-amino acid chemical moieties. A peptidomimetic chemical moiety may also include one or more amino acid that are separated by one or more non-amino acid chemical units. A peptidomimetic chemical moiety does not contain in any portion of its chemical structure two or more adjacent amino acids that are linked by peptide bonds.

The term "amino acid" as used herein means glycine, alanine, valine, leucine, isoleucine, phenylalanine, proline, serine, threonine, tyrosine, cysteine, methionine, lysine, arginine, histidine, tryptophan, aspartic acid, glutamic acid, asparagine, glutamine or citrulline.

The term "antibody" herein is used in the broadest sense and specifically covers monoclonal antibodies, polyclonal antibodies, dimers, multimers, multispecific antibodies (e.g., bispecific antibodies), and antibody fragments, so long as they exhibit the desired biological activity (Miller et al 2003) Jour. of Immunology 170:4854-4861). Antibodies may be murine, human, humanized, chimeric, or derived from other species. An antibody is a protein generated by the immune system that is capable of recognizing and binding to a specific antigen. (Janeway, C., Travers, P., Walport, M., Shlomchik (2001) Immunology Biology, 5th Ed., Garland Publishing, New York). A target antigen generally has numerous binding sites, also called epitopes, recognized by CDRs on multiple antibodies. Each antibody that specifically binds to a different epitope has a different structure. Thus, one antigen may have more than one corresponding antibody. An antibody includes a full-length immunoglobulin molecule or an immunologically active portion of a full-length immunoglobulin molecule, i.e., a molecule that contains an antigen binding site that immunospecifically binds an antigen of a target of interest or part thereof, such targets including but not limited to, cancer cell or cells that produce autoimmune antibodies associated with an autoimmune disease. The immunoglobulin disclosed herein can be of any type (e.g., IgG, IgE, IgM, IgD, and IgA), class (e.g., IgGl, IgG2, IgG3, IgG4, IgAl and IgA2) or subclass of immunoglobulins. The immunoglobulins can be derived from any species. In one aspect, however, the immunoglobulin is of human, murine, or rabbit origin.

The term "antibody fragment(s)" as used herein comprises a portion of a full length antibody, generally the antigen binding or variable region thereof. Examples of antibody fragments include Fab, Fab', F(ab')2, and Fv fragments; diabodies; linear antibodies; minibodies (Olafsen et al 2004) Protein Eng. Design & Sel. 17(4):3 15-323), fragments produced by a Fab expression library, anti-
idiotypic (anti-Id) antibodies, CDR (complementary determining region), and epitope-binding fragments of any of the above which immunospecifically bind to cancer cell antigens, viral antigens or microbial antigens, single-chain antibody molecules; and multispecific antibodies formed from antibody fragments.

The term "monoclonal antibody" as used herein refers to an antibody obtained from a population of substantially homogeneous antibodies, i.e., the individual antibodies comprising the population are identical except for possible naturally occurring mutations that may be present in minor amounts. Monoclonal antibodies are highly specific, being directed against a single antigenic site.

Furthermore, in contrast to polyclonal antibody preparations which include different antibodies directed against different determinants (epitopes), each monoclonal antibody is directed against a single determinant on the antigen. In addition to their specificity, the monoclonal antibodies are advantageous in that they may be synthesized uncontaminated by other antibodies. The modifier "monoclonal" indicates the character of the antibody as being obtained from a substantially homogeneous population of antibodies, and is not to be construed as requiring production of the antibody by any particular method. For example, the monoclonal antibodies to be used in accordance with the present invention may be made by the hybridoma method first described by Kohler et al (1975) Nature, 256:495, or may be made by recombinant DNA methods (see for example: US 4816567; US 5807715). The monoclonal antibodies may also be isolated from phage antibody libraries using the techniques described in Clackson et al (1991) Nature, 352:624-628; Marks et al (1991) J. Mol. Biol., 222:581-597; for example.

The monoclonal antibodies herein specifically include "chimeric" antibodies in which a portion of the heavy and/or light chain is identical with or homologous to corresponding sequences in antibodies derived from a particular species or belonging to a particular antibody class or subclass, while the remainder of the chain(s) is identical with or homologous to corresponding sequences in antibodies derived from another species or belonging to another antibody class or subclass, as well as fragments of such antibodies, so long as they exhibit the desired biological activity (US 4816567; and Morrison et al (1984) Proc. Natl. Acad. Sci. USA, 81:6851-6855). Chimeric antibodies of interest herein include "primatized" antibodies comprising variable domain antigen-binding sequences derived from a non-human primate (e.g., Old World Monkey, Ape, etc.) and human constant region sequences.

The term "intact antibody" as used herein is one comprising a VL and VH domains, as well as a light chain constant domain (CL) and heavy chain constant domains, CH1, CH2 and CH3. The constant domains may be native sequence constant domains (e.g., human native sequence constant domains) or amino acid sequence variant thereof. The intact antibody may have one or more
"effector functions" which refer to those biological activities attributable to the Fc constant region (a native sequence Fc region or amino acid sequence variant Fc region) of an antibody. Examples of antibody effector functions include Clq binding; complement dependent cytotoxicity; Fc receptor binding; antibody-dependent cell-mediated cytotoxicity (ADCC); phagocytosis; and down regulation of cell surface receptors such as B cell receptor and BCR.

The term "Fc region" as used herein means a C-terminal region of an immunoglobulin heavy chain that contains at least a portion of the constant region. The term includes native sequence Fc regions and variant Fc regions. In one embodiment, a human IgG heavy chain Fc region extends from Cys226, or from Pro230, to the carboxyl-terminus of the heavy chain. However, the C-terminal lysine (Lys447) of the Fc region may or may not be present. Unless otherwise specified herein, numbering of amino acid residues in the Fc region or constant region is according to the EU numbering system, also called the EU index, as described in Kabat et al. Sequences of Proteins of Immunological Interest, 5th Ed. Public Health Service, National Institutes of Health, Bethesda, MD, 1991.

The term "framework" or "FR" as used herein refers to variable domain residues other than hypervariable region (HVR) residues. The FR of a variable domain generally consists of four FR domains: FR1, FR2, FR3, and FR4. Accordingly, the HVR and FR sequences generally appear in the following sequence in VH (or VL): FRI-H1(L1)-FR2-H2(L2)-FR3-H3(L3)-FR4.

Depending on the amino acid sequence of the constant domain of their heavy chains, intact antibodies can be assigned to different "classes." There are five major classes of intact immunoglobulin antibodies: IgA, IgD, IgE, IgG, and IgM, and several of these may be further divided into "subclasses" (isotypes), e.g., IgGl, IgG2, IgG3, IgG4, IgA, and IgA2. The heavy-chain constant domains that correspond to the different classes of antibodies are called α, δ, ε, γ, and μ, respectively. The subunit structures and three-dimensional configurations of different classes of immunoglobulins are well known. Ig forms include hinge-modifications or hingeless forms (Roux et al (1998) J. Immunol. 161:4083-4090; Lund et al (2000) Eur. J. Biochem. 267:7246-7256; US 2005/0048572; US 2004/0229310).

The term "human antibody" as used herein refers to an antibody which possesses an amino acid sequence which corresponds to that of an antibody produced by a human or a human cell or derived from a non-human source that utilizes human antibody repertoires or other human antibody-encoding sequences. This definition of a human antibody specifically excludes a humanized antibody comprising non-human antigen-binding residues.
The term "human consensus framework" as used herein refers to a framework which represents the most commonly occurring amino acid residues in a selection of human immunoglobulin VL or VH framework sequences. Generally, the selection of human immunoglobulin VL or VH sequences is from a subgroup of variable domain sequences. Generally, the subgroup of sequences is a subgroup as in Kabat et al., *Sequences of Proteins of Immunological Interest*, Fifth Edition, NIH Publication 91-3242, Bethesda MD (1991), vols. 1-3. In one embodiment, for the VL, the subgroup is subgroup kappa I as in Kabat et al., *supra*. In one embodiment, for the VH, the subgroup is subgroup III as in Kabat et al., *supra*.

The term "humanized antibody" as used herein refers to a chimeric antibody comprising amino acid residues from non-human HVRs and amino acid residues from human FRs. In certain embodiments, a humanized antibody will comprise substantially all of at least one, and typically two, variable domains, in which all or substantially all of the HVRs (e.g., CDRs) correspond to those of a non-human antibody, and all or substantially all of the FRs correspond to those of a human antibody. A humanized antibody optionally may comprise at least a portion of an antibody constant region derived from a human antibody. A "humanized form" of an antibody, e.g., a non-human antibody, refers to an antibody that has undergone humanization.

The term "hypervariable region" or "HVR," as used herein, refers to each of the regions of an antibody variable domain which are hypervariable in sequence and/or form structurally defined loops ("hypervariable loops"). Generally, native four-chain antibodies comprise six HVRs; three in the VH (HI, H2, H3), and three in the VL (LI, L2, L3). HVRs generally comprise amino acid residues from the hypervariable loops and/or from the "complementarity determining regions" (CDRs), the latter being of highest sequence variability and/or involved in antigen recognition.

Exemplary hypervariable loops occur at amino acid residues 26-32 (LI), 50-52 (L2), 91-96 (L3), 26-32 (HI), 53-55 (H2), and 96-101 (H3). (Chothia and Lesk, *J. Mol. Biol.* 196:901-917 (1987).) Exemplary CDRs (CDR-L1, CDR-L2, CDR-L3, CDR-H1, CDR-H2, and CDR-H3) occur at amino acid residues 24-34 of LI, 50-56 of L2, 89-97 of L3, 31-35B of HI, 50-65 of H2, and 95-102 of H3. (Kabat et al., *Sequences of Proteins of Immunological Interest*, 5th Ed. Public Health Service, National Institutes of Health, Bethesda, MD (1991).) With the exception of CDR1 in VH, CDRs generally comprise the amino acid residues that form the hypervariable loops. CDRs also comprise "specificity determining regions," or "SDRs," which are residues that contact antigen. SDRs are contained within regions of the CDRs called abbreviated-CDRs, or a-CDRs. Exemplary a-CDRs (a-CDR-L1, a-CDR-L2, a-CDR-L3, a-CDR-H1, a-CDR-H2, and a-CDR-H3) occur at amino acid residues 31-34 of LI, 50-55 of L2, 89-96 of L3, 31-35B of HI, 50-58 of H2, and 95-102 of H3. (See Almagro and Fransson, *Front. Biosci.* 13:1619-1633 (2008).) Unless otherwise
indicated, HVR residues and other residues in the variable domain (e.g., FR residues) are numbered herein according to Kabat et al., supra.

The term "variable region" or "variable domain" as used herein refers to the domain of an antibody heavy or light chain that is involved in binding the antibody to antigen. The variable domains of the heavy chain and light chain (VH and VL, respectively) of a native antibody generally have similar structures, with each domain comprising four conserved framework regions (FRs) and three hypervariable regions (HVRs). (See, e.g., Kindt et al. *Kuby Immunology*, 6th ed., W.H. Freeman and Co., page 91 (2007).) A single VH or VL domain may be sufficient to confer antigen-binding specificity. Furthermore, antibodies that bind a particular antigen may be isolated using a VH or VL domain from an antibody that binds the antigen to screen a library of complementary VL or VH domains, respectively. See, e.g., Portolano et al., *J. Immunol.* 150:880-887 (1993); Clarkson et al., *Nature* 352:624-628 (1991).

The term "vector" as used herein, refers to a nucleic acid molecule capable of propagating another nucleic acid to which it is linked. The term includes the vector as a self-replicating nucleic acid structure as well as the vector incorporated into the genome of a host cell into which it has been introduced. Certain vectors are capable of directing the expression of nucleic acids to which they are operatively linked. Such vectors are referred to herein as "expression vectors."

The term "free cysteine amino acid" as used herein refers to a cysteine amino acid residue which has been engineered into a parent antibody, has a thiol functional group (-SH), and is not paired as an intramolecular or intermolecular disulfide bridge.

The term "Linker", "Linker Unit", or "link" as used herein means a chemical moiety comprising a chain of atoms that covalently attaches a drug moiety to an antibody. In various embodiments, a linker is a divalent radical, specified as L.

The term "drug moiety" as used herein means a substance that that inhibits or prevents a cellular function and/or causes cell death or destruction. Cytotoxic agents include, but are not limited to, radioactive isotopes (e.g., At\textsuperscript{211}, I\textsuperscript{131}, I\textsuperscript{123}, Y\textsuperscript{90}, Re\textsuperscript{186}, Re\textsuperscript{188}, Sm\textsuperscript{153}, Bi\textsuperscript{212}, P\textsuperscript{32}, Pb\textsuperscript{212} and radioactive isotopes of Lu); chemotherapeutic agents or drugs (e.g., methotrexate, adriamycin, vinca alkaloids (vincristine, vinblastine, etoposide), doxorubicin, melphanal, mitomycin C, chlorambucil, daunorubicin or other intercalating agents); growth inhibitory agents; enzymes and fragments thereof such as nucleolytic enzymes; and the various antitumor or anticancer agents disclosed below.
As used herein, unless defined otherwise in a claim, the term "acyl" refers to the group -C(0)R', where R' is alkyl, C₃₋₅ cycloalkyl, or heterocyclyl, as each is defined herein.

As used herein, unless defined otherwise in a claim, the term "alkoxy" refers to the group -OR', where R' is C₁₋₅ alkyl or C₃₋₅ cycloalkyl as defined above. Examples of "alkoxy" include methoxy, ethoxy, isopropoxy, propoxy, t-butoxy, isobutoxy, cyclopropoxy, and cyclobutoxy, and halogenated forms thereof, e.g. fluoromethoxy and difluoromethoxy.

As used herein, unless defined otherwise in a claim, the term "alkyl" refers to a straight or branched, monovalent or divalent hydrocarbon chain radical having from one to twelve(Ci-C₁₂) carbon atoms, which may be unsubstituted or substituted with multiple degrees of substitution, for example one, two, three, four, five or six included within the present invention. Examples of substituents are selected from the group consisting of halo, trifluoromethyl, difluoromethyl, amino, alkylamino, cyano, sulfonyl, sulfonamide, sulfoxide, hydroxy, alkoxy, ester, carboxylic acid and alkythio. Examples of "alkyl" as used herein include, but are not limited to, methyl (Me, -CH₃), ethyl (Et, -CH₂CH₃), 1-propyl (n-Pr, n-propyl, -CH₂CH₂CH₃), 2-propyl (i-Pr, i-propyl, -CH(CH₃)CH₂CH₃), 1-butyl (n-Bu, n-butyl, -CH₂CH₂CH₂CH₃), 2-butyl (s-Bu, s-butyl, -CH₂CH₂CH₂CH₂CH₃), 3-butyl (t-Bu, t-butyl, -C(CH₃)₃), 1-pentyl (n-pentyl, -CH₂CH₂CH₂CH₂CH₃), 2-pentyl (i-CH(CH₃)CH₂CH₂CH₃), 3-pentyl (t-CH₂CH₂CH₂CH₂CH₃), 2-methyl-2-butyl (1(CH₃)₂CH₂CH₃), 2-methyl-2-pentyl (t-CH₂CH₂CH₂CH₂CH₃), 2-methyl-2-propyl (1(CH₃)₂CH₂CH₃), 2-methyl-3-butyl (t-CH₂CH₂CH₂CH₂CH₃), 3-methyl-2-butyl (1(CH₃)₂CH₂CH₃), 3-methyl-3-butyl (t-CH₂CH₂CH₂CH₂CH₃), 3-methyl-1-butyl (1(CH₃)₂CH₂CH₂CH₃), 1-hexyl (1(CH₂CH₂CH₂CH₂CH₂CH₃), 2-hexyl (1(CH₂CH₃)CH₂CH₂CH₂CH₃), 3-hexyl (1(CH₂CH₂CH₃)(CH₂CH₂CH₃)), 2-methyl-2-pentyl (1(C(CH₃)₂CH₂CH₂CH₃), 3-methyl-2-pentyl (1(CH(CH₃)CH₂CH₂CH₃), 4-methyl-2-pentyl (1(CH₂CH₃)CH₂CH₂CH₃), 3-methyl-3-pentyl (1(CH₃)(CH₂CH₂CH₃), 2-methyl-3-pentyl (1(CH₂CH₂CH₃)(CH₃)(CH₂CH₂CH₃), 2,3-dimethyl-2-butyl (1(CH₃)(CH₂CH₃)(CH₃)(CH₂CH₃), 3,3-dimethyl-2-butyl (1(CH₂CH₃)(CH₃)(CH₃)(CH₂CH₂CH₃), as well as the divalent ("alkylene") and substituted versions thereof.

Examples of substituted alkyl include but are not limited to, hydroxymethyl, difluoromethyl and trifluoromethyl.

As used herein unless otherwise defined in a claim, the term "alkenyl" means a linear or branched, monovalent or divalent hydrocarbon chain radical of any length from two to eight carbon atoms (C₂₋₈) with at least one site of unsaturation, i.e., a carbon-carbon, sp² double bond, wherein the alkenyl radical may be optionally substituted independently with one or more substituents described above in the definition of "alkyl", and includes radicals having "cis" and "trans"
orientations, or alternatively, "E" and "Z" orientations. Examples of alkenyl include, but are not limited to, ethenyl or vinyl (\(-\text{CH=CH}_2\)), prop-l-ethyl (\(-\text{CH=CHCH}_3\)), prop-2-ethyl (\(-\text{CH}_2\text{CH=CH}_2\)), 2-methylprop-1-ethyl, but-l -enyl, but-2-enyl, but-3-enyl, buta-l,3-dienyl, 2-methylbuta-l,3-diene, hex-l -enyl, hex-2-enyl, hex-3-enyl, hexa-l,3-dienyl as well as the di-valent 5 ("alkenylene") and substituted versions thereof.

As used herein unless otherwise defined in a claim, the term "alkynyl" refers to a linear or branched, monovalent or divalent hydrocarbon radical of any length from two to eight carbon atoms (C\(_2\) to C\(_8\)) with at least one site of unsaturation, i.e., a carbon-carbon, sp triple bond, wherein the alkynyl radical may be optionally substituted independently with one or more substituents described above in the definition of alkyl, examples of alkynyl includes, but not limited to, ethynyl (\(-\text{C≡CH}\)), prop-l -ynyl (\(-\text{C≡CCH}_3\)), prop-2-ynyl (propargyl, -\text{CH}_2\text{C≡CH}\)), but-l -ynyl, but-2-ynyl, andbut-3-ynyl as well as the di-valent ("alkynylene") and substituted versions thereof.

As used herein, unless defined otherwise in a claim, the term "alkylamino" refers to the group -\text{NR'R}^\prime\), wherein R' is H, d-C \(_\text{alkyl}\) or C\(_3\)\(_\text{Cycloalkyl}\), and R" is d-C \(_\text{alkyl}\) or C\(_3\)\(_\text{Cycloalkyl}\), examples of alkylamino include, but are not limited to, methylamino, dimethylamino, ethylamino, diethylamino, propylamino and cyclopropylamino.

As used herein, unless defined otherwise in a claim, the term "amide" refers to the group -\text{C(0)NR'R}^\prime\), wherein R' and R" are each independently H, d-alkyl, or C\(_3\)\(_\text{Cycloalkyl}\); examples of amide include, but are not limited to, -\text{C(0)NH}_2, -\text{C(0)NHCH}_3, and -\text{C(0)N(CH}_3)_2.

As used herein, unless defined otherwise in a claim, the term "aryl" refers to an aromatic, hydrocarbon, ring system. The ring system may be monocyclic or fused polycyclic (e.g., bicyclic, tricyclic, etc.), substituted or unsubstituted. In various embodiments, the monocyclic aryl ring is \(\text{C}_5\text{C}_{10} \) or \(\text{C}_5\text{C}_7\), or d-d, where these carbon numbers refer to the number of carbon atoms that form the ring system. A \(\text{C}_6\) ring system, i.e. a phenyl ring, is an aryl group. In various embodiments, the polycyclic ring is a bicyclic aryl group, where examples of bicyclic aryl groups include are d -d \(_2\), or \(\text{C}_9\text{C}_{10}\). A naphthyl ring, which has 10 carbon atoms, is a polycyclic aryl group. Examples of substituents for aryl are described below in the definition of "optionally substituted".

As used herein, unless defined otherwise in a claim, the term "cyano" refers to the group -\text{CN}.

As used herein, unless defined otherwise in a claim, "cycloalkyl" refers to a non-aromatic, substituted or unsubstituted, saturated or partially unsaturated hydrocarbon ring group. Examples
of substituents are described in the definition of "optionally substituted". In one example, the cycloalkyl group is 3 to 12 carbon atoms (C3-C12). In other examples, cycloalkyl is C3-C6, C7-C10 or C11-C20. In other examples, the cycloalkyl group, as a monocycle, is C3-C6, C7-C10 or C11-C20. In another example, the cycloalkyl group, as a bicycle, is C7-C12. In another example, the cycloalkyl group, as a spiro system, is C7-C12. Examples of monocyclic cycloalkyl include cyclopropyl, cyclobutyl, cyclopentyl, 1-cyclopent-l-enyl, 1-cyclopent-2-enyl, 1-cyclopent-3-enyl, cyclohexyl, perdeuteriocyclohexyl, 1-cyclohex-1-enyl, 1-cyclohex-2-enyl, 1-cyclohex-3-enyl, cyclohexadienyl, cycloheptyl, cyclooctyl, cyclononyl, cyclodecyl, cycloundecyl and cyclododecyl. Exemplary arrangements of bicyclic cycloalkyls having 7 to 12 ring atoms include, but are not limited to, [4,4], [4,5], [5,5], [5,6] or [6,6] ring systems. Exemplary bridged bicyclic cycloalkyls include, but are not limited to, bicyclo[2.2.1]heptane, bicyclo[2.2.2]octane and bicyclo[3.2.2]nonane. Examples of spiro cycloalkyl include, spiro[2.2]pentane, spiro[2.3]hexane, spiro[2.4]heptane, spiro[2.5]octane and spiro[4.5]decane.

As used herein, unless defined otherwise in a claim, the term "ester" refers to the group -C(0)OR', where R' is C1-C10alkyl, or C3-C10 cycloalkyl.

As used herein, unless defined otherwise in a claim, the term "heterocycle" "heterocycloalkyl" or "heterocyclyl" refers to unsubstituted and substituted mono- or polycyclic non-aromatic ring system containing 2 to 12 ring carbon atoms and 1 to 3 ring hetero atoms. Polycyclic ring systems can be fused bi- or tri-cyclic, spiro or bridged. Examples of heteroatoms include N, O, and S, including N-oxides, sulfur oxides, and dioxides. In one embodiment, the ring is three to eight-membered and is either fully saturated or has one or more degrees of unsaturation. Multiple degrees of substitution are included within the present definition. Examples of substituents are defined hereunder. Examples of "heterocyclic" groups include, but are not limited to tetrahydrofuranyl, pyranyl, 1,4-dioxanyl, 1,3-dioxanyl, oxolanyl, oxetanyl, 2-oxa-6-azaspiro[3.3]heptan-6-yl, piperidinyl, pyrrolidinyl, morpholinyl, azetidinyl, piperazinyl, pyrrolidinonyl, piperazinonyl, pyrazolidinyl, imidazolidinyl, imidazolidinyl, and their various tautomers.

As used herein, unless defined otherwise in a claim, the term "heteroaryl", unless defined otherwise in a claim, refers to an aromatic ring system containing 1 to 9 carbon(s) and at least one heteroatom. Examples of heteroatoms include N, O, and S. Heteroaryl may be monocyclic or polycyclic, substituted or unsubstituted. A monocyclic heteroaryl group may have 2 to 6 ring carbon atoms and 1 to 3 ring hetero atoms in the ring, while a polycyclic heteroaryl may contain 3 to 9 ring carbon atoms and 1 to 5 ring hetero atoms. A polycyclic heteroaryl ring may contain fused, spiro or bridged ring junctions, for example, bicyclic heteroaryl is a polycyclic heteroaryl.
Bicyclic heteroaryl rings may contain from 8 to 12 member atoms. Monocyclic heteroaryl rings may contain from 5 to 8 member atoms (carbons and heteroatoms). Exemplary heteroaryl groups include but are not limited to: benzofuranyl, benzothiophenyl, furanyl, imidazolyl, indolyl, azaindolyl, azabenimidazolyl, benzoxazolyl, benzthiazolyl, benzothiadiazolyl, benzoimidazolyl, tetrazinyl, tetrazolyl, isothiazolyl, oxazolyl, isoxazolyl, pyrazinyl, pyrazolyl, pyridazinyl, pyridinyl, pyrimidinyl, pyrrolyl, quinolinyl, quinazolinyl, quinoxaliny, triazinyl, triazolyl, thiazolyl and thiophenyl. Examples of substituents for heteroaryl are described below in the definition of "optionally substituted".

As used herein, unless defined otherwise in a claim, the term "heteroarylalkyl" means the group (heteroaryl)C-C_alkyl.

As used herein, unless defined otherwise in a claim, the term "arylalkyl" means the group (aryl)C-C_alkyl.

As used herein, unless defined otherwise in a claim, the term "urea" refers to the group -NR'C(0)NR", wherein R' and R" are each independently H, C_1-C_6 alkyl, or C_3-C_6 cycloalkyl.

As used herein, unless defined otherwise in a claim, the term "optionally" means that the subsequently described event(s) may or may not occur, and includes both event(s) that occur and event(s) that do not occur.

As used herein, unless defined otherwise, the phrase "optionally substituted", "substituted" or variations thereof denote an optional substitution, including multiple degrees of substitution, with one or more substituent group, for example, one, two or three. The phrase should not be interpreted as duplicative of the substitutions herein described and depicted. Exemplary optional substituent groups include acyl, C_1-C_6 alkyl, sulfonyl, amino, sulfonamide, sulfoxide, alkoxy, cyano, halo, urea, ester, carboxylic acid, amide, hydroxy, oxo, and nitro.

As used herein, unless defined otherwise in a claim, the term "treatment" refers to alleviating the specified condition, eliminating or reducing one or more symptoms of the condition, slowing or eliminating the progression of the condition

As used herein, unless defined otherwise in a claim, the term "effective amount" means that amount of a drug or pharmaceutical agent that will elicit the biological or medical response of a tissue, system, animal, or human that is being sought, for instance, by a researcher or clinician.

As used herein, unless defined otherwise in a claim, the term "therapeutically effective amount" means any amount which, as compared to a corresponding subject who has not received such
amount, results in treatment of a disease, disorder, or side effect, or a decrease in the rate of advancement of a disease or disorder. The term also includes within its scope amounts effective to enhance normal physiological function. For use in therapy, therapeutically effective amounts of a compound of Formula 1, as well as salts thereof, may be administered as the raw chemical.

Additionally, the active ingredient may be presented as a pharmaceutical composition.

This invention also relates to any one of the examples in the Experimental section.

The phrase "pharmaceutically acceptable salt," as used herein, refers to pharmaceutically acceptable organic or inorganic salts of an antibody-drug conjugate (ADC) or a linker-drug moiety. Exemplary salts include, but are not limited, to sulfate, citrate, acetate, oxalate, chloride, bromide, iodide, nitrate, bisulfate, phosphate, acid phosphate, isonicotinate, lactate, salicylate, acid citrate, tartrate, oleate, tannate, pantothenate, bitartrate, ascorbate, succinate, maleate, gentisinate, fumarate, gluconate, glucuronate, saccharate, formate, benzoate, glutamate, methanesulfonate, ethanesulfonate, benzenesulfonate, 2,2'-toluenesulfonate, and pamoate (i.e., 1,1'-methylene-bis-(2-hydroxy-3-naphthoate)) salts. A pharmaceutically acceptable salt may involve the inclusion of another molecule such as an acetate ion, a succinate ion or other counterion. The counterion may be any organic or inorganic moiety that stabilizes the charge on the parent compound. Furthermore, a pharmaceutically acceptable salt may have more than one charged atom in its structure. Instances where multiple charged atoms are part of the pharmaceutically acceptable salt can have multiple counter ions. Hence, a pharmaceutically acceptable salt can have one or more charged atoms and/or one or more counterion.

Other salts, which are not pharmaceutically acceptable, may be useful in the preparation of compounds of this invention and these should be considered to form a further aspect of the invention. These salts, such as oxalic or trifluoroacetate, while not in themselves pharmaceutically acceptable, may be useful in the preparation of salts useful as intermediates in obtaining the compounds of the invention and their pharmaceutically acceptable salts.

Compounds of the present invention may exist in solid or liquid form. In the solid state, it may exist in crystalline or noncrystalline form, or as a mixture thereof. The skilled artisan will appreciate that pharmaceutically acceptable solvates may be formed for crystalline or non-crystalline compounds. In crystalline solvates, solvent molecules are incorporated into the crystalline lattice during crystallization. Solvates may involve non-aqueous solvents such as, but not limited to, ethanol, isopropanol, DMSO, acetic acid, ethanolamine, or ethyl acetate, or they may involve water as the solvent that is incorporated into the crystalline lattice. Solvates wherein water is the solvent incorporated into the crystalline lattice are typically referred to as "hydrates."
Hydrates include stoichiometric hydrates as well as compositions containing variable amounts of water. The invention includes all such solvates.

The skilled artisan will further appreciate that certain compounds of the invention that exist in crystalline form, including the various solvates thereof, may exhibit polymorphism (i.e. the capacity to occur in different crystalline structures). These different crystalline forms are typically known as "polymorphs." The invention includes all such polymorphs. Polymorphs have the same chemical composition but differ in packing, geometrical arrangement, and other descriptive properties of the crystalline solid state. Polymorphs, therefore, may have different physical properties such as shape, density, hardness, deformability, stability, and dissolution properties. Polymorphs typically exhibit different melting points, IR spectra, and X-ray powder diffraction patterns, which may be used for identification. The skilled artisan will appreciate that different polymorphs may be produced, for example, by changing or adjusting the reaction conditions or reagents, used in making the compound. For example, changes in temperature, pressure, or solvent may result in polymorphs. In addition, one polymorph may spontaneously convert to another polymorph under certain conditions.

Compounds of the present invention or a salt thereof may exist in stereoisomeric forms (e.g., it contains one or more asymmetric carbon atoms). The individual stereoisomers (enantiomers and diastereomers) and mixtures of these are included within the scope of the present invention. Likewise, it is understood that a compound or salt of Formula (I) may exist in tautomeric forms other than that shown in the formula and these are also included within the scope of the present invention. It is to be understood that the present invention includes all combinations and subsets of the particular groups defined hereinabove. The scope of the present invention includes mixtures of stereoisomers as well as purified enantiomers or enantiomerically/diastereomerically enriched mixtures. It is to be understood that the present invention includes all combinations and subsets of the particular groups defined hereinabove.

The subject invention also includes isotopically-labelled forms of the compounds of the present invention, but for the fact that one or more atoms are replaced by an atom having an atomic mass or mass number different from the atomic mass or mass number usually found in nature. Examples of isotopes that can be incorporated into compounds of the invention and pharmaceutically acceptable salts thereof include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorous, sulphur, fluorine, iodine, and chlorine, such as 2H, 3H, 11C, 13C, 14C, 15N, 17O, 18O, 31P, 32P, 35S, 18F, 36Cl, 123I and 125I.
Compounds of the present invention and pharmaceutically acceptable salts of said compounds that contain the aforementioned isotopes and/or other isotopes of other atoms are within the scope of the present invention. Isotopically-labelled compounds of the present invention, for example those into which radioactive isotopes such as $^3$H, $^{14}$C are incorporated, are useful in drug and/or substrate tissue distribution assays. Tritiated, i.e., $^3$H, and carbon-14, i.e., $^{14}$C, isotopes are commonly used for their ease of preparation and detectability. $^{11}$C and $^{18}$F isotopes are useful in PET (positron emission tomography), and $^{125}$I isotopes are useful in SPECT (single photon emission computerized tomography), all useful in brain imaging. Further, substitution with heavier isotopes such as deuterium, i.e., $^2$H, can afford certain therapeutic advantages resulting from greater metabolic stability, for example increased in vivo half-life or reduced dosage requirements and, hence, may be preferred in some circumstances. Isotopically labelled compounds of formula I and following of this invention can generally be prepared by carrying out the procedures disclosed in the Schemes and/or in the Examples below, by substituting a readily available isotopically labelled reagent for a non-isotopically labelled reagent.

PHARMACEUTICAL COMPOSITION OF ADCS

Pharmaceutical formulations of therapeutic antibody-drug conjugates (ADC) of the invention are typically prepared for parenteral administration, i.e. bolus, intravenous, intratumor injection with a pharmaceutically acceptable parenteral vehicle and in a unit dosage injectable form. An antibody-drug conjugate (ADC) having the desired degree of purity is optionally mixed with pharmaceutically acceptable diluents, carriers, excipients or stabilizers (Remington's Pharmaceutical Sciences (1980) 16th edition, Osol, A. Ed.), in the form of a lyophilized formulation or an aqueous solution.

CYSTEINE ENGINEEREED ANTIBODIES

The compounds of the invention include antibody-drug conjugates comprising cysteine engineered antibodies where one or more amino acids of a wild-type or parent antibody are replaced with a cysteine amino acid. Any form of antibody may be so engineered, i.e. mutated. For example, a parent Fab antibody fragment may be engineered to form a cysteine engineered Fab, referred to herein as "ThioFab." Similarly, a parent monoclonal antibody may be engineered to form a "ThioMab." It should be noted that a single site mutation yields a single engineered cysteine residue in a ThioFab, while a single site mutation yields two engineered cysteine residues in a ThioMab, due to the dimeric nature of the IgG antibody. Mutants with replaced ("engineered") cysteine (Cys) residues are evaluated for the reactivity of the newly introduced, engineered cysteine thiol groups. The thiol reactivity value is a relative, numerical term in the range of 0 to 1.0 and can be measured for any cysteine engineered antibody. Thiol reactivity values of cysteine engineered antibodies of the invention are in the ranges of 0.6 to 1.0; 0.7 to 1.0; or 0.8 to 1.0.
To prepare a cysteine engineered antibody by mutagenesis, DNA encoding an amino acid
sequence variant of the starting polypeptide is prepared by a variety of methods known in the art.
These methods include, but are not limited to, preparation by site-directed (or oligonucleotide-
mediated) mutagenesis, PCR mutagenesis, and cassette mutagenesis of an earlier prepared DNA
encoding the polypeptide. Variants of recombinant antibodies may be constructed also by
restriction fragment manipulation or by overlap extension PCR with synthetic oligonucleotides.
Mutagenic primers encode the cysteine codon replacement s). Standard mutagenesis techniques
can be employed to generate DNA encoding such mutant cysteine engineered antibodies. General
guidance can be found in Sambrook et al Molecular Cloning, A Laboratory Manual, Cold Spring
Cysteine amino acids may be engineered at reactive sites in an antibody and which do not form
intrachain or intermolecular disulfide linkages (Junutula, et al., 2008b Nature Biotech., 26(8):925-
332:41-52). The engineered cysteine thiols may react with linker reagents or the linker-drug
intermediates of the present invention which have thiol-reactive, electrophilic groups such as
maleimide or alpha-halo amides to form ADC with cysteine engineered antibodies (ThioMabs) and
the drug (D) moiety. The location of the drug moiety can thus be designed, controlled, and known.
The drug loading can be controlled since the engineered cysteine thiol groups typically react with
thiol-reactive linker reagents or linker-drug intermediates in high yield. Engineering an antibody
to introduce a cysteine amino acid by substitution at a single site on the heavy or light chain gives
two new cysteines on the symmetrical antibody. A drug loading near 2 can be achieved and near
homogeneity of the conjugation product ADC.

Cysteine engineered antibodies of the invention preferably retain the antigen binding capability of
their wild type, parent antibody counterparts. Thus, cysteine engineered antibodies are capable of
binding, preferably specifically, to antigens. Such antigens include, for example, tumor-associated
antigens (TAA), cell surface receptor proteins and other cell surface molecules, transmembrane
proteins, signaling proteins, cell survival regulatory factors, cell proliferation regulatory factors,
molecules associated with (for e.g., known or suspected to contribute functionally to) tissue
development or differentiation, lymphokines, cytokines, molecules involved in cell cycle
regulation, molecules involved in vasculogenesis and molecules associated with (for e.g., known
or suspected to contribute functionally to) angiogenesis. The tumor-associated antigen may be a
cluster differentiation factor (i.e., a CD protein). An antigen to which a cysteine engineered
antibody is capable of binding may be a member of a subset of one of the above-mentioned
categories, wherein the other subset(s) of said category comprise other molecules/antigens that
have a distinct characteristic (with respect to the antigen of interest).

Cysteine engineered antibodies are prepared for conjugation with linker-drug intermediates by
reduction and reoxidation of intrachain disulfide groups.

5

TUMOR-ASSOCIATED ANTIGENS:
Antibodies, including but not limited to cysteine engineered antibodies, which may be useful in the
antibody-drug conjugates of the invention in the treatment of cancer include, but are not limited to,
antibodies against cell surface receptors and tumor-associated antigens (TAA). Certain tumor-
associated antigens are known in the art, and can be prepared for use in generating antibodies
using methods and information which are well known in the art. In attempts to discover effective
cellular targets for cancer diagnosis and therapy, researchers have sought to identify
transmembrane or otherwise tumor-associated polypeptides that are specifically expressed on the
surface of one or more particular type(s) of cancer cell as compared to on one or more normal non-
cancerous cell(s). Often, such tumor-associated polypeptides are more abundantly expressed on
the surface of the cancer cells as compared to on the surface of the non-cancerous cells. The
identification of such tumor-associated cell surface antigen polypeptides has given rise to the
ability to more specifically target cancer cells for destruction via antibody-based therapies.
Examples of tumor-associated antigens TAA include, but are not limited to, those listed below.

For convenience, information relating to these antigens, all of which are known in the art, is listed
below and includes names, alternative names, Genbank accession numbers and primary
reference(s), following nucleic acid and protein sequence identification conventions of the
National Center for Biotechnology Information (NCBI). Nucleic acid and protein sequences
corresponding to TAA listed below are available in public databases such as GenBank. Tumor-
associated antigens targeted by antibodies include all amino acid sequence variants and isoforms
possessing at least about 70%, 80%, 85%, 90%, or 95% sequence identity relative to the sequences
identified in the cited references, and/or which exhibit substantially the same biological properties
or characteristics as a TAA having a sequence found in the cited references. For example, a TAA
having a variant sequence generally is able to bind specifically to an antibody that binds
specifically to the TAA with the corresponding sequence listed. The sequences and disclosure in
the reference specifically recited herein are expressly incorporated by reference.

In one embodiment, the antibody binds to one or more of the following polypeptides: BMPR1B; E16; STEAP1; 0772P; MPF; Napi3b; Sema 5b; PSCAhlg; ETBR; MSG783; STEAP2; TrpM4; CRIPTO; CD21; CD79b; FcRH2; HER2; NCA; MDP; IL20Ra; Brevican; EphB2R; ASLG659; PSCA; GEDA; BAFF-R; CD22; CD79a; CXCR5; HLA-DOB; P2X5; CD72; LY64; FcRHI; IRTA2; TENB2; PMEL17; TMEFF1; GDNF-Ral; Ly6E; TMEM46; Ly6G6D; LGR5; RET; LY6K; GPR19; GPR54; ASPHD1; Tyrosinase; TMEM118; GPR172A; and CD33.
In one embodiment, the antibody binds to BMPR1B;
In one embodiment, the antibody binds to E16;
In one embodiment, the antibody binds to STEAP1;
In one embodiment, the antibody binds to 0772P;
In one embodiment, the antibody binds to MPF;
In one embodiment, the antibody binds to NaPi2b;
In one embodiment, the antibody binds to Sema 5b;
In one embodiment, the antibody binds to PSACA hlg;
In one embodiment, the antibody binds to ETBR;
In one embodiment, the antibody binds to MSG783;
In one embodiment, the antibody binds to STEAP2;
In one embodiment, the antibody binds to TrpM4;
In one embodiment, the antibody binds to CRIPTO;
In one embodiment, the antibody binds to CD21;
In one embodiment, the antibody binds to CD79b;
In one embodiment, the antibody binds to FcRH2;
In one embodiment, the antibody binds to HER2;
In one embodiment, the antibody binds to NCA;
In one embodiment, the antibody binds to MDP;
In one embodiment, the antibody binds to IL20Ra;
In one embodiment, the antibody binds to Brevican;
In one embodiment, the antibody binds to EphB2R;
In one embodiment, the antibody binds to ASLG659;
In one embodiment, the antibody binds to PSCA;
In one embodiment, the antibody binds to GEDA;
In one embodiment, the antibody binds to BAFF-R;
In one embodiment, the antibody binds to CD22;
In one embodiment, the antibody binds to CD79a;
In one embodiment, the antibody binds to CXCR5;
In one embodiment, the antibody binds to HLA-DOB;
In one embodiment, the antibody binds to P2X5;
In one embodiment, the antibody binds to CD72;
In one embodiment, the antibody binds to LY64;
In one embodiment, the antibody binds to FcRHI;
In one embodiment, the antibody binds to IRTA2;
In one embodiment, the antibody binds to TENB2;
In one embodiment, the antibody binds to PMEL17;
In one embodiment, the antibody binds to TMEFF1;  
In one embodiment, the antibody binds to GDNF-Ral;  
In one embodiment, the antibody binds to Ly6E;  
In one embodiment, the antibody binds to TMEM46;  
In one embodiment, the antibody binds to Ly6G6D;  
In one embodiment, the antibody binds to LGR5;  
In one embodiment, the antibody binds to RET;  
In one embodiment, the antibody binds to LY6K;  
In one embodiment, the antibody binds to GPR19;  
In one embodiment, the antibody binds to GPR54;  
In one embodiment, the antibody binds to ASPHD1;  
In one embodiment, the antibody binds to Tyrosinase;  
In one embodiment, the antibody binds to TMEM118;  
In one embodiment, the antibody binds to GPR172A;  
In one embodiment, the antibody binds to CD33.

The parent antibody may also be a fusion protein comprising an albumin-binding peptide (ABP) sequence (Dennis et al. (2002) "Albumin Binding As A General Strategy For Improving The Pharmacokinetics Of Proteins" J Biol Chem. 277:35035-35043; WO 01/45746). Antibodies of the invention include fusion proteins with ABP sequences taught by: (i) Dennis et al (2002) J Biol Chem. 277:35035-35043 at Tables III and IV, page 35038; (ii) US 20040001827 at [0076]; and (iii) WO 01/45746 at pages 12-13, and all of which are incorporated herein by reference. Antibodies may be produced using recombinant methods and compositions, e.g., as described in US 4816567 and known in the art. In some embodiments, the antibody is produced in a eukaryotic host cell (e.g., mammalian host cell). In some embodiments, the antibody is produced in a prokaryotic host cell (e.g., E. coli).

In certain embodiments, one or more amino acid modifications may be introduced into the Fc region of an antibody provided herein, thereby generating an Fc region variant. The Fc region variant may comprise a human Fc region sequence (e.g., a human IgGl, IgG2, IgG3 or IgG4 Fc region) comprising an amino acid modification (e.g. a substitution) at one or more amino acid positions.

In certain embodiments, the invention contemplates an antibody variant that possesses some but not all effector functions, which make it a desirable candidate for applications in which the half-life of the antibody in vivo is important yet certain effector functions (such as complement and ADCC) are unnecessary or deleterious. In vitro and/or in vivo cytotoxicity assays can be
conducted to confirm the reduction/depletion of CDC and/or ADCC activities. For example, Fc receptor (FcR) binding assays can be conducted to ensure that the antibody lacks FcγR binding (hence likely lacking ADCC activity), but retains FcRn binding ability.

5 **DRUG LOADING OF ADC**

The drug loading is the average number of drug moieties per antibody. Drug loading may range from 1 to 8 drugs (D) per antibody (Ab), i.e. where 1, 2, 3, 4, 5, 6, 7, and 8 drug moieties are covalently attached to the antibody. Compositions of ADC include collections of antibodies conjugated with a range of drugs, from 1 to 8. The average number of drugs per antibody in preparations of ADC from conjugation reactions may be characterized by conventional means such as mass spectroscopy, ELISA assay, electrophoresis, and HPLC. The quantitative distribution of ADC in terms of p may also be determined. By ELISA, the averaged value of p in a particular preparation of ADC may be determined (Hamblett et al. (2004) Clin. Cancer Res. 10:7063-7070; Sanderson et al. (2005) Clin. Cancer Res. 11:843-852). However, the distribution of p (drug) values is not discernible by the antibody-antigen binding and detection limitation of ELISA. Also, ELISA assay for detection of antibody-drug conjugates does not determine where the drug moieties are attached to the antibody, such as the heavy chain or light chain fragments, or the particular amino acid residues. In some instances, separation, purification, and characterization of homogeneous ADC where p is a certain value from ADC with other drug loadings may be achieved by means such as reverse phase HPLC or electrophoresis.

For some antibody-drug conjugates, p may be limited by the number of attachment sites on the antibody. For example, an antibody may have only one or several cysteine thiol groups, or may have only one or several sufficiently reactive thiol groups through which a linker may be attached. Higher drug loading, e.g. p >5, may cause aggregation, insolubility, toxicity, or loss of cellular permeability of certain antibody-drug conjugates.

Typically, fewer than the theoretical maximum of drug moieties is conjugated to an antibody during a conjugation reaction. An antibody may contain, for example, many lysine residues that do not react with the linker-drug intermediate (X-L-D) or linker reagent. Only the most reactive lysine groups may react with an amine-reactive linker reagent. Also, only the most reactive cysteine thiol groups may react with a thiol-reactive linker reagent or linker-drug intermediate. Generally, antibodies do not contain many, if any, free and reactive cysteine thiol groups which may be linked to a drug moiety. Most cysteine thiol residues in the antibodies of the compounds exist as disulfide bridges and must be reduced with a reducing agent such as dithiothreitol (DTT) or TCEP, under partial or total reducing conditions. The loading (drug/antibody ratio, "DAR") of an ADC may be controlled in several different manners, including: (i) limiting the molar excess of
linker-drug intermediate or linker reagent relative to antibody, (ii) limiting the conjugation reaction time or temperature, and (iii) partial or limiting reductive conditions for cysteine thiol modification.

Where more than one nucleophilic or electrophilic group of the antibody reacts with a linker-drug intermediate, or linker reagent followed by dimer drug moiety reagent, then the resulting product is a mixture of Antibody-drug conjugate s with a distribution of drug moieties attached to an antibody, e.g. 1, 2, 3, etc. Liquid chromatography methods such as polymeric reverse phase (PLRP) and hydrophobic interaction (HIC) may separate compounds in the mixture by drug loading value. Preparations of ADC with a single drug loading value (p) may be isolated, however, these single loading value ADCs may still be heterogeneous mixtures because the drug moieties may be attached, via the linker, at different sites on the antibody. Thus the antibody-drug conjugate compositions of the invention include mixtures of antibody-drug conjugate compounds where the antibody has one or more drug moieties and where the drug moieties may be attached to the antibody at various amino acid residues.

EXEMPLARY DRUG MOIETIES
In some embodiments, an ADC comprising anthracycline. Anthracyclines are antibiotic compounds that exhibit cytotoxic activity. While not intending to be bound by any particular theory, studies have indicated that anthracyclines may operate to kill cells by a number of different mechanisms, including: 1) intercalation of the drug molecules into the DNA of the cell thereby inhibiting DNA-dependent nucleic acid synthesis; 2) production by the drug of free radicals which then react with cellular macromolecules to cause damage to the cells, and/or 3) interactions of the drug molecules with the cell membrane (see, e.g., C. Peterson et al., "Transport And Storage Of Anthracycline In Experimental Systems And Human Leukemia" in Anthracycline Antibiotics In Cancer Therapy; N.R. Bachur, "Free Radical Damage" id. at pp.97-102). Because of their cytotoxic potential anthracyclines have been used in the treatment of numerous cancers such as leukemia, breast carcinoma, lung carcinoma, ovarian adenocarcinoma and sarcomas (see e.g., P.H-Wiernik, in Anthracycline: Current Status And New Developments p 11).

A nonlimiting exemplary ADC comprising nemorubicin or nemorubicin derivatives is shown in Formulas 1a:

(1a)

wherein \(R_{11}\) is hydrogen atom, hydroxy or methoxy group and \(R_{22}\) is a C1-C5 alkoxy group, or a pharmaceutically acceptable salt thereof;

Ll and Z together are a linker (L) as described herein;

T is an antibody (Ab) as described herein; and

\(m\) is 1 to about 20.

In some embodiments, \(m\) is 1 to 10, 1 to 7, 1 to 5, or 1 to 4.

In some embodiments, \(R_{11}\) and \(R_{22}\) are both methoxy (-OMe).

A further non-limiting exemplary ADC comprising nemorubicin or nemorubicin derivatives is shown in Formula 1b:
wherein \( R_1 \) is hydrogen atom, hydroxy or methoxy group and \( R_2 \) is a \( C_2-C_4 \) alkoxy group, or a pharmaceutically acceptable salt thereof;

\[ L_2 \text{ and } Z \text{ together are a linker (L) as described herein;} \]

\[ T \text{ is an antibody (Ab) as described herein; and} \]

\[ m \text{ is 1 to about 20. In some embodiments, } m \text{ is 1 to 10, 1 to 7, 1 to 5, or 1 to 4.} \]

In some embodiments, \( R_1 \) and \( R_2 \) are both methoxy (-OME).

In some embodiments, the nemorubicin component of a nemorubicin-containing ADC is PNU-159682.

In some such embodiments, the drug portion of the ADC may have one of the following structures:
wherein the wavy line indicates the attachment to the linker (L).

Anthracyclines, including PNU-1 59682, may be conjugated to antibodies through several linkage sites and a variety of linkers (US 201 1/0076287; WO2009/099741; US 2010/0034837; WO 2010/009 124), including the linkers described herein.

Exemplary ADCs comprising a nemorubicin and linker include, but are not limited to:

PNU-1 59682 maleimide acetal-Ab;
PNU-1 59682-val-cit-PAB-Ab;
PNU-159682-val-cit-PAB-spacer-Ab;
PNU-1 59682-val-cit-PAB-spacer (R'R^2)-Ab, wherein:

R1 and R2 are independently selected from H and C1-C6 alkyl; and

PNU-1 59682-maleimide-Ab.

The linker of PNU-1 59682 maleimide acetal-Ab is acid-labile, while the linkers of PNU-159682-val-cit-PAB-Ab, PNU-1 59682-val-cit-PAB-spacer-Ab, and PNU-159682-val-cit-PAB-spacer(R'R^2)-Ab are protease cleavable.

Exemplary ADCs comprising an anthracycline derivative and peptidomimetic linker include, but are not limited to:
INDICATIONS AND METHODS OF TREATMENT

It is contemplated that the antibody-drug conjugates (ADC) of the present invention may be used to treat various diseases or disorders, e.g. characterized by the overexpression of a tumor antigen. Exemplary conditions or hyperproliferative disorders include benign or malignant solid tumors and hematological disorders such as leukemia and lymphoid malignancies. Others include neuronal, glial, astrocytal, hypothalamic, glandular, macrophagal, epithelial, stromal, blastocoelic, inflammatory, angiogenic and immunologic, including autoimmune, disorders.

In certain embodiments, an ADC of the invention comprising an anti-NaPi2b antibody, such as those described above, is used in a method of treating solid tumor, e.g., ovarian.

In another embodiment, an ADC of the invention comprising an anti-CD33 antibody, such as those described herein, is used in a method of treating hematological malignancies such as non-

In certain embodiments, an ADC of the invention comprising an anti-HER2 antibody, such as those described above, is used in a method of treating cancer, e.g., breast or gastric cancer, more specifically HER2+ breast or gastric cancer, wherein the method comprises administering such ADC to a patient in need of such treatment. In one such embodiment, the ADC comprises the anti-HER2 antibody trastuzumab or pertuzumab.

Generally, the disease or disorder to be treated is a hyperproliferative disease such as cancer. Examples of cancer to be treated herein include, but are not limited to, carcinoma, lymphoma, blastoma, sarcoma, and leukemia or lymphoid malignancies. More particular examples of such cancers include squamous cell cancer (e.g. epithelial squamous cell cancer), lung cancer including small-cell lung cancer, non-small cell lung cancer, adenocarcinoma of the lung and squamous carcinoma of the lung, cancer of the peritoneum, hepatocellular cancer, gastric or stomach cancer including gastrointestinal cancer, pancreatic cancer, glioblastoma, cervical cancer, ovarian cancer, liver cancer, bladder cancer, hepatoma, breast cancer, colon cancer, rectal cancer, colorectal cancer, endometrial or uterine carcinoma, salivary gland carcinoma, kidney or renal cancer, prostate cancer, vulval cancer, thyroid cancer, hepatic carcinoma, anal carcinoma, penile carcinoma, as well as head and neck cancer.

Autoimmune diseases for which the Antibody-drug conjugates may be used in treatment include rheumatologic disorders (such as, for example, rheumatoid arthritis, Sjogren's syndrome, scleroderma, lupus such as systemic lupus erythematosus (SLE) and lupus nephritis, polymyositis/dermatomyositis, cryoglobulinemia, anti-phospholipid antibody syndrome, and psoriatic arthritis), osteoarthritis, autoimmune gastrointestinal and liver disorders (such as, for
example, inflammatory bowel diseases (e.g., ulcerative colitis and Crohn's disease), autoimmune gastritis and pernicious anemia, autoimmune hepatitis, primary biliary cirrhosis, primary sclerosing cholangitis, and celiac disease), vasculitis (such as, for example, ANCA-associated vasculitis, including Churg-Strauss vasculitis, Wegener's granulomatosis, and polyarteritis), autoimmune neurological disorders (such as, for example, multiple sclerosis, opsoclonus myoclonus syndrome, myasthenia gravis, neuromyelitis optica, Parkinson's disease, Alzheimer's disease, and autoimmune polyneuropathies), renal disorders (such as, for example, glomerulonephritis, Goodpasture's syndrome, and Berger's disease), autoimmune dermatologic disorders (such as, for example, psoriasis, urticaria, hives, pemphigus vulgaris, bullous pemphigoid, and cutaneous lupus erythematosus), hematologic disorders (such as, for example, thrombocytopenic purpura, thrombotic thrombocytopenic purpura, post-transfusion purpura, and autoimmune hemolytic anemia), atherosclerosis, uveitis, autoimmune hearing diseases (such as, for example, inner ear disease and hearing loss), Behcet's disease, Raynaud's syndrome, organ transplant, and autoimmune endocrine disorders (such as, for example, diabetic-related autoimmune diseases such as insulin-dependent diabetes mellitus (IDDM), Addison's disease, and autoimmune thyroid disease (e.g., Graves' disease and thyroiditis)). More preferred such diseases include, for example, rheumatoid arthritis, ulcerative colitis, ANCA-associated vasculitis, lupus, multiple sclerosis, Sjogren's syndrome, Graves' disease, IDDM, pernicious anemia, thyroiditis, and glomerulonephritis.

For the prevention or treatment of disease, the appropriate dosage of an ADC will depend on the type of disease to be treated, as defined above, the severity and course of the disease, whether the molecule is administered for preventive or therapeutic purposes, previous therapy, the patient's clinical history and response to the antibody, and the discretion of the attending physician. The molecule is suitably administered to the patient at one time or over a series of treatments. Depending on the type and severity of the disease, about 1 µg/kg to 15 mg/kg (e.g. 0.1-20 mg/kg) of molecule is an initial candidate dosage for administration to the patient, whether, for example, by one or more separate administrations, or by continuous infusion. A typical daily dosage might range from about 1 µg/kg to 100 mg/kg or more, depending on the factors mentioned above. An exemplary dosage of ADC to be administered to a patient is in the range of about 0.1 to about 10 mg/kg of patient weight.

**EXPERIMENTALS**

**Scheme 1. Synthesis of common intermediate PNU-INT1**
After triphosgene (218.2 mg, 0.735 mmol) in toluene (6 mL) was cooled to 0°C, a solution of compound 1 (600 mg, 1.84 mmol) and triethylamine (372 mg, 3.68 mmol) in toluene (4 mL) were added dropwise. After the reaction mixture was warmed to r.t. over 1 h, the solution was filtered and the solvent was removed under reduced pressure. The crude product was purified by column chromatography on silica gel (EtOAc/Hex 3:7) to give the desired product 2 as white solid (600 mg, 83.9%) MS (ESI): 405.59 [M+NH₄]⁺.

Step 2:
To a solution of compound 3 (150 mg, 0.234 mmol) in anhydrous DCM (2.5 mL), molecular sieves (powder-4 Å, 100 mg), 4-dimethylaminopyridine (142.8 mg, 1.17 mmol) and a solution of compound 2 (272.75 mg, 0.701 mmol) in anhydrous DCM (0.5 mL) were added. The solution was stirred in the dark at 25°C for 5 days. The crude product was purified by prep-TLC (MeOH:CH$_2$Cl$_2$ = 1:40) to give the product 4 (140 mg, 60.2%).

LCMS: (5-95, AB, 1.5 min), 0.983 min, MS = 994.4 [M+H]$^+$; 

Step 3:

To a solution of compound 4 (80.0 mg, 0.080 mmol) in DCM (1 mL) in ice bath, a solution of dichloroacetic acid (1.61 mmol) in DCM (0.4 mL) was added. The solution was stirred at r.t. for 2 h. A mixture of diethyl ether and hexane was added. The crude red solid was used in the next step without further purification (52 mg, 85%).

**Synthesis of INT5**

(S)-4-(2-(1-(5-(2.5-dioxo-2.5-dihydro-lH-pyrrol-1-yl)pentylcarbamoyl)cyclobutanecarboxamido)-5-ureidopentanamido)benzyl 4-nitrophenyl carbonate

**Scheme 1**
5 Procedure

Compound \(1\) (150 g, 1.53 mol) was added to a stirred solution of Compound \(2\) (201 g, 1.53 mol) in \(\text{HOAc}\ (1000 \text{ mL})\). After the mixture was stirred at r.t. for 2 h, it was heated at reflux for 8 h. The organic solvents were removed under reduced pressure and the residue was extracted with \(\text{EtOAc}\ (500 \text{ mL} \times 3)\), washed with \(\text{H}_2\text{O}\). The combined organic layers was dried over \(\text{Na}_2\text{SO}_4\) and concentrated to give the crude product. It was washed with petroleum ether to give compound \(3\) as white solid (250 g, 77.4 %).
DPPA (130 g, 473 mmol) and TEA (47.9 g, 473 mmol) was added to a solution of compound 3 (100 g, 473 mmol) in t-BuOH (200 mL). The mixture was heated at reflux for 8 h under N₂. The mixture was concentrated, and the residue was purified by column chromatography on silica gel (PE:EtOAc= 3:1) to give compound 4 (13 g, 10%).

To a solution of compound 4 (28 g, 992 mmol) in anhydrous EtOAc (30 mL) was added HCl/EtOAc (50 mL) dropwise. After the mixture was stirred at r.t. for 5 h, it was filtered and the solid was dried to give compound 5 (16 g, 73.7%). ¾ NMR (400 MHz, DMSO-d₆; δ 8.02 (s, 2H), 6.99 (s, 2H), 3.37-3.34 (m, 2H), 2.71-2.64 (m, 2H), 1.56-1.43 (m, 4H), 1.23-1.20 (m, 2H).

To a mixture of compound 6 (17.50 g, 0.10 mol) in a mixture of dioxane and H₂O (50 mL / 75 mL) was added K₂CO₃ (34.55 g, 0.25 mol). Fmoc-Cl (30.96 g, 0.12 mol) was added slowly at 0 °C. The reaction mixture was warmed to r.t. over 2 h. Organic solvent was removed under reduced pressure, and the water slurry was adjusted to pH = 3 with 6 M HCl solution, and extracted with EtOAc (100 mL x 3). The organic layer was dried over Na₂SO₄, filtered, and concentrated under reduced pressure to give the desired product 7 (38.0 g, 95.6%).

To a solution of compound 7 (4.0 g, 10 mmol) in a mixture of DCM and MeOH (100 mL / 50 mL) were added 4-amino-phenyl-methanol (8) (1.6 g, 13 mmol, 1.3 eq) and EEDQ (3.2 g, 13 mmol, 1.3 eq). After the mixture was stirred at r.t. for 16 h under N₂, it was concentrated to give a brown.
solid. MTBE (200 mL) was added and it was stirred at 15°C for 2 h. The solid was collected by filtration, washed with MTBE (50 mL × 2) to give the crude product 9 as an orange solid (4.2 g, 84%).

LCMS (ESI): m/z 503.0 [M+1].

To a stirred solution of compound 9 (4.2 g, 8.3 mmol) in dry DMF (20 mL) was added piperidine (1.65 mL, 17 mmol, 2.0 eq) dropwise at r.t. The mixture was stirred at r.t. for 30 min, and solid precipitate formed. Dry DCM (50 mL) was added, and the mixture became transparent immediately. The mixture was stirred at r.t. for another 30 min, and LCMS showed compound 9 was consumed. It was concentrated to dryness under reduced pressure (make sure no piperidine remained), and the residue was partitioned between EtOAc and H₂O (50 mL / 20 mL). Aqueous phase was washed with EtOAc (50 mL × 2) and concentrated to give 10 as an oily residual (2.2 g, 94%) (contained small amount of DMF).

To a solution of compound 11 (8.0 g, 29.7 mmol) in DME (50 mL) was added a solution of compound 10 (6.0 g, 21.4 mmol) and NaHCO₃ (7.48 g, 89.0 mmol) in water (30 mL). After the mixture was stirred at r.t. for 16 h, it was concentrated to dryness under reduced pressure and the residue was purified by column chromatography (DCM:MeOH = 10:1) to give crude compound 12 as white solid (6.4 g, 68.7%).

LCMS (ESI): m/z 435.0 [M+1].
To a stirred solution of compound 12 (6.4 g, 14.7 mmol) in a mixture of THF and MeOH (20 mL/10 mL) was added a solution of LiOH.H2O (1.2 g, 28.6 mmol) in H2O (20 mL) at r.t. After the reaction mixture was stirred at r.t. for 16 h, solvent was removed under reduced pressure, the residue obtained was purified by prep-HPLC to give compound 13 (3.5 g, yield: 58.5%).

LCMS (ESI): m/z 406.9 [M+1].

1H NMR (400 MHz, Methanol-d4) δ 8.86 (d, J = 8.4 Hz, 2 H), 8.51 (d, J = 8.4 Hz, 2 H), 5.88 - 5.85 (m, 1 H), 5.78 (s, 2 H), 4.54 - 4.49 (m, 3 H), 4.38 - 4.32 (m, 1 H), 3.86 - 3.75 (m, 1 H), 3.84 - 3.80 (m, 2 H), 3.28 - 3.21 (m, 1 H), 3.00 - 2.80 (m, 1 H), 2.37 - 2.28 (m, 2 H).

DIPEA (1.59 g, 12.3 mmol) and BOP-Cl (692 mg, 2.71 mmol) was added to a solution of compound 13 (1.0 g, 2.46 mmol) in DMF (10 mL) at 0°C, followed by compound 5 (592 mg, 2.71 mmol). The mixture was stirred at 0°C for 0.5 h. The reaction mixture was quenched with a citric acid solution (10 mL), extracted with DCM/MeOH (10:1). The organic layer was dried and concentrated, and the residue was purified by column chromatography on silica gel (DCM:MeOH = 10:1) to give compound 14 (1.0 g, 71%).

1H NMR (400 MHz, DMSO-d6): δ 10.00 (s, 1H), 7.82-7.77 (m, 2H), 7.53 (d, J = 8.4 Hz, 2H), 7.19 (d, J = 8.4 Hz, 2H), 6.96 (s, 2H), 5.95 (t, J = 6.4 Hz, 1H), 5.39 (s, 2H), 5.08 (t, J = 5.6 Hz, 1H), 4.40-4.35 (m, 3H), 4.09 (d, J = 4.8 Hz, 1H), 3.01 (d, J = 3.2 Hz, 2H), 3.05-2.72 (m, 4H), 2.68-2.58 (m, 3H), 2.40-2.36 (m, 4H), 1.72-1.70 (m, 3H), 1.44-1.42 (m, 1H), 1.40-1.23 (m, 6H), 1.21 - 1.16 (m, 4H).
To a solution of compound 14 (500 mg, 0.035 mmol) in dry DMF (20 ml) was added compound PNP (533 mg, 1.75 mmol) and DIPEA (340 mg, 2.63 mmol) at 20°C, and the mixture was allowed to stir at 16°C for 2 h under N₂ atmosphere. The mixture was concentrated and purified by pre-TLC (DCM/MeOH=10/1) to give the product INT5 (250 mg, 39%) LCMS (ESI, 5-95AB, 1.5 min): 0.842 min, m/z 736.4 [M+1].

**Synthesis of INT6**

4-((2R,5S,Z)-5-(6-(2.5-dioxo-2.5-dihydro-1H-pyrrol-1-yl)hexanamido)-4-fluoro-6-methyl-2-(3-ureidopropyl)hept-3-enamido)benzyl 4-nitrophenyl carbonate

**Scheme 2**
Experimental

A mixture of compound 1 (10.0 g, 85.36 mmol), compound 2 (13.3 g, 89.79 mmol) was stirred at 150 °C for 1 h. The mixture was cooled to 25 °C and solid was dissolved in hot water. The mixture was further cooled in an ice bath. The precipitate was collected by filtration and washed with water. The filter cake was dried to give compound 3 as white solid (19.0 g, 90.0%).

$\frac{1}{2}$ NMR (400 MHz, DMSO-d$_6$) $\delta$ 11.96 (br, 1H), 7.78 - 7.77 (m, 4H), 3.52 (t, $J = 6.8$ Hz, 2H), 2.18 (t, $J = 12$ Hz, 2H), 1.59 - 1.51 (m, 2H), 1.47 - 1.41 (m, 2H).
To a mixture of compound 3 (9.0 g, 36.40 mmol) in anhydrous DCM (100 mL) were added (COCl)₂ (15.0 mL, 157.76 mmol), DMF (1 mL) dropwise at r.t. The reaction mixture was stirred at r.t. for 0.5 h. The mixture was concentrated under reduced pressure, and the residue was diluted in anhydrous THF (60 mL), and concentrated again to give the acyl chloride as yellow solid. To a mixture of compound 4 (6.6 g, 37.25 mmol) in anhydrous THF (60 mL) was added n-BuLi (15.0 mL, 2 M, 37.5 mmol) dropwise at -78 °C under N₂. The above acyl chloride in THF (40 mL) was added slowly into the mixture at -78 °C. The reaction mixture was stirred at -78 °C for 15 min, then quenched with aq. NH₄Cl solution (30 mL). The mixture was extracted with EtOAc washed with water. The combined organic layers was dried over Na₂SO₄, filtered, and concentrated under reduced pressure. The residue was purified by column chromatography on silica gel (PE/EtOAc 3:1) to give crude compound 5 as white solid (13.0 g, 87.9%).

\[ \text{δ 7.89 - 7.83 (m, 4H), 7.32 - 7.28 (m, 2H), 7.25 - 7.22 (m, 1H), 7.19 - 7.17 (m, 2H), 4.66 - 4.60 (m, 1H), 4.30 (t, } J = 8.4 \text{ Hz, 1H), 4.17 (dd, } J = 9.2, 2.8 \text{ Hz, 1H), 3.61 (t, } J = 6.4 \text{ Hz, 2H), 3.00 - 2.78 (m, 4H), 1.70 - 1.60 (m, 4H).} \]

To a solution of compound 6 (3.0 g, 25.39 mmol) in DCM (100 mL) was added PCC (10.9 g, 50.78 mmol). The mixture was stirred at 25 °C for 16 h under N₂. The mixture was filtered through a silica gel plug. The filtrate was concentrated under reduced pressure at a bath temperature of 25 °C to give compound 7 as an oil (1.8 g, 61.0 %).

\[ \text{δ 9.18 (d, } J = 18.4 \text{Hz, 1H), 5.79 (dd, } J = 32.8, 9.2 \text{ Hz, 1H), 3.02 - 2.93 (m, 1H), 1.13 (d, } J = 6.8 \text{ Hz, 6H).} \]
A solution of compound 5 (6.0 g, 14.7 mmol) in DCM (20 mL) was cooled to 0°C with an ice bath. Bu₂BOTf in DCM (1.0 M, 15 mL, 15 mmol) was added dropwise followed by Et₂N (3.03 g, 30 mmol) at a rate to keep the internal temperature below 3°C. The ice bath was replaced by a dry ice-acetone bath. When the internal temperature dropped below -65°C, compound 7 (1.5 g, 12.9 mmol) in DCM (10 mL) was added dropwise. The solution was stirred for 20 min in the dry ice-acetone bath, then for 1 h in ice bath. The reaction mixture was quenched with aqueous phosphate buffer (pH = 7.0, 20 mL) and MeOH (10 mL). To this cloudy solution was added a mixture of MeOH/30% H₂O₂ (2:1, 20 mL) at such a rate as keep the internal temperature below 10°C. After the solution was stirred for an additional 1 h, the volatile was removed on a rotary evaporator at a bath temperature of 25-30°C. The slurry was extracted with EtOAc (50 mL x 3). The combined organic layer was washed with saturated Na₂SO₄ solution (15 mL), 5% NaHC0₃ solution (30 mL) and brine (25 mL). It was dried over Na₂SO₄, filtered and concentrated. The residue was purified by column chromatography on silica gel (PE/EtOAc 3:1) to give crude compound 8 as oil (4.0 g, 59.7%).

LCMS (ESI): m/z 505.0 [M-17].

To a solution of compound 8 (4.0 g, 7.65 mmol) and C₅CCN (1.67 g, 11.48 mmol) in DCM (20 mL) was added DBU (234 mg, 1.53 mmol) at 0°C under N₂. The mixture was stirred at 0°C for 1 h. After the solvent was removed, the residue was purified by column chromatography on silica gel (5%-20% petroleum in EtOAc) to give compound 9 (3.0 g, 58.8%).

LCMS (ESI): m/z 505.1 [M-160].

¾ NMR (400 MHz, CDC1₃) δ 8.47 (s, 1H), 7.83 - 7.80 (m, 2H), 7.72 - 7.69 (m, 2H), 7.36 - 7.28 (m, 2H), 7.28 - 7.22 (m, 3H), 5.69 - 5.63 (q, 1H), 4.89 (dd, J = 37.6, 9.6 Hz, 1H), 4.63 - 4.58 (m,
A solution of compound 9 (3.0 g, 4.50 mmol) in xylene (5 mL) was heated in microwave for 2 h at 135°C. The mixture was cooled to 25 °C and purified by column chromatography on silica gel (5%-10%-50% of petroleum in EtOAc) to give compound 10 (1.4 g, 46.7%).

1H NMR (400 MHz, CDCl₃) δ 7.83 - 7.81 (m, 2H), 7.71 - 7.69 (m, 2H), 7.36 - 7.32 (m, 2H), 7.29 - 7.25 (m, 1H), 7.21 - 7.19 (m, 2H), 6.90 (d, J = 8.8 Hz, 1H), 5.11 (dd, J = 36.4, 9.6 Hz, 1H), 4.81 - 4.76 (m, 1H), 4.68 - 4.64 (m, 1H), 4.30 - 4.16 (m, 3H), 3.75 - 3.68 (m, 2H), 3.27 (dd, J = 13.2, 3.2 Hz, 1H), 2.80 - 2.74 (q, 1H), 2.08 - 2.05 (m, 1H), 1.93 - 1.90 (m, 1H), 1.76 - 1.70 (m, 2H), 1.65 - 1.62 (m, 1H), 1.00 (dd, J = 6.8, 3.2 Hz, 6H).

To a solution of compound 10 (1.4 g, 2.1 mmol) in THF/H₂O (v/v 4:1, 10 mL) was added H₂O₂ (1.43 g, 30 % in water, 12.6 mmol), followed by LiOH H₂O (264.6 mg, 6.3 mmol). After the solution was stirred for 1.5 h at 25 °C, saturated Na₂SO₄ solution (8 mL) was added. After removal of the solvent, the residue was extracted with DCM (20 mL × 2). The aqueous solution was acidified to pH = 1.0 with 1M HCl, and extracted with EtOAc/MeOH (10/1, 25 mL × 3). The combined organic layer was dried over Na₂SO₄, filtered, and concentrated to give compound 11 (1.0 g, 93.4%).

LCMS (ESI): m/z 527.0 [M+Na⁺].
To a solution of compound 11 (1.0 g, 1.97 mmol) and (4-aminophenyl) methanol (364 mg, 2.96 mmol) in DCM/MeOH (v/v 2:1, 7.5 mL) was added EEDQ (732 mg, 2.96 mmol) at 0°C under N₂. The mixture was stirred at 25°C for 16 h. The solvent was removed, and the residue was purified by column chromatography on silica gel (30% petroleum in EtOAc) to give crude compound 13 (1.0 g, 82.8 %).

LCMS (ESI): m/z 614.0 [M+H⁺].

To a solution of compound 13 (1.5 g, 2.45 mmol) in EtOH (20 mL) was added NH₂NH₂·H₂O (471 mg, c = 50 %, 7.35 mmol). The reaction mixture was stirred at 100 °C for 2 h. The mixture was concentrated under reduced pressure to afford compound 14 (1.18 g, 100 %) as crude product.

To a mixture of compound 14 (1.18 g, 2.45 mmol) in DMF (10 mL) was added TEA (496 mg, 4.90 mmol), followed by CDI (795 mg, 4.90 mmol). The mixture was stirred at r.t. for 1 h, then NH₃·H₂O (5 mL) was added. The reaction mixture was stirred at r.t. overnight. After removal of the solvent, the residue was purified by prep-HPLC (FA) to afford compound 15 (350 mg, 27.1 %, 2 steps) as a solid.
\(^1\)H NMR (400 MHz, DMSO-d\(_6\)) \(\delta\) 9.96 (s, 1H), 9.24 (d, \(J = 8.4\) Hz, 1H), 7.53 (d, \(J = 8.4\) Hz, 2H), 7.22 (d, \(J = 8.4\) Hz, 2H), 5.94 (s, 1H), 5.38 (br, 2H), 5.09 (dd, \(J = 38.4, 9.6\) Hz, 1H), 4.42 (s, 2H), 4.07 - 3.97 (m, 1H), 3.50 - 3.40 (m, 2H), 2.95 (dd, \(J = 15.2, 5.2\) Hz, 2H), 2.18 - 2.14 (m, 1H), 1.70 - 1.65 (m, 1H), 1.42 - 1.30 (m, 3H), 0.94 - 0.89 (m, 6H).

To a solution of compound 15 (120 mg, 0.23 mmol) in anhydrous EtOH (10 mL) was added NaBH\(_4\) (104 mg, 2.74 mmol) at 0 °C. The reaction mixture was stirred at r.t. for 4 h. H\(_2\)O (1 mL) was added to quench the reaction. The mixture was concentrated under reduced pressure, and the residue was purified by prep-TLC (DCM/MeOH = 4:1) to afford crude compound 16 (50 mg) which contained an unknown impurity.

To a mixture of compound 16 (50 mg, 0.13 mmol) in DMF (4 mL) was added TEA (39 mg, 0.39 mmol), followed by compound 17 (61 mg, 0.20 mmol). The reaction mixture was stirred at r.t. for 3 h. The mixture was purified by prep-HPLC (FA) to afford compound 18 (30 mg, 40 %) as white solid.

\(^1\)H NMR (400 MHz, DMSO-d\(_6\)) \(\delta\) 9.93 (s, 1H), 8.00 (d, \(J = 8.4\) Hz, 1H), 7.53 (d, \(J = 8.4\) Hz, 2H), 7.21 (d, \(J = 8.4\) Hz, 2H), 7.00 (s, 2H), 5.94 (s, 1H), 5.37 (br, 2H), 4.95 (dd, \(J = 38.8, 9.6\) Hz, 1H), 4.42 (s, 2H), 4.24 - 4.15 (m, 1H), 3.47 - 3.35 (m, 2H), 2.95 (dd, \(J = 10.0, 5.2\) Hz, 2H), 2.13 - 2.09 (m, 2H), 1.90 - 1.85 (m, 1H), 1.20 - 1.15 (m, 1H), 1.49 - 1.43 (m, 6H), 1.28 - 1.25 (m, 1H), 1.19 - 1.15 (m, 2H), 0.84 (dd, \(J = 6.4, 2.8\) Hz, 6H).
To a solution of compound 18 (20 mg, 0.035 mmol) in dry DMF (2 mL) was added PNP carbonate (32 mg, 0.105 mmol) and DIPEA (9 mg, 0.07 mmol) at 20°C. After the mixture was stirred at 16°C for 16 h under N₂, it was filtered and purified by prep-TLC (DCM/MeOH=10/1), to give compound 19 (INT6) (18 mg, yield: 69%).

Synthesis of INT7

4-((S)-2-(4-((S)-l-(6-(2.5-dioxo-2.5-dihydro-1H-pyrrol-1-yl)hexanamido)-2-methylpropyl)-1H-1,2,3-triazol-1-yl)-5-ureidopentanamido)benzyl 4-nitrophenyl carbonate

Scheme 3
Experimental

A solution of NaN₃ (20 g, 285.7 mmol) was dissolved in distilled H₂O (75 mL) and DCM (100 mL) was added. It was cooled in an ice bath and TfO (19.2 mL, 114.28 mmol) was added slowly over 30 min while stirring continued for 3 h. The mixture was placed in a separation funnel and the CH₂Cl₂ phase collected. The aqueous portion was extracted with CH₂Cl₂ (50 mL x 2). The organic fractions, containing the triflyl azide were pooled and washed once with saturated Na₂CO₃ (150 mL) and used without further purification. Compound 1 (10 g, 57.14 mmol) was combined with K₂C₅N₃ (11.83 g, 85.7 mmol) and CuSO₄·5H₂O (1.43 g, 5.71 mmol) distilled H₂O (50 mL) and MeOH (100 mL). The triflyl azide in CH₂Cl₂ (120 mL) generated above was added and the mixture was stirred at r.t. overnight. Subsequently, the organic solvents were removed under reduced pressure and the aqueous slurry was diluted with H₂O (100 mL). It was acidified to pH 6 with cone. HCl and diluted with 0.2 M pH 6.2 phosphate buffer (150 mL) and washed with EtOAc (100 mL x 3) to remove sulfonamide byproduct. The aqueous phase was then acidified to pH 2 with cone. HCl. It was extracted with EtOAc/MeOH (20:1) (100 mL x 4). The EtOAc/MeOH extractions were combined, dried over Na₂SO₄ and evaporated to give compound 2 without further purification (10 g, 87 %).

To a solution of compound 3 (18.00 g, 108.36 mmol) in anhydrous THF (300 mL) was added NaH (5.2 g, 130.03 mmol) at 0 °C. The mixture was stirred at 0 °C for 1 h, then compound 4 (25.64 g, 130.03 mmol) was added slowly into the mixture. The reaction mixture was stirred at 0 °C for 0.5 h. The mixture was filtered, concentrated, and purified by column chromatography on silica gel (PE: EtOAc= 1:1) to give the desired product (20 g, 96 %).

¹H NMR (400 MHz, CDCl₃) δ 3.84 (s, 3H), 3.81 (s, 3H), 2.25 (s, 3H).
To a mixture of compound 6 (20.0 g, 79.59 mmol) in anhydrous DCM (150 mL) was added Et$_3$N (24.16 g, 238.77 mmol) and HATU (45.40 g, 119.39 mmol). The mixture was stirred at r.t. for 15 min, then NHMe(OMe) HCl (11.65 g, 119.39 mmol) was added. The reaction mixture was stirred at r.t. overnight. The mixture was diluted with DCM, washed with saturated aq. Na$_2$CO$_3$ (100 mL × 3), saturated citric acid (100 mL × 3) and brine (100 mL). The organic layer was dried, concentrated, and purified by column chromatography on silica gel (PE: EtOAc = 10: 1) to give the desired product (20.0 g, 85.4 %).

$^1$H NMR (400 MHz, DMSO-$d_6$) $\delta$ 7.97 (s, 1H), 7.73 (d, $J = 9.2$ Hz, 1H), 7.36-7.29 (m, 5H), 6.01 (s, 1H), 5.40 (dd, $J = 5.2$ Hz, 1H), 5.08-4.99 (m, 2H), 4.58 (dd, $J = 2.8$ Hz, 1H), 2.99-2.94 (m, 2H), 2.21-2.02 (m, 4H), 1.02-1.33 (m, 2H), 0.86-0.77 (m, 6H).

Compound 7 (12 g, 40.77 mmol) was dissolved in anhydrous DCM (40 mL) and the resulting solution was cooled to -78°C with a dry ice/acetone bath. DIBAL-H (122.3 mL, 122.3 mmol, 1.0 M in toluene) was added dropwise and the resulting solution was stirred at -78°C for 4 h. Excess hydride was quenched by the addition of MeOH (40 mL) at -78°C and the resulting solution was warmed to r.t. The solution was evaporated to give the compound 8 (~ 9.2 g, 96 %) without further purification.

To a solution of compound 8 (crude, ~9.2 g, 39.1 mmol) and compound 5 (11.27 g, 58.65 mmol) in MeOH (150 mL) was added K$_2$CO$_3$ (16.2 g, 117.3 mmol). The reaction mixture was stirred at r.t. overnight. The mixture was concentrated in vacuum, and purified by column chromatography on silica gel (PE: EtOAc = 50: 1) to give the desired product (4 g, 44 %).
To the solution of compound 9 (4.0 g, 17.29 mmol) and Compound 2 (4.17 g, 20.75 mmol) in DMF (15 mL) was added Cu(CH$_3$CN)$_4$PF$_6$ (1.29 g, 3.46 mmol). The reaction mixture was stirred at 60°C for 2 h. The mixture was purified to give compound 10 (5.0 g, 66.8%).

$^1$H NMR (400 MHz, DMSO-$d_6$) δ 7.97 (s, 1H), 7.73 (d, J = 9.2 Hz, 1H), 7.36-7.29 (m, 5H), 6.01 (s, 1H), 5.40 (dd, J = 5.2 Hz, 1H), 5.08-4.99 (m, 2H), 4.58 (dd, J = 2.8 Hz, 1H), 2.99-2.94 (m, 2H), 2.21-2.02 (m, 4H), 1.02-1.33 (m, 2H), 0.86-0.77 (m, 6H).

To a solution of compound 10 (crude, ~3.8 g, 8.79 mmol) in DMF (15 mL) was added EEDQ (4.34 g, 17.58 mmol) and compound 11 (1.62 g, 13.18 mmol) at 0°C. The reaction mixture was stirred at r.t. under N$_2$ overnight. The mixture was purified by prep-HPLC to give compound 12 (650 mg, 13.7%).

$^1$H NMR (400 MHz, DMSO-$d_6$) δ 10.52 (d, J = 6.8 Hz, 1H), 8.05 (s, 1H), 7.72 (d, J = 9.2 Hz, 2H), 7.33-7.23 (m, 7H), 6.01 (s, 1H), 5.47-5.43 (m, 3H), 5.04-4.96 (m, 2H), 4.59-4.54 (m, 1H), 4.41 (s, 2H), 3.04-2.94 (m, 3H), 2.09-1.97 (m, 4H), 1.24 (t, J = 6.4 Hz, 2H), 0.82-0.74 (m, 6H).
To the reaction of compound 12 (650 mg, 1.21 mmol) in MeOH (15 mL) was added Pd/C (300 mg). The reaction mixture was stirred at r.t. under H₂ for 2 h. The reaction mixture was filtered and the filtrate was concentrated to give the 13 (450 mg, 92%).

LCMS (ESI): RT = 0.61 1 min, M+H⁺ = 404.0. method = 5-95 / 1.5 min.

¾ NMR (400 MHz, OMSO-d₆) δ 10.55 (s, 1 H), 8.03 (d, J = 7.6 Hz, 1H), 7.51 (d, J = 8.4 Hz, 2H), 7.23 (d, J = 8.4, 2H), 6.05 (t, J = 5.6 Hz, 1H), 5.46-5.42 (m, 3H), 5.14 (s, 1H), 4.40 (s, 2H), 3.76 (d, J = 5.2 Hz, 2H), 3.00-2.93 (m, 3H), 2.09-2.04 (m, 2H), 1.90-1.87 (m, 1H), 1.25-1.21 (m, 2H), 0.82-0.77 (m, 6H).

Compound 13 (390 mg, 0.965 mmol) and compound 14 (327 mg, 1.06 mmol) were dissolved in DMF (10 mL) at 16°C. The mixture was stirred at r.t. for 2 h. The mixture was concentrated in vacuum and purified by column chromatography (PE/EtOAc=3/1) to give desire product 15 (400 mg, yield: 54%).

LCMS: (5-95, AB, 1.5 min), 0.726 min, MS=597.1 [M+1];

¾ NMR (400 MHz, DMSO-δ₆) δ 10.52 (s, 1 H), 8.09 (d, J = 9.2 Hz, 1 H), 8.03 (s, 1 H), 7.53 (d, J = 8.4 Hz, 2 H), 7.25 (d, J = 8.4 Hz, 2 H), 7.00 (s, 2 H), 6.03 - 6.00 (t, J = 5.6 Hz, 1 H), 5.45 (s, 1 H), 5.42 (s, 2 H), 5.14 - 5.11 (t, J = 5.8 Hz, 1 H), 4.91 - 4.87 (m, 1 H), 4.43 (d, J = 5.2 Hz, 2 H), 3.38 (s, 2 H), 3.03 - 2.98 (m, 2 H), 2.14 - 2.05 (m, 4 H), 1.50 - 1.46 (m, 4 H), 1.27 - 1.18 (m, 4 H), 0.82 - 0.77 (m, 6 H).
To a solution of compound 15 (30 mg, 0.05 mmol) in dry DMF (2 mL) was added PNP carbonate (46 mg, 0.15 mmol) and DIPEA (13 mg, 0.101 mmol) at 20°C. After the mixture was stirred at 16°C for 16 h under N₂, it was filtered and purified by prep-TLC (DCM/MeOH=10/1) to give 16 (INT7) (25 mg, yield: 65%).

Synthesis of PNU-LD2, PNU-LD3 and PNU-LD4 from the common intermediate.
Scheme 4
Step 1:

To a solution of PNU-INT1 (90.00 mg, 119.08 umol) and compound INT5 (131.42 mg, 178.63 umol) in DMSO (1 mL) was added Et$_3$N (60.25 mg, 592.42 umol) at 25°C. After the reaction mixture was stirred at 25°C for 1 h, it was diluted with H$_2$O (5 mL) and extracted twice with DCM/MeOH (10 mL/1 mL). The organic layer was dried over Na$_2$SO$_4$ and concentrated to give the crude product which was purified by prep-TLC (DCM:MeOH = 10:1) to give the desired product (50 mg, 31%) [4-[[2S]-2-[[1-5-(2,5-dioxopyrrol-l-yl)pentylcarbamoyl]cyclobutanecarbonyl]amino]-5-ureido-pentanoyl]amino]phenyl)methyl N-[2-[[2-]/(2S,4S)-4-[[1S,3R,4aS,9S,9aR,10aS]-9-methoxy-1-methyl-3,4,4a,6,7,9,9a,10a-octahydro-IH-pyrano[1,2]-[oxazolo[3,4-b][1,4]oxazin-3-yl][oxy]-2,5,12-trihydroxy-7-methoxy-6,1 l-dioxo-3,4-dihydro-IH-tetracen-2-yl]-2-oxo-ethoxy]carbonyl-methyl-amino]ethyl]-N-methyl-carbamate PNU-LD2 as a red solid.

LCMS: (10-80, AB, 3.0 min), 1.948 min, MS = 1352.5 [M+H]$^+$;

'$^1$HNMR (400MHZ, CDCl$_3$) δ 13.82 (s, 1H), 13.20 (s, 1H), 7.96 (d, $J$ = 7.2 Hz, 1H), 7.71 (t, $J$ = 8.0 Hz, 1H), 7.53 (d, $J$ = 7.2 Hz, 1H), 7.31 (d, $J$ = 8.0 Hz, 1H), 7.23-7.10 (m, 2H), 6.61 (s, 2H), 5.4 (br, 1H), 5.2-4.4 (m, 10H), 4.01 (s, 6H), 3.53-3.33 (m, 14H), 3.16-2.50 (m, 19H), 1.94-1.18 (m, 22H).

Step 2:

To a solution of PNU-INT1 (11.00 mg, 14.55 umol) and compound INT6 (12.00 mg, 16.01 umol) in DMSO (0.5 mL) was added Et$_3$N (7.36 mg, 72.75 umol) at 25°C. The reaction mixture was stirred at 25°C for 1 h. The reaction mixture was diluted with H$_2$O (3 mL) and extracted twice with
DCM/MeOH (5 mL / 0.5 mL). The organic layer was dried over Na₂SO₄ and concentrated to give the crude product which was purified by prep-TLC (DCM:MeOH=10:1) to give the desired product [4-[[([Z,2R,5S]-5-[6-(2,5-dioxopyrrol-1-yl)hexanoylamino]-4-fluoro-6-methyl-2-(3-ureido)propyl)hept-3-enoyl]amino)phenyl]methyl N-[2-[[2-(2S,4S)-4-[[([1S,3R,4aS,9S,9aR,10aS)-9-methoxy-1-methyl-3,4,4a,6,7,9,9a,10a-octahydro-lH-pyrano[1,2]oxazolo[3,4-b][1,4]oxazin-3-yl]oxy]2,5,12-trihydroxy-7-methoxy-6,11-dioxo-3,4-dihydro-lH-tetracen-2-yl]-2-oxoethoxy]carbonyl-methyl-amino)ethyl]-N-methyl-carbamate PNU-LD4 (6 mg, 31.17%) as a red solid.

The reaction mixture was stirred at 25°C for 1 h. The reaction mixture was diluted with H₂O (3 mL) and extracted twice with DCM/MeOH (5 mL/0.5 mL). The organic layer was dried over Na₂SO₄ and concentrated to give the crude product which was purified by prep-TLC (DCM:MeOH=10:1) to give the desired product [4-[[[(2S)-2-[[[1S,3R,4aS,9S,9aR,10aS)-9-methoxy-1-methyl-3,4,4a,6,7,9,9a,10a-octahydro-lH-pyrano[1,2]oxazolo[3,4-b][1,4]oxazin-3-yl]oxy]2,5,12-trihydroxy-7-methoxy-6,11-dioxo-3,4-dihydro-lH-tetracen-2-yl]-2-oxoethoxy]carbonyl-methyl-amino)ethyl]-N-methyl-carbamate PNU-LD3 (14 mg, 34.89%o) as a red solid.

LCMS: (10-80, AB, 3.0 min), 1.938 min, MS = 1378.5 [M+H]^+;

Method of Preparing ADCs

Preparation of cysteine engineered antibodies for conjugation by reduction and reoxidation

Under certain conditions, the cysteine engineered antibodies may be made reactive for conjugation with linker-drug intermediates of the invention, by treatment with a reducing agent such as DTT (Cleland’s reagent, dithiothreitol) or TCEP (tris(2-carboxyethyl)phosphine hydrochloride; Getz et al (1999) Anal. Biochem. Vol 273:73-80; Soltec Ventures, Beverly, MA). Full length, cysteine...
engineered monoclonal antibodies (ThioMabs) expressed in CHO cells (Gomez et al. 2010) Biotechnology and Bioeng. 105(4):748-760; Gomez et al. (2010) Biotechnol. Prog. 26:1438-1445) were reduced, for example with about a 50 fold excess of DTT overnight at room temperature to reduce disulfide bonds which may form between the newly introduced cysteine residues and the cysteine present in the culture media.

Full length, cysteine engineered monoclonal antibodies (ThioMabs) expressed in CHO cells bear cysteine adducts (cystines) or glutathionylated on the engineered cysteines due to cell culture conditions. To liberate the reactive thiol groups of the engineered cysteines, the ThioMabs are dissolved in 500 mM sodium borate and 500 mM sodium chloride at about pH 8.0 and reduced with about a 50-100 fold excess of 1 mM TCEP (tris(2-carboxyethyl)phosphine hydrochloride (Getz et al (1999) Anal. Biochem. Vol 273:73-80; Soltec Ventures, Beverly, MA) for about 1-2 hrs at 37 °C. Alternatively, DTT can be used as reducing agent. The formation of inter-chain disulfide bonds was monitored either by non-reducing SDS-PAGE or by denaturing reverse phase HPLC PRLP column chromatography. The reduced ThioMab is diluted and loaded onto a HiTrap SP FF column in 10 mM sodium acetate, pH 5, and eluted with PBS containing 0.3M sodium chloride, or 50 mM Tris-Cl, pH 7.5 containing 150 mM sodium chloride.

Disulfide bonds were reestablished between cysteine residues present in the parent Mab by carrying out reoxidation. The eluted reduced ThioMab is treated with 15X or 2 mM dehydroascorbic acid (dhAA) at pH 7 for 3 hours or for 3 hrs in 50 mM Tris-Cl, pH 7.5, or with 2 mM aqueous copper sulfate (CuSO₄) at room temperature overnight. Other oxidants, i.e. oxidizing agents, and oxidizing conditions, which are known in the art may be used. Ambient air oxidation may also be effective. This mild, partial reoxidation step forms intrachain disulfides efficiently with high fidelity. The buffer is exchanged by elution over Sephadex G25 resin and eluted with PBS with ImM DTPA. The thiol/Ab value is checked by determining the reduced antibody concentration from the absorbance at 280 nm of the solution and the thiol concentration by reaction with DTNB (Aldrich, Milwaukee, WI) and determination of the absorbance at 412 nm.

Liquid chromatography/Mass Spectrometric Analysis was performed on a TSQ Quantum Triple quadrupole™ mass spectrometer with extended mass range (Thermo Electron, San Jose California). Samples were chromatographed on a PRLP-S®, 1000 A, microbore column (50mm x
2.1mm, Polymer Laboratories, Shropshire, UK) heated to 75 °C. A linear gradient from 30-40% B (solvent A: 0.05% TFA in water, solvent B: 0.04% TFA in acetonitrile) was used and the eluent was directly ionized using the electrospray source. Data were collected by the Xcalibur® data system and deconvolution was performed using ProMass® (Novatia, LLC, New Jersey). Prior to LC/MS analysis, antibodies or drug conjugates (50 micrograms) were treated with PNGase F (2 units/ml; PROzyme, San Leandro, CA) for 2 hours at 37 °C to remove N-linked carbohydrates.

Hydrophobic Interaction Chromatography (HIC) samples were injected onto a Butyl HIC NPR column (2.5 micron particle size, 4.6 mm x 3.5 cm) (Tosoh Bioscience) and eluted with a linear gradient from 0 to 70% B at 0.8 ml/min (A: 1.5 M ammonium sulfate in 50 mM potassium phosphate, pH 7, B: 50 mM potassium phosphate pH 7, 20% isopropanol). An Agilent 1100 series HPLC system equipped with a multi wavelength detector and Chemstation software was used to resolve and quantitate antibody species with different ratios of drugs per antibody. Cysteine engineered antibodies of the present invention can be prepared according the general method described above.

Conjugation of linker-drug intermediates to antibodies (procedure 1)

Engineered antibody cysteines were blocked as mixed disulfides with glutathione and/or cysteine as expressed in CHO cells. These cysteines had to be "deblocked" prior to conjugation.

Deblocked antibody (5-12 mg/mL) in 20 mM succinate, 150 mM NaCl, 2 mM EDTA was brought to 75-100 mM Tris, pH 7.5-8 (using 1M Tris). Co-solvent (DMSO, DMF, or DMA) was added to the antibody solution, followed by linker-drug (in DMSO or DMF) to give a final -organic solvent of 10-13% and final concentration of linker-drug 2.5-10X relative to antibody concentration. Reactions were allowed to proceed at room temperature for 1-12 hours (until maximum conjugation was achieved). Conjugation reactions were purified via cation exchange chromatography and/or gel filtration using disposable columns (S maxii or Zeba, respectively).

Additional purification by preparative gel filtration (S200 columns) was performed if the crude conjugate was significantly aggregated according to analytical SEC (e.g., >10%). Conjugates were subsequently exchanged into formulation buffer (20 mM His-acetate, pH 5.5, 240 mM sucrose) using either gel filtration or dialysis. Tween-20 was subsequently added to the purified conjugate to reach a final concentration of 0.2%. Final conjugate concentrations ranged from 2.4 to 7.5 mg/mL (%Yield: 34-81% from deblocked antibody). Conjugates were analyzed by LCMS to obtain a measurement of the drug-antibody ratio (DAR), which ranged from 1.3 to 2.1 (average: 1.8). Conjugates were also analyzed for presence of high-molecular weight aggregates using analytical SEC (Zenix or Shodex columns); final, purified conjugates displayed aggregation ranging from 0-10%. Conjugates were also assessed for endotoxin contamination, which, in all
cases, did not exceed 1.3 EU/mg. Free, unconjugated drug did not exceed 1% of the final conjugate.

Conjugation of linker-drug intermediates to antibodies (procedure 2, alternative procedure)

After the reduction and reoxidation procedures of the above example, the antibody is dissolved in PBS (phosphate buffered saline) buffer and chilled on ice. An excess, from about 1.5 molar to 20 equivalents of a linker-drug intermediate with a thiol-reactive functional group such as maleimido or bromo-acetamide, is dissolved in DMSO, diluted in acetonitrile and water, and added to the chilled reduced, reoxidized antibody in PBS. After about one hour, an excess of maleimide is added to quench the reaction and cap any unreacted antibody thiol groups. The conjugation mixture may be loaded and eluted through a HiTrap SP FF column to remove excess drug-linker intermediate and other impurities. The reaction mixture is concentrated by centrifugal ultrafiltration and the cysteine engineered antibody drug conjugate is purified and desalted by elution through G25 resin in PBS, filtered through 0.2 \( \mu \)m filters under sterile conditions, and frozen for storage.

The ADCs of the present invention can be prepared according to the procedure described in the above section.

ASSAYS

Select linkers were then tested and found active in \textit{in vitro} and \textit{in vivo} assays. The cleavage data is shown in the table below.

Cathepsin B cleavage Assay

Like peptide linkers, non-peptide linkers for ADC is expect to be cleavable in lysosome in order for proper drug release. As a digestive organelle of the cell, lysosome is enriched with some proteases which show optimal hydrolytic activity at an acidic pH. Cathepsin B is a representative lysosomal protease and has been shown to contribute to the activation of ADC peptide linkers (ref). As an initial screen, an assay was developed using purified cathepsin B to identify cleavable linker-drug constructs that are suitable for conjugation with antibody. Norfloxacin was used to represent the drug component of the linker-drug. The percentage of cleavage relative to the control peptides (such as Val-Cit) was measured at a given time point as well as the kinetic parameters of the cleavage reaction (Km and Vmax). Detailed description of the assay is shown below. From this assay, a variety of proteolytically active and structurally diverse linkers were identified and later used in making ADCs.
Cathepsin B cleavage activity using experimental linker-drugs as substrate was measured by monitoring the release of Norfloxacin using LC/MS. Varying concentrations of linker-drug (3-fold serial dilutions) were incubated in 20 μL reactions containing 20 nM Cathepsin B (EMD Millipore cat. #219364, human liver), 10 mM MES pH 6.0, 1 mM DTT, 0.03% CHAPS, and 25 nM Norfloxacin-d5 internal standard (Santa Cruz Biotechnology, cat. #sc-301482). Reactions were incubated for 1 hour at 37°C, followed by addition of 60 μL of 2% formic acid to quench the reactions. Samples were analyzed by injecting 2 μL of stopped reactions on a Waters Acquity UPLC BEH Phenyl column (2.1 mm x 50 mm, Waters cat. #186002884). Samples were purified using a linear 2 minute gradient (0% to 80%) of acetonitrile, 0.1% formic acid on a Water Acquity UPLC. Norfloxacin and Norfloxacin-d5 internal standard were detected using an AB Sciex QTrap 5500 triple quadrupole mass spectrometer operating in positive MRM mode (Norfloxacin 320->233 m/z, Norfloxacin-d5 325 ->233 m/z). The quantified norfloxacin (normalized with internal standard) was plotted against linker-drug concentration, and the resulting plot was curve fitted with a Michaelis-Menten fit using GraphPad Prism software for the kinetic constants Km and Vmax.

**In vitro cell proliferation assay**

Efficacy of ADC was measured by a cell proliferation assay employing the following protocol (CELLTITER GLO™ Luminescent Cell Viability Assay, Promega Corp. Technical Bulletin TB288; Mendoza et al (2002) Cancer Res. 62:5485-5488):

1. An aliquot of 100 μL of cell culture containing about 10^4 cells (SKBR-3, BT474, MCF7 or MDA-MB-468) in medium was deposited in each well of a 96-well, opaque-walled plate.

2. Control wells were prepared containing medium and without cells.

3. ADC was added to the experimental wells and incubated for 3-5 days.

4. The plates were equilibrated to room temperature for approximately 30 minutes.

5. A volume of CELLTITER GLO™ Reagent equal to the volume of cell culture medium present in each well was added.

6. The contents were mixed for 2 minutes on an orbital shaker to induce cell lysis.

7. The plate was incubated at room temperature for 10 minutes to stabilize the luminescence signal.

8. Luminescence was recorded and reported in graphs as RLU = relative luminescence units.
Data are plotted as the mean of luminescence for each set of replicates, with standard deviation error bars. The protocol is a modification of the CELLTITER GLO™ Luminescent Cell Viability Assay.

Media: SK-BR-3 grow in 50/50/0%FBS/glutamine/250 μg/mL G-418 OVCAR-3 grow in RPMI/20%FBS/glutamine

In vivo assay

1. The efficacy of the anti-CD33 antibody-drug conjugates (ADCs) was investigated in a mouse xenograft model of HL-60 or EOL-1 (human acute myeloid leukemia). The HL-60 cell line was obtained from ATCC (American Type Culture Collection; Manassas, VA) and EOL-1 cell line was originated from DSMZ (German Collection of Microorganisms and Cell Cultures; Braunschweig, Germany).

Female C.B-17 SCID mice (Charles River Laboratories; Hollister, CA) were each inoculated subcutaneously in the flank area with five million cells of HL-60 or EOL-1. When the xenograft tumors reached an average tumor volume of 100-300 mm³ (referred to as Day 0), animals were randomized into groups of 7-10 mice each and received a single intravenous injection of the ADCs. Approximately 4 hours prior to administration of ADCs, animals were dosed intraperitoneally with excess amount (30mg/kg) of anti-gD control antibody to block possible nonspecific antibody binding sites on the tumor cells. Tumors and body weights of mice were measured 1-2 times a week throughout the study. Mice were promptly euthanized when body weight loss was >20% of their starting weight. All animals were euthanized before tumors reached 3000 mm³ or showed signs of impending ulceration.

2. The efficacy of the anti-Napi2B antibody-drug conjugates (ADCs) was investigated in a mouse xenograft model of OVCAR3-X2.1 (human ovarian cancer). The OVCAR3 cell line was obtained from ATCC (American Type Culture Collection; Manassas, VA) and a sub-line OVCAR3-X2.1 was generated at Genentech for optimal growth in mice.

Female C.B-17 SCID-beige mice (Charles River Laboratories; San Diego, CA) were each inoculated in the thoracic mammary fat pad area with ten million OVCAR3-X2.1 cells. When the xenograft tumors reached an average tumor volume of 100-300 mm³ (referred to as Day 0), animals were randomized into groups of 7-10 mice each and received a single intravenous injection of the ADCs. Tumors and body weights of mice were measured 1-2 times a week throughout the study. Mice were promptly euthanized when body weight loss was >20% of their...
starting weight. All animals were euthanized before tumors reached 3000 mm$^3$ or showed signs of impending ulceration.

3. The efficacy of the anti-CD22 antibody-drug conjugates (ADCs) is investigated in a mouse xenograft model of BJAB-luc (human Burkitt's lymphoma) or WSU-DLCL2 (human diffuse large B-cell lymphoma). The BJAB cell line is obtained from DSMZ (German Collection of Microorganisms and Cell Cultures; Braunschweig, Germany), and a sub-line BJAB-luc is generated at Genentech to stably express the luciferase gene. The WSU-DLCL2 cell line is also originated from DSMZ.

Female C.B-17 SCID mice (Charles River Laboratories; Hollister, CA) are each inoculated subcutaneously in the flank area with 20 million cells of BJAB-luc or WSU-DLCL2. When the xenograft tumors reached an average tumor volume of 100-300 mm$^3$ (referred to as Day 0), animals are randomized into groups of 7-10 mice each and received a single intravenous injection of the ADCs. Tumors and body weights of mice are measured 1-2 times a week throughout the study. Mice are promptly euthanized when body weight loss is >20% of their starting weight. All animals are euthanized before tumors reached 3000 mm$^3$ or showed signs of impending ulceration.

4. The efficacy of the anti-Her2 antibody-drug conjugates (ADCs) is investigated in a mouse allograft model of MMTV-HER2 Founder #5 (murine mammary tumor). The MMTV-HER2 Founder #5 (Fo5) model (developed at Genentech) is a transgenic mouse model in which the human HER2 gene, under transcriptional regulation of the murine mammary tumor virus promoter (MMTV-HER2), is overexpressed in mammary epithelium. The overexpression causes spontaneous development of mammary tumors that overexpress the human HER2 receptor. The mammary tumor from one of the founder animals (founder #5, Fo5) has been propagated in FVB mice (Charles River Laboratories) by serial transplantation of tumor fragments.

For efficacy studies, the Fo5 transgenic mammary tumor is surgically transplanted into the thoracic mammary fat pad of female nu/nu mice (Charles River Laboratories; Hollister, CA) as tumor fragments of approximately 2mm x 2mm in size. When the allograft tumors reached an average tumor volume of 100-300 mm$^3$ (referred to as Day 0), animals are randomized into groups of 7-10 mice each and received a single intravenous injection of the ADCs. Tumors and body weights of mice are measured 1-2 times a week throughout the study. Mice are promptly euthanized when body weight loss is >20% of their starting weight. All animals are euthanized before tumors reached 3000 mm$^3$ or showed signs of impending ulceration.

ADC in vitro Data

The following ADCs were tested in in vitro assays described above and were found to be active. The activities of said ADCs are illustrated in the table below.
ADC in vivo data

The following ADCs were tested in *in vivo* assays described above and were found to be active. The activities of said ADCs are illustrated in Figures 1-2 and the description below.

Figure 1 shows efficacy comparison of CD33 ADCs in SCID mice with HL-60 human acute myeloid leukemia tumors. CD33 PNU ADC3-2 showed dose-dependent inhibition of tumor growth compared with vehicle group. 5 ug/m2 drug dose of ADC3-2 resulted in similar tumor growth delay as ADC2-2 at 15 ug/m2 drug dose. Tumor remission was achieved when CD33 PNU ADC3-2 was given at 15 ug/m2 drug dose. The non-targeting control NaPi2b PNU ADC3-1 had minimal effect on the tumor growth.

Figure 2 shows efficacy comparison of CD33 ADCs in SCID mice with HL-60 human acute myeloid leukemia tumors. CD33 PNU ADC4-2 showed dose-dependent inhibition of tumor growth compared with vehicle group. The anti-tumor activity of CD33 PNU ADC4-2 was comparable with CD33 PNU ADC2-2, resulting in tumor growth delay at drug dose of 10ug/m2 (= 0.4 mg/kg of antibody dose). Tumor regression was achieved when CD33 PNU ADC4-2 was given at drug dose of 20ug/m2. The non-targeting control NaPi2b PNU ADC4-1 had no effect on tumor growth.
Claims

1. An antibody-drug conjugate represented by Formula (I)

\[ \text{Ab—(L—D)} \]

Ab is an antibody;
L is a peptidomimetic linker represented by the following formula

\[ \text{—Str—(PM)—Sp—} \]

wherein
Str is a stretcher unit covalently attached to Ab;
Sp is a bond or spacer unit covalently attached to a drug moiety;
PM is a non-peptide chemical moiety selected from the group consisting of:

![Chemical structure 1](image1)

![Chemical structure 2](image2)

W is -NH-heterocycloalkyl- or heterocycloalkyl;
Y is heteroaryl, aryl, -C(0)Ci-C\text{_	ext{10}}alkylene, Ci-C\text{_	ext{10}}alkenyl, Ci-C\text{_	ext{10}}alkylene or - Ci-C\text{_	ext{10}}alkylene-NH-;
each R\text{1} is independently Ci-C\text{_	ext{10}}alkyl, Q-dialkenyle, (C\text{1}-C\text{10}alkyl)NHC(NH)NH \text{2} or (C\text{1}-
C\text{10}alkyl)NHC(O)NH \text{2};
R\text{3} and R\text{2} are each independently H, C\text{1}-C\text{10}alkyl, C\text{1}-C\text{10}alkenyl, aryalkyl or heteroarylalkyl, or R\text{3}
and R\text{2} together may form a C\text{3}-C\text{7}cycloalkyl ring;
R\text{4} and R\text{5} are each independently Ci-C\text{10}alkyl, Ci-C\text{10}alkenyl, aryalkyl, heteroarylalkyl, (Ci-
C\text{10}alkyl )OCH\text{2} or R\text{4} and R\text{5} together may form a C\text{3}-C\text{7}cycloalkyl ring;
p is an integer from 1 to 8;
D is a drug moiety of Formula (la) or (lb) represented by the following structures:

wherein $R_{11}$ is hydrogen atom, hydroxy or methoxy group and $R_{22}$ is a Cl-C$_4$ alkoxy group, or a pharmaceutically acceptable salt thereof.

2. The antibody-drug conjugate of claim 1 wherein $Y$ is heteroaryl; $R^4$ and $R^5$ together form a cyclobutyl ring.

3. The antibody-drug conjugate of claim 1, wherein $Y$ is a moiety selected from the group consisting of

- 107 -
4. An antibody-drug conjugate of claim 1, wherein
Str is a chemical moiety represented by the following formula:

![Chemical structure](image)

wherein R^6 is selected from the group consisting of Ci-Ci_0 alkyne, Ci-Ci_0 alkenyl, C_3-Qcycloalkyl, (Q-galkyleneX)-, and C_i-C_i_0 alkylene-C(O)N(R^6)-C_2-C_6 alkylene, where each alkyne may be substituted by one to five substituents selected from the group consisting of halo, trifluoromethyl, difluoromethyl, amino, alkylamino, cyano, sulfonyl, sulfonamide, sulfoxide, hydroxy, alkoxy, ester, carboxylic acid, alkylthio, aryl, arylalkyl, C_3-C_6 cycloalkyl, C_4-C_8 heterocycloalkyl, heteroaryalkyl and heteroaryl each R^6 is independently H or Ci-C_9 alkyl; Sp is —Ar—R^b—, wherein Ar is aryl or heteroaryl, R^b is (Ci-Ci_0 alkyylene)O- or Sp is the following formula

![Chemical structure](image)

wherein each n is independently 1-6;
X is N, CH_2 or a bond; and
each R^d is independently H or C_1-C_3 alkyl.

5. The antibody-drug conjugate compound of claim 1, wherein Str has the formula:

![Chemical structure](image)

wherein R^7 is selected from Ci-Ci_0 alkyne, Ci-Ci_0 alkenyl, (Ci-Ci_0 alkylene)O-, N(R^7)-(C_2-C_6 alkyne)-N(R^7) and N(R^7)-(C_2-C_6 alkyne); where each R^c is independently H or Ci-C_9 alkyl; Sp is —Ar—R^b—, wherein Ar is aryl or heteroaryl, R^b is (Ci-Ci_0 alkylene)O- or Sp is the following formula
wherein
each \( n \) is independently 1-6;
\( X \) is \( N, \text{CH}_2 \) or a bond; and
each \( R^d \) is independently \( H \) or \( \text{Ci-C}_3\text{alkyl} \).

6. The antibody-drug conjugate compound of claim 4, wherein
\( L \) is non-peptide chemical moiety represented by the following formula

\[
\begin{align*}
\text{Str} & \quad R_1 \quad R_2 \\
\text{O} & \quad \text{N} & \quad \text{Y} & \quad \text{Sp} \\
\text{O} & \quad \text{N} & \quad \text{H} \quad \text{C} & \quad \text{H} \\
R_1 & \quad R_2 & \quad R_3 & \quad \text{Str} \\
\end{align*}
\]

\( R_1 \) is \( \text{C}_1-\text{C}_9\text{alkyl} \), \( \text{C}_1-\text{C}_9\text{alkenyl} \), \( (\text{C}_1-\text{C}_9\text{alkyl})\text{NHC(NH)}\text{NH}_2 \) or \( (\text{C}_1-\text{C}_9\text{alkyl})\text{NHC(0)}\text{NH}_2 \);
\( R_3 \) and \( R_2 \) are each independently \( H, \text{Ci-C}_1\text{alkyl} \).

7. The antibody-drug conjugate compound of claim 4, wherein
\( L \) is non-peptide chemical moiety represented by the following formula

\[
\begin{align*}
\text{Str} & \quad R_4 \quad R_5 \\
\text{O} & \quad \text{N} & \quad \text{H} & \quad \text{C} & \quad \text{H} \\
\text{O} & \quad \text{N} & \quad \text{H} & \quad \text{C} & \quad \text{H} \\
R_1 & \quad R_4 & \quad R_5 & \quad \text{Str} \\
\end{align*}
\]

\( R_1 \) is \( \text{C}_1-\text{C}_9\text{alkyl} \), \( (\text{C}_1-\text{C}_9\text{alkyl})\text{NHC(NH)}\text{NH}_2 \) or \( (\text{C}_1-\text{C}_9\text{alkyl})\text{NHC(0)}\text{NH}_2 \);
\( R_4 \) and \( R_5 \) together form a \( \text{C}_3-\text{C}_7\text{cycloalkyl} \) ring.

8. The antibody-drug conjugate compound of claim 4, wherein
\( L \) is non-peptide chemical moiety represented by the following formula

\[
\begin{align*}
\text{Str} & \quad W \\
\text{O} & \quad \text{N} & \quad \text{H} \quad \text{C} & \quad \text{H} \\
\text{O} & \quad \text{N} & \quad \text{H} \quad \text{C} & \quad \text{H} \\
W & \quad \text{Str} & \quad R_1 & \quad \text{Sp} \\
\end{align*}
\]
9. The antibody-drug conjugate compound of claim 4 represented by the following formula:

\[
\text{Ab} \quad \begin{array}{c}
\text{Str} \\
\text{NH} \\
\text{Y} \\
\text{NH} \\
\text{Sp} \\
\text{D}
\end{array}
\] \\
\begin{array}{c}
\text{O} \\
\text{R}^3 \\
\text{R}^2 \\
\text{R}^1
\end{array}
\] \\
\begin{array}{c}
\text{p}
\end{array}
\]

wherein
\[ R^1 \text{ is } C_1-C_\alpha \text{alkyl, (}C_\alpha-C_\alpha \text{alkyl\text{)}}\text{NHC(NH)NH or (}C_\alpha-C_\alpha \text{alkyl\text{)}}\text{NHC(O)NH.} \]

10. The antibody-drug conjugate compound of claim 7 represented by the following formula:

\[
\text{Ab} \quad \begin{array}{c}
\text{Str} \\
\text{NH} \\
\text{Y} \\
\text{NH} \\
\text{Sp} \\
\text{D}
\end{array}
\] \\
\begin{array}{c}
\text{O} \\
\text{R}^3 \\
\text{R}^2 \\
\text{R}^1
\end{array}
\] \\
\begin{array}{c}
\text{p}
\end{array}
\]

wherein
\[ R^6 \text{ is selected from the group consisting of } C_1-C_\alpha \text{alkylene, and } C_1-C_\alpha \text{alkylene-C(O)N(}R^\alpha\text{-C}_2\text{-}}C_\alpha \text{alkylene, where each alkylene may be substituted by one to five substituents selected from the group consisting of halo, trifluoromethyl, difluoromethyl, amino, alkylamino, cyano, sulfonyl, sulfonamide, sulfoxide, hydroxy, alkoxy, ester, carboxylic acid, alkylthio, aryl, arylalkyl, } C_3-C_7 \text{cycloalkyl, } C_4-C_7 \text{heterocycloalkyl, heteroarylalkyl and heteroaryl each } R^\alpha \text{is independently } H \text{ or } C_1-C_\alpha \text{alkyl;}
\]
\[ p \text{ is 1, 2, 3 or 4.} \]
group consisting of halo, trifluoromethyl, difluoromethyl, amino, alkylamino, cyano, sulfonyl, sulfonamide, sulfoxide, hydroxy, alkoxy, ester, carboxylic acid, alkylthio, aryl, arylalkyl, C₃-C₆ cycloalkyl, C₄-C₇ heterocycloalkyl, heteroarylalkyl and heteroaryl each Rᵢ is independently H or Ci-C₇ alkyl;
p is 1, 2, 3 or 4.

11. The antibody-drug conjugate compound of any one of claims 4, wherein Y is heteroaryl, aryl or alkenyl; R⁶ is Ci-Cᵢ alkylene.

12. The antibody-drug conjugate compound of claim 11, wherein Y is

13. The antibody-drug conjugate compound of claim 11, wherein Y is

14. The antibody-drug conjugate compound of claim 11, wherein Y is

15. A compound of any one of claims 9, wherein

Str is a chemical moiety represented by the following formula:

R⁶ is Ci-Cᵢ alkylene;
Sp is the following formula
wherein each $n$ is independently 1-6; $X$ is $N$, $CH_2$ or a bond; and each $R^d$ is independently $H$ or $C_i$-$C_3$alkyl.

16. The antibody-drug conjugate compound of claim 9, which is represented by the following formula:

![Diagram](image1)

$I(A2)$

wherein $R^1$ is $C_1$-$C_6$alkyl-$NH_2$, $(C_i$-$C_alkyl)NHC(NH)NH_2$ or $(C_i$-$C_alkyl)NHC(0)NH_2$; $p$ is 1, 2, 3 or 4; $Sp$ is the following formula

![Diagram](image2)

wherein each $n$ is independently 1-6; $X$ is $N$, $CH_2$ or a bond; and
each $R^d$ is independently H or $\text{Ci-C}_3\text{alkyl}$.

17. The antibody-drug conjugate compound of claim 7, which is represented by the following formula:

$$\text{(I)(B2)}$$

wherein

- $p$ is 1, 2, 3 or 4;
- $R^1$ is $\text{C}_1\text{-C}_6\text{alkyl-NH}_2$, $(\text{Ci-C}_3\text{alkyl})\text{NHC(NH)}_2$ or $(\text{Ci-C}_3\text{alkyl})\text{NHC(0)NH}_2$;
- $R^4$ and $R^5$ are each independently $\text{Ci-C}_3\text{alkyl}$, wherein said alkyl are unsubstituted, or $R^4$ and $R^5$ may form a $\text{C}_3\text{-C}_7\text{cycloalkyl}$ ring; and
- $Sp$ is the following formula:

$$\text{Sp}$$

wherein

- each $n$ is independently 1-6;
- $X$ is $\text{N}$, $\text{CH}_2$ or a bond; and
- each $R^d$ is independently H or $\text{Ci-C}_3\text{alkyl}$.

$$\text{(I)(D)(LD1)}$$
wherein

Str is a stretcher unit which can be covalently attached to an antibody;
Sp is a bond or a spacer unit covalently attached to a drug moiety;

\( R^1 \) is \( C_1-C_{10} \) alkyl, \( (C_1-C_{10} \) alkyl)NHC(NH)NH\( _2 \) or \( (C_1-C_{10} \) alkyl)NHC(O)NH\( _2 \);

\( R^4 \) and \( R^5 \) are each independently \( C_1-C_{10} \) alkyl, aryalkyl, heteroarylalkyl, \( (C_1-C_{10} \) alkyl)OCH\( _2 \)-, or \( R^4 \) and \( R^5 \) may form a \( C_3-C_7 \) cycloalkyl ring;

D is a drug moiety of Formula (la) or (lb) represented by the following structures:

![Chemical structure image](image.png)

(la)

![Chemical structure image](image.png)

(lb)

wherein \( R'^{11} \) is hydrogen atom, hydroxy or methoxy group and \( R'^{22} \) is a \( C_1-C_3 \) alkoxy group, or a pharmaceutically acceptable salt thereof.

19. The compound of claim 18 represented by the following formula
wherein \( R_i \) is \( \text{Cl-Ci}_0 \) alkylene; \( R^4 \) and \( R^5 \) together form a \( \text{C}_3-\text{C}_7 \) cycloalkyl ring.

20. The compound of claim 18 represented by the following formula

\[
\text{Formula: (I)(B)(LD3)}
\]

wherein
\( R^1 \) is \( \text{d-C}_\varphi \text{alkyl-NH}_2 \), \( \text{(C}_1-\text{C}_\varphi \text{alkyl})\text{NHC(NH)NH}_2 \) or \( \text{(C}_1-\text{C}_\varphi \text{alkyl})\text{NHC(O)NH}_2 \);
\( R^4 \) and \( R^5 \) are each independently \( \text{Cl-C}_\varphi \text{alkyl} \), wherein said alkyl are unsubstituted, or \( R^4 \) and \( R^5 \) may form a \( \text{C}_3-\text{C}_7 \) cycloalkyl ring; and
\( \text{Sp} \) is the following formula

\[
\text{Formula: (I)(B)(LD3)}
\]

wherein
each \( n \) is independently 1-6;
\( X \) is \( \text{N} \), \( \text{CH}_2 \) or a bond; and
each \( \text{Rd} \) is independently \( \text{H} \) or \( \text{Cl-C}_3 \text{alkyl} \).

21. A compound of Formula:
wherein
Str is a stretcher unit which can be covalently attached to an antibody;
Sp is an optional spacer unit covalently attached to a drug moiety;
Y is heteroaryl, aryl, -C(0)Ci-C\_alkenyl, Ci-C\_alkenyl or - Ci-C\_alkenyl-NH;
R^1 is C\_i\_C\_0 alkyl, (C\_i\_C\_0 alkyl)NHC(NH)NH\_2 or (C\_i\_C\_m alkyl)NHC(O)NH\_2;
R^3 and R^2 are each independently H, Ci-C\_alkyl, arylalkyl or heteroarylalkyl, or R^3 and R^2
together may form a C\_3-C\_7 cycloalkyl;
D is a drug moiety of Formula (la) or (lb) represented by the following structures

wherein R\_11 is hydrogen atom, hydroxy or methoxy group and R\_22 is a C\_3-C\_5 alkoxy group, or a
pharmaceutically acceptable salt thereof.

22. The compound of claim 21 represented by the following formula:
wherein

R̄₁ is C₁₋₅ alkyl, (C₁₋₁₀ alkyl)NHC(NH)NH or (C₁₋₁₀ alkyl)NHC(O)NH;
R₃ and R₂ are each independently H, C₆₋₁₀ alkyl, arylalkyl or heteroarylalkyl, or R₃ and R₂
together may form a C₃₋₇ cycloalkyl;
R₆ is C₁₋₅ alkylenne; and
Sp is the following formula

wherein

each n is independently 1-6;
X is N, CH₂ or a bond; and
each R₄ is independently H or d-C₃₋₅ alkyl.

23. The compound of claim 22 represented by the following formula:

24. The compound of claim 18 or 21, wherein Str has the following formula:
wherein $R^6$ is selected from the group consisting of $C_i-C_{10}$alkylene, $C_3-C_6$cycloalkyl, 0-(Ci-
$C_8$alkylene), and $C_i-C_{10}$alkylene-C(O)N($R^a$)-$C_7-C_9$alkylene, where each alkyne may be
substituted by one to five substituents selected from the group consisting of halo, trifluoromethyl,
difluoromethyl, amino, alkylamino, cyano, sulfonyl, sulfonamide, sulfoxide, hydroxy, alkoxy,
ester, carboxylic acid, alkylthio, aryl, arylalkyl, $C_3-C_6$cycloalkyl, $C_4-C_9$heterocycloalkyl and
heteroaryl each $R^a$ is independently H or Ci-Cgalkyl;

Sp is $—Ar—R^b—$, wherein Ar is aryl or heteroaryl, $R^b$ is (Ci-Cgalkylene)O- or Sp is the following
formula

wherein
each n is independently 1-6;
$X$ is N, CH$_2$ or a bond; and
each $R^d$ is independently H or $C_3$-alkyl.

25. The compound of claim 24, wherein $R^6$ is $C_1-C_{10}$alkylene,
Sp is the following formula

wherein
each n is independently 1-6;
X is N, CH₂ or a bond; and
each Rᵣ is independently H or Ci-C₃ alkyl.

26. The compound of claim 18 and 21, where R₆ is -(CH₂)₅;

27. The compound of claim 18 or 21, wherein Str has the formula:

(Other structural formula)

wherein R⁴ is selected from Ci-Cᵢ₀ alkylene, Ci-Cᵢ₀ alkylene-O, N(R⁴)-(C₂-C₆ alkylene)-N(R⁵) and N(R⁴)-(C₂-C₆ alkylene); where each R⁵ is independently H or Ci-C₆ alkyl;
Sp is —Ar—Rᵇ—, wherein Ar is aryl or heteroaryl, Rᵇ is (Ci-Cᵢ₀ alkylene)₀- or Sp is the following formula

(Another structural formula)

wherein
each n is independently 1-6;
X is N, CH₂ or a bond; and
each Rᵣ is independently H or Ci-C₃ alkyl.

28. The compound of claim 23, wherein R⁶ is C₁-C₁₀ alkylene,
Sp is the following formula

(Third structural formula)

wherein
each n is independently 1-6;
X is N, CH₂ or a bond; and
each Rₖ is independently H or C₃_alkyl.

29. The antibody-drug conjugate according to any one of claims 1-17, wherein p is 2.

30. The antibody-drug conjugate of any one of claims 1-17, wherein the antibody binds to one
or more of polypeptides selected from the group consisting of:
   - CLL1;
   - BMPR1B;
   - E16;
   - STEAP1;
   - 0772P;
   - MPF;
   - NaPi2b;
   - Sema 5b;
   - PSCA hlg;
   - ETBR;
   - MSG783;
   - STEAP2;
   - TrpM4;
   - CRIPTO;
   - CD21;
   - CD79b;
   - FcRH2;
   - HER2;
   - NCA;
   - MDP;
   - IL20Ra;
   - Brevican;
   - EphB2R;
   - ASLG659;
   - PSCA;
   - GEDA;
   - BAFF-R;
   - CD22;
   - CD79a;
   - CXCR5;
HLA-DOB; P2X5; CD72; LY64; FcRHI; IRTA2; TENB2; PMEL17; TMEFF1; GDNF-Ral; Ly6E; TMEM46; Ly6G6D; LGR5; RET; LY6K; GPR19; GPR54; ASPHD1; Tyrosinase; TMEM118; GPR172A; MUC16 and CD33.

32. A pharmaceutical composition comprising a compound of claim 1 and a pharmaceutically acceptable carrier thereof.

33. The antibody-drug conjugate of claim 30, wherein the antibody binds to one or more of polypeptides selected from the group consisting of:
   CLL1;
   STEAP1;
   NaPi2b;
   STEAP2;
TrpM4; CRIPTO; CD21; CD79b; FcRH2; HER2; CD22; CD79a; CD72; LY64; Ly6E; MUC16; and CD33.

34. The antibody-drug conjugate of any one of claims 1-17, wherein the antibody binds to CD33.

35. The antibody-drug conjugate of claim 34, wherein the anti-CD33 antibody comprise an HVR-L1 comprising the amino acid sequence of SEQ ID NO: 1, an HVR-L2 comprising the amino acid sequence of SEQ ID NO: 12, an HVR-L3 comprising the amino acid sequence of SEQ ID NO: 13, an HVR-H1 comprising the amino acid sequence of SEQ ID NO: 14, an HVR-H2 comprising the amino acid sequence of SEQ ID NO: 15, and an HVR-H3 comprising the amino acid sequence of SEQ ID NO: 16.

36. The antibody-drug conjugate of claim 34, wherein said anti-CD33 antibody comprises a VL domain comprising the amino acid sequence of SEQ ID NO: 17 and a VH domain comprising the amino acid sequence of SEQ ID NO: 18.

37. The antibody-drug conjugate of claim 34, wherein said anti-CD33 antibody comprises an amino acid sequence of SEQ ID NO: 19 and an amino acid sequence of SEQ ID NO: 20.

38. The antibody-drug conjugate of claim 34, wherein said anti-CD33 antibody comprises an amino acid sequence that has at least 95% sequence identity with amino acid sequence of SEQ ID NO: 19 and that comprises an amino acid sequence that has at least 95% sequence identity with an amino acid sequence of SEQ ID NO: 20.

39. The antibody-drug conjugate of any one of claims 1-17, wherein the antibody binds to NaPi2b.
40. The antibody-drug conjugate of claim 39, wherein the NaPi2b antibody comprise an HVR-
L1 comprising the amino acid sequence of SEQ ID NO:1, an HVR-L2 comprising the amino acid 
sequence of SEQ ID NO:2, an HVR-L3 comprising the amino acid sequence of SEQ ID NO:3, an 
HVR-H1 comprising the amino acid sequence of SEQ ID NO: 4, an HVR-H2 comprising the 
amino acid sequence of SEQ ID NO:5, and an HVR-H3 comprising the amino acid sequence of 
SEQ ID NO: 6.

41. The antibody-drug conjugate of claim 39, wherein said NaPi2b antibody comprises a VL 
domain comprising the amino acid sequence of SEQ ID NO:7 and a VH domain comprising the 
amino acid sequence of SEQ ID NO:8.

42. The antibody-drug conjugate of claim 39, wherein said NaPi2b antibody comprises an 
amino acid sequence of SEQ ID NO:9 and an amino acid sequence of SEQ ID NO: 10.

43. The antibody-drug conjugate of claim 39, wherein said NaPi2b antibody comprises an 
amino acid sequence that has at least 95% sequence identity with amino acid sequence of SEQ ID 
NO:9 and that comprises an amino acid sequence that has at least 95% sequence identity with an 
amino acid sequence of SEQ ID NO: 10.

44. The antibody-drug conjugate of any one of claims 1-22, wherein the antibody binds to 
CD-22.

45. The antibody-drug conjugate of claim 44, wherein the CD-22 antibody comprise an HVR-
L1 comprising the amino acid sequence of SEQ ID NO:41, an HVR-L2 comprising the amino acid 
sequence of SEQ ID NO:42, an HVR-L3 comprising the amino acid sequence of SEQ ID NO:43, an 
HVR-H1 comprising the amino acid sequence of SEQ ID NO: 44, an HVR-H2 comprising the 
amino acid sequence of SEQ ID NO:45, and an HVR-H3 comprising the amino acid sequence of 
SEQ ID NO: 46.

46. The antibody-drug conjugate of claim 44, wherein said CD-22 antibody comprises a VL 
domain comprising the amino acid sequence of SEQ ID NO:47 and a VH domain comprising the 
amino acid sequence of SEQ ID NO:48.

47. The antibody-drug conjugate of claim 44, wherein said CD-22 antibody comprises an 
amino acid sequence of SEQ ID NO:49 and an amino acid sequence of SEQ ID NO: 50.
48. The antibody-drug conjugate of claim 44, wherein said CD-22 antibody comprises an amino acid sequence that has at least 95% sequence identity with amino acid sequence of SEQ ID NO:49 and that comprises an amino acid sequence that has at least 95% sequence identity with an amino acid sequence of SEQ ID NO: 50.
Figure 1 (HL-60)

Tumor Volume, mm$^3$

Day

- 01 - Vehicle
- 02 - NaPi3b PNU ADC3-1, 0.6 mg/kg (=15 ug/m²)
- 03 - CD33 PNU ADC2-2, 0.7 mg/kg (=15 ug/m²)
- 04 - CD33 PNU ADC3-2, 0.2 mg/kg (=5 ug/m²)
- 05 - CD33 PNU ADC3-2, 0.7 mg/kg (=15 ug/m²)
Figure 2 (HL-60)
