Abstract:
The invention provides methods of treating or delaying progression of cancer in an individual comprising administering to the individual an anti-human OX40 agonist antibody and an anti-PDL1 antibody. In some embodiments, the anti-human OX40 agonist antibody is administered in a dose selected from about 0.8mg, about 3.2mg, about 12mg, about 40mg, about 80mg, about 130mg, about 160mg, about 300mg, about 320mg, about 400mg, about 600mg, and about 1200mg, and the anti-PDL1 antibody is administered at a dose of about 800mg or about 1200mg.
METHODS OF TREATING CANCER USING ANTI-OX40 ANTIBODIES AND PD-1 AXIS BINDING ANTAGONISTS

CROSS REFERENCE TO RELATED APPLICATIONS

This application claims the priority benefit of U.S. Provisional Application Serial Nos. 62/172,803, filed June 8, 2015; 62/173,340, filed June 9, 2015; 62/308,800, filed March 15, 2016; 62/321,679, filed April 12, 2016; and 62/336,470, filed May 13, 2016; each of which is incorporated herein by reference in its entirety.

FIELD OF THE INVENTION

The present invention relates to methods of treating cancer using anti-OX40 antibodies and PD-1 axis binding antagonists (e.g., anti-PD-L1 antibodies). In some embodiments, the methods of treating cancer include administering an anti-OX40 antibody, a PD-1 axis binding antagonist (e.g., anti-PD-L1 antibody), and an anti-angiogenesis agent (e.g., a VEGF antagonist such as an anti-VEGF antibody).

BACKGROUND

In the two-signal model T-cells receive both positive and negative secondary co-stimulatory signals. The regulation of such positive and negative signals is critical to maximize the host's protective immune responses, while maintaining immune tolerance and preventing autoimmunity. Negative secondary signals seem necessary for induction of T-cell tolerance, while positive signals promote T-cell activation. While the simple two-signal model still provides a valid explanation for naive lymphocytes, a host's immune response is a dynamic process, and co-stimulatory signals can also be provided to antigen-exposed T-cells. The mechanism of co-stimulation is of therapeutic interest because the manipulation of co-stimulatory signals has shown to provide a means to either enhance or terminate cell-based immune response. Recently, it has been discovered that T cell dysfunction or anergy occurs concurrently with an induced and sustained expression of the inhibitory receptor, programmed death 1 polypeptide (PD-1). As a result, therapeutic targeting of PD-1 and other molecules which signal through interactions with PD-1, such as programmed death ligand 1 (PD-L1) and programmed death ligand 2 (PD-L2) are an area of intense interest.

PD-L1 is overexpressed in many cancers and is often associated with poor prognosis (Okazaki T et al., Intern. Immun. 2007 19(7):813) (Thompson RH et al., Cancer Res 2006, 66(7):3381). Interestingly, the majority of tumor infiltrating T lymphocytes predominantly express PD-1, in contrast to T lymphocytes in normal tissues and peripheral blood T lymphocytes indicating that up-regulation of PD-1 on tumor-reactive T cells can contribute to impaired antitumor immune responses (Blood 2009 114(8):1537). This may be due to exploitation of PD-L1 signaling mediated by PD-L1 expressing tumor cells interacting with PD-1 expressing T cells to result in attenuation of T cell activation and evasion of immune surveillance (Sharpe et al., Nat Rev 2002) (Keir ME et al., 2008 Annu. Rev. Immunol. 26:677). Therefore, inhibition of the PD-L1/PD-1 interaction may enhance CD8+ T cell-mediated killing of tumors.

Therapeutic targeting PD-1 and other molecules which signal through interactions with PD-1, such as programmed death ligand 1 (PD-L1) and programmed death ligand 2 (PD-L2) are an area of intense interest. The inhibition of PD-L1 signaling has been proposed as a means to enhance T cell immunity for the treatment of cancer (e.g., tumor immunity) and infection, including both acute and chronic (e.g., persistent) infection. An optimal therapeutic treatment may combine blockade of PD-1 receptor/ligand interaction with an agent that directly inhibits tumor growth. There remains a need for an optimal therapy for treating, stabilizing, preventing, and/or delaying development of various cancers.

OX40 (also known as CD34, TNFRSF4 and ACT35) is a member of the tumor necrosis factor receptor superfamily. OX40 is not constitutively expressed on naive T cells, but is induced after engagement of the T cell receptor (TCR). The ligand for OX40, OX40L, is predominantly expressed on antigen presenting cells. OX40 is highly expressed by activated CD4+ T cells, activated CD8+ T cells, memory T cells, and regulatory T cells. OX40 signaling can provide costimulatory
signals to CD4 and CD8 T cells, leading to enhanced cell proliferation, survival, effector function and migration. OX40 signaling also enhances memory T cell development and function.

[0009] Regulatory T cells (Treg) cells are highly enriched in tumors and tumor draining lymph nodes derived from multiple cancer indications, including melanoma, NSCLC, renal, ovarian, colon, pancreatic, hepatocellular, and breast cancer. In a subset of these indications, increased intratumoral T reg cell densities are associated with poor patient prognosis, suggesting that these cells play an important role in suppressing antitumor immunity. OX40 positive tumor infiltrating lymphocytes have been described.

[0010] It is clear that there continues to be a need for agents that have clinical attributes that are optimal for development as therapeutic agents. The invention described herein meets these needs and provides other benefits.

SUMMARY

[0012] In one aspect, provided herein is a method of treating or delaying progression of cancer in an individual comprising administering to the individual: (a) an anti-human OX40 agonist antibody at a dose selected from the group consisting of about 0.8mg, about 3.2mg, about 12mg, about 40mg, about 130mg, about 400mg, and about 1200mg, wherein the anti-human OX40 agonist antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:7; and (b) an anti-PDL1 antibody at a dose of about 1200mg, wherein the anti-PDL1 antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:196; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:197; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:198; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:199; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:200; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:201; wherein the individual is a human.

[0013] In another aspect, provided herein is a method of treating or delaying progression of cancer in an individual comprising administering to the individual: (i) an anti-human OX40 agonist antibody at a dose selected from the group consisting of about 0.8mg, about 3.2mg, about 12mg, about 40mg, about 80mg, about 130mg, about 160mg, about 300mg, about 320mg, about 400mg, about 600mg, and about 1200mg, wherein the anti-human OX40 agonist antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:7; and (b) an anti-PDL1 antibody at a dose of about 1200mg, wherein the anti-PDL1 antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:196; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:197; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:198; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:199; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:200; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:201; wherein the individual is a human.
acid sequence of SEQ ID NO:6; and (f) HVR-L3 comprising an amino acid sequence selected from
SEQ ID NO:7; and (ii) an anti-PDL1 antibody at a dose of about 800mg or about 1200mg per
administration, wherein the anti-PDL1 antibody comprises (a) HVR-H1 comprising the amino acid
sequence of SEQ ID NO: 196; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 197;
(c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 198; (d) HVR-L1 comprising the
amino acid sequence of SEQ ID NO: 199; (e) HVR-L2 comprising the amino acid sequence of SEQ
ID NO:200; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:201;
wherein the individual is a human.

[0014] In some embodiments, the methods further comprise repeating the administration of the
anti-human OX40 agonist antibody at one or more additional doses, wherein each dose of the one or
more additional doses is selected from the group consisting of about 0.8mg, about 3.2mg, about
12mg, about 40mg, about 80mg, about 130mg, about 160mg, about 300mg, about 320mg, about
400mg, about 600mg, and about 1200mg per administration and is administered at an interval of
about 2 weeks or about 14 days between each administration. In some embodiments, the methods
further comprise repeating the administration of the anti-human OX40 agonist antibody at one or
more additional doses, wherein each dose of the one or more additional doses is selected from the
group consisting of about 0.8mg, about 3.2mg, about 12mg, about 40mg, about 80mg, about 130mg,
about 160mg, about 300mg, about 320mg, about 400mg, about 600mg, and about 1200mg per
administration and is administered at an interval of about 3 weeks or about 21 days between each
administration.

[0015] In another aspect, provided herein is a kit for treating or delaying progression of cancer in
an individual, comprising: (a) a container comprising an anti-human OX40 agonist antibody for
administration at a dose selected from the group consisting of 0.8mg, 3.2mg, 12mg, 40mg, 130mg,
400mg, and 1200mg of the anti-human OX40 agonist antibody, wherein the anti-human OX40 agonist
antibody comprises: an HVR-H1 comprising the amino acid sequence of SEQ ID NO:2; an HVR-H2
comprising the amino acid sequence of SEQ ID NO:3; an HVR-H3 comprising the amino acid
sequence of SEQ ID NO:4; an HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; an
HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and an HVR-L3 comprising an amino
acid sequence selected from SEQ ID NO:7; (b) a container comprising an anti-PDL1 antibody for
administration at a dose of 1200mg, wherein the anti-PDL1 antibody comprises (a) HVR-H1
comprising the amino acid sequence of SEQ ID NO: 196; (b) HVR-H2 comprising the amino acid
sequence of SEQ ID NO: 197; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 198;
(d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 199; (e) HVR-L2 comprising the
amino acid sequence of SEQ ID NO:200; and (f) HVR-L3 comprising an amino acid sequence
selected from SEQ ID NO:201; and (c) a package insert with instructions for treating or delaying
progression of cancer in an individual, wherein the individual is a human.
In another aspect, provided herein is a kit for treating or delaying progression of cancer in an individual, comprising: (i) a container comprising an anti-human OX40 agonist antibody formulated for administration at a dose selected from the group consisting of about 0.8mg, about 3.2mg, about 12mg, about 40mg, about 80mg, about 130mg, about 160mg, about 300mg, about 320mg, about 400mg, about 600mg, and about 1200mg per administration, wherein the anti-human OX40 agonist antibody comprises: an HVR-H1 comprising the amino acid sequence of SEQ ID NO:2; an HVR-H2 comprising the amino acid sequence of SEQ ID NO:3; an HVR-H3 comprising the amino acid sequence of SEQ ID NO:4; an HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; an HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and an HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:7; (ii) a container comprising an anti-PDL1 antibody for administration at a dose of about 800mg or about 1200mg per administration, wherein the anti-PDL1 antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:196; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:197; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:198; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:199; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:200; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:201; and (iii) a package insert with instructions for treating or delaying progression of cancer in an individual, wherein the individual is a human. In some embodiments, the anti-human OX40 agonist antibody is formulated for administration at a dose of about 300mg.

In some embodiments, any of the kits of the present disclosure further comprise a container including an anti-VEGF antibody. In some embodiments, the anti-VEGF antibody is bevacizumab. In some embodiments, the bevacizumab is formulated for administration at a dose of about 15mg/kg. In some embodiments, any of the kits of the present disclosure further comprise a package insert with instructions for administering the anti-VEGF antibody with an anti-human OX40 agonist antibody and an anti-PDL1 antibody.

In some embodiments, the anti-human OX40 agonist antibody and the anti-PDL1 antibody are administered intravenously. In some embodiments, the anti-human OX40 agonist antibody and the anti-PDL1 antibody are administered on the same day. In some embodiments, the anti-human OX40 agonist antibody and the anti-PDL1 antibody are administered on different days, and the anti-PDL1 antibody is administered within 7 or fewer days of administering the anti-human OX40 agonist antibody. In some embodiments, the anti-human OX40 agonist antibody is administered at a dose of about 300mg.

In some embodiments, the methods further comprise (a) after administering the anti-human OX40 agonist antibody and the anti-PDL1 antibody, monitoring the individual for an adverse event and/or efficacy of treatment; and (b) if the individual does not exhibit an adverse event, and/or if the treatment exhibits efficacy, administering to the individual: (i) a second dose of the anti-human OX40 agonist antibody, wherein the second dose of the anti-human OX40 agonist antibody is selected
from the group consisting of about 0.8mg, about 3.2mg, about 12mg, about 40mg, about 130mg,
about 400mg, and about 1200mg; and (ii) a second dose of the anti-PDL1 antibody, wherein the
second dose of the anti-PDL1 antibody is about 1200mg. In some embodiments, the methods further
comprise administering to the individual: (a) a second dose of the anti-human OX40 agonist
antibody, wherein the second dose of the anti-human OX40 agonist antibody is selected from the
group consisting of about 0.8mg, about 3.2mg, about 12mg, about 40mg, about 130mg, about 400mg,
and about 1200mg; and (b) a second dose of the anti-PDL1 antibody, wherein the second dose of the
anti-PDL1 antibody is about 1200mg; wherein the second dose of the anti-human OX40 agonist
antibody is not provided until from about 2 weeks to about 4 weeks after the first dose of the anti-
human OX40 agonist antibody; and wherein the second dose of the anti-PDL1 antibody is not
provided until from about 2 weeks to about 4 weeks after the first dose of the anti-PDL1 antibody. In
some embodiments, the first dose of the anti-human OX40 agonist antibody and the first dose of the
anti-PDL1 antibody are administered on the same day, the second dose of the anti-human OX40
agonist antibody and the second dose of the anti-PDL1 antibody are administered on the same day,
and the second dose of the anti-human OX40 agonist antibody and the second dose of the anti-PDL1
antibody are not provided until about 3 weeks after the first dose of the anti-human OX40 agonist
antibody and the first dose of the anti-human OX40 agonist antibody. In some embodiments, the first
dose of the anti-human OX40 agonist antibody and the first dose of the anti-PDL1 antibody are
administered on the same day, the second dose of the anti-human OX40 agonist antibody and the
second dose of the anti-PDL1 antibody are administered on the same day, and the second dose of the
anti-human OX40 agonist antibody and the second dose of the anti-PDL1 antibody are not provided
until about 21 days after the first dose of the anti-human OX40 agonist antibody and the first dose of
the anti-human OX40 agonist antibody. In some embodiments, the second dose of the anti-human
OX40 agonist antibody is greater than the first dose of the anti-human OX40 agonist antibody. In
some embodiments, the first dose of the anti-human OX40 agonist antibody, the first dose of the anti-
PDL1 antibody, the second dose of the anti-human OX40 agonist antibody, and the second dose of the
anti-PDL1 antibody are administered intravenously.

[0020] In another aspect, provided herein is a method of treating or delaying progression of cancer
in an individual comprising administering to the individual: (i) an anti-human OX40 agonist antibody
at a dose selected from the group consisting of about 0.8mg, about 3.2mg, about 12mg, about 40mg,
about 80mg, about 130mg, about 160mg, about 300mg, about 320mg, about 400mg, about 600mg,
and about 1200mg, wherein the anti-human OX40 agonist antibody comprises (a) HVR-H1
comprising the amino acid sequence of SEQ ID NO:2; (b) HVR-H2 comprising the amino acid
sequence of SEQ ID NO:3; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4; (d)
HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (e) HVR-L2 comprising the amino
acid sequence of SEQ ID NO:6; and (f) HVR-L3 comprising an amino acid sequence selected from
SEQ ID NO:7; and (ii) an anti-PDL1 antibody at a dose of about 1200mg, wherein the anti-PDL1
antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 196; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 197; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 198; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 199; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 200; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO: 201; wherein the individual is a human. In some embodiments, the methods further comprise repeating the administration of the anti-human OX40 agonist antibody and/or the anti-PD-L1 antibody at an interval of about 3 weeks or about 21 days between each administration. In some embodiments, the anti-human OX40 agonist antibody is administered at a dose of about 300mg.

[0021] In another aspect, provided herein is a kit for treating or delaying progression of cancer in an individual, comprising: (i) a container comprising an anti-human OX40 agonist antibody formulated for administration at an interval of about 3 weeks or about 21 days between each administration at a dose selected from the group consisting of about 0.8mg, about 3.2mg, about 12mg, about 40mg, about 80mg, about 130mg, about 160mg, about 300mg, about 320mg, about 400mg, about 600mg, and about 1200mg per administration, wherein the anti-human OX40 agonist antibody comprises: an HVR-H1 comprising the amino acid sequence of SEQ ID NO: 2; an HVR-H2 comprising the amino acid sequence of SEQ ID NO: 3; an HVR-H3 comprising the amino acid sequence of SEQ ID NO: 4; an HVR-L1 comprising the amino acid sequence of SEQ ID NO: 5; an HVR-L2 comprising the amino acid sequence of SEQ ID NO: 6; and an HVR-L3 comprising an amino acid sequence selected from SEQ ID NO: 7; (ii) a container comprising an anti-PD-L1 antibody formulated for administration at an interval of about 3 weeks or about 21 days between each administration at a dose of about 1200mg per administration, wherein the anti-PD-L1 antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 196; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 197; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 198; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 199; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 200; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO: 201; and (iii) a package insert with instructions for treating or delaying progression of cancer in an individual, wherein the individual is a human.

[0022] In another aspect, provided herein is a method of treating or delaying progression of cancer in an individual comprising administering to the individual: (i) an anti-human OX40 agonist antibody at a dose selected from the group consisting of about 0.5mg, about 2mg, about 8mg, about 27mg, about 53mg, about 87mg, about 107mg, about 200mg, about 213mg, about 267mg, about 400mg, and about 800mg, wherein the anti-human OX40 agonist antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 2; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 3; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 4; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 5; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 6; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO: 7; and (ii)
an anti-PDL1 antibody at a dose of about 800mg, wherein the anti-PDL1 antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 196; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 197; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 198; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 199; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 200; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO: 201; wherein the individual is a human. In some embodiments, the methods further comprise repeating the administration of the anti-human OX40 agonist antibody and/or the anti-PDL1 antibody at an interval of about 2 weeks or about 14 days between each administration.

[0023] In another aspect, provided herein is a kit for treating or delaying progression of cancer in an individual, comprising: (i) a container comprising an anti-human OX40 agonist antibody formulated for administration at an interval of about 2 weeks or about 14 days between each administration at a dose selected from the group consisting of about 0.5mg, about 2mg, about 8mg, about 27mg, about 53mg, about 87mg, about 107mg, about 200mg, about 213mg, about 267mg, about 400mg, and about 800mg per administration, wherein the anti-human OX40 agonist antibody comprises: an HVR-H1 comprising the amino acid sequence of SEQ ID NO: 2; an HVR-H2 comprising the amino acid sequence of SEQ ID NO: 3; an HVR-H3 comprising the amino acid sequence of SEQ ID NO: 4; an HVR-L1 comprising the amino acid sequence of SEQ ID NO: 5; an HVR-L2 comprising the amino acid sequence of SEQ ID NO: 6; and an HVR-L3 comprising an amino acid sequence selected from SEQ ID NO: 7; (ii) a container comprising an anti-PDL1 antibody formulated for administration at an interval of about 2 weeks or about 14 days between each administration at a dose of about 800mg per administration, wherein the anti-PDL1 antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 196; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 197; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 198; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 199; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 200; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO: 201; and (iii) a package insert with instructions for treating or delaying progression of cancer in an individual, wherein the individual is a human.

[0024] In some embodiments, 1-10 additional doses of the anti-human OX40 agonist antibody are administered.

[0025] In some embodiments, the methods further comprise repeating the administration of the anti-PDL1 antibody at one or more additional doses, wherein each dose of the one or more additional doses is about 800mg and is administered at an interval of about 2 weeks or about 14 days between each administration. In some embodiments, the methods further comprise repeating the administration of the anti-PDL1 antibody at one or more additional doses, wherein each dose of the one or more additional doses is about 1200mg and is administered at an interval of about 3 weeks or
about 21 days between each administration. In some embodiments, 1-10 additional doses of the anti-PDL1 antibody are administered.

[0026] In some embodiments, each dose of the anti-human OX40 agonist antibody administered to the individual is the same. In some embodiments, each dose of the anti-human OX40 agonist antibody administered to the individual is not the same. In some embodiments, each dose of the anti-human OX40 agonist antibody is administered intravenously. In some embodiments, a first dose of the anti-human OX40 agonist antibody is administered to the individual at a first rate, wherein, after the administration of the first dose, one or more additional doses of the anti-human OX40 agonist antibody are administered to the individual at one or more subsequent rates, and wherein the first rate is slower than the one or more subsequent rates. In some embodiments, each dose of the anti-PDL1 antibody is administered intravenously. In some embodiments, a first dose of the anti-PDL1 antibody is administered to the individual at a first rate, wherein, after the administration of the first dose, one or more additional doses of the anti-PDL1 antibody are administered to the individual at one or more subsequent rates, and wherein the first rate is slower than the one or more subsequent rates.

[0027] In some embodiments, the anti-human OX40 agonist antibody is a human or humanized antibody. In some embodiments, the anti-human OX40 agonist antibody comprises a heavy chain variable domain (VH) sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99%, or 100% sequence identity to the amino acid sequence of SEQ ID NO: 56, 58, 60, 62, 64, 66, 68, 183, or 184. In some embodiments, the VH sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% identity contains substitutions (e.g., conservative substitutions), insertions, or deletions relative to the reference sequence, but an anti-human OX40 agonist antibody comprising that sequence retains the ability to bind to human OX40. In some embodiments, the anti-human OX40 agonist antibody comprises a light chain variable domain (VL) having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99%, or 100% sequence identity to the amino acid sequence of SEQ ID NO: 57, 59, 61, 63, 65, 67, or 69. In some embodiments, the VL sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% identity contains substitutions (e.g., conservative substitutions), insertions, or deletions relative to the reference sequence, but an anti-human OX40 agonist antibody comprising that sequence retains the ability to bind to human OX40. In some embodiments, a total of 1 to 10 amino acids have been substituted, inserted and/or deleted in SEQ ID NO: 57. In some embodiments, the anti-human OX40 agonist antibody comprises a VH sequence of SEQ ID NO: 56. In some embodiments, the anti-human OX40 agonist antibody comprises a VL sequence of SEQ ID NO: 57. In some embodiments, the anti-human OX40 agonist antibody comprises a VH sequence of SEQ ID NO:56 and a VL sequence of SEQ ID NO: 57. In some embodiments, the anti-human OX40 agonist antibody is a full length human IgGl antibody. In some embodiments, the anti-human OX40 agonist antibody is MOXR0916.

[0028] In some embodiments, the anti-human OX40 agonist antibody is formulated in a pharmaceutical formulation comprising (a) the anti-human OX40 agonist antibody at a concentration
between about 10 mg/mL and about 100 mg/mL, (b) a polysorbate, wherein the polysorbate concentration is about 0.02% to about 0.06%; (c) a histidine buffer at pH 5.0 to 6.0; and (d) a saccharide, wherein the saccharide concentration is about 120 mM to about 320 mM.

[0029] In some embodiments, the anti-PDL1 antibody is a monoclonal antibody. In some embodiments, the anti-PDL1 antibody is an antibody fragment selected from the group consisting of Fab, Fab'-SH, Fv, scFv, and (Fab')2 fragments. In some embodiments, the anti-PDL1 antibody is a humanized antibody or a human antibody. In some embodiments, the anti-PDL1 antibody comprises a human IgGl having Asn to Ala substitution at position 297 according to EU numbering. In some embodiments, the anti-PDL1 antibody comprises a heavy chain variable region comprising the amino acid sequence of

EVQLVESGGGLVQPGGSLRLSCAASGFTSFSDIWHVRQAPGGKGLEWVAVISYPYGSTYYA
DSVKGRFTISADTSKNTAYLQMNSLRAEDTAVYVCARRHWPGFDYWGQGTTLVTVSS (SEQ ID NO:202) or EVQLVESGGGLVQPGGSLRLSCAASGFTSFSDIWHVRQAPGGKGLEWVAVI
SPYGGSTTYADSVKGRFTISADTSKNTAYLQMNSLRAEDTAVYVCARRHWPGFDYWGQG
TLVTVSSASTK (SEQ ID NO:203). In some embodiments, the anti-PDL1 antibody comprises a light chain variable region comprising the amino acid sequence of

DIQMTQSPSSLSAVVDRVTITCRASQDVSTAVAWYQQKPGKAPKLLIY SASF
LYSGVPSRFSGSGTDTTLTISSLQPEDFATYYCQQLYPATFGQGTKVEKR (SEQ ID NO:204). In some embodiments, the anti-PDL1 antibody comprises a heavy chain variable region comprising the amino acid sequence of

EVQLVESGGGLVQPGGSLRLSCAASGFTSFSDIWHVRQAPGGKGLEWVAVISYPYGSTYYA
DSVKGRFTISADTSKNTAYLQMNSLRAEDTAVYVCARRHWPGFDYWGQGTTLVTVSS (SEQ ID NO:202) or EVQLVESGGGLVQPGGSLRLSCAASGFTSFSDIWHVRQAPGGKGLEWVAVI
SPYGGSTTYADSVKGRFTISADTSKNTAYLQMNSLRAEDTAVYVCARRHWPGFDYWGQG
TLVTVSSASTK (SEQ ID NO:203) and a light chain variable region comprising the amino acid sequence of

DIQMTQSPSSLSAVVDRVTITCRASQDVSTAVAWYQQKPGKAPKLLIY SASF
LYSGVPSRFSGSGTDTTLTISSLQPEDFATYYCQQLYPATFGQGTKVEKR (SEQ ID NO:204). In some embodiments, the anti-PDL1 antibody comprises a heavy chain sequence that has at least 85%, at least 90%, at least 91%, at least 92%, at least 93%, at least 94%, at least 95%, at least 96%, at least 97%, at least 98%, at least 99% or 100% sequence identity to the heavy chain sequence:

HKVACEVTHQGLSSPVTKSFNRCGE (SEQ ID NO:206). In some embodiments, the anti-PDL1 antibody is MPDL3280A.

[0030] In some embodiments, any of the methods described herein further comprise administering to the individual an anti-angiogenesis agent. In some embodiments, any of the methods described herein further comprise administering to the individual an anti-VEGF antibody. In some embodiments, the anti-VEGF antibody is bevacizumab. In some embodiments, bevacizumab is administered to the individual at a dose of about 15mg/kg. In some embodiments, any of the methods described herein further comprise repeating the administration of bevacizumab at one or more additional doses, wherein each dose of the one or more additional doses is about 15mg/kg and is administered at an interval of about 3 weeks or about 21 days between each administration. In some embodiments, any of the methods described herein further comprise administering the anti-human OX40 agonist antibody, the anti-PDL1 antibody, and the anti-VEGF antibody to the individual by intravenous infusion on the same day.

[0031] In some embodiments, the treatment results in a sustained response in the individual after cessation of the treatment. In some embodiments, the treatment results in a complete response (CR) or partial response (PR) in the individual.

[0032] In some embodiments, the individual has a cancer selected from the group consisting of melanoma, triple-negative breast cancer, ovarian cancer, renal cell cancer, bladder cancer, non-small cell lung cancer, gastric cancer, and colorectal cancer. In some embodiments, the individual has melanoma, the melanoma has a BRAF V600 mutation, and, prior to the administration of the anti-human OX40 agonist antibody, the individual has been treated with a B-Raf and/or mitogen-activated protein kinase kinase (MEK) kinase inhibitor and exhibited disease progression or intolerance to the B-Raf and/or mitogen-activated protein kinase kinase (MEK) kinase inhibitor treatment. In some embodiments, the individual has non-small cell lung cancer, the non-small cell lung cancer has a sensitizing epidermal growth factor receptor (EGFR) mutation, and, prior to the administration of the anti-human OX40 agonist antibody, the individual has been treated with an EGFR tyrosine kinase inhibitor and exhibited disease progression or intolerance to the EGFR tyrosine kinase inhibitor treatment. In some embodiments, the individual has non-small cell lung cancer, the non-small cell lung cancer has an anaplastic lymphoma kinase (ALK) rearrangement, and, prior to the administration of the anti-human OX40 agonist antibody, the individual has been treated with an ALK tyrosine
kinase inhibitor and exhibited disease progression or intolerance to the ALK tyrosine kinase inhibitor treatment. In some embodiments, the individual has colorectal cancer, and the colorectal cancer exhibits microsatellite instability-high (MSI-H) status. In some embodiments, the individual has renal cell cancer, and the renal cell cancer is refractory to a prior therapy. In some embodiments, the prior therapy comprises treatment with a VEGF inhibitor, an mTOR inhibitor, or both.

[0033] In some embodiments, prior to the administration of the anti-human OX40 agonist antibody and the anti-PDL1 antibody, the individual has been previously treated with an immunotherapy agent. In some embodiments, the prior treatment with the immunotherapy agent is a monotherapy. In some embodiments, the individual exhibited a stable disease or disease progression prior to the administration of the anti-human OX40 agonist antibody and the anti-PDL1 antibody. In some embodiments, the prior treatment with the immunotherapy agent comprises treatment with an OX40 agonist in the absence of a PD-1 axis binding antagonist. In some embodiments, the OX40 agonist is an anti-human OX40 agonist antibody. In some embodiments, the prior treatment with the immunotherapy agent comprises treatment with a PD-1 axis binding antagonist in the absence of an OX40 agonist. In some embodiments, the OX40 agonist is an anti-human OX40 agonist antibody. In some embodiments, the PD-1 axis binding antagonist is an anti-PDL1 antibody. In some embodiments, the PD-1 axis binding antagonist is an anti-PDL1 antibody.

[0034] In another aspect, provided herein is a use of an anti-human OX40 agonist antibody in the manufacture of a first medicament for treating or delaying progression of cancer in an individual in conjunction with a second medicament, wherein the first medicament comprises an anti-human OX40 agonist antibody formulated at a dose selected from the group consisting of about 0.8mg, about 3.2mg, about 12mg, about 40mg, about 80mg, about 130mg, about 160mg, about 300mg, about 320mg, about 400mg, about 600mg, and about 1200mg per administration, wherein the anti-human OX40 agonist antibody comprises (a) HVR-HI comprising the amino acid sequence of SEQ ID NO:2; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:7; and wherein the second medicament comprises an anti-PDL1 antibody formulated at a dose of about 800mg or about 1200mg per administration, wherein the anti-PDL1 antibody comprises (a) HVR-HI comprising the amino acid sequence of SEQ ID NO:196; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:197; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:198; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:199; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:200; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:201. In some embodiments, the individual is a human. In some embodiments, anti-human OX40 agonist antibody is formulated for administration at a dose of about 300mg.
In another aspect, provided herein is a use of an anti-PDL1 antibody in the manufacture of a first medicament for treating or delaying progression of cancer in an individual in conjunction with a second medicament, wherein the first medicament comprises an anti-PDL1 antibody formulated at a dose of about 800mg or about 1200mg per administration, wherein the anti-PDL1 antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:196; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:197; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:198; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:199; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:200; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:201; and wherein the second medicament comprises an anti-human OX40 agonist antibody formulated at a dose selected from the group consisting of about 0.8mg, about 3.2mg, about 12mg, about 40mg, about 80mg, about 130mg, about 160mg, about 300mg, about 320mg, about 400mg, about 600mg, and about 1200mg per administration, wherein the anti-human OX40 agonist antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:7. In some embodiments, the individual is a human. In some embodiments, anti-human OX40 agonist antibody is formulated for administration at a dose of about 300mg.

In another aspect, provided herein is a use of an anti-VEGF antibody in the manufacture of a first medicament for treating or delaying progression of cancer in an individual in conjunction with a second and a third medicament, wherein the first medicament comprises bevacizumab formulated at a dose of about 15mg/kg, wherein the second medicament comprises an anti-PDL1 antibody formulated at a dose of about 800mg or about 1200mg per administration, wherein the anti-PDL1 antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:196; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:197; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:198; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:199; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:200; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:201; and wherein the third medicament comprises an anti-human OX40 agonist antibody formulated at a dose selected from the group consisting of about 0.8mg, about 3.2mg, about 12mg, about 40mg, about 80mg, about 130mg, about 160mg, about 300mg, about 320mg, about 400mg, about 600mg, and about 1200mg per administration, wherein the anti-human OX40 agonist antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:7.
[0037] In another aspect, provided herein is a use of an anti-human OX40 agonist antibody in the manufacture of a first medicament for treating or delaying progression of cancer in an individual in conjunction with a second medicament, wherein the first medicament comprises an anti-human OX40 agonist antibody formulated for administration at an interval of about 3 weeks or about 21 days between each administration at a dose selected from the group consisting of about 0.8mg, about 3.2mg, about 12mg, about 40mg, about 80mg, about 130mg, about 160mg, about 300mg, about 320mg, about 400mg, about 600mg, and about 1200mg per administration, wherein the anti-human OX40 agonist antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:7; and wherein the second medicament comprises an anti-PDL1 antibody formulated for administration at an interval of about 3 weeks or about 21 days between each administration at a dose of about 1200mg per administration, wherein the anti-PDL1 antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 196; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 197; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 198; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 199; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:200; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:201. In some embodiments, the individual is a human. In some embodiments, anti-human OX40 agonist antibody is formulated for administration at a dose of about 300mg.

[0038] In another aspect, provided herein is a use of an anti-PDL1 antibody in the manufacture of a first medicament for treating or delaying progression of cancer in an individual in conjunction with a second medicament, wherein the first medicament comprises an anti-PDL1 antibody formulated for administration at an interval of about 3 weeks or about 21 days between each administration at a dose of about 1200mg per administration, wherein the anti-PDL1 antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 196; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 197; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 198; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 199; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:200; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:201; and wherein the second medicament comprises an anti-human OX40 agonist antibody formulated for administration at an interval of about 3 weeks or about 21 days between each administration at a dose selected from the group consisting of about 0.8mg, about 3.2mg, about 12mg, about 40mg, about 80mg, about 130mg, about 160mg, about 300mg, about 320mg, about 400mg, about 600mg, and about 1200mg per administration, wherein the anti-human OX40 agonist antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3; (c) HVR-H3 comprising the
amino acid sequence of SEQ ID NO:4; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:7. In some embodiments, the individual is a human. In some embodiments, anti-human OX40 agonist antibody is formulated for administration at a dose of about 300mg.

[0039] In another aspect, provided herein is a use of an anti-human OX40 agonist antibody in the manufacture of a first medicament for treating or delaying progression of cancer in an individual in conjunction with a second medicament, wherein the first medicament comprises an anti-human OX40 agonist antibody formulated for administration at an interval of about 2 weeks or about 14 days between each administration at a dose selected from the group consisting of about 0.5mg, about 2mg, about 8mg, about 27mg, about 53mg, about 87mg, about 107mg, about 200mg, about 213mg, about 267mg, about 400mg, and about 800mg per administration, wherein the anti-human OX40 agonist antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:7; and wherein the second medicament comprises an anti-PDL1 antibody formulated for administration at an interval of about 2 weeks or about 14 days between each administration at a dose of about 800mg per administration, wherein the anti-PDL1 antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:196; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:197; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:198; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:199; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:200; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:201. In some embodiments, the individual is a human. In some embodiments, anti-human OX40 agonist antibody is formulated for administration at a dose of about 300mg.

[0040] In another aspect, provided herein is a use of an anti-PDL1 antibody in the manufacture of a first medicament for treating or delaying progression of cancer in an individual in conjunction with a second medicament, wherein the first medicament comprises an anti-PDL1 antibody formulated for administration at an interval of about 2 weeks or about 14 days between each administration at a dose of about 800mg per administration, wherein the anti-PDL1 antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:196; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:197; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:198; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:199; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:200; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:201; and wherein the second medicament comprises an anti-human OX40 agonist antibody formulated for administration at an interval of about 2 weeks or about 14 days
between each administration at a dose selected from the group consisting of about 0.5mg, about 2mg, about 8mg, about 27mg, about 53mg, about 87mg, about 107mg, about 200mg, about 213mg, about 267mg, about 400mg, and about 800mg per administration, wherein the anti-human OX40 agonist antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:7. In some embodiments, the individual is a human. In some embodiments, anti-human OX40 agonist antibody is formulated for administration at a dose of about 300mg.

[0041] In some embodiments, provided herein is a method of treating or delaying progression of cancer in an individual comprising administering to the individual (i) MOXR0916 at a dose of about 300mg, and (ii) atezolizumab at a dose of about 1200mg, wherein the cancer is selected from the group consisting of melanoma, triple-negative breast cancer, ovarian cancer, renal cell cancer, bladder cancer, non-small cell lung cancer, gastric cancer, and colorectal cancer. In some embodiments, the MOXR0916 and atezolizumab are administered on the same day. In some embodiments, the method further comprises repeating the administration of MOXR0916 at a dose of about 300mg per administration and atezolizumab at a dose of about 1200mg per administration, and wherein the administration is repeated at an interval of about 3 weeks or about 21 days between administrations. In some embodiments, the repeated administrations of the MOXR0916 and the atezolizumab are administered on the same day. In some embodiments, the cancer is RCC. In some embodiments, the cancer is bladder cancer. In some embodiments, MOXR0916 is administered intravenously. In some embodiments, atezolizumab is administered intravenously. In some embodiments, MOXR0916 and atezolizumab are administered intravenously.

[0042] In some embodiments, provided herein is a method of treating or delaying progression of cancer in an individual comprising administering to the individual (i) MOXR0916 at a dose of about 160mg, and (ii) atezolizumab at a dose of about 1200mg, wherein the cancer is selected from the group consisting of melanoma, triple-negative breast cancer, ovarian cancer, renal cell cancer, bladder cancer, non-small cell lung cancer, gastric cancer, and colorectal cancer. In some embodiments, the MOXR0916 and atezolizumab are administered on the same day. In some embodiments, the method further comprises repeating the administration of MOXR0916 at a dose of about 160mg per administration and atezolizumab at a dose of about 1200mg per administration, and wherein the administration is repeated at an interval of about 3 weeks or about 21 days between administrations. In some embodiments, the repeated administrations of the MOXR0916 and the atezolizumab are administered on the same day. In some embodiments, the cancer is RCC. In some embodiments, the cancer is bladder cancer. In some embodiments, MOXR0916 is administered intravenously. In some
embodiments, atezolizumab is administered intravenously. In some embodiments, MOXR0916 and atezolizumab are administered intravenously.

[0043] In some embodiments, provided herein is a method of treating or delaying progression of cancer in an individual comprising administering to the individual (i) MOXR0916 at a dose of about 320mg, and (ii) atezolizumab at a dose of about 1200mg, wherein the cancer is selected from the group consisting of melanoma, triple-negative breast cancer, ovarian cancer, renal cell cancer, bladder cancer, non-small cell lung cancer, gastric cancer, and colorectal cancer. In some embodiments, the MOXR0916 and atezolizumab are administered on the same day. In some embodiments, the method further comprises repeating the administration of MOXR0916 at a dose of about 320mg per administration and atezolizumab at a dose of about 1200mg per administration, and wherein the administration is repeated at an interval of about 3 weeks or about 21 days between administrations. In some embodiments, the repeated administrations of the MOXR0916 and the atezolizumab are administered on the same day. In some embodiments, the cancer is RCC. In some embodiments, the cancer is bladder cancer. In some embodiments, MOXR0916 is administered intravenously. In some embodiments, atezolizumab is administered intravenously. In some embodiments, MOXR0916 and atezolizumab are administered intravenously.

[0044] In some embodiments, provided herein is a method of treating or delaying progression of cancer in an individual comprising administering to the individual (i) MOXR0916 at a dose of about 400mg, and (ii) atezolizumab at a dose of about 1200mg, wherein the cancer is selected from the group consisting of melanoma, triple-negative breast cancer, ovarian cancer, renal cell cancer, bladder cancer, non-small cell lung cancer, gastric cancer, and colorectal cancer. In some embodiments, the MOXR0916 and atezolizumab are administered on the same day. In some embodiments, the method further comprises repeating the administration of MOXR0916 at a dose of about 400mg per administration and atezolizumab at a dose of about 1200mg per administration, and wherein the administration is repeated at an interval of about 3 weeks or about 21 days between administrations. In some embodiments, the repeated administrations of the MOXR0916 and the atezolizumab are administered on the same day. In some embodiments, the cancer is RCC. In some embodiments, the cancer is bladder cancer. In some embodiments, MOXR0916 is administered intravenously. In some embodiments, atezolizumab is administered intravenously. In some embodiments, MOXR0916 and atezolizumab are administered intravenously.

[0045] In some embodiments, provided herein is a method of treating or delaying progression of cancer in an individual comprising administering to the individual (i) MOXR0916 at a dose of about 300mg, (ii) atezolizumab at a dose of about 1200mg, and (iii) bevacizumab at a dose of about 15mg/kg, wherein the cancer is selected from the group consisting of melanoma, triple-negative breast cancer, ovarian cancer, renal cell cancer, bladder cancer, non-small cell lung cancer, gastric cancer, and colorectal cancer. In some embodiments, the MOXR0916, atezolizumab, and bevacizumab are administered on the same day. In some embodiments, the method further comprises repeating the
administration of MOXR0916 at a dose of about 300mg per administration, atezolizumab at a dose of about 1200mg per administration, and bevacizumab at a dose of about 15mg/kg per administration, and wherein the administration is repeated at an interval of about 3 weeks or about 21 days between administrations. In some embodiments, the repeated administrations of the MOXR0916, the atezolizumab, and the bevacizumab are administered on the same day. In some embodiments, MOXR0916 is administered intravenously. In some embodiments, atezolizumab is administered intravenously. In some embodiments, bevacizumab is administered intravenously. In some embodiments, MOXR0916, atezolizumab, and bevacizumab are administered intravenously.

[0046] In some embodiments, provided herein is a method of treating or delaying progression of cancer in an individual comprising administering to the individual (i) MOXR0916 at a dose of about 160mg, (ii) atezolizumab at a dose of about 1200mg, and (iii) bevacizumab at a dose of about 15mg/kg, wherein the cancer is selected from the group consisting of melanoma, triple-negative breast cancer, ovarian cancer, renal cell cancer, bladder cancer, non-small cell lung cancer, gastric cancer, and colorectal cancer. In some embodiments, the MOXR0916, atezolizumab, and bevacizumab are administered on the same day. In some embodiments, the method further comprises repeating the administration of MOXR0916 at a dose of about 160mg per administration, atezolizumab at a dose of about 1200mg per administration, and bevacizumab at a dose of about 15mg/kg per administration, and wherein the administration is repeated at an interval of about 3 weeks or about 21 days between administrations. In some embodiments, the repeated administrations of the MOXR0916, the atezolizumab, and the bevacizumab are administered on the same day. In some embodiments, MOXR0916 is administered intravenously. In some embodiments, atezolizumab is administered intravenously. In some embodiments, bevacizumab is administered intravenously. In some embodiments, MOXR0916, atezolizumab, and bevacizumab are administered intravenously.

[0047] In some embodiments, provided herein is a method of treating or delaying progression of cancer in an individual comprising administering to the individual (i) MOXR0916 at a dose of about 320mg, (ii) atezolizumab at a dose of about 1200mg, and (iii) bevacizumab at a dose of about 15mg/kg, wherein the cancer is selected from the group consisting of melanoma, triple-negative breast cancer, ovarian cancer, renal cell cancer, bladder cancer, non-small cell lung cancer, gastric cancer, and colorectal cancer. In some embodiments, the MOXR0916, atezolizumab, and bevacizumab are administered on the same day. In some embodiments, the method further comprises repeating the administration of MOXR0916 at a dose of about 320mg per administration, atezolizumab at a dose of about 1200mg per administration, and bevacizumab at a dose of about 15mg/kg per administration, and wherein the administration is repeated at an interval of about 3 weeks or about 21 days between administrations. In some embodiments, the repeated administrations of the MOXR0916, the atezolizumab, and the bevacizumab are administered on the same day. In some embodiments, the cancer is bladder cancer. In some embodiments, MOXR0916 is administered intravenously. In some
embodiments, atezolizumab is administered intravenously. In some embodiments, MOXR0916 and atezolizumab are administered intravenously.

[0048] In some embodiments, provided herein is a method of treating or delaying progression of cancer in an individual comprising administering to the individual (i) MOXR0916 at a dose of about 400mg, (ii) atezolizumab at a dose of about 1200mg, and (iii) bevacizumab at a dose of about 15mg/kg, wherein the cancer is selected from the group consisting of melanoma, triple-negative breast cancer, ovarian cancer, renal cell cancer, bladder cancer, non-small cell lung cancer, gastric cancer, and colorectal cancer. In some embodiments, the MOXR0916, atezolizumab, and bevacizumab are administered on the same day. In some embodiments, the method further comprises repeating the administration of MOXR0916 at a dose of about 400mg per administration, atezolizumab at a dose of about 1200mg per administration, and bevacizumab at a dose of about 15mg/kg per administration, and wherein the administration is repeated at an interval of about 3 weeks or about 21 days between administrations. In some embodiments, the repeated administrations of the MOXR0916, the atezolizumab, and the bevacizumab are administered on the same day. In some embodiments, the cancer is bladder cancer. In some embodiments, MOXR0916 is administered intravenously. In some embodiments, atezolizumab is administered intravenously. In some embodiments, MOXR0916 and atezolizumab are administered intravenously.

[0049] In some embodiments of any of the above embodiments, the methods may further comprise, after administering to the individual the anti-human OX40 agonist antibody and the anti-PDL1 antibody, monitoring the responsiveness of the individual to said treatment by: (a) measuring an expression level of one or more marker genes in a sample obtained from the cancer of the individual, wherein the one or more marker genes are selected from the group consisting of CCR5, CD274, IL-7, TNFRSF14, TGFB1, CD40, CD4, PRF1, TNFSF4, CD86, CXCL9, CD3E, LAG3, PDCD1, CCL28, GZMB, IFNγ, and IL-2RA; and (b) optionally, classifying the individual as responsive or non-responsive to treatment with the anti-human OX40 agonist antibody and the anti-PDL1 antibody based on the expression level of the one or more marker genes in the sample, as compared with a reference, wherein an increased expression level of the one or more marker genes as compared with the reference indicates a responsive individual. In some embodiments of any of the above embodiments, the methods may further comprise, after administering to the individual the anti-human OX40 agonist antibody and the anti-PDL1 antibody, monitoring the responsiveness of the individual to said treatment by: (a) measuring an expression level of one or more marker genes in a sample obtained from the cancer of the individual, wherein the one or more marker genes are selected from the group consisting of CD8b, EOMES, GZMA, GZMB, IFNγ, and PRF1; and (b) optionally, classifying the individual as responsive or non-responsive to treatment with the anti-human OX40 agonist antibody and the anti-PDL1 antibody based on the expression level of the one or more marker genes in the sample, as compared with a reference, wherein an increased expression level of the one or more marker genes as compared with the reference indicates a responsive individual. In some
embodiments of any of the above embodiments, the methods may further comprise, after
administering to the individual the anti-human OX40 agonist antibody and the anti-PDL1 antibody,
monitoring the responsiveness of the individual to said treatment by: (a) measuring an expression
level of one or more marker genes in a sample obtained from the cancer of the individual, wherein the
one or more marker genes are selected from the group consisting of CCL22, IL-2, RORC, IL-8,
CTLA4, and FOXP3; and (b) optionally, classifying the individual as responsive or non-responsive to
treatment with the anti-human OX40 agonist antibody and the anti-PDL1 antibody based on the
expression level of the one or more marker genes in the sample, as compared with a reference,
wherein a decreased expression level of the one or more marker genes as compared with the reference
indicates a responsive individual. In some embodiments of any of the above embodiments, the
methods may further comprise, after administering to the individual the anti-human OX40 agonist
antibody, the anti-PDL1 antibody, and the anti-VEGF antibody, monitoring the responsiveness of the
individual to said treatment by: (a) measuring an expression level of one or more marker genes in a
sample obtained from the cancer of the individual, wherein the one or more marker genes are selected
from the group consisting of CCR5, CD274, IL-7, TNFRSF14, TGFB1, CD40, CD4, PRFI, TNFSF4,
CD86, CXCL9, CD3E, LAG3, PDCD1, CCL28, GZMB, IFNg, and IL-2RA; and (b) optionally,
classifying the individual as responsive or non-responsive to treatment with the anti-human OX40
agonist antibody, the anti-PDL1 antibody, and the anti-VEGF antibody based on the expression level
of the one or more marker genes in the sample, as compared with a reference, wherein an increased
expression level of the one or more marker genes as compared with the reference indicates a
responsive individual. In some embodiments of any of the above embodiments, the methods may
further comprise, after administering to the individual the anti-human OX40 agonist antibody, the
anti-PDL1 antibody, and the anti-VEGF antibody, monitoring the responsiveness of the individual to
said treatment by: (a) measuring an expression level of one or more marker genes in a sample
obtained from the cancer of the individual, wherein the one or more marker genes are selected from
the group consisting of CD8b, EOMES, GZMA, GZMB, IFNg, and PRFI; and (b) optionally,
classifying the individual as responsive or non-responsive to treatment with the anti-human OX40
agonist antibody, the anti-PDL1 antibody, and the anti-VEGF antibody based on the expression level
of the one or more marker genes in the sample, as compared with a reference, wherein an increased
expression level of the one or more marker genes as compared with the reference indicates a
responsive individual. In some embodiments of any of the above embodiments, the methods may
further comprise, after administering to the individual the anti-human OX40 agonist antibody, the
anti-PDL1 antibody, and the anti-VEGF antibody, monitoring the responsiveness of the individual to
said treatment by: (a) measuring an expression level of one or more marker genes in a sample
obtained from the cancer of the individual, wherein the one or more marker genes are selected from
the group consisting of CCL22, IL-2, RORC, IL-8, CTLA4, and FOXP3; and (b) optionally,
classifying the individual as responsive or non-responsive to treatment with the anti-human OX40
agonist antibody, the anti-PDL1 antibody, and the anti-VEGF antibody based on the expression level of the one or more marker genes in the sample, as compared with a reference, wherein a decreased expression level of the one or more marker genes as compared with the reference indicates a responsive individual.

[0050] In another aspect, provided herein is a method for determining whether a cancer patient responds to a treatment with an anti-human OX40 agonist antibody and an anti-PDL1 antibody, comprising measuring an expression level of one or more marker genes in a sample obtained from the cancer of the individual, wherein the one or more marker genes are selected from the group consisting of CCR5, CD274, IL-7, TNFRSF14, TGFB1, CD40, CD4, PRF1, TNFSF4, CD86, CXCL9, CD3E, LAG3, PDCD1, CCL28, GZMB, IFNg, and IL-2RA, wherein the expression level of the one or more marker genes is compared with a reference, and wherein an increased expression level of the one or more marker genes as compared with the reference indicates that the cancer patient responds to said treatment. In another aspect, provided herein is a method for determining whether a cancer patient responds to a treatment with an anti-human OX40 agonist antibody and an anti-PDL1 antibody, comprising measuring an expression level of one or more marker genes in a sample obtained from the cancer of the individual, wherein the one or more marker genes are selected from the group consisting of CD8b, EOMES, GZMA, GZMB, IFNg, and PRF1, wherein the expression level of the one or more marker genes is compared with a reference, and wherein an increased expression level of the one or more marker genes as compared with the reference indicates that the cancer patient responds to said treatment. In another aspect, provided herein is a method for determining whether a cancer patient responds to a treatment with an anti-human OX40 agonist antibody and an anti-PDL1 antibody, comprising measuring an expression level of one or more marker genes in a sample obtained from the cancer of the individual, wherein the one or more marker genes are selected from the group consisting of CCL22, IL-2, RORC, IL-8, CTLA4, and FOXP3, wherein the expression level of the one or more marker genes is compared with a reference, and wherein a decreased expression level of the one or more marker genes as compared with the reference indicates the cancer patient responds to said treatment. In some embodiments of any of the above embodiments, the treatment further comprises an anti-VEGF antibody.

[0051] It is to be understood that one, some, or all of the properties of the various embodiments described herein may be combined to form other embodiments of the present invention. These and other aspects of the invention will become apparent to one of skill in the art. These and other embodiments of the invention are further described by the detailed description that follows.

BRIEF DESCRIPTION OF THE FIGURES

[0052] FIG. 1 provides a diagram of the study design and proposed cohorts.

[0053] FIG. 2 provides a pharmacokinetic (PK) plot of the mean serum concentration of MOXR0916 as a function of time from first dose for different dose groups.
FIGS. 3A-3G provide plots of peripheral OX40 receptor occupancy at MOXR0916 doses of 0.2mg (FIG. 3A), 3.2mg (FIG. 3B), 12mg (FIG. 3C), 40mg (FIG. 3D), 80mg (FIG. 3E), 160mg (FIG. 3F), and 300mg (FIG. 3G).

FIGS. 4A & 4B provide diagrams of the study design and proposed cohorts for examining the combination of MOXR0916 and atezolizumab (FIG. 4A), and for examining the combination of MOXR0916, atezolizumab, and bevacizumab (FIG. 4B).

FIG. 5 shows tumor immune modulation in a biopsy of an RCC tumor from a patient treated with MOXR0916 at a dose of 3.2mg. Tumor gene expression is reported as postdose fold change, relative to predose levels.

DETAILED DESCRIPTION OF EMBODIMENTS OF THE INVENTION

I. DEFINITIONS

The term "PD-1 axis binding antagonist" refers to a molecule that inhibits the interaction of a PD-1 axis binding partner with either one or more of its binding partner, so as to remove T-cell dysfunction resulting from signaling on the PD-1 signaling axis - with a result being to restore or enhance T-cell function (e.g., proliferation, cytokine production, target cell killing). As used herein, a PD-1 axis binding antagonist includes a PD-1 binding antagonist, a PD-L1 binding antagonist and a PD-L2 binding antagonist.

The term "PD-1 binding antagonist" refers to a molecule that decreases, blocks, inhibits, abrogates or interferes with signal transduction resulting from the interaction of PD-1 with one or more of its binding partners, such as PD-L1, PD-L2. In some embodiments, the PD-1 binding antagonist is a molecule that inhibits the binding of PD-1 to one or more of its binding partners. In a specific aspect, the PD-1 binding antagonist inhibits the binding of PD-1 to PD-L1 and/or PD-L2. For example, PD-1 binding antagonists include anti-PD-1 antibodies, antigen binding fragments thereof, immunoadhesins, fusion proteins, oligopeptides and other molecules that decrease, block, inhibit, abrogate or interfere with signal transduction resulting from the interaction of PD-1 with PD-L1 and/or PD-L2. In one embodiment, a PD-1 binding antagonist reduces the negative co-stimulatory signal mediated by or through cell surface proteins expressed on T lymphocytes mediated signaling through PD-1 so as to render a dysfunctional T-cell less dysfunctional (e.g., enhancing effector responses to antigen recognition).

The term "PD-L1 binding antagonist" refers to a molecule that decreases, blocks, inhibits, abrogates or interferes with signal transduction resulting from the interaction of PD-L1 with either one or more of its binding partners, such as PD-1, B7-1. In some embodiments, a PD-L1 binding antagonist is a molecule that inhibits the binding of PD-L1 to its binding partners. In a specific aspect, the PD-L1 binding antagonist inhibits binding of PD-L1 to PD-1 and/or B7-1. In some embodiments, the PD-L1 binding antagonists include anti-PD-L1 antibodies, antigen binding
fragments thereof, immunoadhesins, fusion proteins, oligopeptides and other molecules that decrease, block, inhibit, abrogate or interfere with signal transduction resulting from the interaction of PD-L1 with one or more of its binding partners, such as PD-1, B7-1. In one embodiment, a PD-L1 binding antagonist reduces the negative co-stimulatory signal mediated by or through cell surface proteins expressed on T lymphocytes mediated signaling through PD-L1 so as to render a dysfunctional T-cell less dysfunctional (e.g., enhancing effector responses to antigen recognition). In some embodiments, a PD-L1 binding antagonist is an anti-PD-L1 antibody. In a specific aspect, an anti-PD-L1 antibody is MPDL3280A as described herein.

[0060] The term "PD-L2 binding antagonist" refers to a molecule that decreases, blocks, inhibits, abrogates or interferes with signal transduction resulting from the interaction of PD-L2 with either one or more of its binding partners, such as PD-1. In some embodiments, a PD-L2 binding antagonist is a molecule that inhibits the binding of PD-L2 to one or more of its binding partners. In a specific aspect, the PD-L2 binding antagonist inhibits binding of PD-L2 to PD-1. In some embodiments, the PD-L2 antagonists include anti-PD-L2 antibodies, antigen binding fragments thereof, immunoadhesins, fusion proteins, oligopeptides and other molecules that decrease, block, inhibit, abrogate or interfere with signal transduction resulting from the interaction of PD-L2 with either one or more of its binding partners, such as PD-1. In one embodiment, a PD-L2 binding antagonist reduces the negative co-stimulatory signal mediated by or through cell surface proteins expressed on T lymphocytes mediated signaling through PD-L2 so as to render a dysfunctional T-cell less dysfunctional (e.g., enhancing effector responses to antigen recognition). In some embodiments, a PD-L2 binding antagonist is an immunoadhesin.

[0061] The term "dysfunction" in the context of immune dysfunction, refers to a state of reduced immune responsiveness to antigenic stimulation. The term includes the common elements of both exhaustion and/or anergy in which antigen recognition may occur, but the ensuing immune response is ineffective to control infection or tumor growth.

[0062] The term "dysfunctional", as used herein, also includes refractory or unresponsive to antigen recognition, specifically, impaired capacity to translate antigen recognition into down-stream T-cell effector functions, such as proliferation, cytokine production (e.g., IL-2) and/or target cell killing.

[0063] The term "anergy" refers to the state of unresponsiveness to antigen stimulation resulting from incomplete or insufficient signals delivered through the T-cell receptor (e.g., increase in intracellular Ca^{2+} in the absence of ras-activation). T cell anergy can also result upon stimulation with antigen in the absence of co-stimulation, resulting in the cell becoming refractory to subsequent activation by the antigen even in the context of costimulation. The unresponsive state can often be overridden by the presence of Interleukin-2. Anergic T-cells do not undergo clonal expansion and/or acquire effector functions.
[0064] The term "exhaustion" refers to T cell exhaustion as a state of T cell dysfunction that arises from sustained TCR signaling that occurs during many chronic infections and cancer. It is distinguished from anergy in that it arises not through incomplete or deficient signaling, but from sustained signaling. It is defined by poor effector function, sustained expression of inhibitory receptors and a transcriptional state distinct from that of functional effector or memory T cells. Exhaustion prevents optimal control of infection and tumors. Exhaustion can result from both extrinsic negative regulatory pathways (e.g., immunoregulatory cytokines) as well as cell intrinsic negative regulatory (costimulatory) pathways (PD-1, B7-H3, B7-H4, etc.).

[0065] "Enhancing T cell function" means to induce, cause or stimulate an effector or memory T cell to have a renewed, sustained or amplified biological function. Examples of enhancing T-cell function include: increased secretion of γ-interferon from CD8+ effector T cells, increased secretion of γ-interferon from CD4+ memory and/or effector T-cells, increased proliferation of CD4+ effector and/or memory T cells, increased proliferation of CD8+ effector T-cells, increased antigen responsiveness (e.g., clearance), relative to such levels before the intervention. In one embodiment, the level of enhancement is at least 50%, alternatively 60%, 70%, 80%, 90%, 100%, 120%, 150%, 200%. The manner of measuring this enhancement is known to one of ordinary skill in the art.

[0066] A "T cell dysfunctional disorder" is a disorder or condition of T-cells characterized by decreased responsiveness to antigenic stimulation. In a particular embodiment, a T-cell dysfunctional disorder is a disorder that is specifically associated with inappropriate increased signaling through PD-1. In another embodiment, a T-cell dysfunctional disorder is one in which T-cells are anergic or have decreased ability to secrete cytokines, proliferate, or execute cytolytic activity. In a specific aspect, the decreased responsiveness results in ineffective control of a pathogen or tumor expressing an immunogen. Examples of T cell dysfunctional disorders characterized by T-cell dysfunction include unresolved acute infection, chronic infection and tumor immunity.

[0067] "Tumor immunity" refers to the process in which tumors evade immune recognition and clearance. Thus, as a therapeutic concept, tumor immunity is "treated" when such evasion is attenuated, and the tumors are recognized and attacked by the immune system. Examples of tumor recognition include tumor binding, tumor shrinkage and tumor clearance.

[0068] "Sustained response" refers to the sustained effect on reducing tumor growth after cessation of a treatment. For example, the tumor size may remain to be the same or smaller as compared to the size at the beginning of the administration phase. In some embodiments, the sustained response has a duration at least the same as the treatment duration, at least 1.5X, 2.0X, 2.5X, or 3.0X length of the treatment duration.

[0069] "Immunogenicity" refers to the ability of a particular substance to provoke an immune response. Tumors are immunogenic and enhancing tumor immunogenicity aids in the clearance of the tumor cells by the immune response.
An "acceptor human framework" for the purposes herein is a framework comprising the amino acid sequence of a light chain variable domain (VL) framework or a heavy chain variable domain (VH) framework derived from a human immunoglobulin framework or a human consensus framework, as defined below. An acceptor human framework "derived from" a human immunoglobulin framework or a human consensus framework may comprise the same amino acid sequence thereof, or it may contain amino acid sequence changes. In some embodiments, the number of amino acid changes are 10 or less, 9 or less, 8 or less, 7 or less, 6 or less, 5 or less, 4 or less, 3 or less, or 2 or less. In some embodiments, the VL acceptor human framework is identical in sequence to the VL human immunoglobulin framework sequence or human consensus framework sequence.

"Affinity" refers to the strength of the sum total of noncovalent interactions between a single binding site of a molecule (e.g., an antibody) and its binding partner (e.g., an antigen). Unless indicated otherwise, as used herein, "binding affinity" refers to intrinsic binding affinity which reflects a 1:1 interaction between members of a binding pair (e.g., antibody and antigen). The affinity of a molecule X for its partner Y can generally be represented by the dissociation constant (Kd). Affinity can be measured by common methods known in the art, including those described herein. Specific illustrative and exemplary embodiments for measuring binding affinity are described in the following.

An "agonist antibody," as used herein, is an antibody which activates a biological activity of the antigen it binds.

"Antibody-dependent cell-mediated cytotoxicity" or "ADCC" refers to a form of cytotoxicity in which secreted immunoglobulin bound onto Fc receptors (FcRs) present on certain cytotoxic cells (e.g. NK cells, neutrophils, and macrophages) enable these cytotoxic effector cells to bind specifically to an antigen-bearing target cell and subsequently kill the target cell with cytotoxins. The primary cells for mediating ADCC, NK cells, express FcγRIII only, whereas monocytes express FcγRI, FcγRII, and FcγRIII. FcR expression on hematopoietic cells is summarized in Table 3 on page 464 of Ravetch and Kinet, *Annu. Rev. Immunol* 9:457-92 (1991). To assess ADCC activity of a molecule of interest, an *in vitro* ADCC assay, such as that described in US Patent No. 5,500,362 or 5,821,337 or U.S. Patent No. 6,737,056 (Presta), may be performed. Useful effector cells for such assays include PBMC and NK cells. Alternatively, or additionally, ADCC activity of the molecule of interest may be assessed *in vivo*, e.g., in an animal model such as that disclosed in Clynes et al. *PNAS (USA)* 95:652-656 (1998).

The terms "anti-OX40 antibody" and "an antibody that binds to OX40" refer to an antibody that is capable of binding OX40 with sufficient affinity such that the antibody is useful as a diagnostic and/or therapeutic agent in targeting OX40. In one embodiment, the extent of binding of an anti-OX40 antibody to an unrelated, non-OX40 protein is less than about 10% of the binding of the antibody to OX40 as measured, e.g., by a radioimmunoassay (RIA). In certain embodiments, an
antibody that binds to OX40 has a dissociation constant (Kd) of \( \leq 1 \mu M \), \( \leq 100 \) nM, \( \leq 10 \) nM, \( \leq 1 \) nM, \( \leq 0.1 \) nM, \( \leq 0.01 \) nM, or \( \leq 0.001 \) nM (e.g. \( 10^{-8} \) M or less, e.g. from \( 10^{-8} \) M to \( 10^{-13} \) M, e.g., from \( 10^{-9} \) M to \( 10^{-13} \) M). In certain embodiments, an anti-OX40 antibody binds to an epitope of OX40 that is conserved among OX40 from different species.

[0075] As use herein, the term "binds", "specifically binds to" or is "specific for" refers to measurable and reproducible interactions such as binding between a target and an antibody, which is determinative of the presence of the target in the presence of a heterogeneous population of molecules including biological molecules. For example, an antibody that binds to or specifically binds to a target (which can be an epitope) is an antibody that binds this target with greater affinity, avidity, more readily, and/or with greater duration than it binds to other targets. In one embodiment, the extent of binding of an antibody to an unrelated target is less than about 10% of the binding of the antibody to the target as measured, e.g., by a radioimmunoassay (RIA). In certain embodiments, an antibody that specifically binds to a target has a dissociation constant (Kd) of \( \leq 1 \mu M \), \( \leq 100 \) nM, \( \leq 10 \) nM, \( \leq 1 \) nM, or \( \leq 0.1 \) nM. In certain embodiments, an antibody specifically binds to an epitope on a protein that is conserved among the protein from different species. In another embodiment, specific binding can include, but does not require exclusive binding.

[0076] The term "antibody" herein is used in the broadest sense and encompasses various antibody structures, including but not limited to monoclonal antibodies, polyclonal antibodies, multispecific antibodies (e.g., bispecific antibodies), and antibody fragments so long as they exhibit the desired antigen-binding activity.

[0077] An "antibody fragment" refers to a molecule other than an intact antibody that comprises a portion of an intact antibody that binds the antigen to which the intact antibody binds. Examples of antibody fragments include but are not limited to Fv, Fab, Fab', Fab'-SH, F(ab')2; diabodies; linear antibodies; single-chain antibody molecules (e.g. scFv); and multispecific antibodies formed from antibody fragments.

[0078] An "antibody that binds to the same epitope" as a reference antibody refers to an antibody that blocks binding of the reference antibody to its antigen in a competition assay by 50% or more, and conversely, the reference antibody blocks binding of the antibody to its antigen in a competition assay by 50% or more. An exemplary competition assay is provided herein.

[0079] The term "binding domain" refers to the region of a polypeptide that binds to another molecule. In the case of an FcR, the binding domain can comprise a portion of a polypeptide chain thereof (e.g. the alpha chain thereof) which is responsible for binding an Fc region. One useful binding domain is the extracellular domain of an FcR alpha chain.

[0080] A polypeptide with a variant IgG Fc with "altered" FcR, ADCC or phagocytosis activity is one which has either enhanced or diminished FcR binding activity (e.g. FcyR) and/or ADCC activity and/or phagocytosis activity compared to a parent polypeptide or to a polypeptide comprising a native sequence Fc region.
The term "OX40," as used herein, refers to any native OX40 from any vertebrate source, including mammals such as primates (e.g. humans) and rodents (e.g., mice and rats), unless otherwise indicated. The term encompasses "full-length," unprocessed OX40 as well as any form of OX40 that results from processing in the cell. The term also encompasses naturally occurring variants of OX40, e.g., splice variants or allelic variants. The amino acid sequence of an exemplary human OX40 is shown in SEQ ID NO:1.

"OX40 activation" refers to activation, of the OX40 receptor. Generally, OX40 activation results in signal transduction.

The terms "cancer" and "cancerous" refer to or describe the physiological condition in mammals that is typically characterized by unregulated cell growth. Examples of cancer include but are not limited to, carcinoma, lymphoma, blastoma, sarcoma, and leukemia or lymphoid malignancies. More particular examples of such cancers include, but not limited to, squamous cell cancer (e.g., epithelial squamous cell cancer), lung cancer including small-cell lung cancer, non-small cell lung cancer, adenocarcinoma of the lung and squamous carcinoma of the lung, cancer of the peritoneum, hepatocellular cancer, gastric or stomach cancer including gastrointestinal cancer and gastrointestinal stromal tumor, pancreatic cancer, glioblastoma, cervical cancer, ovarian cancer, liver cancer, bladder cancer, cancer of the urinary tract, hepatoma, breast cancer, colon cancer, rectal cancer, colorectal cancer, endometrial or uterine carcinoma, salivary gland carcinoma, kidney or renal cancer, prostate cancer, vulval cancer, thyroid cancer, hepatic carcinoma, anal carcinoma, penile carcinoma, melanoma, superficial spreading melanoma, lentigo maligna melanoma, acral lentiginous melanomas, nodular melanomas, multiple myeloma and B-cell lymphoma; chronic lymphocytic leukemia (CLL); acute lymphoblastic leukemia (ALL); hairy cell leukemia; chronic myeloblastic leukemia; and post-transplant lymphoproliferative disorder (PTLD), as well as abnormal vascular proliferation associated with phakomatoses, edema (such as that associated with brain tumors), Meigs' syndrome, brain, as well as head and neck cancer, and associated metastases. In certain embodiments, cancers that are amenable to treatment by the antibodies of the invention include breast cancer, colorectal cancer, rectal cancer, non-small cell lung cancer, glioblastoma, non-Hodgkins lymphoma (NHL), renal cell cancer, prostate cancer, liver cancer, pancreatic cancer, soft-tissue sarcoma, kaposi's sarcoma, carcinoid carcinoma, head and neck cancer, ovarian cancer, mesothelioma, and multiple myeloma. In some embodiments, the cancer is selected from: non-small cell lung cancer, glioblastoma, neuroblastoma, melanoma, breast carcinoma (e.g. triple-negative breast cancer), gastric cancer, colorectal cancer (CRC), and hepatocellular carcinoma. Yet, in some embodiments, the cancer is selected from: non-small cell lung cancer, colorectal cancer, breast carcinoma (e.g. triple-negative breast cancer), melanoma, ovarian cancer, renal cell cancer, and bladder cancer, including metastatic forms of those cancers. In some embodiments, the cancer is a locally advanced or metastatic solid tumor, e.g. of any of the solid cancers described above.
The terms "cell proliferative disorder" and "proliferative disorder" refer to disorders that are associated with some degree of abnormal cell proliferation. In one embodiment, the cell proliferative disorder is cancer.

The term "chimeric" antibody refers to an antibody in which a portion of the heavy and/or light chain is derived from a particular source or species, while the remainder of the heavy and/or light chain is derived from a different source or species.

The "class" of an antibody refers to the type of constant domain or constant region possessed by its heavy chain. There are five major classes of antibodies: IgA, IgD, IgE, IgG, and IgM, and several of these may be further divided into subclasses (isotypes), e.g., IgGi, IgG2, IgG3, IgG4, IgAi, and IgA2. The heavy chain constant domains that correspond to the different classes of immunoglobulins are called α, δ, ε, γ, and μ, respectively.

"Complement dependent cytotoxicity" or "CDC" refers to the lysis of a target cell in the presence of complement. Activation of the classical complement pathway is initiated by the binding of the first component of the complement system (Clq) to antibodies (of the appropriate subclass), which are bound to their cognate antigen. To assess complement activation, a CDC assay, e.g., as described in Gazzano-Santoro et al., J. Immunol. Methods 202:163 (1996), may be performed. Polypeptide variants with altered Fc region amino acid sequences (polypeptides with a variant Fc region) and increased or decreased Clq binding capability are described, e.g., in US Patent No. 6,194,551 B1 andWO 1999/51642. See also, e.g., Idusogie et al. J. Immunol. 164: 4178-4184 (2000).

The term "cytostatic agent" refers to a compound or composition which arrests growth of a cell either in vitro or in vivo. Thus, a cytostatic agent may be one which significantly reduces the percentage of cells in S phase. Further examples of cytostatic agents include agents that block cell cycle progression by inducing G0/G1 arrest or M-phase arrest. The humanized anti-Her2 antibody trastuzumab (HERCEPTIN®) is an example of a cytostatic agent that induces G0/G1 arrest. Classical M-phase blockers include the vincas (vincristine and vinblastine), taxanes, and topoisomerase II inhibitors such as doxorubicin, epirubicin, daunorubicin, etoposide, and bleomycin. Certain agents that arrest G1 also spill over into S-phase arrest, for example, DNA alkylating agents such as tamoxifen, prednisone, dacarbazine, mechlorethamine, cisplatin, methotrexate, 5-fluorouracil, and ara-C. Further information can be found in Mendelsohn and Israel, eds., The Molecular Basis of Cancer, Chapter 1, entitled "Cell cycle regulation, oncogenes, and antineoplastic drugs" by Murakami et al. (W.B. Saunders, Philadelphia, 1995), e.g., p. 13. The taxanes (paclitaxel and docetaxel) are anticancer drugs both derived from the yew tree. Docetaxel (TAXOTERE®, Rhone-Poulenc Rorer), derived from the European yew, is a semisynthetic analogue of paclitaxel (TAXOL®, Bristol-Myers Squibb). Paclitaxel and docetaxel promote the assembly of microtubules from tubulin dimers and stabilize microtubules by preventing depolymerization, which results in the inhibition of mitosis in cells.
The term "cytotoxic agent" as used herein refers to a substance that inhibits or prevents a cellular function and/or causes cell death or destruction. Cytotoxic agents include, but are not limited to, radioactive isotopes (e.g., At$^{211}$, I$^{131}$, I$^{125}$, Y$^{90}$, Re$^{186}$, Re$^{188}$, Sm$^{153}$, Bi$^{212}$, P$^{32}$, Pb$^{212}$ and radioactive isotopes of Lu); chemotherapeutic agents or drugs (e.g., methotrexate, adriamycin, vinca alkaloids (vinchristine, vinblastine, etoposide), doxorubicin, melphalan, mitomycin C, chlorambucil, daunorubicin or other intercalating agents); growth inhibitory agents; enzymes and fragments thereof such as nucleolytic enzymes; antibiotics; toxins such as small molecule toxins or enzymatically active toxins of bacterial, fungal, plant or animal origin, including fragments and/or variants thereof; and the various antitumor or anticancer agents disclosed below.

A "depleting anti-OX40 antibody," is an anti-OX40 antibody that kills or depletes OX40-expressing cells. Depletion of OX40 expressing cells can be achieved by various mechanisms, such as antibody-dependent cell-mediated cytotoxicity and/or phagocytosis. Depletion of OX40-expressing cells may be assayed in vitro, and exemplary methods for in vitro ADCC and phagocytosis assays are provided herein. In some embodiments, the OX40-expressing cell is a human CD4+ effector T cell. In some embodiments, the OX40-expressing cell is a transgenic BT474 cell that expresses human OX40.

"Effector functions" refer to those biological activities attributable to the Fc region of an antibody, which vary with the antibody isotype. Examples of antibody effector functions include: Clq binding and complement dependent cytotoxicity (CDC); Fc receptor binding; antibody-dependent cell-mediated cytotoxicity (ADCC); phagocytosis; down regulation of cell surface receptors (e.g. B cell receptor); and B cell activation.

An "effective amount" of an agent, e.g., a pharmaceutical formulation, refers to an amount effective, at dosages and for periods of time necessary, to achieve the desired therapeutic or prophylactic result.

"Fc receptor" or "FcR" describes a receptor that binds to the Fc region of an antibody. In some embodiments, an FcR is a native human FcR. In some embodiments, an FcR is one which binds an IgG antibody (a gamma receptor) and includes receptors of the FcγRI, FcγRII, and FcγRIII subclasses, including allelic variants and alternatively spliced forms of those receptors. FcγRII receptors include FcγRIIA (an "activating receptor") and FcγRIIB (an "inhibiting receptor"), which have similar amino acid sequences that differ primarily in the cytoplasmic domains thereof.

Activating receptor FcγRIIA contains an immunoreceptor tyrosine-based activation motif (ITAM) in its cytoplasmic domain. Inhibiting receptor FcγRIIB contains an immunoreceptor tyrosine-based inhibition motif (ITIM) in its cytoplasmic domain, (see, e.g., Daeron, Annu. Rev. Immunol. 15:203-234 (1997)). FcRs are reviewed, for example, in Ravetch and Kinet, Annu. Rev. Immunol 9:457-92 (1991); Capel et al., Immunomethods 4:25-34 (1994); and de Haas et al., J. Lab. Clin. Med. 126:330-41 (1995). Other FcRs, including those to be identified in the future, are encompassed by the term "FcR" herein. The term "Fc receptor" or "FcR" also includes the neonatal receptor, FcRn, which is

Methods of measuring binding to FcRn are known (see, e.g., Ghetie and Ward., Immunol. Today 18(12):592-598 (1997); Ghetie et al, Nature Biotechnology, 15(7):637-640 (1997); Hinton et al, J. Biol. Chem. 279(8):6213-6216 (2004); WO 2004/92219 (Hinton et al). Binding to human FcRn in vivo and serum half life of human FcRn high affinity binding polypeptides can be assayed, e.g., in transgenic mice or transfected human cell lines expressing human FcRn, or in primates to which the polypeptides with a variant Fc region are administered. WO 2000/42072 (Presta) describes antibody variants with improved or diminished binding to FcRs. See also, e.g., Shields et al. J. Biol. Chem. 9(2):6591-6604 (2001).

The term "Fc region" herein is used to define a C-terminal region of an immunoglobulin heavy chain that contains at least a portion of the constant region. The term includes native sequence Fc regions and variant Fc regions. In one embodiment, a human IgG heavy chain Fc region extends from Cys226, or from Pro230, to the carboxyl-terminus of the heavy chain. However, the C-terminal lysine (Lys447) of the Fc region may or may not be present. Unless otherwise specified herein, numbering of amino acid residues in the Fc region or constant region is according to the EU numbering system, also called the EU index, as described in Kabat et al., Sequences of Proteins of Immunological Interest, 5th Ed. Public Health Service, National Institutes of Health, Bethesda, MD, 1991.

A "functional Fc region" possesses an "effector function" of a native sequence Fc region. Exemplary "effector functions" include C1q binding; CDC; Fc receptor binding; ADCC; phagocytosis; down regulation of cell surface receptors (e.g. B cell receptor; BCR), etc. Such effector functions generally require the Fc region to be combined with a binding domain (e.g., an antibody variable domain) and can be assessed using various assays as disclosed, for example, in definitions herein.

"Human effector cells" refer to leukocytes that express one or more FcRs and perform effector functions. In certain embodiments, the cells express at least FcyRIII and perform ADCC effector function(s). Examples of human leukocytes which mediate ADCC include peripheral blood mononuclear cells (PBMC), natural killer (NK) cells, monocytes, cytotoxic T cells, and neutrophils. The effector cells may be isolated from a native source, e.g., from blood.

"Framework" or "FR" refers to variable domain residues other than hypervariable region (HVR) residues. The FR of a variable domain generally consists of four FR domains: FR1, FR2, FR3, and FR4. Accordingly, the HVR and FR sequences generally appear in the following sequence in VH (or VL): FR1-H1(L1)-FR2-H2(L2)-FR3-H3(L3)-FR4.

The terms "full length antibody," "intact antibody," and "whole antibody" are used herein interchangeably to refer to an antibody having a structure substantially similar to a native antibody structure or having heavy chains that contain an Fc region as defined herein.
The terms "host cell," "host cell line," and "host cell culture" are used interchangeably and refer to cells into which exogenous nucleic acid has been introduced, including the progeny of such cells. Host cells include "transformants" and "transformed cells," which include the primary transformed cell and progeny derived therefrom without regard to the number of passages. Progeny may not be completely identical in nucleic acid content to a parent cell, but may contain mutations. Mutant progeny that have the same function or biological activity as screened or selected for in the originally transformed cell are included herein.

A "human antibody" is one which possesses an amino acid sequence which corresponds to that of an antibody produced by a human or a human cell or derived from a non-human source that utilizes human antibody repertoires or other human antibody-encoding sequences. This definition of a human antibody specifically excludes a humanized antibody comprising non-human antigen-binding residues.

A "human consensus framework" is a framework which represents the most commonly occurring amino acid residues in a selection of human immunoglobulin VL or VH framework sequences. Generally, the selection of human immunoglobulin VL or VH sequences is from a subgroup of variable domain sequences. Generally, the subgroup of sequences is a subgroup as in Kabat et al., Sequences of Proteins of Immunological Interest, Fifth Edition, NIH Publication 91-3242, Bethesda MD (1991), vols. 1-3. In one embodiment, for the VL, the subgroup is subgroup kappa I as in Kabat et al., supra. In one embodiment, for the VH, the subgroup is subgroup III as in Kabat et al., supra.

A "humanized" antibody refers to a chimeric antibody comprising amino acid residues from non-human HVRs and amino acid residues from human FRs. In certain embodiments, a humanized antibody will comprise substantially all of at least one, and typically two, variable domains, in which all or substantially all of the HVRs (e.g., CDRs) correspond to those of a non-human antibody, and all or substantially all of the FRs correspond to those of a human antibody. A humanized antibody optionally may comprise at least a portion of an antibody constant region derived from a human antibody. A "humanized form" of an antibody, e.g., a non-human antibody, refers to an antibody that has undergone humanization.

The term "hypervariable region" or "HVR" as used herein refers to each of the regions of an antibody variable domain which are hypervariable in sequence ("complementarity determining regions" or "CDRs") and/or form structurally defined loops ("hypervariable loops") and/or contain the antigen-contacting residues ("antigen contacts"). Generally, antibodies comprise six HVRs: three in the VH (HI, H2, H3), and three in the VL (L1, L2, L3). Exemplary HVRs herein include:
(a) hypervariable loops occurring at amino acid residues 26-32 (L1), 50-52 (L2), 91-96 (L3), 26-32 (HI), 53-55 (H2), and 96-101 (H3) (Chothia and Lesk, /. Mol. Biol. 196:901-917 (1987));
(b) CDRs occurring at amino acid residues 24-34 (LI), 50-56 (L2), 89-97 (L3), 31-35b (HI), 50-65 (H2), and 95-102 (H3) (Kabat et al., *Sequences of Proteins of Immunological Interest*, 5th Ed. Public Health Service, National Institutes of Health, Bethesda, MD (1991));
(c) antigen contacts occurring at amino acid residues 27c-36 (LI), 46-55 (L2), 89-96 (L3), 30-35b (HI), 47-58 (H2), and 93-101 (H3) (MacCallum et al. *J. Mol. Biol.* 262: 732-745 (1996)); and
(d) combinations of (a), (b), and/or (c), including HVR amino acid residues 46-56 (L2), 47-56 (L2), 48-56 (L2), 49-56 (L2), 26-35 (HI), 26-35b (HI), 49-65 (H2), 93-102 (H3), and 94-102 (H3).

[0104] Unless otherwise indicated, HVR residues and other residues in the variable domain (e.g., FR residues) are numbered herein according to Kabat et al., *supra*.

[0105] An "immunoconjugate" is an antibody conjugated to one or more heterologous molecule(s), including but not limited to a cytotoxic agent.

[0106] An "individual" or "subject" is a mammal. Mammals include, but are not limited to, domesticated animals (e.g., cows, sheep, cats, dogs, and horses), primates (e.g., humans and non-human primates such as monkeys), rabbits, and rodents (e.g., mice and rats). In certain embodiments, the individual or subject is a human.

[0107] "Promoting cell growth or proliferation" means increasing a cell's growth or proliferation by at least 10%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90%, 95%, or 100%.

[0108] An "isolated" antibody is one which has been separated from a component of its natural environment. In some embodiments, an antibody is purified to greater than 95% or 99% purity as determined by, for example, electrophoretic (e.g., SDS-PAGE, isoelectric focusing (IEF), capillary electrophoresis) or chromatographic (e.g., ion exchange or reverse phase HPLC). For review of methods for assessment of antibody purity, see, e.g., Flatman et al., *J. Chromatogr. B* 848:79-87 (2007).

[0109] An "isolated" nucleic acid refers to a nucleic acid molecule that has been separated from a component of its natural environment. An isolated nucleic acid includes a nucleic acid molecule contained in cells that ordinarily contain the nucleic acid molecule, but the nucleic acid molecule is present extrachromosomally or at a chromosomal location that is different from its natural chromosomal location.

[0110] "Isolated nucleic acid encoding an anti-OX40 antibody" refers to one or more nucleic acid molecules encoding antibody heavy and light chains (or fragments thereof), including such nucleic acid molecule(s) in a single vector or separate vectors, and such nucleic acid molecule(s) present at one or more locations in a host cell.

[0111] The term "monoclonal antibody" as used herein refers to an antibody obtained from a population of substantially homogeneous antibodies, i.e., the individual antibodies comprising the population are identical and/or bind the same epitope, except for possible variant antibodies, e.g., containing naturally occurring mutations or arising during production of a monoclonal antibody preparation, such variants generally being present in minor amounts. In contrast to polyclonal
antibody preparations, which typically include different antibodies directed against different determinants (epitopes), each monoclonal antibody of a monoclonal antibody preparation is directed against a single determinant on an antigen. Thus, the modifier "monoclonal" indicates the character of the antibody as being obtained from a substantially homogeneous population of antibodies, and is not to be construed as requiring production of the antibody by any particular method. For example, the monoclonal antibodies to be used in accordance with the present invention may be made by a variety of techniques, including but not limited to the hybridoma method, recombinant DNA methods, phage-display methods, and methods utilizing transgenic animals containing all or part of the human immunoglobulin loci, such methods and other exemplary methods for making monoclonal antibodies being described herein.

A "naked antibody" refers to an antibody that is not conjugated to a heterologous moiety (e.g., a cytotoxic moiety) or radiolabel. The naked antibody may be present in a pharmaceutical formulation.

"Native antibodies" refer to naturally occurring immunoglobulin molecules with varying structures. For example, native IgG antibodies are heterotetrameric glycoproteins of about 150,000 daltons, composed of two identical light chains and two identical heavy chains that are disulfide-bonded. From N- to C-terminus, each heavy chain has a variable region (VH), also called a variable heavy domain or a heavy chain variable domain, followed by three constant domains (CHI, CH2, and CH3). Similarly, from N- to C-terminus, each light chain has a variable region (VL), also called a variable light domain or a light chain variable domain, followed by a constant light (CL) domain. The light chain of an antibody may be assigned to one of two types, called kappa (κ) and lambda (λ), based on the amino acid sequence of its constant domain. A "native sequence Fc region" comprises an amino acid sequence identical to the amino acid sequence of an Fc region found in nature. Native sequence human Fc regions include a native sequence human IgGl Fc region (non-A and A allotypes); native sequence human IgG2 Fc region; native sequence human IgG3 Fc region; and native sequence human IgG4 Fc region as well as naturally occurring variants thereof.

The term "package insert" is used to refer to instructions customarily included in commercial packages of therapeutic products, that contain information about the indications, usage, dosage, administration, combination therapy, contraindications and/or warnings concerning the use of such therapeutic products.

"Percent (%) amino acid sequence identity" with respect to a reference polypeptide sequence is defined as the percentage of amino acid residues in a candidate sequence that are identical with the amino acid residues in the reference polypeptide sequence, after aligning the sequences and introducing gaps, if necessary, to achieve the maximum percent sequence identity, and not considering any conservative substitutions as part of the sequence identity. Alignment for purposes of determining percent amino acid sequence identity can be achieved in various ways that are within the skill in the art, for instance, using publicly available computer software such as BLAST, BLAST-2,
ALIGN or Megalign (DNASTAR) software. Those skilled in the art can determine appropriate parameters for aligning sequences, including any algorithms needed to achieve maximal alignment over the full length of the sequences being compared. For purposes herein, however, % amino acid sequence identity values are generated using the sequence comparison computer program ALIGN-2. The ALIGN-2 sequence comparison computer program was authored by Genentech, Inc., and the source code has been filed with user documentation in the U.S. Copyright Office, Washington D.C., 20559, where it is registered under U.S. Copyright Registration No. TXU5 10087. The ALIGN-2 program is publicly available from Genentech, Inc., South San Francisco, California, or may be compiled from the source code. The ALIGN-2 program should be compiled for use on a UNIX operating system, including digital UNIX V4.0D. All sequence comparison parameters are set by the ALIGN-2 program and do not vary.

In situations where ALIGN-2 is employed for amino acid sequence comparisons, the % amino acid sequence identity of a given amino acid sequence A to, with, or against a given amino acid sequence B (which can alternatively be phrased as a given amino acid sequence A that has or comprises a certain % amino acid sequence identity to, with, or against a given amino acid sequence B) is calculated as follows:

\[
100 \text{ times the fraction } X/Y
\]

where X is the number of amino acid residues scored as identical matches by the sequence alignment program ALIGN-2 in that program's alignment of A and B, and where Y is the total number of amino acid residues in B. It will be appreciated that where the length of amino acid sequence A is not equal to the length of amino acid sequence B, the % amino acid sequence identity of A to B will not equal the % amino acid sequence identity of B to A. Unless specifically stated otherwise, all % amino acid sequence identity values used herein are obtained as described in the immediately preceding paragraph using the ALIGN-2 computer program.

The term "pharmaceutical formulation" refers to a preparation which is in such form as to permit the biological activity of an active ingredient contained therein to be effective, and which contains no additional components which are unacceptably toxic to a subject to which the formulation would be administered.

As used herein, "in conjunction with" refers to administration of one treatment modality in addition to another treatment modality. As such, "in conjunction with" refers to administration of one treatment modality before, during, or after administration of the other treatment modality to the individual.

A "pharmaceutically acceptable carrier" refers to an ingredient in a pharmaceutical formulation, other than an active ingredient, which is nontoxic to a subject. A pharmaceutically acceptable carrier includes, but is not limited to, a buffer, excipient, stabilizer, or preservative.
As used herein, "treatment" (and grammatical variations thereof such as "treat" or "treating") refers to clinical intervention in an attempt to alter the natural course of the individual being treated, and can be performed either for prophylaxis or during the course of clinical pathology. Desirable effects of treatment include, but are not limited to, preventing occurrence or recurrence of disease, alleviation of symptoms, diminishment of any direct or indirect pathological consequences of the disease, preventing metastasis, decreasing the rate of disease progression, amelioration or palliation of the disease state, and remission or improved prognosis. In some embodiments, antibodies of the invention are used to delay development of a disease or to slow the progression of a disease.

The term "tumor" refers to all neoplastic cell growth and proliferation, whether malignant or benign, and all pre-cancerous and cancerous cells and tissues. The terms "cancer," "cancerous," "cell proliferative disorder," "proliferative disorder" and "tumor" are not mutually exclusive as referred to herein.

The term "variable region" or "variable domain" refers to the domain of an antibody heavy or light chain that is involved in binding the antibody to antigen. The variable domains of the heavy chain and light chain (VH and VL, respectively) of a native antibody generally have similar structures, with each domain comprising four conserved framework regions (FRs) and three hypervariable regions (HVRs). (See, e.g., Kindt et al. *Kuby Immunology*, 6th ed., W.H. Freeman and Co., page 91 (2007).) A single VH or VL domain may be sufficient to confer antigen-binding specificity. Furthermore, antibodies that bind a particular antigen may be isolated using a VH or VL domain from an antibody that binds the antigen to screen a library of complementary VL or VH domains, respectively. See, e.g., Portolano et al., *J. Immunol.* 150:880-887 (1993); Clarkson et al., *Nature* 352:624-628 (1991).

A "variant Fc region" comprises an amino acid sequence which differs from that of a native sequence Fc region by virtue of at least one amino acid modification, preferably one or more amino acid substitution(s). Preferably, the variant Fc region has at least one amino acid substitution compared to a native sequence Fc region or to the Fc region of a parent polypeptide, e.g. from about one to about ten amino acid substitutions, and preferably from about one to about five amino acid substitutions in a native sequence Fc region or in the Fc region of the parent polypeptide. The variant Fc region herein will preferably possess at least about 80% homology with a native sequence Fc region and/or with an Fc region of a parent polypeptide, and most preferably at least about 90% homology therewith, more preferably at least about 95% homology therewith.

The term "vector," as used herein, refers to a nucleic acid molecule capable of propagating another nucleic acid to which it is linked. The term includes the vector as a self-replicating nucleic acid structure as well as the vector incorporated into the genome of a host cell into which it has been introduced. Certain vectors are capable of directing the expression of nucleic acids to which they are operatively linked. Such vectors are referred to herein as "expression vectors."
A "VH subgroup III consensus framework" comprises the consensus sequence obtained from the amino acid sequences in variable heavy subgroup III of Kabat et al. In one embodiment, the VH subgroup III consensus framework amino acid sequence comprises at least a portion or all of each of the following sequences: EVQLVESGGGLVQPGGSLRLSCAAS (SEQ ID NO:185)-H1-WVRQAPGKGLEWV (SEQ ID NO: 186)-H2-RFTISRDNSKNTLYLQMNSLRAEDTA VYYC (SEQ ID NO: 187)-H3-WGQQLTVSS (SEQ ID NO: 188).

A "VL subgroup I consensus framework" comprises the consensus sequence obtained from the amino acid sequences in variable light kappa subgroup I of Kabat et al. In one embodiment, the VH subgroup I consensus framework amino acid sequence comprises at least a portion or all of each of the following sequences: DIQMTQSPSSLSASVGVVTITC (SEQ ID NO:189)-L1-WYQQKPGAPKLIIY (SEQ ID NO:190)-L2-GVPSRFSQGSGETDFTTLTISSLQPD FATYYC (SEQ ID NO:191)-L3-FGQKTKVEIK (SEQ ID NO: 192).

The term "cytotoxic" as used herein refers to a substance that inhibits or prevents a cellular function and/or causes cell death or destruction. Cytotoxic agents include, but are not limited to, radioactive isotopes (e.g., At211, 1131, 1125, Y90, Rel86, Rel88, Sm153, Bi212, P32, Pb212 and radioactive isotopes of Lu); chemotherapeutic agents; growth inhibitory agents; enzymes and fragments thereof such as nucleolytic enzymes; and toxins such as small molecule toxins or enzymatically active toxins of bacterial, fungal, plant or animal origin, including fragments and/or variants thereof. Exemplary cytotoxic agents can be selected from anti-microtubule agents, platinum coordination complexes, alkylating agents, antibiotic agents, topoisomerase II inhibitors, antimetabolites, topoisomerase I inhibitors, hormones and hormonal analogues, signal transduction pathway inhibitors, non-receptor tyrosine kinase angiogenesis inhibitors, immunotherapeutic agents, proapoptotic agents, inhibitors of LDH-A; inhibitors of fatty acid biosynthesis; cell cycle signalling inhibitors; HDAC inhibitors, proteasome inhibitors; and inhibitors of cancer metabolism.

In one embodiment the cytotoxic agent is selected from anti-microtubule agents, platinum coordination complexes, alkylating agents, antibiotic agents, topoisomerase II inhibitors, antimetabolites, topoisomerase I inhibitors, hormones and hormonal analogues, signal transduction pathway inhibitors, non-receptor tyrosine kinase angiogenesis inhibitors, immunotherapeutic agents, proapoptotic agents, inhibitors of LDH-A, inhibitors of fatty acid biosynthesis, cell cycle signalling inhibitors, HDAC inhibitors, proteasome inhibitors, and inhibitors of cancer metabolism. In one embodiment the cytotoxic agent is a taxane. In one embodiment the taxane is paclitaxel or docetaxel. In one embodiment the cytotoxic agent is a platinum agent. In one embodiment the cytotoxic agent is an antagonist of EGFR. In one embodiment the antagonist of EGFR is N-(3-ethynylphenyl)-6,7-bis(2-methoxyethoxy)quinazolin-4-amine (e.g., erlotinib). In one embodiment the cytotoxic agent is a RAF inhibitor. In one embodiment, the RAF inhibitor is a BRAF and/or CRAF inhibitor. In one embodiment the RAF inhibitor is vemurafenib. In one embodiment the cytotoxic agent is a PI3K inhibitor.
"Chemotherapeutic agent" includes chemical compounds useful in the treatment of cancer. Examples of chemotherapeutic agents include erlotinib (TARCEVA®, Genentech/OSI Pharm.), bortezomib (VELCADE®, Millennium Pharm.), disulfiram, epigallocatechin gallate, salinosporamide A, carfilzomib, 17-AAG (geldanamycin), radicicol, lactate dehydrogenase A (LDH-A), fulvestrant (FASLODEX®, AstraZeneca), sunitib (SUTENT®, Pfizer/Sugen), letrozole (FEMARA®, Novartis), imatinib mesylate (GLEEVEC®, Novartis), finasunate (VATALANIB®, Novartis), oxaliplatin (ELOXATIN®, Sanofi), 5-FU (5-fluorouracil), leucovorin, Rapamycin (Sirolimus, RAPAMUNE®, Wyeth), Lapatinib (TYKERB®, GSK572016, Glaxo Smith Kline), Lonafamib (SCH 66336), sorafenib (NEXAVAR®, Bayer Labs), gefitinib (IRESSA®, AstraZeneca), AG1478, alkylating agents such as thiopeta and CYTOXAN® cyclophosphamide; alkyl sulfonates such as busulfan, improsalan and piposulfan; aziridines such as benzodopa, carboquone, meturedopa, and uredopa; ethylenimines and methylamidamines including altretamine, triethylene melamine, triethylene phosphor amide, triethylenetriphosphor amide and trimethylenolamine; acetogenins (especially bullatacin and bullatacinone); a camptothecin (including topotecan and irinotecan); bryostatin; callystatin; CC-1065 (including its adozelesin, carzelesin and bizelesin synthetic analogs); cryptophycins (particularly cryptophycin 1 and cryptophycin 8); adrenocorticosteroids (including prednisone and prednisolone); cyproterone acetate; 5α-reductases including finasteride and dutasteride; vorinostat, romidepsin, panobinostat, valproic acid, mocetinostat dolastatin; aldesleukin, tale duocarmycin (including the synthetic analogs, KW-2189 and CB1-TM1); eleutherobin; pancratistatin; a sarcoctidyin; spongistatin; nitrogen mustards such as chlorambucil, chloromaphazine, chlorophosphamide, estramustine, ifosfamide, mechlorethamine, mechlorethamine oxide hydrochloride, melphalan, novembichin, phenesterine, prednimustine, trofosfamide, uracil mustard; nitrosoureas such as carmustine, chlorozotocin, fotemustine, lomustine, nimustine, and ranimustine; antibiotics such as the enediyne antibiotics (e.g., calicheamicin, especially calicheamicin γII and calicheamicin coll (Angew Chem. Int. Ed. Engl. 1994 33:183-186); dynemicin, including dynemicin A; bisphosphonates, such as clodronate; an esperamicin; as well as neocarzinostatin chromophore and related chromoprotein enediyne antibiotic chromophores), aclacinomysins, actinomycin, authramycin, azaserine, bleomycins, cactinomycins, carabinc, cinamomycin, carzinophilin, chromomycinis, daclinomycin, daunorubicin, detorubicin, 6-diazo-5-oxo-L-norleucine, ADRIAMYCIN® (doxorubicin), morpholino-doxorubicin, cyanomorpholino-doxorubicin, 2-pyrolino-doxorubicin and deoxy doxorubicin), epirubicin, esorubicin, idarubicin, marcellomycin, mitomycins such as mitomycin C, mycophenolic acid, nogalamycin, olivomycins, peplomycin, porfiromycin, puromycin, quelamycin, rodorubicin, streptonigrin, streptozocin, tubercidin, ubenimex, zinostatin, zorubicin; anti-metabolites such as methotrexate and 5-fluorouracil (5-FU); folic acid analogs such as denopterin, methotrexate, pteropterin, trimetrexate; purine analogs such as fludarabine, 6-mercaptopurine, thiamiprine, thioguanine; pyrimidine analogs such as ancitibine, azacitidine, 6-azaauridine, carmofur, cytarabine, dideoxyuridine, doxifluridine, enocitabine, floxuridine; androgens such as calusterone,
dromostanolone propionate, epitiostanol, mepitiostane, testolactone; anti-adrenals such as aminogluthethimide, mitotane, trilostane; folic acid replenisher such as folinic acid; aceglatone; aldophosphamide glycoside; aminolevulinic acid; eniluracil; amscarine; bestrabucil; bisantrene; edatrazate; def ofamine; demecolcine; diaziquone; elfornithine; elliptinium acetate; an epothilone; etoglucid; gallium nitrate; hydroxyurea; lentinan; lonidamine; maytansinoids such as maytansine and ansamitocins; mitoguazone; mitoxantrone; mopidamol; nitraerine; pentostatin; phenamet; pirarubicin; losoxantrone; podophyllinic acid; 2-ethylhydrazide; procarbazine; PSK® polysaccharide complex (JHS Natural Products, Eugene, Oreg.); razoxane; rhizoxin; sizofuran; spirogermanium; tenuazonic acid; triaziquone; 2,2′,2″-trichlorotriethylamine; trichothecenes (especially T-2 toxin, verracurin A, roridin A and anguidine); urethan; vindesine; dacarbazine; mannonustine; mitobronitol; mitolactol; pipobroman; gacytosine; arabinoside ("Ara-C"); cyclophosphamide; thiopeta; taxoids, e.g., TAXOL (paclitaxel; Bristol-Myers Squibb Oncology, Princeton, N.J.), ABRAXANE® (Cremophor-free), albumin-engineered nanoparticle formulations of paclitaxel (American Pharmaceutical Partners, Schaumburg, 111), and TAXOTERE® (docetaxel, doxetaxel; Sanofi-Aventis); chloranmbucil; GEMZAR® (gemcitabine); 6-thioguanine; mercaptopurine; methotrexate; platinum analogs such as cisplatin and carboplatin; vinblastine; etoposide (VP-16); ifosfamide; mitoxantrone; vincristine; NAVELBINE® (vinorelbine); novantrone; teniposide; edatrexate; daunomycin; aminopterin; capecitabine (XELODA®); ibandronate; CPT-11; topoisomerase inhibitor RFS 2000; difluoromethylornithine (DMFO); retinoids such as retinoic acid; and pharmaceutically acceptable salts, acids and derivatives of any of the above.

[0130] Chemotherapeutic agent also includes (i) anti-hormonal agents that act to regulate or inhibit hormone action on tumors such as anti-estrogens and selective estrogen receptor modulators (SERMs), including, for example, tamoxifen (including NOLVADEX®; tamoxifen citrate), raloxifene, droloxifene, iodoxifene, 4-hydroxymethotrexate, trioxifene, keoxifene, LY1 17018, onapristone, and FARESTON® (toremifine citrate); (ii) aromatase inhibitors that inhibit the enzyme aromatase, which regulates estrogen production in the adrenal glands, such as, for example, 4(5)-imidazoles, aminogluthethimide, MEGASE® (megestrol acetate), AROMASIN® ( exemestane; Pfizer), formestanide, fadrozole, RIVISOR® (vorozole), FEMARA® (letrozole; Novartis), and ARIMIDEX® (anastrozole; AstraZeneca); (iii) anti-androgens such as flutamide, nilutamide, bicalutamide, leuprolide and goserel1n; buserelin, tripterepin, medroxyprogesterone acetate, diethylstilbestrol, premarin, fluoroxymesterone, all transretionc acid, fenretinide, as well as troxacitabine (a 1,3-dioxolane nucleoside cytosine analog); (iv) protein kinase inhibitors; (v) lipid kinase inhibitors; (vi) antisense oligonucleotides, particularly those which inhibit expression of genes in signaling pathways implicated in aberrant cell proliferation, such as, for example, PKC-alpha, Ralf and H-Ras; (vii) ribozymes such as VEGF expression inhibitors (e.g., ANGIOZYME®) and HER2 expression inhibitors; (viii) vaccines such as gene therapy vaccines, for example, ALLOVECTIN®, LEUVECTIN®, and VAXID®; PROLEUKIN®, rIL-2; a topoisomerase I inhibitor such as
LURTOTECAN®; ABARELIX® rmRH; and (ix) pharmaceutically acceptable salts, acids and derivatives of any of the above.

Chemotherapeutic agent also includes antibodies such as alemtuzumab (Campath), bevacizumab (AVASTIN®, Genentech); cetuximab (ERBITUX®, Imclone); panitumumab (VECTIBIX®, Amgen), rituximab (RITUXAN®, Genentech/Biogen Idec), pertuzumab (OMNITARG®, 2C4, Genentech), trastuzumab (HERCEPTIN®, Genentech), tositumomab (Bexxar, Corixia), and the antibody drug conjugate, gemtuzumab ozogamicin (MYLOTARG®, Wyeth). Additional humanized monoclonal antibodies with therapeutic potential as agents in combination with the compounds of the invention include: apolizumab, aselizumab, atlizumab, bapineuzumab, bivatuzumab mertansine, cantuzumab mertansine, cedelizumab, certolizumab pegol, cidfusituzumab, ciduzumab, daclizumab, eculizumab, eflalizumab, epratuzumab, erlizumab, felvizumab, fontolizumab, gemtuzumab ozogamicin, inotuzumab ozogamicin, ipilimumab, labetuzumab, lintuzumab, matuzumab, mepolizumab, motavizumab, motovizumab, natalizumab, nimotuzumab, nolovizumab, numavizumab, ocrelizumab, omalizumab, palivizumab, pascolizumab, pecfusituzumab, pectuzumab, pexelizumab, ralivizumab, ranibizumab, reslizumab, reslizumab, respawnizumab, rovelizumab, rupluzumab, sibrotuzumab, siplizumab, sotruluzumab, tacatuzumab, tedocizumab, talizumab, tefibazumab, tocilizumab, toralizumab, tucotuzumab celmoleukin, tucusituzumab, umavizumab, urtoxazumab, ustekinumab, visilizumab, and the anti-interleukin-12 (ABT-874/J695, Wyeth Research and Abbott Laboratories) which is a recombinant exclusively human-sequence, full-length IgGl λ antibody genetically modified to recognize interleukin-12 p40 protein.

Chemotherapeutic agent also includes "EGFR inhibitors," which refers to compounds that bind to or otherwise interact directly with EGFR and prevent or reduce its signaling activity, and is alternatively referred to as an "EGFR antagonist." Examples of such agents include antibodies and small molecules that bind to EGFR. Examples of antibodies which bind to EGFR include MAb 579 (ATCC CRL HB 8506), MAb 455 (ATCC CRL HB8507), MAb 225 (ATCC CRL 8508), MAb 528 (ATCC CRL 8509) (see, US Patent No. 4,943, 533, Mendelsohn et al.) and variants thereof, such as chimerized 225 (C225 or Cetuximab; ERBUTIX®) and reshaped human 225 (H225) (see, WO 96/40210, Imclone Systems Inc.); IMC-11F8, a fully human, EGFR-targeted antibody (Imclone); antibodies that bind type II mutant EGFR (US Patent No. 5,212,290); humanized and chimeric antibodies that bind EGFR as described in US Patent No. 5,891,996; and human antibodies that bind EGFR, such as ABX-EGF or Panitumumab (see WO98/50433, Abgenix/Amgen); EMD 55900 (Stragliotto et al. Eur. J. Cancer 32A:636-640 (1996)); EMD7200 (matuzumab) a humanized EGFR antibody directed against EGFR that competes with both EGF and TGF-alpha for EGFR binding (EMD/Merck); human EGFR antibody, HuMax-EGFR (GenMab); fully human antibodies known as E1.1, E2.4, E2.5, E6.2, E6.4, E2.1l, E6. 3 and E7.6. 3 and described in US 6,235,883; MDX-447 (Medarex Inc); and mAb 806 or humanized mAb 806 (Johns et al, J. Biol. Chem. 279(29):30375-
The anti-EGFR antibody may be conjugated with a cytotoxic agent, thus generating an immunoconjugate (see, e.g., EP659,439A2, Merck Patent GmbH). EGFR antagonists include small molecules such as compounds described in US Patent Nos: 5,616,582, 5,457,105, 5,475,001, 5,654,307, 5,679,683, 6,084,095, 6,265,410, 6,455,534, 6,521,620, 6,596,726, 6,713,484, 5,770,599, 6,140,332, 5,866,572, 6,399,602, 6,344,459, 6,602,863, 6,391,874, 6,344,455, 5,760,041, 6,002,008, and 5,747,498, as well as the following PCT publications: WO98/14451, WO98/50038, WO99/09016, and WO99/24037. Particular small molecule EGFR antagonists include OSI-774 (CP-358774, erlotinib, TARCEVA® Genentech/OSI Pharmaceuticals); PD 183805 (CI 1033, 2-propenamide, N-[4-[(3-chloro-4-fluorophenyl)amino]-7-3-(4-morpholino)propoxy]-6-quinazolinyl]-3, dihydrochloride, Pfizer Inc.); ZD1839, gefitinib (IRESSA®) 4-(3′-Chloro-4′-fluoroanilino)-7-methoxy-6-(3-morpholinopropoxy)quinazoline, AstraZeneca); ZM 105180 ((6-amino-4-(3-methylphenyl-amino)-quinazoline, Zeneca); BIBX-1382 (N8-(3-chloro-4-fluoro-phenyl)-N2-(1-methyl-piperidin-4-yl)-pyrimido[5,4-d]pyrimidine-2,8-diamine, Boehringer Ingelheim); PKI-166 ((R)-4-[4-[(1-phenylethyl)amino]-IH-pyrrolo[2,3-d]pyrimidin-6-yl]-phenol); (R)-6-[(4-hydroxyphenyl)-4-[(1-phenylethyl)amino]-7H-pyrrolo[2,3-d]pyrimidine; CL-387785 (N-[4-[(3-bromophenyl)amino]-6-quinazolinyl]-2-butynamide); EKB-569 (N-[4-[(3-chloro-4-fluorophenyl)amino]-3-cyano-7-ethoxy-6-quinolinyl]-4-(dimethylamino)-2-butynamide) (Wyeth); AG1478 (Pfizer); AG1571 (SU 5271; Pfizer); dual EGFR/HER2 tyrosine kinase inhibitors such as lapatinib (TYKERB®, GSK572016 or N-[3-chloro-4-[(3 fluorophenyl)methoxy]phenyl]-6[5,6][2methylsulfonyl]ethyl amino)methyl]-2-furanyl]-4-quinazolinamine).

Chemotherapeutic agents also include "tyrosine kinase inhibitors" including the EGFR-targeted drugs noted in the preceding paragraph; small molecule HER2 tyrosine kinase inhibitor such as TAK165 available from Takeda; CP-724,714, an oral selective inhibitor of the ErbB2 receptor tyrosine kinase (Pfizer and OSI); dual-HER inhibitors such as EKB-569 (available from Wyeth) which preferentially binds EGFR but inhibits both HER2 and EGFR-overexpressing cells; lapatinib (GSK572016; available from Glaxo-SmithKline), an oral HER2 and EGFR tyrosine kinase inhibitor; PKI-166 (available from Novartis); pan-HER inhibitors such as canertinib (CI-1033; Pharmacia); Raf-1 inhibitors such as antisense agent ISIS-5132 available from ISIS Pharmaceuticals which inhibit Raf-1 signaling; non-HER targeted TK inhibitors such as imatinib mesylate (GLEEVEC®, available from Glaxo SmithKline); multi-targeted tyrosine kinase inhibitors such as sunitinib (SUTENT®, available from Pfizer); VEGF receptor tyrosine kinase inhibitors such as vatalanib (PTK787/ZK222584, available from Novartis/Schering AG); MAPK extracellular regulated kinase I inhibitor CI-1040 (available from Pharmacia); quinazolines, such as PD 153035,4-(3-chloroanilino) quinazoline; pyridopyrimidines; pyrimidopyrimidines; pyrrolopyrimidines, such as CGP 59326, CGP 60261 and CGP 62706; pyrazolopyrimidines, 4-(phenylamino)-7H-pyrrolo[2,3-d] pyrimidines; curcumin (diferuloyl methane, 4,5-bis (4-fluoroanilino)phthalimide); tyrphostines containing nitrothiophene moieties; PD-0183805 (Warner-Lamber); antisense molecules (e.g. those that bind to HER-encoding
nucleic acid); quinoxalines (US Patent No. 5,804,396); tryptophins (US Patent No. 5,804,396); ZD6474 (Astra Zeneca); PTK-787 (Novartis/Schering AG); pan-HER inhibitors such as CI-1033 (Pfizer); Affinitac (ISIS 3521; Isis/Lilly); imatinib mesylate (GLEEVEC®); PKI 166 (Novartis); GW2016 (Glaxo SmithKline); CI-1033 (Pfizer); EKB-569 (Wyeth); Semaxinib (Pfizer); ZD6474 (AstraZeneca); PTK-787 (Novartis/Schering AG); INC-ICII (Imclone), rapamycin (sirolimus, RAPAMUNE®); or as described in any of the following patent publications: US Patent No. 5,804,396; WO 1999/09016 (American Cyanamid); WO 1998/43960 (American Cyanamid); WO 1997/38983 (Warner Lambert); WO 1999/06378 (Warner Lambert); WO 1999/06396 (Warner Lambert); WO 1996/30347 (Pfizer, Inc); WO 1996/33978 (Zeneca); WO 1996/3397 (Zeneca) and WO 1996/33980 (Zeneca).

Chemotherapeutic agents also include dexamethasone, interferons, colchicine, metoprine, cyclosporine, amphotericin, metronidazole, alemtuzumab, altretinoin, allopurinol, amifostine, arsenic trioxide, asparaginase, BCG live, bevacizumab, bexarotene, cladribine, clofarabine, darbepoetin alfa, denileukin, dexrazoxane, epoetin alfa, elotinib, filgrastim, histrelin acetate, ibritumomab, interferon alfa-2a, interferon alfa-2b, lenalidomide, levamisole, mesna, methotrexate, naldrolone, nelarabine, nofetumomab, oprelvekin, palifermin, pamidronate, pegadisomerase, pegfilgrastim, pemetrexed disodium, porfimer sodium, quinacrine, rasburicase, sargramostim, temozolomide, VM-26, 6-TG, toremifene, tretinoin, ATRA, valrubicin, zoledronate, and zoledronic acid, and pharmaceutically acceptable salts thereof.

Chemotherapeutic agents also include hydrocortisone, hydrocortisone acetate, cortisone acetate, tiocortol pivalate, trimcinolone acetonide, triamcinolone alcohol, mometasone, amcinonide, budesonide, desonide, flucinonide, fluocinolone acetonide, betamethasone, betamethasone sodium phosphate, dexamethasone, dexamethasone sodium phosphate, fluocortolone, hydrocortisone-17-butyrate, hydrocortisone-17-valerate, aclometasone dipropionate, betamethasone valerate, betamethasone dipropionate, prednicarbate, clobetasone-17-butyrate, clobetasol-17-propionate, fluocortolone caproate, fluocortolone pivalate and fluprednidene acetate; immune selective anti-inflammatory peptides (ImSAIDs) such as phenylalanine-glutamine-glycine (fEG) and its D-isomeric form (fEg) (IMULAN BioTherapeutics, LLC); anti-rheumatic drugs such as azathioprine, cyclosporin (cyclosporine A), D-penicillamine, gold salts, hydroxychloroquine, leflunomidemincycline, sulfasalazine, tumor necrosis factor alpha (TNFa) blockers such as etanercept (Enbrel), infliximab (Remicade), adalimumab (Humira), certolizumab pegol (Cimzia), golimumab (Simponi), Interleukin 1 (IL-1) blockers such as anakinra (Kineret), T cell costimulation blockers such as abatacept (Orenicia), Interleukin 6 (IL-6) blockers such as tocilizumab (ACTEMERA®); Interleukin 13 (IL-13) blockers such as lebrikizumab; Interferon alpha (IFN) blockers such as Rontalizumab; Beta 7 integrin blockers such as rhUMab Beta7; IgE pathway blockers such as Anti-Mi prime; Secreted homotrimeric LTa3 and membrane bound heterotrimer LTal/p2 blockers such as Anti-lymphotoxin alpha (LTa); radioactive isotopes (e.g., At211, 1131, 1125, Y90, Rel86, Rel88, Sml53, Bi212, P32,
Pb212 and radioactive isotopes of Lu; miscellaneous investigational agents such as thioplatin, PS-341, phenylbutyrate, ET-18-OCH3, or farnesyl transferase inhibitors (L-739749, L-744832); polyphenols such as quercetin, resveratrol, piceatannol, epigallocatechine gallate, theaflavins, flavanols, procyanidins, betulinic acid and derivatives thereof; autophagy inhibitors such as chloroquine; delta-9-tetrahydrocannabinol (dronabinol, MARINOL®); beta-lapachone; lapachol; colchicines; betulinic acid; acetylcamptothecin, scopolectin, and 9-aminocamptothecin; podophyllotoxin; tegafur (UFTORAL®); bexarotene (TARGRETIN®); bisphosphonates such as clodronate (for example, BONEFOS® or OSTAC®), etidronate (DIDROCAL®), NE-58095, zoledronic acid/zoledronate (ZOMETA®), alendronate (FOSAMAX®), pamidronate (AREDIA®), tiludronate (SKELID®), or risedronate (ACTONEL®); and epidermal growth factor receptor (EGF-R); vaccines such as THERATOPE® vaccine; perifosine, COX-2 inhibitor (e.g. celecoxib or etoricoxib), proteosome inhibitor (e.g. PS341); CCI-779; tipifarnib (R11577); orafenib, ABT510; Bcl-2 inhibitor such as oblimersen sodium (GENASENSE®); pixantrone; farnesyltransferase inhibitors such as lonafarnib (SCH 6636, SARASARTM); and pharmaceutically acceptable salts, acids or derivatives of any of the above; as well as combinations of two or more of the above such as CHOP, an abbreviation for a combined therapy of cyclophosphamide, doxorubicin, vincristine, and prednisolone; and FOLFOX, an abbreviation for a treatment regimen with oxaliplatin (ELOXATINTM) combined with 5-FU and leucovorin.

Chemotherapeutic agents also include non-steroidal anti-inflammatory drugs with analgesic, antipyretic and anti-inflammatory effects. NSAIDs include non-selective inhibitors of the enzyme cyclooxygenase. Specific examples of NSAIDs include aspirin, propionic acid derivatives such as ibuprofen, fenoprofen, ketoprofen, flurbiprofen, oxaprozin and naproxen, acetic acid derivatives such as indomethacin, sulindac, etodolac, diclofenac, enolic acid derivatives such as piroxicam, meloxicam, tenoxicam, droxicam, lornoxicam and isoxicam, fenamic acid derivatives such as mefenamic acid, meclofenamic acid, flufenamic acid, tolfenamic acid, and COX-2 inhibitors such as celecoxib, etoricoxib, lumiracoxib, parecoxib, rofecoxib, valdecoxib, and valdecoxib. NSAIDs can be indicated for the symptomatic relief of conditions such as rheumatoid arthritis, osteoarthritis, inflammatory arthropathies, ankylosing spondylitis, psoriatic arthritis, Reiter's syndrome, acute gout, dysmenorrhoea, metastatic bone pain, headache and migraine, postoperative pain, mild-to-moderate pain due to inflammation and tissue injury, pyrexia, ileus, and renal colic.

The term "cytokine" is a generic term for proteins released by one cell population that act on another cell as intercellular mediators. Examples of such cytokines are lymphokines, monokines; interleukins (ILs) such as IL-1, IL-1α, IL-2, IL-3, IL-4, IL-5, IL-6, IL-7, IL-8, IL-9, IL-11, IL-12, IL-15; a tumor necrosis factor such as TNF-α or TNF-β; and other polypeptide factors including LIF and kit ligand (KL) and gamma interferon. As used herein, the term cytokine includes proteins from natural sources or from recombinant cell culture and biologically active equivalents of the native-
sequence cytokines, including synthetically produced small-molecule entities and pharmaceutically acceptable derivatives and salts thereof.

The term "phagocytosis" means the internalization of cells or particulate matter by cells. In some embodiments, the phagocytic cells or phagocytes are macrophages or neutrophils. In some embodiments, the cells are cells that express human OX40. Methods for assaying phagocytosis are known in the art and include use of microscopy to detect the presence of cells internalized within another cells. In other embodiments, phagocytosis is detected using FACS, e.g., by detecting presence of a detectably labeled cell within another cell (which may be detectably labeled, e.g., with a different label than the first cell).

The phrase "does not possess substantial activity" or "substantially no activity" with respect to an antibody, as used herein, means the antibody does not exhibit an activity that is above background level (in some embodiments, that is above background level that is statistically significant). The phrase "little to no activity" with respect to an antibody, as used herein, means the antibody does not display a biologically meaningful amount of a function. The function can be measured or detected according to any assay or technique known in the art, including, e.g., those described herein. In some embodiments, antibody function is stimulation of effector T cell proliferation and/or cytokine secretion.

The term "biomarker" or "marker" as used herein refers generally to a molecule, including a gene, mRNA, protein, carbohydrate structure, or glycolipid, the expression of which in or on a tissue or cell or secreted can be detected by known methods (or methods disclosed herein) and is predictive or can be used to predict (or aid prediction) for a cell, tissue, or patient's responsiveness to treatment regimes.

By "patient sample" is meant a collection of cells or fluids obtained from a cancer patient. The source of the tissue or cell sample may be solid tissue as from a fresh, frozen and/or preserved organ or tissue sample or biopsy or aspirate; blood or any blood constituents; bodily fluids such as cerebrospinal fluid, amniotic fluid, peritoneal fluid, or interstitial fluid; cells from any time in gestation or development of the subject. The tissue sample may contain compounds which are not naturally intermixed with the tissue in nature such as preservatives, anticoagulants, buffers, fixatives, nutrients, antibiotics, or the like. Examples of tumor samples herein include, but are not limited to, tumor biopsy, fine needle aspirate, bronchiolar lavage, pleural fluid, sputum, urine, a surgical specimen, circulating tumor cells, serum, plasma, circulating plasma proteins, ascitic fluid, primary cell cultures or cell lines derived from tumors or exhibiting tumor-like properties, as well as preserved tumor samples, such as formalin-fixed, paraffin-embedded tumor samples or frozen tumor samples.

The phrase "based on expression of" when used herein means that information about expression level or presence or absence of expression (e.g., presence or absence or prevalence of (e.g., percentage of cells displaying) of the one or more biomarkers herein (e.g., presence or absence of or amount or prevelance of FcR-expressing cells, or e.g., presence or absence or amount or prevelance of
human effector cells) is used to inform a treatment decision, information provided on a package insert, or marketing/promotional guidance etc.

[0143] A cancer or biological sample which "has human effector cells" is one which, in a diagnostic test, has human effector cells present in the sample (e.g., infiltrating human effector cells).

[0144] A cancer or biological sample which "has FcR-expressing cells" is one which, in a diagnostic test, has FcR-expressing present in the sample (e.g., infiltrating FcR-expressing cells). In some embodiments, FcR is FcyR. In some embodiments, FcR is an activating FcyR.

[0145] The phrase "recommending a treatment" as used herein refers to using the information or data generated relating to the level or presence of c-met in a sample of a patient to identify the patient as suitably treated or not suitably treated with a therapy. In some embodiments the therapy may comprise c-met antibody (e.g., onartuzumab). In some embodiments, the therapy may comprise VEGF antagonist (e.g., bevacizumab). In some embodiments, the therapy may comprise anti-human OX40 agonist antibody. The information or data may be in any form, written, oral or electronic. In some embodiments, using the information or data generated includes communicating, presenting, reporting, storing, sending, transferring, supplying, transmitting, delivering, dispensing, or combinations thereof. In some embodiments, communicating, presenting, reporting, storing, sending, transferring, supplying, transmitting, delivering, dispensing, or combinations thereof are performed by a computing device, analyzer unit or combination thereof. In some further embodiments, communicating, presenting, reporting, storing, sending, transferring, supplying, transmitting, dispensing, or combinations thereof are performed by an individual (e.g., a laboratory or medical professional). In some embodiments, the information or data includes a comparison of the amount or prevelance of FcR expressing cells to a reference level. In some embodiments, the information or data includes a comparison of the amount or prevelance of human effector cells to a reference level. In some embodiments, the information or data includes an indication that human effector cells or FcR-expressing cells are present or absent in the sample. In some embodiments, the information or data includes an indication that FcR-expressing cells and/or human effector cells are present in a particular percentage of cells (e.g., high prevelance). In some embodiments, the information or data includes an indication that the patient is suitably treated or not suitably treated with a therapy comprising anti-human OX40 agonist antibody.

II. COMPOSITIONS AND METHODS

[0146] Provided herein are methods for treating or delaying progression of cancer in an individual comprising administering to the individual an effective amount of a PD-1 axis binding antagonist and an OX40 binding agonist. Also provided herein are methods of enhancing immune function in an individual having cancer comprising administering to the individual an effective amount of a PD-1 axis binding antagonist and an OX40 binding agonist. Without wishing to be bound to theory, it is
thought that treatment with an OX40 binding agonist may enhance the efficacy of, or otherwise act synergistically with, PD-1 axis binding antagonist treatment, e.g., through reduction in Tregs, an increase in Teff activation, and/or an increase in PD-L1 expression, and that the complementary mechanism of action of such agents (i.e., OX40 binding agonists and PD-1 axis binding antagonists) support their use in combination for treating or delaying progression of cancer and/or enhancing immune function in an individual having cancer.

[0147] Further provided herein are methods for treating or delaying progression of cancer in an individual comprising administering to the individual an effective amount of a PD-1 axis binding antagonist, an OX40 binding agonist, and an anti-angiogenesis agent. Also provided herein are methods of enhancing immune function in an individual having cancer comprising administering to the individual an effective amount of a PD-1 axis binding antagonist, an OX40 binding agonist, and an anti-angiogenesis agent. Without wishing to be bound to theory, it is thought that since anti-angiogenesis agents (e.g., anti-VEGF antibodies) are thought to have immunomodulatory effects (e.g., through increasing trafficking of T cells into tumors, reducing suppressive cytokines and tumor-infiltrating Treg cells, and/or increasing CD8+ and CD4+ central memory T cells), combining an anti-angiogenesis agent with a PD-1 axis binding antagonist and an OX40 binding agonist may act synergistically to enhance the anti-tumor immune response, particularly for (but not limited to) cancers for which anti-angiogenesis agents are commonly administered (e.g., RCC or CRC).

A. Exemplary Anti-OX40 Antibodies

[0148] Certain aspects of the present disclosure relate to methods of treating or delaying progression of cancer using anti-OX40 antibodies (e.g., antibodies that bind human OX40) and PD-1 axis binding antagonists (e.g., anti-PD-L1 antibodies). In some embodiments, the methods of treating or delaying progression of cancer include using anti-OX40 antibody (e.g., an antibody that binds human OX40), PD-1 axis binding antagonist (e.g., anti-PD-L1 antibody), and an anti-angiogenesis agent (e.g., a VEGF antagonist such as an anti-VEGF antibody).

[0149] In one aspect, the invention provides isolated antibodies that bind to human OX40.

[0150] In some embodiments, the anti-human OX40 agonist antibody binds human OX40 with an affinity of less than or equal to about 0.45 nM. In some embodiments, the anti-human OX40 antibody binds human OX40 with an affinity of less than or equal to about 0.4 nM. In some embodiments, the anti-human OX40 antibody binds human OX40 with an affinity of less than or equal to about 0.5 nM. In some embodiments, the binding affinity is determined using radioimmunoassay.

[0151] In some embodiments, the anti-human OX40 agonist antibody binds human OX40 and cynomolgus OX40. In some embodiments, binding is determined using a FACS assay. In some embodiments, binding to human OX40 has an EC50 of about 0.2 ug/ml. In some embodiments, binding to human OX40 has an EC50 of about 0.3 ug/ml or lower. In some embodiments, binding to
cynomolgus OX40 has an EC50 of about 1.5 ug/ml. In some embodiments, binding to cynomolgus OX40 has an EC50 of about 1.4 ug/ml.

[0152] In some embodiments, the anti-human OX40 agonist antibody does not bind to rat OX40 or mouse OX40.

[0153] In some embodiments, the anti-human OX40 agonist antibody is a depleting anti-human OX40 antibody (e.g., depletes cells that express human OX40). In some embodiments, the human OX40 expressing cells are CD4+ effector T cells. In some embodiments, the human OX40 expressing cells are Treg cells. In some embodiments, depleting is by ADCC and/or phagocytosis. In some embodiments, the antibody mediates ADCC by binding FcγR expressed by a human effector cell and activating the human effector cell function. In some embodiments, the antibody mediates phagocytosis by binding FcγR expressed by a human effector cell and activating the human effector cell function. Exemplary human effector cells include, e.g., macrophage, natural killer (NK) cells, monocytes, neutrophils. In some embodiments, the human effector cell is macrophage. In some embodiments, the human effector cell is NK cells. In some embodiments, depletions is not by apoptosis.

[0154] In some embodiments, the anti-human OX40 agonist antibody has a functional Fc region. In some embodiments, effector function of a functional Fc region is ADCC. In some embodiments, effector function of a functional Fc region is phagocytosis. In some embodiments, effector function of a functional Fc region is ADCC and phagocytosis. In some embodiments, the Fc region is human IgG1. In some embodiments, the Fc region is human IgG4.

[0155] In some embodiments, the anti-human OX40 agonist antibody does not induce apoptosis in OX40-expressing cells (e.g., Treg). In some embodiments, apoptosis is assayed using an antibody concentration of 30ug/ml, e.g., by determining whether apoptosis has occurred using annexin V and propidium iodide stained Treg.

[0156] In some embodiments, the anti-human OX40 agonist antibody enhances CD4+ effector T cell function, for example, by increasing CD4+ effector T cell proliferation and/or increasing gamma interferon production by the CD4+ effector T cell (for example, as compared to proliferation and/or cytokine production prior to treatment with anti-human OX40 agonist antibody). In some embodiments, the cytokine is gamma interferon. In some embodiments, the anti-human OX40 agonist antibody increases number of intratumoral (infiltrating) CD4+ effector T cells (e.g., total number of CD4+ effector T cells, or e.g., percentage of CD4+ cells in CD45+ cells), e.g., as compared to number of intratumoral (infiltrating) CD4+ T cells prior to treatment with anti-human OX40 agonist antibody. In some embodiments, the anti-human OX40 agonist antibody increases number of intratumoral (infiltrating) CD4+ effector T cells that express gamma interferon (e.g., total gamma interferon expressing CD4+ cells, or e.g., percentage of gamma interferon expressing CD4+ cells in total CD4+ cells), e.g., as compared to number of intratumoral (infiltrating) CD4+ T cells that express gamma interferon prior to treatment with anti-human OX40 agonist antibody.
In some embodiments, the anti-human OX40 agonist antibody increases number of intratumoral (infiltrating) CD8+ effector T cells (e.g., total number of CD8+ effector T cells, or e.g., percentage of CD8+ in CD45+ cells), e.g., as compared to number of intratumoral (infiltrating) CD8+ T effector cells prior to treatment with anti-human OX40 agonist antibody. In some embodiments, the anti-human OX40 agonist antibody increases number of intratumoral (infiltrating) CD8+ effector T cells that express gamma interferon (e.g., percentage of CD8+ cells that express gamma interferon in total CD8+ cells), e.g., compared to number of intratumoral (infiltrating) CD8+ T cells that express gamma interferon prior to treatment with anti-human OX40 agonist antibody.

In some embodiments, the anti-human OX40 agonist antibody enhances memory T cell function, for example by increasing memory T cell proliferation and/or increasing cytokine production by the memory cell. In some embodiments, the cytokine is gamma interferon.

In some embodiments, the anti-human OX40 agonist antibody inhibits Treg function, for example, by decreasing Treg suppression of effector T cell function (e.g., effector T cell proliferation and/or effector T cell cytokine secretion). In some embodiments, the effector T cell is a CD4+ effector T cell. In some embodiments, the anti-human OX40 agonist antibody reduces the number of intratumoral (infiltrating) Treg (e.g., total number of Treg or e.g., percentage of Fox3p+ cells in CD4+ cells).

In some embodiments, the anti-human OX40 agonist antibody is engineered to increase effector function (e.g., compared to effector function in a wild-type IgG1). In some embodiments, the antibody has increased binding to a Fc receptor. In some embodiments, the antibody lacks fucose attached (directly or indirectly) to the Fc region. For example, the amount of fucose in such antibody may be from 1% to 80%, from 1% to 65%, from 5% to 65% or from 20% to 40%. In some embodiments, the Fc region comprises bisected oligosaccharides, e.g., in which a biantennary oligosaccharide attached to the Fc region of the antibody is bisected by GlcNAc. In some embodiments, the antibody comprises an Fc region with one or more amino acid substitutions which improve ADCC, e.g., substitutions at positions 298, 333, and/or 334 of the Fc region (EU numbering of residues).

In some embodiments, the anti-human OX40 agonist antibody increases OX40 signal transduction in a target cell that expresses OX40. In some embodiments, OX40 signal transduction is detected by monitoring NFkB downstream signaling.

In some embodiments, the anti-human OX40 agonist antibody is stable after treatment at 40C for two weeks.

In some embodiments, the anti-human OX40 agonist antibody binds human effector cells, e.g., binds FcyR (e.g., an activating FcyR) expressed by human effector cells. In some embodiments, the human effector cell performs (is capable of performing) ADCC effector function. In some embodiments, the human effector cell performs (is capable of performing) phagocytosis effector function.
In some embodiments, the anti-human OX40 agonist antibody comprising a variant IgGl Fc polypeptide comprising a mutation that eliminates binding to human effector cells (e.g., a DANA mutation) has diminished activity (e.g., CD4+ effector T cell function, e.g., proliferation), relative to anti-human OX40 agonist antibody comprising native sequence IgGl Fc portion. In some embodiment, the anti-human OX40 agonist antibody comprising a variant IgGl Fc polypeptide comprising a mutation that eliminates binding to human effector cells (e.g., a DANA mutation) does not possess substantial activity (e.g., CD4+ effector T cell function, e.g., proliferation).

In some embodiments, antibody cross-linking is required for anti-human OX40 agonist antibody function. In some embodiments, function is stimulation of CD4+ effector T cell proliferation. In some embodiments, antibody cross-linking is determined by providing anti-human OX40 agonist antibody adhered on a solid surface (e.g., a cell culture plate). In some embodiments, antibody cross-linking is determined by introducing a mutation in the antibody's IgGl Fc portion (e.g., a DANA mutation) and testing function of the mutant antibody.

In some embodiments, the anti-human OX40 agonist antibody competes for binding to human OX40 with OX40L. In some embodiments, addition of OX40L does not enhance anti-human OX40 antibody function in an in vitro assay.

According to another embodiment, the anti-human OX40 agonist antibodies include any one, any combination, or all of the following properties: (1) binds human OX40 with an affinity of less than or equal to about 0.45 nM, in some embodiments, binds human OX40 with an affinity of less than or equal to about 0.4 nM, in some embodiments, binds human OX40 with an affinity of less than or equal to about 0.5nM, in some embodiments, the binding affinity is determined using radioimmunoassay; (2) binds human OX40 and cynomolgus OX40, in some embodiments, binding is determined using a FACS assay, (3) binds human OX40 with an EC50 of about 0.2 ug/ml, in some embodiments, binds to human OX40 has an EC50 of about 0.3 ug/ml or lower, in some embodiments, binds to cynomolgus OX40 with an EC50 of about 1.5 ug/ml, in some embodiments, binds to cynomolgus OX40 has an EC50 of about 1.4 ug/ml, (4) does not substantially bind to rat OX40 or mouse OX40, (6) is a depleting anti-human OX40 antibody (e.g., depletes cells that express human OX40), in some embodiments, the cells are CD4+ effector T cells and/or Treg cells, (7) enhances CD4+ effector T cell function, for example, by increasing CD4+ effector T cell proliferation and/or increasing gamma interferon production by the CD4+ effector T cell (for example, as compared to proliferation and/or cytokine production prior to treatment with anti-human OX40 agonist antibody), (8) enhances memory T cell function, for example by increasing memory T cell proliferation and/or increasing cytokine production by the memory cell, (9) inhibits Treg function, for example, by decreasing Treg suppression of effector T cell function (e.g., effector T cell proliferation and/or effector T cell cytokine secretion). In some embodiments, the effector T cell is a CD4+ effector T cell, (10) increases OX40 signal transduction in a target cell that expresses OX40 (in some embodiments, OX40 signal transduction is detected by monitoring NFkB downstream signaling), (11) is stable after
treatment at 40°C for two weeks, (12) binds human effector cells, e.g., binds FcγR expressed by human effector cells, (13) anti-human OX40 agonist antibody comprising a variant IgG1 Fc polypeptide comprising a mutation that eliminates binding to human effector cells (e.g., N297G) has diminished activity (e.g., CD4+ effector T cell function, e.g., proliferation), relative to anti-human OX40 agonist antibody comprising native sequence IgG1 Fc portion, in some embodiment, the anti-human OX40 agonist antibody comprising a variant IgG1 Fc polypeptide comprising a mutation that eliminates binding to human effector cells (e.g., N297G) does not possess substantial activity (e.g., CD4+ effector T cell function, e.g., proliferation), (14) antibody cross-linking (e.g., by Fc receptor binding) is required for anti-human OX40 agonist antibody function.

In one aspect, the invention provides an anti-human OX40 agonist antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:7.

In one aspect, the invention provides an anti-human OX40 agonist antibody comprising at least one, at least two, or all three VH HVR sequences selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:4. In another embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:4 and HVR-L3 comprising the amino acid sequence of SEQ ID NO:7. In a further embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:4, HVR-L3 comprising the amino acid sequence of SEQ ID NO:7, and HVR-H2 comprising the amino acid sequence of SEQ ID NO:3. In a further embodiment, the antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4.

In another aspect, the invention provides an anti-human OX40 agonist antibody comprising at least one, at least two, or all three VL HVR sequences selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:7. In one embodiment, the antibody comprises (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:7.

In another aspect, an anti-human OX40 agonist antibody of the invention comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3, and (iii) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4.
acid sequence of SEQ ID NO:3, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO:4; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:7.

[0172] In another aspect, the invention provides an anti-human OX40 agonist antibody comprising (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:7.

[0173] In one aspect, the invention provides an anti-human OX40 agonist antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:26.

[0174] In another embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:4 and HVR-L3 comprising the amino acid sequence of SEQ ID NO:26. In a further embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:4, HVR-L3 comprising the amino acid sequence of SEQ ID NO:26, and HVR-H2 comprising the amino acid sequence of SEQ ID NO:3.

[0175] In another aspect, an antibody of the invention comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO:4; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:26.

[0176] In another aspect, the invention provides an antibody comprising (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:26.
In one aspect, the invention provides an anti-human OX40 agonist antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:27.

In another embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:4 and HVR-L3 comprising the amino acid sequence of SEQ ID NO:27. In a further embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:4, HVR-L3 comprising the amino acid sequence of SEQ ID NO:27, and HVR-H2 comprising the amino acid sequence of SEQ ID NO:3.

In another aspect, an antibody of the invention comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO:4; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:27.

In another aspect, the invention provides an antibody comprising (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:27.

In one aspect, the invention provides an anti-human OX40 agonist antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2, 8 or 9; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3, 10, 11, 12, 13 or 14; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4, 15, or 19; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:7, 22, 23, 24, 25, 26, 27, or 28.

In one aspect, the invention provides an antibody comprising at least one, at least two, or all three VH HVR sequences selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 2, 8 or 9; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 3, 10, 11, 12, 13 or 14; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 4, 15, or 19. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO: 4,
In another embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO: 4, 15, or 19 and HVR-L3 comprising the amino acid sequence of SEQ ID NO: 7, 22, 23, 24, 25, 26, 27, or 28. In a further embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO: 4, 15, or 19, HVR-L3 comprising the amino acid sequence of SEQ ID NO: 7, 22, 23, 24, 25, 26, 27, or 28, and HVR-H2 comprising the amino acid sequence of SEQ ID NO: 3, 10, 11, 12, 13 or 14. In a further embodiment, the antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 2, 8 or 9; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 3, 10, 11, 12, 13 or 14; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 4, 15, or 19.

In another aspect, the invention provides an antibody comprising at least one, at least two, or all three VL HVR sequences selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 5; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 6; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 7, 22, 23, 24, 25, 26, 27, or 28. In one embodiment, the antibody comprises (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 5; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 6; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 7, 22, 23, 24, 25, 26, 27, or 28.

In another aspect, an antibody of the invention comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 2, 8 or 9, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 3, 10, 11, 12, 13 or 14, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO: 4, 15, or 19; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 5, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 6, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 7, 22, 23, 24, 25, 26, 27, or 28.

In another aspect, the invention provides an antibody comprising (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 2, 8 or 9; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 3, 10, 11, 12, 13 or 14; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 4, 15, or 19; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 5; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 6; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO: 7, 22, 23, 24, 25, 26, 27, or 28.

In one aspect, the invention provides an anti-human OX40 agonist antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 172; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 173; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 174; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 5; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 6; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 175. In some embodiment, HVR-H2 is not DMYPDAAAAASYNQKFRE (SEQ ID NO:193).In some embodiments,
HVR-H3 is not APRWAAAA (SEQ ID NO: 194). In some embodiments, HVR-L3 is not QAAAAAAAT (SEQ ID NO: 195).

[0187] In one aspect, the invention provides an antibody comprising at least one, at least two, or all three VH HVR sequences selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 172; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 173; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 174. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO: 174. In another embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO: 174 and HVR-L3 comprising the amino acid sequence of SEQ ID NO: 175. In a further embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO: 174, HVR-L3 comprising the amino acid sequence of SEQ ID NO: 175, and HVR-H2 comprising the amino acid sequence of SEQ ID NO: 173. In a further embodiment, the antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 172; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 173; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 174. In some embodiments, HVR-H2 is not DMYPDAAAASYNQKFRE (SEQ ID NO:193). In some embodiments, HVR-H3 is not APRWAAAA (SEQ ID NO: 194). In some embodiments, HVR-L3 is not QAAAAAAAT (SEQ ID NO: 195).

[0188] In another aspect, the invention provides an antibody comprising (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 175. In some embodiments, HVR-L3 is not QAAAAAAAT (SEQ ID NO: 195).

[0189] In another aspect, an antibody of the invention comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 172, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 173, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO: 174; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:175.

[0190] In another aspect, the invention provides an antibody comprising (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 172; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 173; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 174; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO: 175. In some embodiment, HVR-H2 is not DMYPDAAAASYNQKFRE (SEQ ID NO:193). In some embodiments, HVR-H3 is not APRWAAAA (SEQ ID NO: 194). In some embodiments, HVR-L3 is not QAAAAAAAT (SEQ ID NO: 195).
All possible combinations of the above substitutions are encompassed by the consensus sequences of SEQ ID NO: 172, 173, 174 and 175.

In one aspect, the invention provides an anti-human OX40 agonist antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:29; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:30; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:33; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:37; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:39; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:42.

In one aspect, the invention provides an antibody comprising at least one, at least two, or all three VH HVR sequences selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:29; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:30; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:33. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:33. In another embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:33 and HVR-L3 comprising the amino acid sequence of SEQ ID NO:42. In a further embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:33, HVR-L3 comprising the amino acid sequence of SEQ ID NO:42, and HVR-H2 comprising the amino acid sequence of SEQ ID NO:30. In a further embodiment, the antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:29; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:30; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:33.

In another aspect, the invention provides an antibody comprising at least one, at least two, or all three VL HVR sequences selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:37; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:39; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:42. In one embodiment, the antibody comprises (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:37; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:39; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:42.

In another aspect, an antibody of the invention comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO:29, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO:30, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO:33; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO:37, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO:39, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:42.

In another aspect, the invention provides an antibody comprising (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:29; (b) HVR-H2 comprising the amino acid sequence of SEQ
ID NO:30; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:33; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:37; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:39; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:42.

[0197] In one aspect, the invention provides an anti-human OX40 agonist antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:29; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:30; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:33; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:37; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:40; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:42.

[0198] In another aspect, the invention provides an antibody comprising at least one, at least two, or all three VL HVR sequences selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:37; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:40; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:42. In one embodiment, the antibody comprises (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:37; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:40; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:42.

[0199] In another aspect, an antibody of the invention comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO:29, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO:30, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO:33; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO:37, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO:40, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:42.

[0200] In another aspect, the invention provides an antibody comprising (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:29; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:30; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:33; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:37; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:40; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:42.

[0201] In one aspect, the invention provides an anti-human OX40 agonist antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:29; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:30, 31, or 32; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:33; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:37; (e) HVR-L2 comprising the amino acid sequence of SEQ
ID NO:39, 40 or 41; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:42, 43, or 44.

[0202] In one aspect, the invention provides an antibody comprising at least one, at least two, or all three VH HVR sequences selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:29; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 30, 31, or 32; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:33. In another embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:33 and HVR-L3 comprising the amino acid sequence of SEQ ID NO: 42, 43, or 44. In a further embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:33, HVR-L3 comprising the amino acid sequence of SEQ ID NO: 42, 43, or 44, and HVR-H2 comprising the amino acid sequence of SEQ ID NO: 39, 40 or 41. In a further embodiment, the antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:29; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:30, 31, or 32; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:33.

[0203] In another aspect, the invention provides an antibody comprising at least one, at least two, or all three VL HVR sequences selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:37; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 39, 40 or 41; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 42, 43, or 44. In one embodiment, the antibody comprises (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:37; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 39, 40 or 41; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 42, 43, or 44.

[0204] In another aspect, an antibody of the invention comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO:29, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 30, 31, or 32, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO:33; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO:37, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 39, 40 or 41, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 42, 43, or 44.

[0205] In another aspect, the invention provides an antibody comprising (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:29; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 30, 31, or 32; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:33; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:37; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 39, 40 or 41; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO: 42, 43, or 44.

[0206] In one aspect, the invention provides an anti-human OX40 agonist antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid
sequence of SEQ ID NO:29; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:175; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:33; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:177; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:178.

[0207] In one aspect, the invention provides an antibody comprising at least one, at least two, or all three VH HVR sequences selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:29; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:175; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:33. In another embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:33 and HVR-L3 comprising the amino acid sequence of SEQ ID NO:177. In a further embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:33, HVR-L3 comprising the amino acid sequence of SEQ ID NO:178, and HVR-H2 comprising the amino acid sequence of SEQ ID NO:176. In a further embodiment, the antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:29; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:176; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:33.

[0208] In another aspect, the invention provides an antibody comprising at least one, at least two, or all three VL HVR sequences selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:37; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:177; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:177. In one embodiment, the antibody comprises (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:37; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:177; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:178.

[0209] In another aspect, an antibody of the invention comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO:29, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO:176, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO:33; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO:37, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO:177, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:178.

[0210] In another aspect, the invention provides an antibody comprising (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:29; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:176; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:33; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:37; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:177; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:178.

[0211] In any of the above embodiments, an anti-OX40 agonist antibody is humanized.
In another aspect, an anti-human OX40 agonist antibody comprises a heavy chain variable domain (VH) sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99%, or 100% sequence identity to the amino acid sequence of SEQ ID NO:56, 58, 60, 62, 64, 66, 68, 70, 72, 74, 76, 78, 80, 82, 84, 86, 88, 90, 92, 94, 96, 98, 100, 108, 114, 116, 183, or 184. In certain embodiments, a VH sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% identity contains substitutions (e.g., conservative substitutions), insertions, or deletions relative to the reference sequence, but an anti-human OX40 agonist antibody comprising that sequence retains the ability to bind to OX40. In certain embodiments, a total of 1 to 10 amino acids have been substituted, inserted and/or deleted in SEQ ID NO:56, 58, 60, 62, 64, 66, 68, 70, 72, 74, 76, 78, 80, 82, 84, 86, 88, 90, 92, 94, 96, 98, 100, 108, 114, 116, 183, or 184. In certain embodiments, substitutions, insertions, or deletions occur in regions outside the HVRs (i.e., in the FRs). Optionally, the anti-human OX40 agonist antibody comprises the VH sequence in SEQ ID NO: SEQ ID NO:56, 58, 60, 62, 64, 66, 68, 70, 72, 74, 76, 78, 80, 82, 84, 86, 88, 90, 92, 94, 96, 98, 100, 108, 114, 116, 183, or 184, including post-translational modifications of that sequence. In a particular embodiment, the VH comprises one, two or three HVRs selected from: (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2, (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3, and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4.

In another aspect, an anti-human OX40 agonist antibody is provided, wherein the antibody comprises a light chain variable domain (VL) having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99%, or 100% sequence identity to the amino acid sequence of SEQ ID NO:57, 59, 61, 63, 65, 67, 69, 71, 73, 75, 77, 79, 81, 83, 85, 87, 89, 91, 93, 95, 97, 99, 101, 109, 115 or 117. In certain embodiments, a VL sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% identity contains substitutions (e.g., conservative substitutions), insertions, or deletions relative to the reference sequence, but an anti-human OX40 agonist antibody comprising that sequence retains the ability to bind to OX40. In certain embodiments, a total of 1 to 10 amino acids have been substituted, inserted and/or deleted in SEQ ID NO: 57, 59, 61, 63, 65, 67, 69, 71, 73, 75, 77, 79, 81, 83, 85, 87, 89, 91, 93, 95, 97, 99, 101, 109, 115 or 117. In certain embodiments, the substitutions, insertions, or deletions occur in regions outside the HVRs (i.e., in the FRs). Optionally, the anti-human OX40 agonist antibody comprises the VL sequence in SEQ ID NO: 57, 59, 61, 63, 65, 67, 69, 71, 73, 75, 77, 79, 81, 83, 85, 87, 89, 91, 93, 95, 97, 99, 101, 109, 115 or 117, including post-translational modifications of that sequence. In a particular embodiment, the VL comprises one, two or three HVRs selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:7.

In another aspect, an anti-human OX40 agonist antibody comprises a heavy chain variable domain (VH) sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99%, or 100% sequence identity to the amino acid sequence of SEQ ID NO:56. In certain embodiments, a VH
sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% identity contains substitutions (e.g., conservative substitutions), insertions, or deletions relative to the reference sequence, but an anti-human OX40 agonist antibody comprising that sequence retains the ability to bind to OX40. In certain embodiments, a total of 1 to 10 amino acids have been substituted, inserted and/or deleted in SEQ ID NO:56. In certain embodiments, substitutions, insertions, or deletions occur in regions outside the HVRs (i.e., in the FRs). Optionally, the anti-human OX40 agonist antibody comprises the VH sequence in SEQ ID NO:56, including post-translational modifications of that sequence. In a particular embodiment, the VH comprises one, two or three HVRs selected from: (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2, (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3, and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4.

[0215] In another aspect, an anti-human OX40 agonist antibody is provided, wherein the antibody comprises a light chain variable domain (VL) having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99%, or 100% sequence identity to the amino acid sequence of SEQ ID NO:57. In certain embodiments, a VL sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% identity contains substitutions (e.g., conservative substitutions), insertions, or deletions relative to the reference sequence, but an anti-human OX40 agonist antibody comprising that sequence retains the ability to bind to OX40. In certain embodiments, a total of 1 to 10 amino acids have been substituted, inserted and/or deleted in SEQ ID NO:57. In certain embodiments, the substitutions, insertions, or deletions occur in regions outside the HVRs (i.e., in the FRs). Optionally, the anti-human OX40 agonist antibody comprises the VL sequence in SEQ ID NO: 57, including post-translational modifications of that sequence. In a particular embodiment, the VL comprises one, two or three HVRs selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:7.

[0216] In another aspect, an anti-human OX40 agonist antibody comprises a heavy chain variable domain (VH) sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99%, or 100% sequence identity to the amino acid sequence of SEQ ID NO:180. In certain embodiments, a VH sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% identity contains substitutions (e.g., conservative substitutions), insertions, or deletions relative to the reference sequence, but an anti-human OX40 agonist antibody comprising that sequence retains the ability to bind to OX40. In certain embodiments, a total of 1 to 10 amino acids have been substituted, inserted and/or deleted in SEQ ID NO:180. In certain embodiments, substitutions, insertions, or deletions occur in regions outside the HVRs (i.e., in the FRs). Optionally, the anti-human OX40 agonist antibody comprises the VH sequence in SEQ ID NO:180, including post-translational modifications of that sequence. In a particular embodiment, the VH comprises one, two or three HVRs selected from: (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2, (b) HVR-
H2 comprising the amino acid sequence of SEQ ID NO:3, and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4.

[0217] In another aspect, an anti-human OX40 agonist antibody is provided, wherein the antibody comprises a light chain variable domain (VL) having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99%, or 100% sequence identity to the amino acid sequence of SEQ ID NO:179. In certain embodiments, a VL sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% identity contains substitutions (e.g., conservative substitutions), insertions, or deletions relative to the reference sequence, but an anti-human OX40 agonist antibody comprising that sequence retains the ability to bind to OX40. In certain embodiments, a total of 1 to 10 amino acids have been substituted, inserted and/or deleted in SEQ ID NO: 179. In certain embodiments, the substitutions, insertions, or deletions occur in regions outside the HVRs (i.e., in the FRs). Optionally, the anti-human OX40 agonist antibody comprises the VL sequence in SEQ ID NO: 179, including post-translational modifications of that sequence. In a particular embodiment, the VL comprises one, two or three HVRs selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:7.

[0218] In another aspect, an anti-human OX40 agonist antibody comprises a heavy chain variable domain (VH) sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99%, or 100% sequence identity to the amino acid sequence of SEQ ID NO:94. In certain embodiments, a VH sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% identity contains substitutions (e.g., conservative substitutions), insertions, or deletions relative to the reference sequence, but an anti-human OX40 agonist antibody comprising that sequence retains the ability to bind to OX40. In certain embodiments, a total of 1 to 10 amino acids have been substituted, inserted and/or deleted in SEQ ID NO:94. In certain embodiments, substitutions, insertions, or deletions occur in regions outside the HVRs (i.e., in the FRs). Optionally, the anti-human OX40 agonist antibody comprises the VH sequence in SEQ ID NO:94, including post-translational modifications of that sequence. In a particular embodiment, the VH comprises one, two or three HVRs selected from: (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2, (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3, and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4.

[0219] In another aspect, an anti-human OX40 agonist antibody is provided, wherein the antibody comprises a light chain variable domain (VL) having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99%, or 100% sequence identity to the amino acid sequence of SEQ ID NO:95. In certain embodiments, a VL sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% identity contains substitutions (e.g., conservative substitutions), insertions, or deletions relative to the reference sequence, but an anti-human OX40 agonist antibody comprising that sequence retains the ability to bind to OX40. In certain embodiments, a total of 1 to 10 amino acids have been
substituted, inserted and/or deleted in SEQ ID NO:95. In certain embodiments, the substitutions, insertions, or deletions occur in regions outside the HVRs (i.e., in the FRs). Optionally, the anti-human OX40 agonist antibody comprises the VL sequence in SEQ ID NO:95, including post-translational modifications of that sequence. In a particular embodiment, the VL comprises one, two or three HVRs selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:26.

[0220] In another aspect, an anti-human OX40 agonist antibody comprises a heavy chain variable domain (VH) sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99%, or 100% sequence identity to the amino acid sequence of SEQ ID NO:96. In certain embodiments, a VH sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% identity contains substitutions (e.g., conservative substitutions), insertions, or deletions relative to the reference sequence, but an anti-human OX40 agonist antibody comprising that sequence retains the ability to bind to OX40. In certain embodiments, a total of 1 to 10 amino acids have been substituted, inserted and/or deleted in SEQ ID NO:96. In certain embodiments, substitutions, insertions, or deletions occur in regions outside the HVRs (i.e., in the FRs). Optionally, the anti-human OX40 agonist antibody comprises the VH sequence in SEQ ID NO:96, including post-translational modifications of that sequence. In a particular embodiment, the VH comprises one, two or three HVRs selected from: (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2, (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3, and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4.

[0221] In another aspect, an anti-human OX40 agonist antibody is provided, wherein the antibody comprises a light chain variable domain (VL) having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99%, or 100% sequence identity to the amino acid sequence of SEQ ID NO:97. In certain embodiments, a VL sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% identity contains substitutions (e.g., conservative substitutions), insertions, or deletions relative to the reference sequence, but an anti-human OX40 agonist antibody comprising that sequence retains the ability to bind to OX40. In certain embodiments, a total of 1 to 10 amino acids have been substituted, inserted and/or deleted in SEQ ID NO:97. In certain embodiments, the substitutions, insertions, or deletions occur in regions outside the HVRs (i.e., in the FRs). Optionally, the anti-human OX40 agonist antibody comprises the VL sequence in SEQ ID NO:97, including post-translational modifications of that sequence. In a particular embodiment, the VL comprises one, two or three HVRs selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:27.

[0222] In another aspect, an anti-human OX40 agonist antibody comprises a heavy chain variable domain (VH) sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99%, or
100% sequence identity to the amino acid sequence of SEQ ID NO: 118, 120, 122, 124, 126, 128, 130, 132, 134, 136, 138, 140, 142, 144, 146, 148. In certain embodiments, a VH sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% identity contains substitutions (e.g., conservative substitutions), insertions, or deletions relative to the reference sequence, but an anti-humanOX40 agonist antibody comprising that sequence retains the ability to bind toOX40. In certain embodiments, a total of 1 to 10 amino acids have been substituted, inserted and/or deleted in SEQ ID NO: 118, 120, 122, 124, 126, 128, 130, 132, 134, 136, 138, 140, 142, 144, 146, 148. In certain embodiments, substitutions, insertions, or deletions occur in regions outside the HVRs (i.e., in the FRs). Optionally, the anti-humanOX40 agonist antibody comprises the VH sequence in SEQ ID NO: SEQ ID NO: 118, 120, 122, 124, 126, 128, 130, 132, 134, 136, 138, 140, 142, 144, 146, 148, including post-translational modifications of that sequence. In a particular embodiment, the VH comprises one, two or three HVRs selected from: (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 29, (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:30, and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:33.

[0223] In another aspect, an anti-humanOX40 agonist antibody is provided, wherein the antibody comprises a light chain variable domain (VL) having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99%, or 100% sequence identity to the amino acid sequence of SEQ ID NO: 119, 121, 123, 125, 127, 129, 131, 133, 135, 137, 139, 141, 143, 145, 147, 149. In certain embodiments, a VL sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% identity contains substitutions (e.g., conservative substitutions), insertions, or deletions relative to the reference sequence, but an anti-humanOX40 agonist antibody comprising that sequence retains the ability to bind toOX40. In certain embodiments, a total of 1 to 10 amino acids have been substituted, inserted and/or deleted in SEQ ID NO: 119, 121, 123, 125, 127, 129, 131, 133, 135, 137, 139, 141, 143, 145, 147, 149. In certain embodiments, the substitutions, insertions, or deletions occur in regions outside the HVRs (i.e., in the FRs). Optionally, the anti-humanOX40 agonist antibody comprises the VL sequence in SEQ ID NO: 119, 121, 123, 125, 127, 129, 131, 133, 135, 137, 139, 141, 143, 145, 147, 149, including post-translational modifications of that sequence. In a particular embodiment, the VL comprises one, two or three HVRs selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:37; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:39; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:42.

[0224] In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO:56 and SEQ ID NO:57, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO:58 and SEQ ID NO:59, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO:60 and SEQ ID NO:61, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO:62 and SEQ ID
NO:63, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO:64 and SEQ ID NO:65, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO:66 and SEQ ID NO:67, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO:68 and SEQ ID NO:69, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO:70 and SEQ ID NO:71, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO:72 and SEQ ID NO:73, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO:74 and SEQ ID NO:75, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO:76 and SEQ ID NO:77, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO:78 and SEQ ID NO:79, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO:80 and SEQ ID NO:81, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO:82 and SEQ ID NO:83, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO:84 and SEQ ID NO:85, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO:86 and SEQ ID NO:87, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO:88 and SEQ ID NO:89, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO:90 and SEQ ID NO:91, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO:92 and SEQ ID NO:93, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO:94 and SEQ ID NO:95, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO:96 and SEQ ID NO:97, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO:98 and SEQ ID NO:99, respectively, including post-translational modifications of those sequences. In one
embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 100 and SEQ ID NO: 101, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 108 and SEQ ID NO: 109, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 114 and SEQ ID NO: 115, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 116 and SEQ ID NO: 117, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 118 and SEQ ID NO: 119, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 120 and SEQ ID NO: 121, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 122 and SEQ ID NO: 123, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 124 and SEQ ID NO: 125, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 126 and SEQ ID NO: 127, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 128 and SEQ ID NO: 129, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 130 and SEQ ID NO: 131, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 132 and SEQ ID NO: 133, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 134 and SEQ ID NO: 135, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 136 and SEQ ID NO: 137, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 138 and SEQ ID NO: 139, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 140 and SEQ ID NO: 141, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 142 and SEQ ID NO: 143.
NO: 143, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 144 and SEQ ID NO: 145, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 146 and SEQ ID NO: 147, respectively, including post-translational modifications of those sequences.

[0226] In another aspect, an anti-human OX40 agonist antibody is provided, wherein the antibody comprises a VH as in any of the embodiments provided above, and a VL as in any of the embodiments provided above.

[0227] In a further aspect, the invention provides an antibody that binds to the same epitope as an anti-human OX40 antibody provided herein. In some embodiments, the antibody is an anti-human OX40 agonist antibody.

[0228] In a further aspect of the invention, an anti-OX40 antibody according to any of the above embodiments is a monoclonal antibody, including a chimeric, humanized or human antibody. In one embodiment, an anti-OX40 antibody is an antibody fragment, e.g., a Fv, Fab, Fab', scFv, diabody, or F(ab')2 fragment. In another embodiment, the antibody is a full length antibody, e.g., an intact IgGl antibody or other antibody class or isotype as defined herein. In some embodiments, the antibody is a full length intact IgG4 antibody.

B. Exemplary PD-1 Axis Binding Antagonists

[0229] Certain aspects of the present disclosure relate to methods of treating or delaying progression of cancer using PD-1 axis binding antagonists (e.g., anti-PD-L1 antibodies) and anti-OX40 antibodies (e.g., antibodies that bind human OX40). In some embodiments, the methods of treating or delaying progression of cancer include using a PD-1 axis binding antagonist (e.g., anti-PD-L1 antibody), an anti-OX40 antibody (e.g., an antibody that binds human OX40), and an antiangiogenesis agent (e.g., a VEGF antagonist such as an anti-VEGF antibody).

[0230] Certain aspects of the present disclosure relate to PD-1 axis binding antagonists. For example, a PD-1 axis binding antagonist includes a PD-1 binding antagonist, a PDL1 binding antagonist and a PDL2 binding antagonist. Alternative names for "PD-1" include CD279 and SLEB2. Alternative names for "PDL1" include B7-H1, B7-4, CD274, and B7-H. Alternative names for "PDL2" include B7-DC, Btde, and CD273. In some embodiments, PD-1, PDL1, and PDL2 are human PD-1, PDL1 and PDL2. In some embodiments, the PD-1 axis binding antagonist is a PDL1 binding antagonist, e.g., an anti-PDL1 antibody.

[0231] In some embodiments, the PD-1 binding antagonist is a molecule that inhibits the binding of PD-1 to its ligand binding partners. In a specific aspect the PD-1 ligand binding partners are PDL1 and/or PDL2. In another embodiment, a PDL1 binding antagonist is a molecule that inhibits the binding of PDL1 to its binding partners. In a specific aspect, PDL1 binding partners are PD-1 and/or
B7-1. In another embodiment, the PDL2 binding antagonist is a molecule that inhibits the binding of PDL2 to its binding partners. In a specific aspect, a PDL2 binding partner is PD-1. The antagonist may be an antibody, an antigen binding fragment thereof, an immunoadhesin, a fusion protein, or an oligopeptide.

In some embodiments, the PD-1 binding antagonist is an anti-PD-1 antibody (e.g., a human antibody, a humanized antibody, or a chimeric antibody). In some embodiments, the anti-PD-1 antibody is selected from the group consisting of MDX-1 106 (nivolumab, OPDIVO), Merck 3475 (MK-3475, pembrolizumab, KEYTRUDA), CT-011 (Pilizumab or MDV9300), MEDI-0680 (AMP-514), PDR001, REGN2810, BGB-108, and BGB-A317. In some embodiments, the PD-1 binding antagonist is an immunoadhesin (e.g., an immunoadhesin comprising an extracellular or PD-1 binding portion of PDL1 or PDL2 fused to a constant region (e.g., an Fc region of an immunoglobulin sequence). In some embodiments, the PD-1 binding antagonist is AMP-224. Nivolumab, also known as MDX-1 106-04, MDX-1 106, ONO-4538, BMS-936558, and OPDIVO®, is an anti-PD-1 antibody described in WO2006/121 168. Pembrolizumab, also known as MK-3475, Merck 3475, lambrolizumab, KEYTRUDA®, and SCH-900475, is an anti-PD-1 antibody described in WO2009/1 14335. CT-01 1, also known as hBAT or hBAT-1, is an anti-PD-1 antibody described in WO2009/10161 1. AMP-224, also known as B7–DC Ig, is a PDL2-Fc fusion soluble receptor described in WO2010/027827 and WO201 1/066342.

In some embodiments, the anti-PD-1 antibody is nivolumab (CAS Registry Number: 946414-94-4). In a still further embodiment, provided is an isolated anti-PD-1 antibody comprising a heavy chain variable region comprising the heavy chain variable region amino acid sequence from SEQ ID NO:210 and/or a light chain variable region comprising the light chain variable region amino acid sequence from SEQ ID NO:21 1. In a still further embodiment, provided is an isolated anti-PD-1 antibody comprising a heavy chain and/or a light chain sequence, wherein:

(a) the heavy chain sequence has at least 85%, at least 90%, at least 91%, at least 92%, at least 93%, at least 94%, at least 95%, at least 96%, at least 97%, at least 98%, at least 99% or 100% sequence identity to the heavy chain sequence:

```
QVQLVESGGGVVQPGSRSLRLCKASGLFTSFNSGMHWPQRAPGKGLEWVAVIYW
```

(b) the light chain sequences has at least 85%, at least 90%, at least 91%, at least 92%, at least 93%, at least 94%, at least 95%, at least 96%, at least 97%, at least 98%, at least 99% or 100%
sequence identity to the light chain sequence:

[0234] In some embodiments, the anti-PD-1 antibody is pembrolizumab (CAS Registry Number: 1374853-91-4). In a still further embodiment, provided is an isolated anti-PD-1 antibody comprising a heavy chain variable region comprising the heavy chain variable region amino acid sequence from SEQ ID NO:212 and/or a light chain variable region comprising the light chain variable region amino acid sequence from SEQ ID NO:213. In a still further embodiment, provided is an isolated anti-PD-1 antibody comprising a heavy chain and/or a light chain sequence, wherein:

(a) the heavy chain sequence has at least 85%, at least 90%, at least 91%, at least 92%, at least 93%, at least 94%, at least 95%, at least 96%, at least 97%, at least 98%, at least 99% or 100% sequence identity to the heavy chain sequence:

[0235] In some embodiments, the PDL1 binding antagonist is anti-PDL1 antibody. In some embodiments, the anti-PDL1 binding antagonist is selected from the group consisting of YW243.55.S70, MPDL3280A (atezolizumab), MDX-1105, MEDI4736 (durvalumab), and MSB0010718C (avelumab). MDX-1105, also known as BMS-936559, is an anti-PDL1 antibody described in WO2007/005874. Antibody YW243.55.S70 (heavy and light chain variable region sequences shown in SEQ ID Nos. 20 and 21, respectively) is an anti-PDL1 described in WO
2010/077634 AI. MEDI4736 is an anti-PDL1 antibody described in WO2011/066389 and US2013/034559.

[0236] Examples of anti-PDL1 antibodies useful for the methods of this invention, and methods for making thereof are described in PCT patent application WO 2010/077634 A1 and US Patent No. 8,217,149, which are incorporated herein by reference.

[0237] In some embodiments, the PD-1 axis binding antagonist is an anti-PDL1 antibody. In some embodiments, the anti-PDL1 antibody is capable of inhibiting binding between PDL1 and PD-1 and/or between PDL1 and B7-1. In some embodiments, the anti-PDL1 antibody is a monoclonal antibody. In some embodiments, the anti-PDL1 antibody is an antibody fragment selected from the group consisting of Fab, Fab'-SH, Fv, scFv, and (Fab')2 fragments. In some embodiments, the anti-PDL1 antibody is a humanized antibody. In some embodiments, the anti-PDL1 antibody is a human antibody.

[0238] The anti-PDL1 antibodies useful in this invention, including compositions containing such antibodies, such as those described in WO 2010/077634 A1, may be used in combination with an OX40 binding agonist to treat cancer. In some embodiments, the anti-PDL1 antibody comprises a heavy chain variable region comprising the amino acid sequence of SEQ ID NO:202 or 203 and a light chain variable region comprising the amino acid sequence of SEQ ID NO:204.

[0239] In another aspect, the polypeptide further comprises variable region heavy chain framework sequences juxtaposed between the HVRs according to the formula: (HC-FR1)-(HVR-H1)-(HC-FR2)-(HVR-H2)-(HC-FR3)-(HVR-H3)-(HC-FR4). In yet another aspect, the framework sequences are derived from human consensus framework sequences. In a further aspect, the framework sequences are VH subgroup III consensus framework. In a still further aspect, at least one of the framework sequences is the following:

<table>
<thead>
<tr>
<th>Framework Sequence</th>
<th>SEQ ID NO.</th>
</tr>
</thead>
<tbody>
<tr>
<td>HC-FR1</td>
<td>EVQLVESGGLVQPGGSLRLSCAAS</td>

<td>RFTISADTSKNTAYLMNSLRAEDTAVYYCAR</td>
</tr>
<tr>
<td>HC-FR4</td>
<td>WGGQGTLVTYVA</td>
</tr>
</tbody>
</table>

[0240] In another aspect, the heavy chain variable region comprises one or more framework sequences juxtaposed between the HVRs as: (HC-FR1)-(HVR-H1)-(HC-FR2)-(HVR-H2)-(HC-FR3)-(HVR-H3)-(HC-FR4), and the light chain variable regions comprises one or more framework sequences juxtaposed between the HVRs as: (LC-FR1)-(HVR-L1)-(LC-FR2)-(HVR-L2)-(LC-FR3)-(HVR-L3)-(LC-FR4). In yet another aspect, the framework sequences are derived from human consensus framework sequences. In a further aspect, the heavy chain framework sequences are derived from a Kabat subgroup I, II, or III sequence. In a still further aspect, the heavy chain framework sequence is a VH subgroup III consensus framework. In a still further aspect, one or more of the heavy chain framework sequences is the following:

<table>
<thead>
<tr>

[0242] In a still further specific aspect, the anti-PDL1 antibody further comprises a human or murine constant region. In a still further aspect, the human constant region is selected from the group consisting of IgGl, IgG2, IgG2, IgG3, IgG4. In a still further specific aspect, the human constant region is IgGl. In a still further aspect, the murine constant region is selected from the group consisting of IgGl, IgG2A, IgG2B, IgG3. In a still further aspect, the murine constant region if IgG2A. In a still further specific aspect, the anti-PDL1 antibody has reduced or minimal effector function. In a still further specific aspect the minimal effector function results from an "effector-less Fc mutation" or aglycosylation. In still a further embodiment, the effector-less Fc mutation is an N297A or D265A/N297A substitution in the constant region.

[0243] In yet another embodiment, provided is an anti-PDL1 antibody comprising a heavy chain and a light chain variable region sequence, wherein:

(a) the heavy chain further comprises and HVR-H1, HVR-H2 and an HVR-H3 sequence having at least 85% sequence identity to GFTFSDSWIH (SEQ ID NO: 196), AWISPYGGSTYYADSVKG (SEQ ID NO: 197) and RHWPAGFDY (SEQ ID NO: 198), respectively, or

(b) the light chain further comprises an HVR-L1, HVR-L2 and an HVR-L3 sequence having at least 85% sequence identity to RASQDVSTAVA (SEQ ID NO: 199), SASFLYS (SEQ ID NO:200) and QQLYHPAT (SEQ ID NO:201), respectively.

[0244] In a still further embodiment, provided is an isolated anti-PDL1 antibody comprising a heavy chain and a light chain variable region sequence, wherein:

(a) the heavy chain sequence has at least 85% sequence identity to the heavy chain sequence: EVQLVESGGGLVQPGGLRLSCAASGFTFSDSWIHWRQAPGKGLEWVYWASPYGGSTYYADSVKGRFTISADTSKNTAYLQMNSLRAEDTAVYYCARRHWPGFDYWQGTLVTVSA (SEQ ID NO:209), or

(b) the light chain has at least 85% sequence identity to the light chain sequence: DIQMTQSPSSLSASVGDRVTITCRASQD VSTAVAWYQQKPGPKLILY SASF
LYSGVPSRFSGSGTDTFTLTISSLQPEDFATYYCQQYLYHPATFGQGTKVEIKR (SEQ ID NO: 204).

[0245] In another further embodiment, provided is an isolated anti-PDL1 antibody comprising a heavy chain and a light chain variable region sequence, wherein:

(a) the heavy chain sequence has at least 85% sequence identity to the heavy chain sequence: EVQLVESGGGLVQPGGLRLSCAASGFTSFSDSWIHWVRQAPGKGLEWVAVISPYG GSTYYADSVKGRFTISADTSKNTAYLQMNSLRAEDTAAYYCARRHWPGFGDYWGQGTLVTVSS (SEQ ID NO:202), or

(b) the light chain sequence has at least 85% sequence identity to the light chain sequence: DIQMTQSPSSLASVAVYQQKPGKAPKLIY SASF LYSIGVPSRGSGSGTDFTLTISSLQPEDFATYYCQQYLYHPATFGQGTKVEIKR (SEQ ID NO: 204).

[0246] In a still further embodiment, provided is an isolated anti-PDL1 antibody comprising a heavy chain and a light chain variable region sequence, wherein:

(a) the heavy chain sequence has at least 85% sequence identity to the heavy chain sequence: EVQLVESGGGLVQPGGLRLSCAASGFTSFSDSWIHWVRQAPGKGLEWVAVISPYG GSTYYADSVKGRFTISADTSKNTAYLQMNSLRAEDTAAYYCARRHWPGFGDYWGQGTLVTVSS (SEQ ID NO:203), or

(b) the light chain sequence has at least 85% sequence identity to the light chain sequence: DIQMTQSPSSLASVAVYQQKPGKAPKLIY SASF LYSIGVPSRGSGSGTDFTLTISSLQPEDFATYYCQQYLYHPATFGQGTKVEIKR (SEQ ID NO: 204).

[0247] In yet another embodiment, the anti-PDL1 antibody is MPDL3280A (CAS Registry Number: 1422185-06-5). In a still further embodiment, provided is an isolated anti-PDL1 antibody comprising a heavy chain variable region comprising the heavy chain variable region amino acid sequence from EVQLVESGGGLVQPGGLRLSCAASGFTSFSDSWIHWVRQAPGKGLEWVAVISPYG GSTYYADSVKGRFTISADTSKNTAYLQMNSLRAEDTAAYYCARRHWPGFGDYWGQGTLVTVSS (SEQ ID NO:202) or EVQLVESGGGLVQPGGLRLSCAASGFTSFSDSWIHWVRQAPGKGLEWVAVISPYG GSTYYADSVKGRFTISADTSKNTAYLQMNSLRAEDTAAYYCARRHWPGFGDYWGQGTLVTVSS (SEQ ID NO:203) and a light chain variable region comprising the amino acid sequence of DIQMTQSPSSLASVAVYQQKPGKAPKLIY SASF LYSIGVPSRGSGSGTDFTLTISSLQPEDFATYYCQQYLYHPATFGQGTKVEIKR (SEQ ID NO:204).

[0248] In a still further embodiment, provided is an isolated anti-PDL1 antibody comprising a heavy chain and/or a light chain sequence, wherein:

(a) the heavy chain sequence has at least 85%, at least 90%, at least 91%, at least 92%, at least 93%, at least 94%, at least 95%, at least 96%, at least 97%, at least 98%, at least 99% or 100%
sequence identity to the heavy chain sequence:

EVQLVESGGGLVQPGSSLRLSCAASGFTTFSWVQRQAPKKLEWVAWISPYGGSTYYADSVKGRFTISADTSSKNTAYLQMNSLRAEDTAAYYCARRHWPGFDYWGQGTTLVTSSASTKGPSVFPLAPSSKSTGTVATLALGKVFKYFPEPVPMTSVWLNSGALTSGGVTHTFQELRQSSGLYSLSVYTVPSGLGTGYCINQNHPSNTKVDKVEPKSCDKTHTCPPCPAPELLGGPSVFLFQPVKPDKELISRTPEVTVVDDDEDPEVKNFYVGVNASTKPREEQYASTYRVVSLTVLHQLDWNGKEYKCKVSQNLAPIEKTISKAKGQPREQVYTLPSREEMTKKNQVSLTCLVKGFYPSDIAAVESNGQPPENNYKTTPVPLDSGSGFLYSLGSKLTVDKSRQWQGNNVFCSSVMHEALHNHYTQKSLSLSPG (SEQ ID NO:205), and/or

(b) the light chain sequences has at least 85%, at least 90%, at least 91%, at least 92%, at least 93%, at least 94%, at least 95%, at least 96%, at least 97%, at least 98%, at least 99% or 100% sequence identity to the light chain sequence:

DIQMTQSPSSLASVGRVTITCRASQDSTAVAVYQQPKGPAPLVIYSASFLYSGVSQPSFSGSGSTDFSLTISLQPEDFATCYYCQQLYVPAPGQGTTKEIKRTVAAQVFIFPSDEQLKS GTASVVCNLNNFYPREAKQVQNKVDNLQNSQESVTEQDSTYSLSSTLTLKADYEKHKVYACEVTHQGLLSVPVTKSFNRGEC (SEQ ID NO:206).

[0249] In a still further embodiment, the invention provides for compositions comprising any of the above described anti-PDL1 antibodies in combination with at least one pharmaceutically-acceptable carrier.

[0250] In some embodiments, the isolated anti-PDL1 antibody is aglycosylated. Glycosylation of antibodies is typically either N-linked or O-linked. N-linked refers to the attachment of the carbohydrate moiety to the side chain of an asparagine residue. The tripeptide sequences asparagine-X-serine and asparagine-X-threonine, where X is any amino acid except proline, are the recognition sequences for enzymatic attachment of the carbohydrate moiety to the asparagine side chain. Thus, the presence of either of these tripeptide sequences in a polypeptide creates a potential glycosylation site. O-linked glycosylation refers to the attachment of one of the sugars N-acetylgalactosamine, galactose, or xylose to a hydroxy amino acid, most commonly serine or threonine, although 5-hydroxyproline or 5-hydroxylysine may also be used. Removal of glycosylation sites form an antibody is conveniently accomplished by altering the amino acid sequence such that one of the above-described tripeptide sequences (for N-linked glycosylation sites) is removed. The alteration may be made by substitution of an asparagine, serine or threonine residue within the glycosylation site another amino acid residue (e.g., glycine, alanine or a conservative substitution).

[0251] In any of the embodiments herein, the isolated anti-PDL1 antibody can bind to a human PDL1, for example a human PDL1 as shown in UniProtKB/Swiss-Prot Accession No.Q9NQ7.1, or a variant thereof.

[0252] In some embodiments, the anti-PDL1 antibody or antigen binding fragment thereof administered to the individual is a composition comprising one or more pharmaceutically acceptable
carrier. Any of the pharmaceutically acceptable carriers described herein or known in the art may be used.

[0253] In some embodiments, the anti-PDL1 antibody described herein is in a formulation comprising the antibody at an amount of about 60 mg/mL, histidine acetate in a concentration of about 20 mM, sucrose in a concentration of about 120 mM, and polysorbate (e.g., polysorbate 20) in a concentration of 0.04% (w/v), and the formulation has a pH of about 5.8. In some embodiments, the anti-PDL1 antibody described herein is in a formulation comprising the antibody in an amount of about 125 mg/mL, histidine acetate in a concentration of about 20 mM, sucrose in a concentration of about 240 mM, and polysorbate (e.g., polysorbate 20) in a concentration of 0.02% (w/v), and the formulation has a pH of about 5.5.

C. VEGF Antagonists

[0254] Certain aspects of the present disclosure relate to methods of treating or delaying progression of cancer using an anti-angiogenesis agent (e.g., a VEGF antagonist such as an anti-VEGF antibody) in combination with a PD-1 axis binding antagonist (e.g., anti-PD-L1 antibody) and an anti-OX40 antibody (e.g., an antibody that binds human OX40).

[0255] As used herein, an "anti-angiogenesis agent" or "angiogenesis inhibitor" refers to a small molecular weight substance, a polynucleotide, a polypeptide, an isolated protein, a recombinant protein, an antibody, or conjugates or fusion proteins thereof, that inhibits angiogenesis, vasculogenesis, or undesirable vascular permeability, either directly or indirectly. It should be understood that the anti-angiogenesis agent includes those agents that bind and block the angiogenic activity of the angiogenic factor or its receptor. For example, an anti-angiogenesis agent is an antibody or other antagonist to an angiogenic agent as defined throughout the specification or known in the art, e.g., but are not limited to, antibodies to VEGF-A or to the VEGF-A receptor (e.g., KDR receptor or Flt-1 receptor), VEGF-trap, anti-PDGF inhibitors such as Gleevec™ (Imatinib Mesylate). Anti-angiogenesis agents also include native angiogenesis inhibitors, e.g., angiostatin, endostatin, etc. See, e.g., Klagsbrun and DAmore, Annu. Rev. Physiol., 53:217-39 (1991); Streit and Detmar, Oncogene, 22:3 172-3 179 (2003) (e.g., Table 3 listing anti-angiogenic therapy in malignant melanoma); Ferrara & Alitalo, Nature Medicine 5:1359-1364 (1999); Tonini et al., Oncogene, 22:6549-6556 (2003) (e.g., Table 2 listing known antiangiogenic factors); and Sato. Int. J. Clin. Oncol., 8:200-206 (2003) (e.g., Table 1 lists anti-angiogenic agents used in clinical trials).

[0256] As used herein, the term "VEGF" or "VEGF-A" is used to refer to the 165-amino acid human vascular endothelial cell growth factor and related 121-, 145-, 189-, and 206-amino acid human vascular endothelial cell growth factors, as described by, e.g., Leung et al. Science, 246: 1306 (1989), and Houck et al. Mol. Endocrin., 5:1806 (1991), together with the naturally occurring allelic and processed forms thereof. VEGF-A is part of a gene family including VEGF-B, VEGF-C, VEGF-D, VEGF-E, VEGF-F, and P1GF. VEGF-A primarily binds to two high affinity receptor tyrosine
kinases, VEGFR-1 (Flt-1) and VEGFR-2 (Flk-1/KDR), the latter being the major transmitter of vascular endothelial cell mitogenic signals of VEGF-A. Additionally, neuropilin-1 has been identified as a receptor for heparin-binding VEGF-A isoforms, and may play a role in vascular development. The term "VEGF" or "VEGF-A" also refers to VEGFs from non-human species such as mouse, rat, or primate. Sometimes the VEGF from a specific species is indicated by terms such as hVEGF for human VEGF or mVEGF for murine VEGF. Typically, VEGF refers to human VEGF. The term "VEGF" is also used to refer to truncated forms or fragments of the polypeptide comprising amino acids 8 to 109 or 1 to 109 of the 165-amino acid human vascular endothelial cell growth factor.

Reference to any such forms of VEGF may be identified in the application, e.g., by "VEGF (8-109)," "VEGF (1-109)" or "VEGF165." The amino acid positions for a "truncated" native VEGF are numbered as indicated in the native VEGF sequence. For example, amino acid position 17 (methionine) in truncated native VEGF is also position 17 (methionine) in native VEGF. The truncated native VEGF has binding affinity for the KDR and Flt-1 receptors comparable to native VEGF.

[0257] As used herein, a "chimeric VEGF receptor protein" is a VEGF receptor molecule having amino acid sequences derived from at least two different proteins, at least one of which is a VEGF receptor protein. In certain embodiments, the chimeric VEGF receptor protein is capable of binding to and inhibiting the biological activity of VEGF.

[0258] As used herein, a "VEGF antagonist" or "VEGF-specific antagonist" refers to a molecule capable of binding to VEGF, reducing VEGF expression levels, or neutralizing, blocking, inhibiting, abrogating, reducing, or interfering with VEGF biological activities, including, but not limited to, VEGF binding to one or more VEGF receptors, VEGF signaling, and VEGF mediated angiogenesis and endothelial cell survival or proliferation. For example, a molecule capable of neutralizing, blocking, inhibiting, abrogating, reducing, or interfering with VEGF biological activities can exert its effects by binding to one or more VEGF receptor (VEGFR) (e.g., VEGFR1, VEGFR2, VEGFR3, membrane-bound VEGF receptor (mbVEGFR), or soluble VEGF receptor (sVEGFR)). Included as VEGF-specific antagonists useful in the methods of the invention are polypeptides that specifically bind to VEGF, anti-VEGF antibodies and antigen-binding fragments thereof, receptor molecules and derivatives which bind specifically to VEGF thereby sequestering its binding to one or more receptors, fusions proteins (e.g., VEGF-Trap (Regeneron)), and VEGF171rgelonm (Peregrine). VEGF-specific antagonists also include antagonist variants of VEGF polypeptides, antisense nucleobase oligomers complementary to at least a fragment of a nucleic acid molecule encoding a VEGF polypeptide; small RNAs complementary to at least a fragment of a nucleic acid molecule encoding a VEGF polypeptide; ribozymes that target VEGF; peptibodies to VEGF; and VEGF aptamers. VEGF antagonists also include polypeptides that bind to VEGFR, anti-VEGFR antibodies, and antigen-binding fragments thereof, and derivatives which bind to VEGFR thereby blocking, inhibiting, abrogating, reducing, or interfering with VEGF biological activities (e.g., VEGF signaling), or fusions
proteins. VEGF-specific antagonists also include nonpeptide small molecules that bind to VEGF or VEGFR and are capable of blocking, inhibiting, abrogating, reducing, or interfering with VEGF biological activities. Thus, the term "VEGF activities" specifically includes VEGF mediated biological activities of VEGF. In certain embodiments, the VEGF antagonist reduces or inhibits, by at least 10%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90% or more, the expression level or biological activity of VEGF. In some embodiments, the VEGF inhibited by the VEGF-specific antagonist is VEGF (8-109), VEGF (1-109), or VEGF...[0259] As used herein, VEGF antagonists can include, but are not limited to, anti-VEGFR2 antibodies and related molecules (e.g., ramucirumab, tanibiramub, afilbercept), anti-VEGFR1 antibodies and related molecules (e.g., icrucumab, afilbercept (VEGF Trap-Eye; EYLEA©), and ziv-afilbercept (VEGF Trap; ZALTRAP©)), bispecific VEGF antibodies (e.g., MP-0250, vanucizumab (VEGF-ANG2), and bispecific antibodies disclosed in US 2001/0236388), bispecific antibodies including combinations of two of anti-VEG, anti-VEGFR, and anti-VEGFR2 arms, anti-VEGFA antibodies (e.g., bevacizumab, sevacizumab), anti-VEGFB antibodies, anti-VEGFc antibodies (e.g., VGX-100), anti-VEGF D antibodies, and nonpeptide small molecule VEGF antagonists (e.g., pazopanib, axitinib, vandetanib, stivarga, cabozeatinib, lenvatinib, nintedanib, orantinib, telatinib, dovitining, cediramin, motesanib, sulfatanib, apatinib, foretinib, famitinib, and tivozanib).

[0260] As used herein, an "anti-VEGF antibody" is an antibody that binds to VEGF with sufficient affinity and specificity. In certain embodiments, the antibody will have a sufficiently high binding affinity for VEGF, for example, the antibody may bind hVEGF with a $K_d$ value of between 100 nM-1 pM. Antibody affinities may be determined, e.g., by a surface piasmon resonance based assay (such as the BIAcore assay as described in PCT Application Publication No. WO2005/012359); enzyme-linked immunoabsorbent assay (ELISA); and competition assays (e.g. RIA's). In certain embodiments, the anti-VEGF antibody can be used as a therapeutic agent in targeting and interfering with diseases or conditions wherein the VEGF activity is involved. Also, the antibody may be subjected to other biological activity assays, e.g., in order to evaluate its effectiveness as a therapeutic. Such assays are known in the art and depend on the target antigen and intended use for the antibody. Examples include the HLIVEC inhibition assay; tumor cell growth inhibition assays (as described in WO 89/06692, for example); antibody-dependent cellular cytotoxicity (ADCC) and complement-mediated cytotoxicity (CDC) assays (U.S. Pat. No. 5,500,362); and agonistic activity or hematopoiesis assays (see WO 95/27062). An anti-VEGF antibody will usually not bind to other VEGF homologues such as VEGF-B or VEGF-C, nor other growth factors such as PIGF, PDGF, or bFGF. In one embodiment, anti-VEGF antibody is a monoclonal antibody that binds to the same epitope as the monoclonal anti-VEGF antibody A4.6.1 produced by hybridoma ATCC HB 10709. In another embodiment, the anti-VEGF antibody is a recombinant humanized anti-VEGF monoclonal antibody generated according to Presta et al. (1997) Cancer Res. 57:4593-4599, including but not limited to the antibody known as bevacizumab (BV; AVASTIN©).
[0261] As used herein, the anti-VEGF antibody "Bevacizumab (BV)," also known as "rhuMAb VEGF" or "AVASTIN®," is a recombinant humanized anti-VEGF monoclonal antibody generated according to Presta et al. (1997) Cancer Res. 57:4593-4599. It comprises mutated human IgG1 framework regions and antigen-binding complementarity-determining regions from the murine anti-hVEGF monoclonal antibody A.4.6.1 that blocks binding of human VEGF to its receptors. Approximately 93% of the amino acid sequence of bevacizumab, including most of the framework regions, is derived from human IgG1, and about 7% of the sequence is derived from the murine antibody A4.6.1. Bevacizumab has a molecular mass of about 149,000 daltons and is glycosylated. Bevacizumab and other humanized anti-VEGF antibodies are further described in U.S. Pat. No. 6,884,879 issued Feb. 26, 2005, the entire disclosure of which is expressly incorporated herein by reference. Additional preferred antibodies include the G6 or B20 series antibodies (e.g., G6-31, B20-4.1), as described in PCX Application Publication No. WO 2005/012359. For additional preferred antibodies see U.S. Pat. Nos. 7,060,269, 6,582,959, 6,703,020; 6,054,297; WO98/45332; WO 96/30046; WO94/10202; EP 0666868B1; U.S. Patent Application Publication Nos. 2006009360, 200501 86208, 20030206899, 20030190317, 20030203409, and 200501 12126; and Popkov et al., Journal of Immunological Methods 288:149-164 (2004). Other preferred antibodies include those that bind to a functional epitope on human VEGF comprising of residues F17, M18, D19, Y21, Y25, Q89, 191, K101, E103, and C104 or, alternatively, comprising residues F17, Y21, Q22, Y25, D63, 183, and Q89.

[0262] As used herein, the "epitope A4.6.1" refers to the epitope recognized by the anti-VEGF antibody bevacizumab (AVASTIN®) (see Muller Y et al., Structure 15 September 1998, 6:1153-1167). In certain embodiments of the invention, the anti-VEGF antibodies include, but are not limited to, a monoclonal antibody that binds to the same epitope as the monoclonal anti-VEGF antibody A4.6.1 produced by hybridoma ATCC HB 10709; a recombinant humanized anti-VEGF monoclonal antibody generated according to Presta et al. (1997) Cancer Res. 57:4593-4599.

[0263] As described supra, an anti-angiogenesis agent may include a compound such as a small molecular weight substance, a polynucleotide, a polypeptide, an isolated protein, a recombinant protein, an antibody, or conjugates or fusion proteins thereof. In some embodiments, the anti-angiogenesis agent is an anti-VEGF-R2 antibody; an anti-VEGF-R1 antibody; a VEGF-trap; a bispecific VEGF antibody; a bispecific antibody comprising a combination of two arms selected from an anti-VEGF arm, an anti-VEGF-R1 arm, and an anti-VEGF-R2 arm; an anti-VEGF-A antibody (e.g., an anti-KDR receptor or anti-Fit-1 receptor antibody); an anti-VEGF-B antibody; an anti-VEGF-C antibody; an anti-VEGF-D antibody; a nonpeptide small molecule VEGF antagonist; an anti-PDGFR inhibitor; or a native angiogenesis inhibitor. In certain embodiments, the anti-angiogenesis agent is ramucirumab, tanibiramub, aflibercept (e.g., VEGF Trap-Eye; EYLEA®), icrucumab, ziv-aflibercept (e.g., VEGF Trap; ZALTRAP®), MP-0250, vanucizumab, sevacizumab, VGX-100, pazopanib, axitinib, vandetanib, stivarga, cabozantinib, lenvatinib, nintedanib, orantinib, telatinib, dovitinig,
cediranib, motesanib, sulfatinib, apatinib, foretinib, famitinib, imatinib (e.g., Imatinib Mesylate; Gleevec™), and tivozanib.

[0264] In some embodiments, the anti-angiogenesis agent is an anti-angiogenesis antibody. Descriptions of antibodies and methods for generating antibodies are further provided infra. In some embodiments, the anti-angiogenesis antibody is a monoclonal antibody. In some embodiments, the anti-angiogenesis antibody is a human or humanized antibody (described in more detail below).

[0265] In some embodiments, the anti-angiogenesis agent is a VEGF antagonist. For example, VEGF antagonists of the present disclosure may include without limitation polypeptides that specifically bind to VEGF, anti-VEGF antibodies and antigen-binding fragments thereof; receptor molecules and derivatives which bind specifically to VEGF, thereby sequestering its binding to one or more receptors; fusion proteins (e.g., VEGF-Trap (Regeneron)), VEGF₁₅r gelonin (Peregrine), antagonist variants of VEGF polypeptides, antisense nucleobase oligomers complementary to at least a fragment of a nucleic acid molecule encoding a VEGF polypeptide; small RNAs complementary to at least a fragment of a nucleic acid molecule encoding a VEGF polypeptide (e.g., an RNAi, siRNA, shRNA, or miRNA); ribozymes that target VEGF; peptibodies to VEGF; VEGF aptamers; polypeptides that bind to VEGFR; anti-VEGFR antibodies and antigen-binding fragments thereof; derivatives which bind to VEGFR thereby blocking, inhibiting, abrogating, reducing, or interfering with VEGF biological activities (e.g., VEGF signaling); fusion proteins; and nonpeptide small molecules that bind to VEGF or VEGFR and are capable of blocking, inhibiting, abrogating, reducing, or interfering with VEGF biological activities.

[0266] In certain embodiments, the VEGF antagonist reduces or inhibits, by at least 10%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90% or more, the expression level or biological activity of VEGF. For example, in some embodiments, the VEGF antagonist may reduce or inhibit the expression level or biological activity of VEGF by at least 10%, at least 15%, at least 20%, at least 25%, at least 30%, at least 35%, at least 40%, at least 45%, at least 50%, at least 55%, at least 60%, at least 65%, at least 70%, at least 75%, at least 80%, at least 85%, at least 90%, or at least 95%. In some embodiments, the VEGF inhibited by the VEGF-specific antagonist is VEGF (8-109), VEGF (1-109), or VEGF₁₅₅.

[0267] Certain aspects of the methods, uses, and kits of the present disclosure are based, at least in part, on the surprising discovery that anti-VEGF treatment can improve the functional phenotype of tumoral dendritic cells (e.g., by leading to increased expression of MHC Class II and/or OX40L). Without wishing to be bound to theory, this property, inter alia, may make combination therapies including an anti-angiogenesis agent and an OX40 binding agonist particularly advantageous for the treatment of cancer, e.g., by resulting in enhanced anti-tumor responses such as anti-tumoral T cell responses.

[0268] Therefore, in some embodiments, the VEGF antagonist increases MHC class II expression on intratumoral dendritic cells, e.g., as compared to MHC class II expression on dendritic cells from a tumor treated with a control antibody (e.g., an isotype control). MHC class II is known as a family of
related molecules (typically heterodimers containing alpha and beta chains) that present antigen to T
cells. As used herein, MHC class II expression may refer to expression of any MHC class II molecule
or chain, including without limitation a polypeptide encoded by the human genes HLA-DM alpha
(e.g., NCBI Gene ID No. 3108), HLA-DM beta (e.g., NCBI Gene ID No. 3109), HLA-DO alpha (e.g.,
NCBI Gene ID No. 3111), HLA-DO beta (e.g., NCBI Gene ID No. 3112), HLA-DP alpha 1 (e.g.,
NCBI Gene ID No. 3113), HLA-DP beta 1 (e.g., NCBI Gene ID No. 3115), HLA-DQ alpha 1 (e.g.,
NCBI Gene ID No. 3117), HLA-DQ alpha 2 (e.g., NCBI Gene ID No. 3118), HLA-DQ beta 1 (e.g.,
NCBI Gene ID No. 3119), HLA-DQ beta 2 (e.g., NCBI Gene ID No. 3120), HLA-DR alpha (e.g.,
NCBI Gene ID No. 3122), HLA-DR beta 1 (e.g., NCBI Gene ID No. 3123), HLA-DR beta 3 (e.g.,
NCBI Gene ID No. 3125), HLA-DR beta 4 (e.g., NCBI Gene ID No. 3126), or HLA-DR beta 5 (e.g.,
NCBI Gene ID No. 3127). It will be appreciated by one of skill in the art that MHC genes are highly
variable across populations, and thus the specific genes and sequences listed are merely exemplary
and in no way intended to be limiting.

[0269] In some embodiments, the VEGF antagonist increases OX40L expression on intratumoral
dendritic cells, e.g., as compared to OX40L expression on dendritic cells from a tumor treated with a
control antibody (e.g., an isotype control). OX40L (also known as tumor necrosis factor ligand
superfamily member 4 or CD252) is known as the binding partner or ligand of OX40. Examples of
OX40L polypeptides including without limitation polypeptides having the amino acid sequence
represented by UniProt Accession No. P43488 and/or a polypeptide encoded by gene TNFSF4 (e.g.,
NCBI Gene ID No. 7292).

[0270] Methods for measuring MHC class II or OX40L expression are known in the art and may
include without limitation FACS, Western blot, ELISA, immunoprecipitation, immunohistochemistry,
immunofluorescence, radioimmunoassay, dot blotting, immunodetection methods, HPLC, surface
plasmon resonance, optical spectroscopy, mass spectrometry, HPLC, qPCR, RT-qPCR, multiplex
qPCR or RT-qPCR, RNA-seq, microarray analysis, SAGE, MassARRAY technique, and FISH, and
combinations thereof.

[0271] In some embodiments, the dendritic cells are myeloid dendritic cells. In other
embodiments, the dendritic cells are non-myeloid dendritic cells (e.g., lymphoid or plasmacytoid
dendritic cells). The cell-surface antigens expressed by dendritic cells, and those that distinguish
myeloid and non-myeloid dendritic cells, are known in the art. For example, dendritic cells may be
identified by expression of CD45, CD1 lc, and MHC class II. They may be distinguished from other
cell types (e.g., macrophages, neutrophils, and granulocytic myeloid cells) by their lack of significant
F4/80 and Gr1 expression. In some embodiments, myeloid dendritic cells are dendritic cells that
express CD1 lb, and non-myeloid dendritic cells are dendritic cells that lack significant CD11b
expression. For further descriptions of myeloid and non-myeloid dendritic cells, see, e.g., Steinman,
VEGF Receptor Molecules

In some embodiments, the anti-angiogenesis agent is a VEGF antagonist. In some embodiments, the VEGF antagonist comprises a soluble VEGF receptor or a soluble VEGF receptor fragment that specifically binds to VEGF. The two best characterized VEGF receptors are VEGFR1 (also known as Flt-1) and VEGFR2 (also known as KDR and FLK-1 for the murine homolog). The specificity of each receptor for each VEGF family member varies but VEGF-A binds to both Flt-1 and KDR. Both Flt-1 and KDR belong to the family of receptor tyrosine kinases (RTKs). The RTKs comprise a large family of transmembrane receptors with diverse biological activities. At least nineteen (19) distinct RTK subfamilies have been identified. The receptor tyrosine kinase (RTK) family includes receptors that are crucial for the growth and differentiation of a variety of cell types (Yarden and Ullrich (1988) Ann. Rev. Biochem. 57:433-478; Ullrich and Schlessinger (1990) Cell 61:243-254). The intrinsic function of RTKs is activated upon ligand binding, which results in phosphorylation of the receptor and multiple cellular substrates, and subsequently in a variety of cellular responses (Ullrich & Schlessinger (1990) Cell 61:203-212). Thus, receptor tyrosine kinase mediated signal transduction is initiated by extracellular interaction with a specific growth factor (ligand), typically followed by receptor dimerization, stimulation of the intrinsic protein tyrosine kinase activity and receptor trans-phosphorylation. Binding sites are thereby created for intracellular signal transduction molecules and lead to the formation of complexes with a spectrum of cytoplasmic signaling molecules that facilitate the appropriate cellular response, (e.g., cell division, differentiation, metabolic effects, changes in the extracellular microenvironment) see, Schlessinger and Ullrich (1992) Neuron 9:1-20. Structurally, both Flt-1 and KDR have seven immunoglobulin-like domains in the extracellular domain, a single transmembrane region, and a consensus tyrosine kinase sequence which is interrupted by a kinase-insert domain. Matthews et al. (1991) PNAS USA 88:9026-9030; Terman et al. (1991) Oncogene 6:1677-1683. The extracellular domain is involved in the binding of VEGF and the intracellular domain is involved in signal transduction.

In some embodiments, the VEGF receptor molecules, or fragments thereof, that specifically bind to VEGF can be used in the methods of the invention to bind to and sequester the VEGF protein, thereby preventing it from signaling. In certain embodiments, the VEGF receptor molecule, or VEGF binding fragment thereof, is a soluble form, such as sFlt-1. A soluble form of the receptor exerts an inhibitory effect on the biological activity of the VEGF protein by binding to VEGF, thereby preventing it from binding to its natural receptors present on the surface of target cells. Also included are VEGF receptor fusion proteins, examples of which are described below.

In some embodiments, the VEGF antagonist is a chimeric VEGF receptor protein. A chimeric VEGF receptor protein is a receptor molecule having amino acid sequences derived from at least two different proteins, at least one of which is a VEGF receptor protein (e.g., the flt-1 or KDR receptor), that is capable of binding to and inhibiting the biological activity of VEGF. In certain embodiments, the chimeric VEGF receptor proteins of the invention consist of amino acid sequences
derived from only two different VEGF receptor molecules; however, amino acid sequences comprising one, two, three, four, five, six, or all seven Ig-like domains from the extracellular ligand-binding region of the Flt-1 and/or KDR receptor can be linked to amino acid sequences from other unrelated proteins, for example, immunoglobulin sequences. Other amino acid sequences to which Ig-like domains are combined will be readily apparent to those of ordinary skill in the art. Examples of chimeric VEGF receptor proteins include, e.g., soluble Flt-1/Fc, KDR/Fc, or FLt-1/KDR/Fc (also known as VEGF Trap). (See for example PCT Application Publication No. W097/44453).

[0275] A soluble VEGF receptor protein or chimeric VEGF receptor proteins of the invention includes VEGF receptor proteins which are not fixed to the surface of cells via a transmembrane domain. As such, soluble forms of the VEGF receptor, including chimeric receptor proteins, while capable of binding to and inactivating VEGF, do not comprise a transmembrane domain and thus generally do not become associated with the cell membrane of cells in which the molecule is expressed.

[0276] In some embodiments, the VEGF antagonist (I, an anti-VEGF antibody, such as bevacizumab) is administered by gene therapy. See, for example, WO 96/07321 published Mar. 14, 1996 concerning the use of gene therapy to generate intracellular antibodies. There are two major approaches to getting the nucleic acid (optionally contained in a vector) into the patient's cells: in vivo and ex vivo. For in vivo delivery the nucleic acid is injected directly into the patient, usually at the site where the antibody is required. For ex vivo treatment, the patient's cells are removed, the nucleic acid is introduced into these isolated cells and the modified cells are administered to the patient either directly or, for example, encapsulated within porous membranes which are implanted into the patient (see, e.g., U.S. Pat. Nos. 4,892,538 and 5,283,187). There are a variety of techniques available for introducing nucleic acids into viable cells. The techniques vary depending upon whether the nucleic acid is transferred into cultured cells in vitro, or in vivo in the cells of the intended host. Techniques suitable for the transfer of nucleic acid into mammalian cells in vitro include the use of liposomes, electroporation, microinjection, cell fusion, DEAE-dextran, the calcium phosphate precipitation method, etc. A commonly used vector for ex vivo delivery of the gene is a retrovirus. The currently preferred in vivo nucleic acid transfer techniques include transfection with viral vectors (such as adenovirus, Herpes simplex I virus, or adeno-associated virus) and lipid-based systems (useful lipids for lipid-mediated transfer of the gene are DOTMA, DOPE and DC-Choi, for example). In some situations it is desirable to provide the nucleic acid source with an agent that targets the target cells, such as an antibody specific for a cell surface membrane protein or the target cell, a ligand for a receptor on the target cell, etc. Where liposomes are employed, proteins which bind to a cell surface membrane protein associated with endocytosis may be used for targeting and/or to facilitate uptake, e.g. capsid proteins or fragments thereof tropic for a particular cell type, antibodies for proteins which undergo internalization in cycling, and proteins that target intracellular localization and enhance intracellular half-life. The technique of receptor-mediated endocytosis is described, for example, by
Anti-VEGF Antibodies

[0277] In some embodiments, the anti-angiogenesis agent is a VEGF antagonist. In some embodiments, the VEGF antagonist is an anti-VEGF antibody. In some embodiments, the anti-VEGF antibody may be a human or humanized antibody. In some embodiments, the anti-VEGF antibody may be a monoclonal antibody.

[0278] The VEGF antigen to be used for production of VEGF antibodies may be, e.g., the VEGF165 molecule as well as other isoforms of VEGF or a fragment thereof containing the desired epitope. In one embodiment, the desired epitope is the one recognized by bevacizumab, which binds to the same epitope as the monoclonal anti-VEGF antibody A4.6.1 produced by hybridoma ATCC HB 10709 (known as "epitope A.4.6.1" defined herein). Other forms of VEGF useful for generating anti-VEGF antibodies of the invention will be apparent to those skilled in the art.

[0279] Human VEGF was obtained by first screening a cDNA library prepared from human cells, using bovine VEGF cDNA as a hybridization probe. Leung et al. (1989) Science, 246:1306. One cDNA identified thereby encodes a 165-amino acid protein having greater than 95% homology to bovine VEGF; this 165-amino acid protein is typically referred to as human VEGF (hVEGF) or VEGF165. The mitogenic activity of human VEGF was confirmed by expressing the human VEGF cDNA in mammalian host cells. Media conditioned by cells transfected with the human VEGF cDNA promoted the proliferation of capillary endothelial cells, whereas control cells did not. Leung et al. (1989) Science, supra. Further efforts were undertaken to clone and express VEGF via recombinant DNA techniques. (See, e.g., Ferrara, Laboratory Investigation 72:615-618 (1995), and the references cited therein).

[0280] VEGF is expressed in a variety of tissues as multiple homodimeric forms (121, 145, 165, 189, and 206 amino acids per monomer) resulting from alternative RNA splicing. VEGF121 is a soluble mitogen that does not bind heparin; the longer forms of VEGF bind heparin with progressively higher affinity. The heparin-binding forms of VEGF can be cleaved in the carboxy terminus by plasmin to release a diffusable form(s) of VEGF. Amino acid sequencing of the carboxy terminal peptide identified after plasmin cleavage is Arg160-Ala111. Amino terminal "core" protein, VEGF (1-110) isolated as a homodimer, binds neutralizing monoclonal antibodies (such as the antibodies referred to as 4.6.1 and 3.2E3.1.1) and soluble forms of VEGF receptors with similar affinity compared to the intact VEGF165 homodimer.

[0281] Several molecules structurally related to VEGF have also been identified recently, including placenta growth factor (PIGF), VEGF-B, VEGF-C, VEGF-D and VEGF-E. Ferrara and Davis-Smyth

[0282] Two VEGF receptors have been identified, Flt-1 (also called VEGFR-1) and KDR (also called VEGFR-2). Shibuya et al. (1990) Oncogene 8:519-527; de Vries et al. (1992) Science 255:989-991; Terman et al. (1992) Biochem. Biophys. Res. Commun. 187:1579-1586. Neuropilin-1 has been shown to be a selective VEGF receptor, able to bind the heparin-binding VEGF isoforms (Soker et al. (1998) Cell 92:735-45).

[0283] Anti-VEGF antibodies that are useful in the methods of the invention include any antibody, or antigen binding fragment thereof, that bind with sufficient affinity and specificity to VEGF and can reduce or inhibit the biological activity of VEGF. An anti-VEGF antibody will usually not bind to other VEGF homologues such as VEGF-B or VEGF-C, nor other growth factors such as P1GF, PDGF, or bFGF.

[0284] In certain embodiments of the invention, the anti-VEGF antibodies include, but are not limited to, a monoclonal antibody that binds to the same epitope as the monoclonal anti-VEGF antibody A4.6.1 produced by hybridoma ATCC HB 10709; a recombinant humanized anti-VEGF monoclonal antibody generated according to Presta et al. (1997) Cancer Res. 57:4593-4599. In one embodiment, the anti-VEGF antibody is "bevacizumab (BV)", also known as "rhuMAb VEGF" or "AVASTIN®". It comprises mutated human IgGl framework regions and antigen-binding complementarity-determining regions from the murine anti-hVEGF monoclonal antibody A.4.6.1 that blocks binding of human VEGF to its receptors. Approximately 93% of the amino acid sequence of bevacizumab, including most of the framework regions, is derived from human IgGl, and about 7% of the sequence is derived from the murine antibody A4.6.1.

[0285] Bevacizumab (AVASTIN®) was the first anti-angiogenesis therapy approved by the FDA and is approved for the treatment metastatic colorectal cancer (first- and second-line treatment in combination with intravenous 5-FU-based chemotherapy), advanced non-squamous, non-small cell lung cancer (NSCLC) (first-line treatment of unresectable, locally advanced, recurrent or metastatic NSCLC in combination with carboplatin and paclitaxel) and metastatic HER2-negative breast cancer (previously untreated, metastatic HER2-negative breast cancer in combination with paclitaxel).

[0286] Bevacizumab and other humanized anti-VEGF antibodies are further described in U.S. Pat. No. 6,884,879 issued Feb. 26, 2005. Additional antibodies include the G6 or B20 series antibodies (e.g., G6-31, B20-4.1), as described in PCT Publication No. WO2005/012359, PCT Publication No. WO2005/044853, and U.S. Patent Application 60/991,302, the content of these patent applications are expressly incorporated herein by reference. For additional antibodies see U.S. Pat. Nos. 7,060,269, 6,582,959, 6,703,020; 6,054,297; W098/45332; WO 96/30046; WO94/10202; EP 0666868B1; U.S.
Patent Application Publication Nos. 2006009360, 20050186208, 20030206899, 20030190317, 20030203409, and 20050112126; and Popkov et al., Journal of Immunological Methods 288:149-164 (2004). Other antibodies include those that bind to a functional epitope on human VEGF comprising of residues F17, M18, D19, Y21, Y25, Q89, 1191, K101, E103, and C104 or, alternatively, comprising residues F17, Y21, Q22, Y25, D63, 183 and Q89.

[0287] In one embodiment of the invention, the anti-VEGF antibody has a light chain hypervariable region comprising the following amino acid sequence:

DIQMTQSPSS LSASVGVDRVT ITCSASQDIS NYLNWYYQQKP GKAPKVLIFY TSSLHSGVPS RFSGSGSTGD FTLTISLQP EDFATYYCQQ YSTVPWTFQG GTKVEIKR. (SEQ ID NO:214); and/or a heavy chain variable region comprising the following amino acid sequence: EVQLVESGGG LVQPGSRL LLSCAASGYFT NYGMNWVRQA PGKGEWVGW INTYGEPTY AADFKRRFIF SLTSDKSTAY LQMNLSRAED TAVYYCAKYP HYGGSSHWYF DVWQGQTLVT VSS (SEQ ID NO:215).

[0288] In some embodiments, the anti-VEGF antibody comprises one, two, three, four, five, or six hypervariable region (HVR) sequences of bevacizumab. In some embodiments, the anti-VEGF antibody comprises one, two, three, four, five, or six hypervariable region (HVR) sequences of selected from (a) HVR-H1 comprising the amino acid sequence of GYTFTNYGMN (SEQ ID NO:216); (b) HVR-H2 comprising the amino acid sequence of WINTYTFEGTYADFKR (SEQ ID NO:217); (c) HVR-H3 comprising the amino acid sequence of YPHYGSSHWYFDV (SEQ ID NO:218); (d) HVR-L1 comprising the amino acid sequence of SASQDISNYLN (SEQ ID NO:219); (e) HVR-L2 comprising the amino acid sequence of FTSSLHS (SEQ ID NO:220); and (f) HVR-L3 comprising the amino acid sequence of QQYSTVPWT (SEQ ID NO:221). In some embodiments, the anti-VEGF antibody comprises one, two, three, four, five, or six hypervariable region (HVR) sequences of an antibody described in U.S. Pat. No. 6,884,879. In some embodiments, the anti-VEGF antibody comprises one, two, or three hypervariable region (HVR) sequences of a light chain variable region comprising the following amino acid sequence: DIQMTQSPSS LSASVGVDRVT ITCSASQDIS NYLNWYYQQKP GKAPKVLIFY TSSLHSGVPS RFSGSGSTGD FTLTISLQP EDFATYYCQQ YSTVPWTFQG GTKVEIKR. (SEQ ID NO:214) and/or one, two, or three hypervariable region (HVR) sequences of a heavy chain variable region comprising the following amino acid sequence: EVQLVESGGG LVQPGSRL LLSCAASGYFT NYGMNWVRQA PGKGEWVGW INTYGEPTY AADFKRRFIF SLTSDKSTAY LQMNLSRAED TAVYYCAKYP HYGGSSHWYF DVWQGQTLVT VSS (SEQ ID NO:215).

[0289] A "G6 series antibody" according to this invention, is an anti-VEGF antibody that is derived from a sequence of a G6 antibody or G6-derived antibody according to any one of FIGS. 7, 24-26, and 34-35 of PCT Publication No. WO2005/012359, the entire disclosure of which is expressly incorporated herein by reference. See also PCT Publication No. WO2005/044853, the entire disclosure of which is expressly incorporated herein by reference. In one embodiment, the G6 series
antibody binds to a functional epitope on human VEGF comprising residues F17, Y21, Q22, Y25, D63, 183 and Q89.

[0290] A "B20 series antibody" according to this invention is an anti-VEGF antibody that is derived from a sequence of the B20 antibody or a B20-derived antibody according to any one of FIGS. 27-29 of PCT Publication No. WO2005/012359, the entire disclosure of which is expressly incorporated herein by reference. See also PCT Publication No. WO2005/044853, and U.S. Patent Application 60/991,302, the content of these patent applications are expressly incorporated herein by reference. In one embodiment, the B20 series antibody binds to a functional epitope on human VEGF comprising residues F17, M18, D19, Y21, Y25, Q89, K101, E103, and C104.

A "functional epitope" according to this invention refers to amino acid residues of an antigen that contribute energetically to the binding of an antibody. Mutation of any one of the energetically contributing residues of the antigen (for example, mutation of wild-type VEGF by alanine or homolog mutation) will disrupt the binding of the antibody such that the relative affinity ratio (IC50mutant VEGF/IC50wild-type VEGF) of the antibody will be greater than 5 (see Example 2 of WO2005/012359). In one embodiment, the relative affinity ratio is determined by a solution binding phage displaying ELISA. Briefly, 96-well Maxisorp immunoplates (NUNC) are coated overnight at 4°C with an Fab form of the antibody to be tested at a concentration of 2 µg/ml in PBS, and blocked with PBS, 0.5% BSA, and 0.05% Tween20 (PBT) for 2 h at room temperature. Serial dilutions of phage displaying hVEGF alanine point mutants (residues 8-109 form) or wild type hVEGF (8-109) in PBT are first incubated on the Fab-coated plates for 15 min at room temperature, and the plates are washed with PBS, 0.05% Tween20 (PBST). The bound phage is detected with an anti-M13 monoclonal antibody horseradish peroxidase (Amersham Pharmacia) conjugate diluted 1:5000 in PBT, developed with 3,3',5,5'-tetramethylbenzidine (TMB, Kirkegaard & Perry Labs, Gaithersburg, Md.) substrate for approximately 5 min, quenched with 1.0 M H3PO4, and read spectrophotometrically at 450 nm. The ratio of IC50 values (IC50,ala/IC50,wt) represents the fold of reduction in binding affinity (the relative binding affinity).

1. Antibody Affinity

[0291] In a further aspect, an anti-OX40 antibody, anti-PDL1 antibody, or anti-VEGF antibody according to any of the above embodiments may incorporate any of the features, singly or in combination, as described in Sections 1-7 below:

[0292] In certain embodiments, an antibody provided herein has a dissociation constant (Kd) of ≤ 1µM, < 100 nM, < 10 nM, < 1 nM, < 0.1 nM, < 0.01 nM, or < 0.001 nM (e.g. 10⁻⁸ M or less, e.g. from 10⁻⁸ M to 10⁻¹³ M, e.g., from 10⁻⁶ M to 10⁻¹³ M).

[0293] In one embodiment, Kd is measured by a radiolabeled antigen binding assay (RIA). In one embodiment, an RIA is performed with the Fab version of an antibody of interest and its antigen. For
example, solution binding affinity of Fabs for antigen is measured by equilibrating Fab with a minimal concentration of $^{125}$I-labeled antigen in the presence of a titration series of unlabeled antigen, then capturing bound antigen with an anti-Fab antibody-coated plate (see, e.g., Chen et al., J. Mol. Biol. 293:865-881(1999)). To establish conditions for the assay, MICROTITER® multi-well plates (Thermo Scientific) are coated overnight with 5 µg/ml of a capturing anti-Fab antibody (Cappel Labs) in 50 nM sodium carbonate (pH 9.6), and subsequently blocked with 2% (w/v) bovine serum albumin in PBS for two to five hours at room temperature (approximately 23°C). In a non-adsorbent plate (Nunc #269620), 100 pM or 26 pM $^{125}$I-antigen are mixed with serial dilutions of a Fab of interest (e.g., consistent with assessment of the anti-VEGF antibody, Fab-12, in Presta et al., Cancer Res. 57:4593-4599 (1997)). The Fab of interest is then incubated overnight; however, the incubation may continue for a longer period (e.g., about 65 hours) to ensure that equilibrium is reached. Thereafter, the mixtures are transferred to the capture plate for incubation at room temperature (e.g., for one hour). The solution is then removed and the plate washed eight times with 0.1% polysorbate 20 (TWEEN-20®) in PBS. When the plates have dried, 150 µl/well of scintillant (MICROSCINT-20™; Packard) is added, and the plates are counted on a TOPCOUNT™ gamma counter (Packard) for ten minutes. Concentrations of each Fab that give less than or equal to 20% of maximal binding are chosen for use in competitive binding assays.

[0294] According to another embodiment, Kd is measured using a BIACORE® surface plasmon resonance assay. For example, an assay using a BIACORE®-2000 or a BIACORE®-3000 (BIAcore, Inc., Piscataway, NJ) is performed at 25°C with immobilized antigen CM5 chips at -10 response units (RU). In one embodiment, carboxymethylated dextran biosensor chips (CM5, BIACORE, Inc.) are activated with N-ethyl-N’-(3-dimethylaminopropyl)-carbodiimide hydrochloride (EDC) and N-hydroxysuccinimide (NHS) according to the supplier’s instructions. Antigen is diluted with 10 mM sodium acetate, pH 4.8, to 5 µg/ml (-0.2 µM) before injection at a flow rate of 5 µl/minute to achieve approximately 10 response units (RU) of coupled protein. Following the injection of antigen, 1 M ethanolamine is injected to block unreacted groups. For kinetics measurements, two-fold serial dilutions of Fab (0.78 nM to 500 nM) are injected in PBS with 0.05% polysorbate 20 (TWEEN-20™) surfactant (PBST) at 25°C at a flow rate of approximately 25 µl/min. Association rates ($k_{on}$) and dissociation rates ($k_{off}$) are calculated using a simple one-to-one Langmuir binding model (BIACORE® Evaluation Software version 3.2) by simultaneously fitting the association and dissociation sensograms. The equilibrium dissociation constant (Kd) is calculated as the ratio $k_{off}/k_{on}$. See, e.g., Chen et al., J. Mol. Biol. 293:865-881 (1999). If the on-rate exceeds 106 M⁻¹ s⁻¹ by the surface plasmon resonance assay above, then the on-rate can be determined by using a fluorescent quenching technique that measures the increase or decrease in fluorescence emission intensity (excitation = 295 nm; emission = 340 nm, 16 nm band-pass) at 25°C of a 20 nM anti-antigen antibody (Fab form) in PBS, pH 7.2, in the presence of increasing concentrations of antigen as
measured in a spectrometer, such as a stop-flow equipped spectrophotometer (Aviv Instruments) or a 8000-series SLM-AMINCO™ spectrophotometer (ThermoSpectronic) with a stirred cuvette.

2. Antibody Fragments

In certain embodiments, an antibody provided herein is an antibody fragment. Antibody fragments include, but are not limited to, Fab, Fab', F(ab')2, Fv, and scFv fragments, and other fragments described below. For a review of certain antibody fragments, see Hudson et al. Nat. Med. 9:129-134 (2003). For a review of scFv fragments, see, e.g., Pluckthun, in The Pharmacology of Monoclonal Antibodies, vol. 113, Rosenberg and Moore eds., (Springer-Verlag, New York), pp. 269-315 (1994); see also WO 93/16185; and U.S. Patent Nos. 5,571,894 and 5,587,458. For discussion of Fab and F(ab')2 fragments comprising salvage receptor binding epitope residues and having increased in vivo half-life, see U.S. Patent No. 5,869,046.

Diabodies are antibody fragments with two antigen-binding sites that may be bivalent or bispecific. See, for example, EP 404,097; WO 1993/01161; Hudson et al., Nat. Med. 9:129-134 (2003); and Hollinger et al., Proc. Natl. Acad. Sci. USA 90: 6444-6448 (1993). Triabodies and tetrabodies are also described in Hudson et al., Nat. Med. 9:129-134 (2003).

Single-domain antibodies are antibody fragments comprising all or a portion of the heavy chain variable domain or all or a portion of the light chain variable domain of an antibody. In certain embodiments, a single-domain antibody is a human single-domain antibody (Domantis, Inc., Waltham, MA; see, e.g., U.S. Patent No. 6,248,516 Bl).

Antibody fragments can be made by various techniques, including but not limited to proteolytic digestion of an intact antibody as well as production by recombinant host cells (e.g. E. coli or phage), as described herein.

3. Chimeric and Humanized Antibodies

In certain embodiments, an antibody provided herein is a chimeric antibody. Certain chimeric antibodies are described, e.g., in U.S. Patent No. 4,816,567; and Morrison et al., Proc. Natl. Acad. Sci. USA, 81:6851-6855 (1984)). In one example, a chimeric antibody comprises a non-human variable region (e.g., a variable region derived from a mouse, rat, hamster, rabbit, or non-human primate, such as a monkey) and a human constant region. In a further example, a chimeric antibody is a "class switched" antibody in which the class or subclass has been changed from that of the parent antibody. Chimeric antibodies include antigen-binding fragments thereof.

In certain embodiments, a chimeric antibody is a humanized antibody. Typically, a non-human antibody is humanized to reduce immunogenicity to humans, while retaining the specificity and affinity of the parental non-human antibody. Generally, a humanized antibody comprises one or
more variable domains in which HVRs, e.g., CDRs, (or portions thereof) are derived from a non-human antibody, and FRs (or portions thereof) are derived from human antibody sequences. A humanized antibody optionally will also comprise at least a portion of a human constant region. In some embodiments, some FR residues in a humanized antibody are substituted with corresponding residues from a non-human antibody (e.g., the antibody from which the HVR residues are derived), e.g., to restore or improve antibody specificity or affinity.

4. Human Antibodies

[0303] In certain embodiments, an antibody provided herein is a human antibody. Human antibodies can be produced using various techniques known in the art. Human antibodies are described generally in van Dijk and van de Winkel, Curr. Opin. Pharmacol. 5: 368-74 (2001) and Lonberg, Curr. Opin. Immunol. 20:450-459 (2008).

[0304] Human antibodies may be prepared by administering an immunogen to a transgenic animal that has been modified to produce intact human antibodies or intact antibodies with human variable regions in response to antigenic challenge. Such animals typically contain all or a portion of the human immunoglobulin loci, which replace the endogenous immunoglobulin loci, or which are present extrachromosomally or integrated randomly into the animal's chromosomes. In such transgenic mice, the endogenous immunoglobulin loci have generally been inactivated. For review of methods for obtaining human antibodies from transgenic animals, see Lonberg, Nat. Biotech.

5. Library-Derived Antibodies

In certain phage display methods, repertoires of VH and VL genes are separately cloned by polymerase chain reaction (PCR) and recombined randomly in phage libraries, which can then be screened for antigen-binding phage as described in Winter et al., *Ann. Rev. Immunol.*, 12: 433-455 (1994). Phage typically display antibody fragments, either as single-chain Fv (scFv) fragments or as Fab fragments. Libraries from immunized sources provide high-affinity antibodies to the immunogen without the requirement of constructing hybridomas. Alternatively, the naive repertoire can be cloned (e.g., from human) to provide a single source of antibodies to a wide range of non-self and also self antigens without any immunization as described by Griffiths et al., *EMBO J.*, 12: 725-734 (1993). Finally, naive libraries can also be made synthetically by cloning unrearranged V-gene segments from stem cells, and using PCR primers containing random sequence to encode the highly variable CDR3 regions and to accomplish rearrangement *in vitro*, as described by Hoogenboom and Winter, *J. Mol. Biol.*, 227: 381-388 (1992). Patent publications describing human antibody phage libraries include, for example: US Patent No. 5,750,373, and US Patent Publication Nos. 2005/0079574, 2005/0119455, 2005/0266000, 2007/0117126, 2007/0160598, 2007/0237764, 2007/0292936, and 2009/0002360.

Antibodies or antibody fragments isolated from human antibody libraries are considered human antibodies or human antibody fragments herein.

6. Multispecific Antibodies

In certain embodiments, an antibody provided herein is a multispecific antibody, e.g. a bispecific antibody. Multispecific antibodies are monoclonal antibodies that have binding specificities for at least two different sites. In certain embodiments, one of the binding specificities is for OX40 and the other is for any other antigen. In certain embodiments, bispecific antibodies may bind to two different epitopes of OX40. Bispecific antibodies may also be used to localize cytotoxic agents to cells which express OX40. Bispecific antibodies can be prepared as full length antibodies or antibody fragments.

[0312] Engineered antibodies with three or more functional antigen binding sites, including "Octopus antibodies," are also included herein (see, e.g. US 2006/0025576A1).

[0313] The antibody or fragment herein also includes a "Dual Acting FAb" or "DAF" comprising an antigen binding site that binds to OX40 as well as another, different antigen (see, US 2008/0069820, for example).

7. Antibody Variants

[0314] In certain embodiments, amino acid sequence variants of the antibodies provided herein are contemplated. For example, it may be desirable to improve the binding affinity and/or other biological properties of the antibody. Amino acid sequence variants of an antibody may be prepared by introducing appropriate modifications into the nucleotide sequence encoding the antibody, or by peptide synthesis. Such modifications include, for example, deletions from, and/or insertions into and/or substitutions of residues within the amino acid sequences of the antibody. Any combination of deletion, insertion, and substitution can be made to arrive at the final construct, provided that the final construct possesses the desired characteristics, e.g., antigen-binding.

a) Substitution, Insertion, and Deletion Variants

[0315] In certain embodiments, antibody variants having one or more amino acid substitutions are provided. Sites of interest for substitutional mutagenesis include the HVRs and FRs. Conservative substitutions are shown in Table A under the heading of "preferred substitutions." More substantial changes are provided in Table A under the heading of "exemplary substitutions," and as further described below in reference to amino acid side chain classes. Amino acid substitutions may be introduced into an antibody of interest and the products screened for a desired activity, e.g., retained/improved antigen binding, decreased immunogenicity, or improved ADCC or CDC.

[A0316] Amino acids may be grouped according to common side-chain properties:

1. hydrophobic: Norleucine, Met, Ala, Val, Leu, He;
2. neutral hydrophilic: Cys, Ser, Thr, Asn, Gin;
3. acidic: Asp, Glu;
4. basic: His, Lys, Arg;
5. residues that influence chain orientation: Gly, Pro;
6. aromatic: Trp, Tyr, Phe.

[A0317] Non-conservative substitutions will entail exchanging a member of one of these classes for another class.

[A0318] One type of substitutional variant involves substituting one or more hypervariable region residues of a parent antibody (e.g., a humanized or human antibody). Generally, the resulting variant(s) selected for further study will have modifications (e.g., improvements) in certain biological properties (e.g., increased affinity, reduced immunogenicity) relative to the parent antibody and/or will have substantially retained certain biological properties of the parent antibody. An exemplary substitutional variant is an affinity matured antibody, which may be conveniently generated, e.g., using phage display-based affinity maturation techniques such as those described herein. Briefly, one
or more HVR residues are mutated and the variant antibodies displayed on phage and screened for a particular biological activity (e.g. binding affinity).

[0319] Alterations (e.g., substitutions) may be made in HVRs, e.g., to improve antibody affinity. Such alterations may be made in HVR "hotspots," i.e., residues encoded by codons that undergo mutation at high frequency during the somatic maturation process (see, e.g., Chowdhury, Methods Mol. Biol. 207:179-196 (2008)), and/or residues that contact antigen, with the resulting variant VH or VL being tested for binding affinity. Affinity maturation by constructing and reselecting from secondary libraries has been described, e.g., in Hoogenboom et al. in Methods in Molecular Biology 178:1-37 (O'Brien et al., ed., Human Press, Totowa, NJ, (2001).) In some embodiments of affinity maturation, diversity is introduced into the variable genes chosen for maturation by any of a variety of methods (e.g., error-prone PCR, chain shuffling, or oligonucleotide-directed mutagenesis). A secondary library is then created. The library is then screened to identify any antibody variants with the desired affinity. Another method to introduce diversity involves HVR-directed approaches, in which several HVR residues (e.g., 4-6 residues at a time) are randomized. HVR residues involved in antigen binding may be specifically identified, e.g., using alanine scanning mutagenesis or modeling. CDR-H3 and CDR-L3 in particular are often targeted.

[0320] In certain embodiments, substitutions, insertions, or deletions may occur within one or more HVRs so long as such alterations do not substantially reduce the ability of the antibody to bind antigen. For example, conservative alterations (e.g., conservative substitutions as provided herein) that do not substantially reduce binding affinity may be made in HVRs. Such alterations may, for example, be outside of antigen contacting residues in the HVRs. In certain embodiments of the variant VH and VL sequences provided above, each HVR either is unaltered, or contains no more than one, two or three amino acid substitutions.

[0321] A useful method for identification of residues or regions of an antibody that may be targeted for mutagenesis is called "alanine scanning mutagenesis" as described by Cunningham and Wells (1989) Science, 244:1081-1085. In this method, a residue or group of target residues (e.g., charged residues such as arg, asp, his, lys, and glu) are identified and replaced by a neutral or negatively charged amino acid (e.g., alanine or polyalanine) to determine whether the interaction of the antibody with antigen is affected. Further substitutions may be introduced at the amino acid locations demonstrating functional sensitivity to the initial substitutions. Alternatively, or additionally, a crystal structure of an antigen-antibody complex to identify contact points between the antibody and antigen. Such contact residues and neighboring residues may be targeted or eliminated as candidates for substitution. Variants may be screened to determine whether they contain the desired properties.

[0322] Amino acid sequence insertions include amino- and/or carboxyl-terminal fusions ranging in length from one residue to polypeptides containing a hundred or more residues, as well as intrasequence insertions of single or multiple amino acid residues. Examples of terminal insertions
include an antibody with an N-terminal methionyl residue. Other insertional variants of the antibody molecule include the fusion to the N- or C-terminus of the antibody to an enzyme (e.g. for ADEPT) or a polypeptide which increases the serum half-life of the antibody.

b) Glycosylation variants

In certain embodiments, an antibody provided herein is altered to increase or decrease the extent to which the antibody is glycosylated. Addition or deletion of glycosylation sites to an antibody may be conveniently accomplished by altering the amino acid sequence such that one or more glycosylation sites is created or removed.

Where the antibody comprises an Fc region, the carbohydrate attached thereto may be altered. Native antibodies produced by mammalian cells typically comprise a branched, biantennary oligosaccharide that is generally attached by an N-linkage to Asn297 of the CH2 domain of the Fc region. See, e.g., Wright et al. TIBTECH 15:26-32 (1997). The oligosaccharide may include various carbohydrates, e.g., mannose, N-acetyl glucosamine (GlcNAc), galactose, and sialic acid, as well as a fucose attached to a GlcNAc in the "stem" of the biantennary oligosaccharide structure. In some embodiments, modifications of the oligosaccharide in an antibody of the invention may be made in order to create antibody variants with certain improved properties.

In one embodiment, antibody variants are provided having a carbohydrate structure that lacks fucose attached (directly or indirectly) to an Fc region. For example, the amount of fucose in such antibody may be from 1% to 80%, from 1% to 65%, from 5% to 65% or from 20% to 40%. The amount of fucose is determined by calculating the average amount of fucose within the sugar chain at Asn297, relative to the sum of all glycostructures attached to Asn 297 (e.g. complex, hybrid and high mannose structures) as measured by MALDI-TOF mass spectrometry, as described in WO 2008/077546, for example. Asn297 refers to the asparagine residue located at about position 297 in the Fc region (Eu numbering of Fc region residues); however, Asn297 may also be located about ±3 amino acids upstream or downstream of position 297, i.e., between positions 294 and 300, due to minor sequence variations in antibodies. Such fucosylation variants may have improved ADCC function. See, e.g., US Patent Publication Nos. US 2003/0157108 (Presta, L.); US 2004/0093621 (Kyowa Hakko Kogyo Co., Ltd.). Examples of publications related to "defucosylated" or "fucose-deficient" antibody variants include: US 2003/0157108; WO 2000/61739; WO 2001/29246; US 2003/0115614; US 2002/0164328; US 2004/0093621; US 2004/0132140; US 2004/0110704; US 2004/0110282; US 2004/0109865; WO 2003/085119; WO 2003/084570; WO 2005/035586; WO 2005/035778; WO2005/053742; WO2002/031140; Okazaki et al. / Mol. Biol. 336:1239-1249 (2004); Yamane-Ohnuki et al. Biotech. Bioeng. 87: 614 (2004). Examples of cell lines capable of producing defucosylated antibodies include Led 3 CHO cells deficient in protein fucosylation (Ripka et al. Arch. Biochem. Biophys. 249:533-545 (1986); US Pat Appl No US 2003/0157108 Al, Presta, L.;
and WO 2004/056312 Al, Adams et al., especially at Example 11), and knockout cell lines, such as alpha-1,6-fucosyltransferase gene, FUT8, knockout CHO cells (see, e.g., Yamane-Ohnuki et al. Biotech. Bioeng. 87: 614 (2004); Kanda, Y. et al., Biotechnol. Bioeng., 94(4):680-688 (2006); and WO2003/085107).

[0326] Antibodies variants are further provided with bisected oligosaccharides, e.g., in which a biantennary oligosaccharide attached to the Fc region of the antibody is bisected by GlcNAc. Such antibody variants may have reduced fucosylation and/or improved ADCC function. Examples of such antibody variants are described, e.g., in WO 2003/011878 (Jean-Mairet et al.); US Patent No. 6,602,684 (Umana et al.); and US 2005/0123546 (Umana et al.). Antibody variants with at least one galactose residue in the oligosaccharide attached to the Fc region are also provided. Such antibody variants may have improved CDC function. Such antibody variants are described, e.g., in WO 1997/30087 (Patel et al.); WO 1998/58964 (Raju, S.); and WO 1999/22764 (Raju, S.).

c) Fc region variants

[0327] In certain embodiments, one or more amino acid modifications may be introduced into the Fc region of an antibody provided herein, thereby generating an Fc region variant. The Fc region variant may comprise a human Fc region sequence (e.g., a human IgGl, IgG2, IgG3 or IgG4 Fc region) comprising an amino acid modification (e.g. a substitution) at one or more amino acid positions.

[0328] In certain embodiments, the invention contemplates an antibody variant that possesses some but not all effector functions, which make it a desirable candidate for applications in which the half life of the antibody in vivo is important yet certain effector functions (such as complement and ADCC) are unnecessary or deleterious. In vitro and/or in vivo cytotoxicity assays can be conducted to confirm the reduction/depletion of CDC and/or ADCC activities. For example, Fc receptor (FcR) binding assays can be conducted to ensure that the antibody lacks FcyR binding (hence likely lacking ADCC activity), but retains FcRn binding ability. The primary cells for mediating ADCC, NK cells, express FcRIII only, whereas monocytes express FcRI, FcRII and FcRIII. FcR expression on hematopoietic cells is summarized in Table 3 on page 464 of Ravetch and Kinet, Annu. Rev. Immunol. 9:457-492 (1991). Non-limiting examples of in vitro assays to assess ADCC activity of a molecule of interest is described in U.S. Patent No. 5,500,362 (see, e.g. Hellstrom, I. et al. Proc. Nat'l Acad. Sci. USA 83:7059-7063 (1986)) and Hellstrom, I et al., Proc. Nat'l Acad. Sci. USA 82:1499-1502 (1985); 5,821,337 (see Bruggemann, M. et al., J. Exp. Med. 166:1351-1361 (1987)). Alternatively, non-radioactive assays methods may be employed (see, for example, ACTI™ non-radioactive cytotoxicity assay for flow cytometry (CellTechnology, Inc. Mountain View, CA; and CytoTox 96® non-radioactive cytotoxicity assay (Promega, Madison, WI). Useful effector cells for such assays include peripheral blood mononuclear cells (PBMC) and Natural Killer (NK) cells. Alternatively, or
additionally, ADCC activity of the molecule of interest may be assessed in vivo, e.g., in a animal model such as that disclosed in Clynes et al. Proc. Nat’l Acad. Sci. USA 95:652-656 (1998). Clq binding assays may also be carried out to confirm that the antibody is unable to bind Clq and hence lacks CDC activity. See, e.g., Clq and C3c binding ELISA in WO 2006/029879 and WO 2005/100402. To assess complement activation, a CDC assay may be performed (see, for example, Gazzano-Santoro et al., J. Immunol. Methods 202:163 (1996); Cragg, M.S. et al., Blood 101:1045-1052 (2003); and Cragg, M.S. and M.J. Glennie, Blood 103:2738-2743 (2004)). FcRn binding and in vivo clearance/half life determinations can also be performed using methods known in the art (see, e.g., Petkova, S.B. et al., Int’l. Immunol. 18(12):1759-1769 (2006)).

0329 Antibodies with reduced effector function include those with substitution of one or more of Fc region residues 238, 265, 269, 270, 297, 327 and 329 (U.S. Patent No. 6,737,056). Such Fc mutants include Fc mutants with substitutions at two or more of amino acid positions 265, 269, 270, 297 and 327, including the so-called "DANA" Fc mutant with substitution of residues 265 and 297 to alanine (US Patent No. 7,332,581).

0330 Certain antibody variants with improved or diminished binding to FcRs are described.(See, e.g., U.S. Patent No. 6,737,056; WO 2004/056312, and Shields et al., J. Biol. Chem. 9(2): 6591-6604 (2001).)

0331 In certain embodiments, an antibody variant comprises an Fc region with one or more amino acid substitutions which improve ADCC, e.g., substitutions at positions 298, 333, and/or 334 of the Fc region (EU numbering of residues).

0332 In some embodiments, alterations are made in the Fc region that result in altered (i.e., either improved or diminished) Clq binding and/or Complement Dependent Cytotoxicity (CDC), e.g., as described in US Patent No. 6,194,551, WO 99/51642, and Idusogie et al. J. Immunol. 164: 4178-4184 (2000).

0333 Antibodies with increased half lives and improved binding to the neonatal Fc receptor (FcRn), which is responsible for the transfer of maternal IgGs to the fetus (Guyer et al., J. Immunol. 117:587 (1976) and Kim et al., J. Immunol. 24:249 (1994)), are described in US2005/0014934A1 (Hinton et al.). Those antibodies comprise an Fc region with one or more substitutions therein which improve binding of the Fc region to FcRn. Such Fc variants include those with substitutions at one or more of Fc region residues: 238, 256, 265, 272, 286, 303, 305, 307, 311, 312, 317, 340, 356, 360, 362, 376, 378, 380, 382, 413, 424 or 434, e.g., substitution of Fc region residue 434 (US Patent No. 7,371,826).

d) Cysteine engineered antibody variants

In certain embodiments, it may be desirable to create cysteine engineered antibodies, e.g., "thioMAbs," in which one or more residues of an antibody are substituted with cysteine residues. In particular embodiments, the substituted residues occur at accessible sites of the antibody. By substituting those residues with cysteine, reactive thiol groups are thereby positioned at accessible sites of the antibody and may be used to conjugate the antibody to other moieties, such as drug moieties or linker-drug moieties, to create an immunoconjugate, as described further herein. In certain embodiments, any one or more of the following residues may be substituted with cysteine: V205 (Kabat numbering) of the light chain; A118 (EU numbering) of the heavy chain; and S400 (EU numbering) of the heavy chain Fc region. Cysteine engineered antibodies may be generated as described, e.g., in U.S. Patent No. 7,521,541.

e) Antibody Derivatives

In certain embodiments, an antibody provided herein may be further modified to contain additional nonproteinaceous moieties that are known in the art and readily available. The moieties suitable for derivatization of the antibody include but are not limited to water soluble polymers. Non-limiting examples of water soluble polymers include but are not limited to, polyethylene glycol (PEG), copolymers of ethylene glycol/propylene glycol, carboxymethylcellulose, dextran, polyvinyl alcohol, polyvinyl pyrrolidone, poly-l, 3-dioxolane, poly-l,3,6-trioxane, ethylene/maleic anhydride copolymer, polyaminoacids (either homopolymers or random copolymers), and dextran or poly(n-vinyl pyrrolidone)polyethylene glycol, propylene glycol homopolymers, propylene oxide/ethylene oxide co-polymers, polyoxyethylated polyols (e.g., glycerol), polyvinyl alcohol, and mixtures thereof. Polyethylene glycol propionaldehyde may have advantages in manufacturing due to its stability in water. The polymer may be of any molecular weight, and may be branched or unbranched. The number of polymers attached to the antibody may vary, and if more than one polymer are attached, they can be the same or different molecules. In general, the number and/or type of polymers used for derivatization can be determined based on considerations including, but not limited to, the particular properties or functions of the antibody to be improved, whether the antibody derivative will be used in a therapy under defined conditions, etc.

In another embodiment, conjugates of an antibody and nonproteinaceous moiety that may be selectively heated by exposure to radiation are provided. In one embodiment, the nonproteinaceous moiety is a carbon nanotube (Kamet al., Proc. Natl. Acad. Sci. USA 102: 11600-11605 (2005)). The radiation may be of any wavelength, and includes, but is not limited to, wavelengths that do not harm ordinary cells, but which heat the nonproteinaceous moiety to a temperature at which cells proximal to the antibody-nonproteinaceous moiety are killed.
B. Recombinant Methods and Compositions

[0338] Antibodies may be produced using recombinant methods and compositions, e.g., as described in U.S. Patent No. 4,816,567. In one embodiment, isolated nucleic acid encoding an anti-OX40 antibody and/or anti-PD-L1 antibody described herein is provided. Such nucleic acid may encode an amino acid sequence comprising the VL and/or an amino acid sequence comprising the VH of the antibody (e.g., the light and/or heavy chains of the antibody). In a further embodiment, one or more vectors (e.g., expression vectors) comprising such nucleic acid are provided. In a further embodiment, a host cell comprising such nucleic acid is provided. In one such embodiment, a host cell comprises (e.g., has been transformed with): (1) a vector comprising a nucleic acid that encodes an amino acid sequence comprising the VL of the antibody and an amino acid sequence comprising the VH of the antibody, or (2) a first vector comprising a nucleic acid that encodes an amino acid sequence comprising the VL of the antibody and a second vector comprising a nucleic acid that encodes an amino acid sequence comprising the VH of the antibody. In one embodiment, the host cell is eukaryotic, e.g. a Chinese Hamster Ovary (CHO) cell or lymphoid cell (e.g., Y0, NSO, Sp20 cell). In one embodiment, a method of making an anti-OX40 antibody and/or anti-PD-L1 antibody is provided, wherein the method comprises culturing a host cell comprising a nucleic acid encoding the antibody, as provided above, under conditions suitable for expression of the antibody, and optionally recovering the antibody from the host cell (or host cell culture medium).

[0339] For recombinant production of an anti-OX40 antibody and/or anti-PD-L1 antibody, nucleic acid encoding an antibody, e.g., as described above, is isolated and inserted into one or more vectors for further cloning and/or expression in a host cell. Such nucleic acid may be readily isolated and sequenced using conventional procedures (e.g., by using oligonucleotide probes that are capable of binding specifically to genes encoding the heavy and light chains of the antibody).

[0340] Suitable host cells for cloning or expression of antibody-encoding vectors include prokaryotic or eukaryotic cells described herein. For example, antibodies may be produced in bacteria, in particular when glycosylation and Fc effector function are not needed. For expression of antibody fragments and polypeptides in bacteria, see, e.g., U.S. Patent Nos. 5,648,237, 5,789,199, and 5,840,523. (See also Charlton, Methods in Molecular Biology, Vol. 248 (B.K.C. Lo, ed., Humana Press, Totowa, NJ, 2003), pp. 245-254, describing expression of antibody fragments in E. coli.) After expression, the antibody may be isolated from the bacterial cell paste in a soluble fraction and can be further purified.

[0341] In addition to prokaryotes, eukaryotic microbes such as filamentous fungi or yeast are suitable cloning or expression hosts for antibody-encoding vectors, including fungi and yeast strains whose glycosylation pathways have been "humanized," resulting in the production of an antibody with a partially or fully human glycosylation pattern. See Gerngross, Nat. Biotech. 22:1409-1414 (2004), and Li et al., Nat. Biotech. 24:210-215 (2006).
Suitable host cells for the expression of glycosylated antibody are also derived from multicellular organisms (invertebrates and vertebrates). Examples of invertebrate cells include plant and insect cells. Numerous baculoviral strains have been identified which may be used in conjunction with insect cells, particularly for transfection of Spodoptera frugiperda cells.

Plant cell cultures can also be utilized as hosts. See, e.g., US Patent Nos. 5,959,177, 6,040,498, 6,420,548, 7,125,978, and 6,417,429 (describing PLANTIBODIES™ technology for producing antibodies in transgenic plants).

Vertebrate cells may also be used as hosts. For example, mammalian cell lines that are adapted to grow in suspension may be useful. Other examples of useful mammalian host cell lines are monkey kidney CV1 line transformed by SV40 (COS-7); human embryonic kidney line (293 or 293 cells as described, e.g., in Graham et al., J. Gen Virol. 36:59 (1977)); baby hamster kidney cells (BHK); mouse Sertoli cells (TM4 cells as described, e.g., in Mather, Biol. Reprod. 23:243-251 (1980)); monkey kidney cells (CV1); African green monkey kidney cells (VERO-76); human cervical carcinoma cells (HELA); canine kidney cells (MDCK); buffalo rat liver cells (BRL 3A); human lung cells (W138); human liver cells (Hep G2); mouse mammary tumor (MMT 060562); TRI cells, as described, e.g., in Mather et al., Annals N.Y. Acad. Sci. 383:44-68 (1982); MRC 5 cells; and FS4 cells. Other useful mammalian host cell lines include Chinese hamster ovary (CHO) cells, including DHFR CHO cells (Urlaub et al., Proc. Natl. Acad. Sci. USA 77:4216 (1980)); and myeloma cell lines such as Y0, NS0 and Sp2/0. For a review of certain mammalian host cell lines suitable for antibody production, see, e.g., Yazaki and Wu, Methods in Molecular Biology, Vol. 248 (B.K.C. Lo, ed., Humana Press, Totowa, NJ), pp. 255-268 (2003).

C. Assays

Anti-OX40 antibodies and/or anti-PDL1 antibodies provided herein may be identified, screened for, or characterized for their physical/chemical properties and/or biological activities by various assays known in the art.

1. Binding assays and other assays

In one aspect, an antibody of the invention is tested for its antigen binding activity, e.g., by known methods such as ELISA, Western blot, etc. OX40 or PDL1 binding may be determined using methods known in the art and exemplary methods are disclosed herein. In one embodiment, binding is measured using radioimmunoassay. In an exemplary radioimmunassay, OX40 antibody is iodinated, and competition reaction mixtures are prepared containing a fixed concentration of iodinated antibody and decreasing concentrations of serially diluted, unlabeled OZ X40 antibody. Cells expressing OX40 (e.g., BT474 cells stably transfected with human OX40) are added to the reaction mixture. Following
an incubation, cells are washed to separate the free iodinated OX40 antibody from the OX40 antibody bound to the cells. Level of bound iodinated OX40 antibody is determined, e.g., by counting radioactivity associated with cells, and binding affinity determined using standard methods. In another embodiment, ability of OX40 antibody to bind to surface-expressed OX40 (e.g., on T cell subsets) is assessed using flow cytometry. Peripheral white blood cells are obtained (e.g., from human, cynomolgus monkey, rat or mouse) and cells are blocked with serum. Labeled OX40 antibody is added in serial dilutions, and T cells are also stained to identify T cell subsets (using methods known in the art). Following incubation of the samples and washing, the cells are sorted using flow cytometer, and data analyzed using methods well known in the art. In another embodiment, OX40 binding may be analyzed using surface plasmon resonance. An exemplary surface plasmon resonance method is exemplified in the Examples.

[0347] In another aspect, competition assays may be used to identify an antibody that competes with any of the anti-OX40 antibodies disclosed herein for binding to OX40. In certain embodiments, such a competing antibody binds to the same epitope (e.g., a linear or a conformational epitope) that is bound by any of the anti-OX40 antibodies disclosed herein. Detailed exemplary methods for mapping an epitope to which an antibody binds are provided in Morris (1996) "Epitope Mapping Protocols," in *Methods in Molecular Biology* vol. 66 (Humana Press, Totowa, NJ). A competition assay is exemplified in the Examples.

[0348] In an exemplary competition assay, immobilized OX40 is incubated in a solution comprising a first labeled antibody that binds to OX40 (e.g., mab 1A7.gr.1, mab 3C8.gr5) and a second unlabeled antibody that is being tested for its ability to compete with the first antibody for binding to OX40. The second antibody may be present in a hybridoma supernatant. As a control, immobilized OX40 is incubated in a solution comprising the first labeled antibody but not the second unlabeled antibody. After incubation under conditions permissive for binding of the first antibody to OX40, excess unbound antibody is removed, and the amount of label associated with immobilized OX40 is measured. If the amount of label associated with immobilized OX40 is substantially reduced in the test sample relative to the control sample, then that indicates that the second antibody is competing with the first antibody for binding to OX40. See Harlow and Lane (1988) *Antibodies: A Laboratory Manual* ch.14 (Cold Spring Harbor Laboratory, Cold Spring Harbor, NY). It will be appreciated that similar techniques may be used to identify anti-PD1 antibodies.

2. Activity assays

[0349] In one aspect, assays are provided for identifying anti-OX40 antibodies thereof having biological activity. Biological activity may include, e.g., binding OX40 (e.g., binding human and/or cynomolgus OX40), increasing OX40-mediated signal transduction (e.g., increasing NFkB-mediated transcription), depleting cells that express human OX40 (e.g., T cells), depleting cells that express
human OX40 by ADCC and/or phagocytosis, enhancing T effector cell function (e.g., CD4+ effector T cell), e.g., by increasing effector T cell proliferation and/or increasing cytokine production (e.g., gamma interferon) by effector T cells, enhancing memory T cell function (e.g., CD4+ memory T cell), e.g., by increasing memory T cell proliferation and/or increasing cytokine production by memory T cells (e.g., gamma interferon), inhibiting regulatory T cell function (e.g., by decreasing Treg suppression of effector T cell function (e.g., CD4+ effector T cell function), binding human effector cells. Antibodies having such biological activity in vivo and/or in vitro are also provided.

In certain embodiments, an antibody of the invention is tested for such biological activity.

T cell costimulation may be assayed using methods known in the art and exemplary methods are disclosed herein. For example, T cells (e.g., memory or effector T cells) may be obtained from peripheral white blood cells (e.g., isolated from human whole blood using Ficoll gradient centrifugation). Memory T cells (e.g., CD4+ memory T cells) or effector T cells (e.g. CD4+ Teff cells) may be isolated from PBMC using methods known in the art. For example, the Miltenyi CD4+ memory T cell isolation kit or Miltenyi naïve CD4+ T cell isolation kit may be used. Isolated T cells are cultured in the presence of antigen presenting cells (e.g., irradiated L cells that express CD32 and CD80), and activated by addition of anti-CD3 antibody in the presence or absence of OX40 agonist antibody. Effect of agonist OX40 antibody on T cell proliferation may be measured using methods well known in the art. For example, the CellTiter Glo kit (Promega) may be used, and results read on a Multilabel Reader (Perkin Elmer). Effect of agonist OX40 antibody on T cell function may also be determined by analysis of cytokines produced by the T cell. In one embodiment, production of interferon gamma by CD4+ T cells is determined, e.g., by measurement of interferon gamma in cell culture supernatant. Methods for measuring interferon gamma are well-known in the art.

Treg cell function may be assayed using methods known in the art and exemplary methods are disclosed herein. In one example, the ability of Treg to suppress effector T cell proliferation is assayed. T cells are isolated from human whole blood using methods known in the art (e.g., isolating memory T cells or naïve T cells). Purified CD4+ naïve T cells are labeled (e.g., with CFSE) and purified Treg cells are labeled with a different reagent. Irradiated antigen presenting cells (e.g., L cells expressing CD32 and CD80) are co-cultured with the labeled purified naïve CD4+ T cells and purified Tregs. The co-cultures are activated using anti-CD3 antibody and tested in the presence or absence of agonist OX40 antibody. Following a suitable time (e.g., 6 days of coculture), level of CD4+ naïve T cell proliferation is tracked by dye dilution in reduced label staining (e.g., reduced CFSE label staining) using FACS analysis.

OX40 signaling may be assayed using methods well known in the art and exemplary methods are disclosed herein. In one embodiment, transgenic cells are generated that express human OX40 and a reporter gene comprising the NFkB promoter fused to a reporter gene (e.g., beta luciferase). Addition of OX40 agonist antibody to the cells results in increased NFkB transcription, which is detected using an assay for the reporter gene.
Phagocytosis may be assayed, e.g., by using monocyte-derived macrophages, or U937 cells (a human histiocytic lymphoma cells line with the morphology and characteristics of mature macrophages). OX40 expressing cells are added to the monocyte-derived macrophages or U937 cells in the presence or absence of anti-OX40 agonist antibody. Following culturing of the cells for a suitable period of time, the percentage of phagocytosis is determined by examining percentage of cells that double stain for markers of 1) the macrophage or U937 cell and 2) the OX40 expressing cell, and dividing this by the total number of cells that show markers of the OX40 expressing cell (e.g., GFP). Analysis may be done by flow cytometry. In another embodiment, analysis may be done by fluorescent microscopy analysis.

ADCC may be assayed, e.g., using methods well known in the art. Exemplary methods are described in the definition section and an exemplary assay is disclosed in the Examples. In some embodiments, level of OX40 is characterized on an OX40 expressing cell that is used for testing in an ADCC assay. The cell may be stained with a detectably labeled anti-OX40 antibody (e.g., PE labeled), then level of fluorescence determined using flow cytometry, and results presented as median fluorescence intensity (MFI). In another embodiment, ADCC may be analyzed by CellTiter Glo assay kit and cell viability/cytotoxicity may be determined by chemiluminescence.

The binding affinities of various antibodies to FcyRIA, FcyRIIA, FcyRIIB, and two allotypes of FcyRIIIA (F158 and V158) may be measured in ELISA-based ligand-binding assays using the respective recombinant Fey receptors. Purified human Fey receptors are expressed as fusion proteins containing the extracellular domain of the receptor γ chain linked to a Gly/6xHis/glutathione S-transferase (GST) polypeptide tag at the C-terminus. The binding affinities of antibodies to those human Fey receptors are assayed as follows. For the low-affinity receptors, i.e. FcyRIIA (CD32A), FcyRIIB (CD32B), and the two allotypes of FcyRIIIA (CD16), F-158 and V-158, antibodies may be tested as multimers by cross-linking with a F(ab')2 fragment of goat anti-human kappa chain (ICN Biomedical; Irvine, CA) at an approximate molar ratio of 1:3 antibody:cross-linking F(ab')2. Plates are coated with an anti-GST antibody (Genentech) and blocked with bovine serum albumin (BSA). After washing with phosphate-buffered saline (PBS) containing 0.05% Tween-20 with an ELx405™ plate washer (Biotek Instruments; Winooski, VT), Fey receptors are added to the plate at 25 ng/well and incubated at room temperature for 1 hour. After the plates are washed, serial dilutions of test antibodies are added as multimeric complexes and the plates were incubated at room temperature for 2 hours. Following plate washing to remove unbound antibodies, the antibodies bound to the Fey receptor are detected with horseradish peroxidase (HRP)-conjugated F(ab')2 fragment of goat anti-human F(ab')2 (Jackson ImmunoResearch Laboratories; West Grove, PA) followed by the addition of substrate, tetramethylbenzidine (TMB) (Kirkegaard & Perry Laboratories; Gaithersburg, MD). The plates are incubated at room temperature for 5-20 minutes, depending on the Fey receptors tested, to allow color development. The reaction is terminated with 1 M H₃PO₄ and absorbance at 450 nm was measured with a microplate reader (SpectraMax®190, Molecular Devices; Sunnyvale, CA). Dose-
response binding curves are generated by plotting the mean absorbance values from the duplicates of antibody dilutions against the concentrations of the antibody. Values for the effective concentration of the antibody at which 50% of the maximum response from binding to the Fey receptor is detected (EC_{50}) were determined after fitting the binding curve with a four-parameter equation using SoftMax Pro (Molecular Devices).

[0357] To select for antibodies which induce cell death, loss of membrane integrity as indicated by, e.g., propidium iodide (PI), trypan blue or 7AAD uptake may be assessed relative to control. A PI uptake assay can be performed in the absence of complement and immune effector cells. OX40 expressing cells are incubated with medium alone or medium containing of the appropriate monoclonal antibody at e.g., about IC_{50}/ml. The cells are incubated for a time period (e.g., 1 or 3 days). Following each treatment, cells are washed and aliquoted. In some embodiments, cells are aliquoted into 35 mm strainer-capped 12 x 75 tubes (1ml per tube, 3 tubes per treatment group) for removal of cell clumps. Tubes then receive PI (IC_{50}/ml). Samples may be analyzed using a FACSCAN™ flow cytometer and FACSCONVERT™ CellQuest software (Becton Dickinson).

[0358] Cells for use in any of the above in vitro assays include cells or cell lines that naturally express OX40 or that have been engineered to express OX40. Such cells include activated T cells, Treg cells and activated memory T cells that normally express OX40. Such cells also include cell lines that express OX40 and cell lines that do not normally express OX40 but have been transfected with nucleic acid encoding OX40. Exemplary cell lines provided herein for use in any of the above in vitro assays include transgenic BT474 cells (a human breast cancer cell line) that express human OX40.

[0359] Anti-PDL1 antibodies may be identified using methods known in the art (such as ELISA, Western Blot, biological activity assays, etc.). For example, for an anti-PDL1 antibody, the antigen binding properties of the antibody can be evaluated in an assay that detects the ability to bind to PDL1. In some embodiments, the binding of the antibody may be determined by saturation binding: ELISA; and/or competition assays (e.g. RIA’s), for example. Also, the antibody may be subjected to other biological activity assays, e.g., in order to evaluate its effectiveness as a therapeutic. Such assays are known in the art and depend on the target antigen and intended use for the antibody. For example, the biological effects of PD-L1 blockade by the antibody can be assessed in CD8+T cells, a lymphocytic choriomeningitis virus (LCMV) mouse model and/or a syngeneic tumor model e.g., as described in US Patent 8,217,149.

[0360] To screen for antibodies which bind to a particular epitope on the antigen of interest (e.g., those which block binding of the anti-PDL1 antibody of the example to PD-L1), a routine cross-blocking assay such as that described in Antibodies, A Laboratory Manual, Cold Spring Harbor Laboratory, Ed Harlow and David Lane (1988), can be performed. Alternatively, epitope mapping, e.g. as described in Champe et al., / Biol. Chem. 270:1388-1394 (1995), can be performed to determine whether the antibody binds an epitope of interest.
It is understood that any of the above assays may be carried out using an immunoconjugate of the invention in place of or in addition to an anti-OX40 antibody and/or anti-PDL1 antibody.

It is understood that any of the above assays may be carried out using anti-OX40 antibody and/or anti-PDL1 antibody and an additional therapeutic agent.

D. Immunoconjugates

The invention also provides immunoconjugates comprising an anti-OX40 antibody herein conjugated to one or more cytotoxic agents, such as chemotherapeutic agents or drugs, growth inhibitory agents, toxins (e.g., protein toxins, enzymatically active toxins of bacterial, fungal, plant, or animal origin, or fragments thereof), or radioactive isotopes.

In one embodiment, an immunoconjugate is an antibody-drug conjugate (ADC) in which an antibody is conjugated to one or more drugs, including but not limited to a maytansinoid (see U.S. Patent Nos. 5,208,020, 5,416,064 and European Patent EP 0 425 235 B1); an auristatin such as monomethylauristatin drug moieties DE and DF (MMAE and MMAB) (see U.S. Patent Nos. 5,635,483 and 5,780,588, and 7,498,298); a dolastatin; a calicheamicin or derivative thereof (see U.S. Patent Nos. 5,712,374, 5,714,586, 5,739,116, 5,767,285, 5,770,701, 5,770,710, 5,773,001, and 5,877,296; Hinman et al., Cancer Res. 53:3336-3342 (1993); and Lode et al., Cancer Res. 58:2925-2928 (1998)); an anthracycline such as daunomycin or doxorubicin (see Kratz et al., Current Med. Chem. 13:477-523 (2006); Jeffrey et al., Bioorganic & Med. Chem. Letters 16:358-362 (2006); Torgov et al., Bioconj. Chem. 16:717-721 (2005); Nagy et al., Proc. Natl. Acad. Sci. USA 97:829-834 (2000); Dubowchik et al., Bioorg. & Med. Chem. Letters 12:1529-1532 (2002); King et al., J. Med. Chem. 45:4336-4343 (2002); and U.S. Patent No. 6,630,579); methotrexate; vindesine; a taxane such as docetaxel, paclitaxel, larotaxel, tesetaxel, and ortataxel; a trichothecene; and CC1065.

In another embodiment, an immunoconjugate comprises an antibody as described herein conjugated to an enzymatically active toxin or fragment thereof, including but not limited to diphtheria A chain, nonbinding active fragments of diphtheria toxin, exotoxin A chain (from Pseudomonas aeruginosa), ricin A chain, abrin A chain, modeccin A chain, alpha-sarcin, Aleurites fordii proteins, dianthin proteins, Phytolaca americana proteins (PAPI, PAPII, and PAP-S), momordica charantia inhibitor, curcin, crotin, sapaonaria officinalis inhibitor, gelonin, mitogellin, restrictocin, phenomycin, enomycin, and the tricothecenes.

In another embodiment, an immunoconjugate comprises an antibody as described herein conjugated to a radioactive atom to form a radioconjugate. A variety of radioactive isotopes are available for the production of radioconjugates. Examples include At²¹¹, I¹³¹, I¹²⁵, Y⁹⁰, Re¹⁸⁶, Re¹⁸⁸, Sm¹⁵³, Bi²¹², Pb²¹², and radioactive isotopes of Lu. When the radioconjugate is used for detection, it may comprise a radioactive atom for scintigraphic studies, for example tc99m or 1123, or a spin...
label for nuclear magnetic resonance (NMR) imaging (also known as magnetic resonance imaging, MRI), such as iodine-123 again, iodine-131, indium-III, fluorine-19, carbon-13, nitrogen-15, oxygen-17, gadolinium, manganese or iron.

[0367] Conjugates of an antibody and cytotoxic agent may be made using a variety of bifunctional protein coupling agents such as N-succinimidyl-3-(2-pyridyldithio) propionate (SPDP), succinimidyl-4-(N-maleimidomethyl) cyclohexane-l-carboxylate (SMCC), iminothiolane (IT), bifunctional derivatives of imidoesters (such as dimethyl adipimide HCI), active esters (such as disuccinimidyl suberate), aldehydes (such as glutaraldehyde), bis-azido compounds (such as bis (p-azidobenzoyl) hexanedianime), bis-diazonium derivatives (such as bis-(p-diazioniumbenzoyl)-ethylenediamine), diisocyanates (such as toluene 2,6-diisocyanate), and bis-active fluorine compounds (such as 1,5-difluoro-2,4-dinitrobenzene). For example, a ricin immunotoxin can be prepared as described in Vitetta et al., Science 238:1098 (1987). Carbon-14-labeled 1-isothiocyanatobenzyl-3-methyldiethylene triaminepentaacetic acid (MX-DTPA) is an exemplary chelating agent for conjugation of radionucleotide to the antibody. See W094/1 1026. The linker may be a "cleavable linker" facilitating release of a cytotoxic drug in the cell. For example, an acid-labile linker, peptidase-sensitive linker, photolabile linker, dimethyl linker or disulfide-containing linker (Chari et al., Cancer Res. 52:127-131 (1992); U.S. Patent No. 5,208,020) may be used.

[0368] The immunoconjugates or ADCs herein expressly contemplate, but are not limited to such conjugates prepared with cross-linker reagents including, but not limited to, BMPS, EMCS, GMBS, HBVS, LC-SMCC, MBS, MPBH, SBAP, SIA, SIAB, SMCC, SMPB, SMPH, sulfo-EMCS, sulfo-GMBS, sulfo-KMUS, sulfo-MBS, sulfo-SIAB, sulfo-SMCC, and sulfo-SMPB, and SVSB (succinimidyl-(4-vinylsulfone)benzoate) which are commercially available (e.g., from Pierce Biotechnology, Inc., Rockford, IL, U.S.A).

E. Methods and Compositions for Diagnostics and Detection

[0369] In certain embodiments, any of the anti-OX40 antibodies provided herein is useful for detecting the presence of OX40 in a biological sample. The term "detecting" as used herein encompasses quantitative or qualitative detection. In certain embodiments, a biological sample comprises a cell or tissue, such as a sample of a tumor (e.g., NSCLC or breast tumor).

[0370] In one embodiment, an anti-OX40 antibody for use in a method of diagnosis or detection is provided. In a further aspect, a method of detecting the presence of OX40 in a biological sample is provided. In certain embodiments, the method comprises contacting the biological sample with an anti-OX40 antibody as described herein under conditions permissive for binding of the anti-OX40 antibody to OX40, and detecting whether a complex is formed between the anti-OX40 antibody and OX40. Such method may be an in vitro or in vivo method. In one embodiment, an anti-OX40
antibody is used to select subjects eligible for therapy with an anti-OX40 antibody, e.g. where OX40 is a biomarker for selection of patients.

[0371] In some embodiments, the anti-OX40 antibody for use in a method of diagnosis or detection is an anti-human OX40 antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:7. In some embodiments, the anti-OX40 antibody comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO:4; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:7. In some embodiments, the OX40 antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:7. In some embodiments, the antibody comprises a heavy chain variable domain (VH) sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% or 100% sequence identity to the amino acid sequence of SEQ ID NO: 180. In certain embodiments, a VH sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% identity contains substitutions (e.g., conservative substitutions), insertions, or deletions relative to the reference sequence, but an anti-human OX40 agonist antibody comprising that sequence retains the ability to bind to OX40. In certain embodiments, a total of 1 to 10 amino acids have been substituted, inserted and/or deleted in SEQ ID NO: 180. In certain embodiments, substitutions, insertions, or deletions occur in regions outside the HVRs (i.e., in the FRs). Optionally, the anti-human OX40 agonist antibody comprises the VH sequence in SEQ ID NO: 180, including post-translational modifications of that sequence. In a particular embodiment, the VH comprises one, two or three HVRs selected from: (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2, (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3, and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4. In some embodiments, the antibody comprises a light chain variable domain (VL) having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% sequence identity to the amino acid sequence of SEQ ID NO: 179. In certain embodiments, a VL sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% identity contains substitutions (e.g.,
conservative substitutions), insertions, or deletions relative to the reference sequence, but an anti-human OX40 agonist antibody comprising that sequence retains the ability to bind to OX40. In certain embodiments, a total of 1 to 10 amino acids have been substituted, inserted and/or deleted in SEQ ID NO: 179. In certain embodiments, the substitutions, insertions, or deletions occur in regions outside the HVRs (i.e., in the FRs). Optionally, the anti-human OX40 agonist antibody comprises the VL sequence in SEQ ID NO: 179, including post-translational modifications of that sequence. In a particular embodiment, the VL comprises one, two or three HVRs selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:31; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:7.

[0372] In some embodiments, the anti-OX40 antibody used in the method of diagnosis or detection is an anti-human OX40 antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:29; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:30; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:31; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:37; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:39; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:42. In some embodiments, the anti-OX40 antibody comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO:29, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO:30, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO:31; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO:37, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO:39, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:42. In some embodiments, the anti-OX40 antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:29; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:30; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:31; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:37; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:39; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:42. In some embodiment, the anti-OX40 antibody comprises a heavy chain variable domain (VH) sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99%, or 100% sequence identity to the amino acid sequence of SEQ ID NO: 182. In certain embodiments, a VH sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% identity contains substitutions (e.g., conservative substitutions), insertions, or deletions relative to the reference sequence, but an anti-human OX40 agonist antibody comprising that sequence retains the ability to bind to OX40. In certain embodiments, a total of 1 to 10 amino acids have been substituted, inserted and/or deleted in SEQ ID NO: 182. In certain embodiments, substitutions, insertions, or deletions occur in regions outside the HVRs (i.e., in the FRs). Optionally, the anti-human OX40 agonist antibody comprises the VH sequence in SEQ ID NO: 182, including post-
translational modifications of that sequence. In a particular embodiment, the VH comprises one, two or three HVRs selected from: (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:29, (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:30, and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:31. In some embodiments, the anti-OX40 antibody comprises a light chain variable domain (VL) having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99%, or 100% sequence identity to the amino acid sequence of SEQ ID NO:181. In certain embodiments, a VL sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% identity contains substitutions (e.g., conservative substitutions), insertions, or deletions relative to the reference sequence, but an anti-human OX40 agonist antibody comprising that sequence retains the ability to bind to OX40. In certain embodiments, a total of 1 to 10 amino acids have been substituted, inserted and/or deleted in SEQ ID NO: 181. In certain embodiments, the substitutions, insertions, or deletions occur in regions outside the HVRs (i.e., in the FRs). Optionally, the anti-human OX40 agonist antibody comprises the VL sequence in SEQ ID NO: 181, including post-translational modifications of that sequence. In a particular embodiment, the VL comprises one, two or three HVRs selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:37; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:39; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:42.

[0373] In some embodiments, the anti-OX40 antibody comprises a VH sequence of SEQ ID NO: 180. In some embodiments, the anti-OX40 antibody comprises a VL sequence of SEQ ID NO: 179. In some embodiments, the anti-OX40 antibody comprises a VH sequence of SEQ ID NO: 180 and a VL sequence of SEQ ID NO: 179. In some embodiments, the anti-OX40 antibody comprises a VH sequence of SEQ ID NO: 182. In some embodiments, the anti-OX40 antibody comprises a VL sequence of SEQ ID NO: 181. In some embodiments, the anti-OX40 antibody comprises a VH sequence of SEQ ID NO: 182 and a VL sequence of SEQ ID NO: 181.

[0374] Exemplary disorders that may be diagnosed using an antibody of the invention include cancer.

[0375] In certain embodiments, labeled anti-OX40 antibodies are provided. Labels include, but are not limited to, labels or moieties that are detected directly (such as fluorescent, chromophoric, electron-dense, chemiluminescent, and radioactive labels), as well as moieties, such as enzymes or ligands, that are detected indirectly, e.g., through an enzymatic reaction or molecular interaction. Exemplary labels include, but are not limited to, the radioisotopes 32P, 14C, 125I, 3H, and 131I, fluorophores such as rare earth chelates or fluorescein and its derivatives, rhodamine and its derivatives, dansyl, umbelliferone, luciferases, e.g., firefly luciferase and bacterial luciferase (U.S. Patent No. 4,737,456), luciferin, 2,3-dihydropthalazinediones, horseradish peroxidase (HRP), alkaline phosphatase, β-galactosidase, glucoamylase, lysozyme, saccharide oxidases, e.g., glucose oxidase, galactose oxidase, and glucose-6-phosphate dehydrogenase, heterocyclic oxidases such as uricase and xanthine oxidase, coupled with an enzyme that employs hydrogen peroxide to oxidize a
dye precursor such as HRP, lactoperoxidase, or microperoxidase, biotin/avidin, spin labels, bacteriophage labels, stable free radicals, and the like.

[0376] In one aspect, the invention provides diagnostic methods, e.g., for identifying a cancer patient who is likely to respond to treatment with an anti-human OX40 agonist antibody.

[0377] In some embodiments, methods are provided for identifying patients who are likely to respond to treatment with anti-human OX40 agonist antibody, the methods comprising (i) determining presence or absence or amount (e.g., number per given sample size) of cells expressing FcR in a sample of cancer from the patient, and (ii) identifying the patient as likely to respond if the sample comprises cells expressing FcR (e.g., high number of cells expressing FcR). Methods for detecting cells that express FcR are well known in the art, including, e.g., by IHC. In some embodiments, FcR is FcYR. In some embodiments, FcR is an activating FcYR. In some embodiments, the cancer is any cancer described herein. In some embodiments, the cancer is non-small cell lung cancer (NSCLC), glioblastoma, neuroblastoma, melanoma, breast carcinoma (e.g., triple-negative breast cancer), gastric cancer, colorectal cancer (CRC), or hepatocellular carcinoma. In some embodiments, the method is an in vitro method. In some embodiments, the methods further comprise (iii) recommending treatment with the anti-human OX40 agonist antibody (e.g., any of the anti-human OX40 agonist antibodies described herein). In some embodiments, the methods further comprise (iv) treating the patient with the anti-human OX40 agonist antibody.

[0378] In some embodiments, methods are provided for identifying patients who are likely to respond to treatment with anti-human OX40 agonist antibody, the methods comprising (i) determining presence or absence or amount (e.g., number per given sample size) of human effector cells (e.g., infiltrating effector cells) in a sample of cancer from the patient, and (ii) identifying the patient as likely to respond if the sample comprises effector cells (e.g., high number of effector cells). Methods for detecting infiltrating human effector cells are well known in the art, including, e.g., by IHC. In some embodiments, human effector cells are one or more of NK cells, macrophages, monocytes. In some embodiments, the effector cells express activating FcYR. In some embodiments, the method is an in vitro method. In some embodiments, the cancer is any cancer described herein. In some embodiments, the cancer is non-small cell lung cancer (NSCLC), glioblastoma, neuroblastoma, melanoma, breast carcinoma (e.g., triple-negative breast cancer), gastric cancer, colorectal cancer (CRC), or hepatocellular carcinoma. In some embodiments, the methods further comprise (iii) recommending treatment with the anti-human OX40 agonist antibody (e.g., any of the anti-human OX40 agonist antibodies described herein). In some embodiments, the methods further comprise (iv) treating the patient with the anti-human OX40 agonist antibody.

[0379] Provided are methods of providing a cancer diagnosis comprising: (i) measuring FcR expressing cells (e.g., the level or presence or absence of or prevalence (e.g., percentage of cells expressing FcR, e.g., by IHC) of FcR) in a sample from the patient; (ii) diagnosing the patient as having cancer comprising FcR biomarker (e.g., high FcR biomarker) when the sample has FcR
biomarker expression. In some embodiments, the method further comprises (iii) selecting a therapy comprising (a) anti-human OX40 agonist antibody or (b) recommending a therapy comprising anti-human OX40 agonist antibody for the patient. In some embodiments, the method is an in vitro method.

Provided are methods of providing a cancer diagnosis comprising: (i) measuring human effector cells (e.g., the level or presence or absence of or prevalence (e.g., percentage of human effector cells) of human effector cells) in a sample from the patient; (ii) diagnosing the patient as having cancer comprising human effector cells (e.g., high human effector cells) when the sample has human effector cell biomarker. In some embodiments, the method further comprises (iii) selecting a therapy comprising (a) anti-human OX40 agonist antibody or (b) recommending a therapy comprising anti-human OX40 agonist antibody for the patient. In some embodiments, the method is an in vitro method.

Provided are methods of recommending a treatment to a cancer patient comprising: (i) measuring FcR expressing cells (e.g., the level or presence or absence of or prevalence (e.g., percentage of cells expressing FcR) of FcR) in a sample from the patient; (ii) recommending treatment with an anti-human OX40 agonist antibody when the sample has FcR expressing cells (in some embodiments, high FcR expressing cells). In some embodiments, the method further comprises (iii) selecting a therapy comprising anti-human OX40 agonist antibody for the patient. In some embodiments, the method is an in vitro method.

Provided are methods of recommending a treatment to a cancer patient comprising: (i) measuring human effector cells (e.g., the level or presence or absence of or prevalence (e.g., percentage of human effector cells) of human effector cells) in a sample from the patient; (ii) recommending treatment with an anti-human OX40 agonist antibody when the sample has human effector cells (in some embodiments, high human effector cells). In some embodiments, the method further comprises (iii) selecting a therapy comprising anti-human OX40 agonist antibody for the patient. In some embodiments, the method is an in vitro method.

In some embodiments of any of the inventions provided herein, the sample is obtained prior to treatment with anti-human OX40 agonist antibody. In some embodiments, the sample is obtained prior to treatment with a cancer medicament. In some embodiments, the sample is obtained after the cancer has metastasized. In some embodiments, the sample is formalin fixed and paraffin embedded (FFPE). In some embodiments, the sample is of a biopsy (e.g., a core biopsy), a surgical specimen (e.g., a specimen from a surgical resection), or a fine needle aspirate.

F. Pharmaceutical Formulations

108
Pharmaceutical formulations of an anti-OX40 antibody as described herein are prepared by mixing such antibody having the desired degree of purity with one or more optional pharmaceutically acceptable carriers (Remington's Pharmaceutical Sciences 16th edition, Osol, A. Ed. (1980)), in the form of lyophilized formulations or aqueous solutions. Pharmaceutically acceptable carriers are generally nontoxic to recipients at the dosages and concentrations employed, and include, but are not limited to: buffers such as phosphate, citrate, and other organic acids; antioxidants including ascorbic acid and methionine; preservatives (such as octadecyldimethylbenzyl ammonium chloride; hexamethonium chloride; benzalkonium chloride; benzethonium chloride; phenol, butyl or benzyl alcohol; alkyl parabens such as methyl or propyl paraben; catechol; resorcinol; cyclohexanol; 3-pentanol; and m-cresol); low molecular weight (less than about 10 residues) polypeptides; proteins, such as serum albumin, gelatin, or immunoglobulins; hydrophilic polymers such as polyvinylpyrrolidone; amino acids such as glycine, glutamine, asparagine, histidine, arginine, or lysine; monosaccharides, disaccharides, and other carbohydrates including glucose, mannose, or dextrins; chelating agents such as EDTA; sugars such as sucrose, mannitol, trehalose or sorbitol; salt-forming counter-ions such as sodium; metal complexes (e.g. Zn-protein complexes); and/or non-ionic surfactants such as polyethylene glycol (PEG). Exemplary pharmaceutically acceptable carriers herein further include interstitial drug dispersion agents such as soluble neutral-active hyaluronidase glycoproteins (sHASEGP), for example, human soluble PH-20 hyaluronidase glycoproteins, such as rHuPH20 (HYLENEX®, Baxter International, Inc.). Certain exemplary sHASEGPs and methods of use, including rHuPH20, are described in US Patent Publication Nos. 2005/0260186 and 2006/0104968. In one aspect, a sHASEGP is combined with one or more additional glycosaminoglycanases such as chondroitinases.

In some embodiments, a "histidine buffer" is a buffer comprising histidine ions. Examples of histidine buffers include histidine chloride, histidine acetate, histidine phosphate, histidine sulfate. The preferred histidine buffer identified in the examples herein was found to be histidine acetate. In the preferred embodiment, the histidine acetate buffer is prepared by titrating L-histidine (free base, solid) with acetic acid (liquid). In some embodiments, the histidine buffer or histidine-acetate buffer is at pH 5.0 to 6.0, in some embodiments, pH 5.3 to 5.8.

In some embodiments, a "saccharide" herein comprises the general composition (CH2)n and derivatives thereof, including monosaccharides, disaccharides, trisaccharides, polysaccharides, sugar alcohols, reducing sugars, nonreducing sugars, etc. Examples of saccharides herein include glucose, sucrose, trehalose, lactose, fructose, maltose, dextran, glycerin, dextran, erythritol, glycerol, arabinol, sylitol, sorbitol, mannitol, mellibiose, melezitose, raffinose, mannotriose, stachyose, maltose, lactulose, maltulose, glucitol, maltitol, lactitol, iso-maltulose, etc. In some embodiments, the saccharide is a nonreducing disaccharide, such as trehalose or sucrose.

In some embodiments herein, a "surfactant" refers to a surface-active agent, preferably a nonionic surfactant. Examples of surfactants herein include polysorbate (for example, polysorbate 20
and polysorbate 80; poloxamer (e.g. poloxamer 188); Triton; sodium dodecyl sulfate (SDS); sodium laurel sulfate; sodium octyl glycoside; lauryl-, myristyl-, linoleyl-, or stearyl-sulfobetaine; lauryl-, myristyl-, linoleyl- or stearyl-sarcosine; linoleyl-, myristyl-, or cetyl-betaine; lauroamidopropyl-, cocamidopropyl-, linoleamidopropyl-, myristamidopropyl-, palmidopropyl-, or isostearamidopropyl-betaine (e.g. lauroamidopropyl); myristamidopropyl-, palmidopropyl-, or isostearamidopropyl-dimethylamine; sodium methyl cocoyl-, or disodium methyl oleyl-taurate; and the MONAQUAT™ series (Mona Industries, Inc., Paterson, New Jersey); polyethyl glycol, polypropyl glycol, and copolymers of ethylene and propylene glycol (e.g. Pluronics, PF68 etc); etc. In some embodiments, the surfactant is polysorbate 20. In some embodiments, the surfactant is polysorbate 80.

Exemplary lyophilized antibody formulations are described in US Patent No. 6,267,958. Aqueous antibody formulations include those described in US Patent No. 6,171,586 and WO2006/044908, the latter formulations including a histidine-acetate buffer.

The formulation herein may also contain more than one active ingredients as necessary for the particular indication being treated, preferably those with complementary activities that do not adversely affect each other. For example, it may be desirable to further provide an additional medicament (examples of which are provided herein). Such active ingredients are suitably present in combination in amounts that are effective for the purpose intended.

Active ingredients may be entrapped in microcapsules prepared, for example, by coacervation techniques or by interfacial polymerization, for example, hydroxyethylcellulose or gelatin-microcapsules and poly-(methylmethacrylate) microcapsules, respectively, in colloidal drug delivery systems (for example, liposomes, albumin microspheres, microemulsions, nano-particles and nanocapsules) or in macroemulsions. Such techniques are disclosed in Remington's Pharmaceutical Sciences 16th edition, Osol, A. Ed. (1980).

Sustained-release preparations may be prepared. Suitable examples of sustained-release preparations include semipermeable matrices of solid hydrophobic polymers containing the antibody, which matrices are in the form of shaped articles, e.g. films, or microcapsules.

The formulations to be used for in vivo administration are generally sterile. Sterility may be readily accomplished, e.g., by filtration through sterile filtration membranes.

In some embodiments, provided herein are pharmaceutical formulations comprising: (a) any of the anti-human OX40 agonist antibodies described herein; (b) a histidine buffer at pH 5.0-6.0.

In some embodiments, provided herein are pharmaceutical formulations comprising: (a) any of the anti-human OX40 agonist antibodies described herein; (b) a histidine buffer at pH 5.0-6.0; (c) a saccharide; and (d) a surfactant.

In some embodiments of any of the formulations, the anti-human OX40 agonist antibody is present at a concentration between about 10 mg/mL and about 100 mg/mL (e.g. about 15 mg/mL, 18 mg/mL, 20 mg/mL, 60 mg/mL, and 75 mg/mL). In some embodiments, the anti-human OX40 agonist antibody is present at a concentration of about 20 mg/mL. In some embodiments, the anti-human
OX40 agonist antibody is present at a concentration of about 50 mg/mL. In some embodiments, the anti-human OX40 agonist antibody is present at a concentration of about 60 mg/mL. In some embodiments, the anti-human OX40 agonist antibody is present at a concentration of about 70 mg/mL.

In some embodiments of any of the formulations, the saccharide is present at a concentration of about 75 mM to about 360 mM (e.g., about 100 mM, about 120 mM, about 240 mM, about 320 mM to about 360 mM). In some embodiments, the saccharide is present at a concentration of about 120 mM. In some embodiments, the saccharide is present at a concentration of about 240 mM. In some embodiments, the saccharide is present at a concentration of about 320 mM. In some embodiments, the saccharide is a disaccharide. In some embodiments, the disaccharide is trehalose. In some embodiments, the disaccharide is sucrose.

In some embodiments of any of the formulations, the histidine buffer is at a concentration of about 1 mM to about 50 mM (e.g., about 1 mM to about 25 mM). In some embodiments, the histidine buffer is at a concentration of about 10 mM. In some embodiments, the histidine buffer is at a concentration of about 20 mM. In some embodiments, the histidine buffer is at a concentration of about 30 mM. In some embodiments, the histidine buffer is histidine acetate.

In some embodiments of any of the formulations, the surfactant is polysorbate (e.g., polysorbate 20 or polysorbate 40), poloxamer (e.g., poloxamer 188); Triton; sodium dodecyl sulfate (SDS); sodium laurel sulfate; or sodium octyl glycoside.

In some embodiments of any of the formulations, the surfactant is polysorbate. In some embodiments, the polysorbate is present at a concentration of about 0.005% to about 0.1%. In some embodiments, the polysorbate is present at a concentration of about 0.005%. In some embodiments, the polysorbate is present at a concentration of about 0.02%. In some embodiments, the polysorbate is present at a concentration of about 0.04%. In some embodiments, the polysorbate is present at a concentration of about 0.06%. In some embodiments, the polysorbate is polysorbate 20. In some embodiments, the polysorbate is polysorbate 80.

In some embodiments of any of the formulations, the formulation is diluted with a diluent (e.g., 0.9% NaCl). In some embodiments, the anti-human OX40 agonist antibody is present at a concentration of about 1 mg/mL.

In particular, provided herein are pharmaceutical formulations comprising (a) any of the anti-human OX40 agonist antibodies described herein, (b) a polysorbate, wherein the polysorbate concentration is about 0.005% to about 0.1%; and (c) a histidine buffer (e.g., a histidine buffer at pH between 5.0 and 6.0).

In some embodiments, the pharmaceutical formulation comprises (a) any of the anti-human OX40 agonist antibodies described herein (e.g., at a concentration between about 10 mg/mL and about 100 mg/mL), (b) a polysorbate, wherein the polysorbate concentration is about 0.02% to about 0.06%; (c) a histidine buffer (e.g., a histidine buffer at pH 5.0 to 6.0); and a saccharide, wherein the
saccharide concentration is about 120 mM to about 320 mM. In some embodiments, the saccharide is sucrose.

[0403] In some embodiments, the pharmaceutical formulation comprises (a) any of the anti-human OX40 agonist antibodies described herein at a concentration between about 10 mg/mL and about 100 mg/mL, (b) a polysorbate, wherein the polysorbate concentration is about 0.02% to about 0.06%, wherein the polysorbate is polysorbate 20 or polysorbate 40; (c) a histidine acetate buffer at pH 5.0 to 6.0; and (d) sucrose, wherein the sucrose concentration is about 120 mM to about 320 mM.

[0404] In some embodiments, the pharmaceutical formulation comprises (a) any of the anti-human OX40 agonist antibodies described herein, (b) polysorbate 20, wherein the polysorbate concentration is about 0.02% to about 0.06%; (c) a histidine acetate buffer (e.g., a histidine acetate buffer at pH 5.0 to 6.0); and (d) sucrose, wherein the sucrose concentration is about 120 mM to about 320 mM.

[0405] In some embodiments, the pharmaceutical formulation comprises (a) any of the anti-human OX40 agonist antibodies described herein, (b) polysorbate 40, wherein the polysorbate concentration is about 0.02% to about 0.06%; (c) a histidine acetate buffer (e.g., a histidine acetate buffer at a pH between 5.0 and 6.0); and sucrose, wherein the sucrose concentration is about 120 mM to about 320 mM.

[0406] In some embodiments, the pharmaceutical formulation comprises (a) any of the anti-human OX40 agonist antibodies described herein, (b) polysorbate 20, wherein the polysorbate concentration is about 0.02%; (c) a histidine acetate buffer at pH 6.0; and (d) sucrose, wherein the sucrose concentration is about 320 mM.

[0407] In some embodiments, the pharmaceutical formulation comprises (a) any of the anti-human OX40 agonist antibodies described herein, (b) polysorbate 20, wherein the polysorbate concentration is about 0.02%; (c) a histidine acetate buffer at pH 5.5; and (d) sucrose, wherein the sucrose concentration is about 240 mM.

[0408] In some embodiments, the pharmaceutical formulation comprises (a) any of the anti-human OX40 agonist antibodies described herein, (b) polysorbate 20, wherein the polysorbate concentration is about 0.04%; (c) a histidine acetate buffer at pH 6.0; and (d) sucrose, wherein the sucrose concentration is about 120 mM.

[0409] In some embodiments, the pharmaceutical formulation comprises (a) any of the anti-human OX40 agonist antibodies described herein, (b) polysorbate 40, wherein the polysorbate concentration is about 0.04%; (c) a histidine acetate buffer at pH 5.0; and (d) sucrose, wherein the sucrose concentration is about 240 mM.

[0410] In some embodiments, the pharmaceutical formulation comprises (a) any of the anti-human OX40 agonist antibodies described herein, (b) polysorbate 40, wherein the polysorbate concentration is about 0.04%; (c) a histidine acetate buffer at pH 6.0; and (d) sucrose, wherein the sucrose concentration is about 120 mM.
In some embodiments, the pharmaceutical formulation is a liquid pharmaceutical formulation. In some embodiments, the pharmaceutical formulation is a stable pharmaceutical formulation. In some embodiments, the pharmaceutical formulation is a stable liquid pharmaceutical formulation.

In some embodiments of any of the pharmaceutical formulations described herein, the saccharide is human lactulose, nonreducing monosaccharides, trisaccharides, disaccharides, etc.

The pharmaceutical formulation preferably comprises a polysorbate. The polysorbate is generally included in an amount which reduces aggregate formation (such as that which occurs upon shaking or shipping). Examples of polysorbate include, but are not limited to, polysorbate 20 (polyoxyethylene (20) sorbitan monolaurate), polysorbate 40 (polyoxyethylene (20) sorbitan monopalmitate), polysorbate 60 (polyoxyethylene (20) sorbitan monostearate), and/or polysorbate 80 (polyoxyethylene (20) sorbitan monooleate). In some embodiments, the polysorbate is polysorbate 20 (polyoxyethylene (20) sorbitan monolaurate). In some embodiments of any of the pharmaceutical formulations described herein, the polysorbate concentration is sufficient to minimize aggregation and/or maintain stability upon long term storage and/or during administration (e.g. , after dilution in an IV bag). In some embodiments, the polysorbate concentration is about 0.005% w/v, about 0.02% w/v, about 0.04% w/v and less than about 0.1% w/v. In some embodiments, the polysorbate concentration is greater than 0.01% w/v and less than about 0.1% w/v. In some embodiments, the polysorbate concentration is about any of 0.005% w/v, about 0.02% w/v, 0.03% w/v, 0.04% w/v, or 0.05% w/v. In some embodiments, the polysorbate is present at a concentration of about 0.04% w/v. In some embodiments, the polysorbate is present at a concentration of about 0.02% w/v.

The pharmaceutical formulation preferably comprises a saccharide. Saccharides include monosaccharides, disaccharides, trisaccharides, polysaccharides, sugar alcohols, reducing sugars, nonreducing sugars, etc. Further examples of saccharides include, but are not limited to, glucose, sucrose, trehalose, lactose, fructose, maltose, dextan, glycerin, dextan, erythritol, glycerol, arabinol, sylitol, sorbitol, mannitol, mellibiose, melezitose, raffinose, mannitolose, stachyose, maltose, lactulose, maltulose, glucitol, maltitol, lactitol, iso-maltulose, etc. In some embodiments, the saccharide is a disaccharide. In some embodiments, the saccharide is a nonreducing disaccharide. In some embodiments, the saccharide is trehalose.

The saccharide is generally included in an amount which reduces aggregate formation. In some embodiments of any of the pharmaceutical formulations described herein, the saccharide is
present at a concentration of between about any of 50 mM to 250 mM, 75 mM to 200 mM, 75 mM to 150 mM, 100 mM to 150 mM, or 110 mM to 130 mM, or 100 mM to 320 mM, or 240 mM to 320 mM, or 240 mM to 400 mM. In some embodiments, the saccharide is present at a concentration greater than about any of 50 mM, 75 mM, 100 mM, 110 mM, or 115 mM. In some embodiments, the saccharide is present at a concentration of about any of 100 mM, 110 mM, 120 mM, 130 mM, or 140 mM. In some embodiments, the saccharide is present at a concentration of about 120 mM. In some embodiments of any of the formulations, the saccharide is present at a concentration of about 75 mM to about 360 mM (e.g., about 100 mM, about 120 mM, about 240 mM, about 320 mM to about 360 mM). In some embodiments, the saccharide is present at a concentration of about 240 mM. In some embodiments, the saccharide is present at a concentration of about 320 mM.

The pharmaceutical formulation preferably comprises a histidine buffer. Examples of histidine buffers include, but are not limited to, histidine chloride, histidine succinate, histidine acetate, histidine phosphate, histidine sulfate. In some embodiments, the histidine buffer is histidine acetate. In some embodiments of any of the pharmaceutical formulations described herein, the histidine buffer concentration is between about any of 1 mM to 50 mM, 1 mM to 35 mM, 1 mM to 25 mM, 1 mM to 20 mM, 7.5 mM to 12.5 mM, or 5 mM to 15 mM, 20 mM to 30 mM, 25 mM to 35 mM. In some embodiments, the histidine buffer concentration is about any of 5 mM, 7.5 mM, 10 mM, 12.5 mM, 15 mM, 20 mM, 25 mM, 30 mM, 35 mM or 40 mM. In some embodiments, the histidine buffer concentration is about 10 mM. In some embodiments, the histidine buffer concentration is about 20 mM. In some embodiments, the histidine buffer concentration is about 30 mM. In some embodiments, the histidine buffer concentration is about 40 mM. In some embodiments of any of the pharmaceutical formulations described herein, the histidine buffer is at a pH of between pH 5.0 and 6.0, for example, about any of pH 5.0, pH 5.1, pH 5.2, pH 5.3, pH 5.4, pH 5.5, pH 5.6, pH 5.7, pH 5.8, pH 5.9 or pH 6.0. In some embodiments, the pH is between pH 4.9 to pH 6.3.

The pharmaceutical formulation herein may also contain more than one active compound as necessary for the particular indication being treated, preferably those with complementary activities that do not adversely affect each other. Such molecules are suitably present in combination in amounts that are effective for the purpose intended.

Further, provided herein are vials and methods of filing a vial comprising a pharmaceutical formulation described herein. In some embodiments, the pharmaceutical formulation is provided inside a vial with a stopper pierceable by a syringe, preferably in aqueous form. The vial is desirably stored at about 2-8°C as well as up to 30°C for 24 hours until it is administered to a subject in need thereof. The vial may for example be a 15 cc vial (for example for a 200 mg dose).

The pharmaceutical formulation for administration is preferably a liquid formulation (not lyophilized) and has not been subjected to prior lyophilization. While the pharmaceutical formulation may be lyophilized, preferably it is not. In some embodiments of any of the pharmaceutical formulations, the pharmaceutical formulation, the pharmaceutical formulation is a lyophilized
pharmaceutical formulation. In some embodiments, the pharmaceutical formulation is a liquid formulation. In some embodiments, the pharmaceutical formulation does not contain a tonicifying amount of a salt such as sodium chloride. In some embodiments of any of the pharmaceutical formulations, the pharmaceutical formulation is diluted.

G. Therapeutic Methods and Compositions

[0420] Any of the anti-human OX40 antibodies and anti-PDL1 antibodies provided herein may be used in therapeutic methods. For example, in certain aspects, the invention provides methods of treating or delaying progression of cancer in an individual by administering to the individual a dose of an anti-human OX40 agonist antibody of the present disclosure and a dose of an anti-PDL1 antibody of the present disclosure. In some embodiments, the dose(s) of the anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be part of a pharmaceutical formulation. In some embodiments, the anti-human OX40 agonist antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:7. In certain embodiments, the anti-human OX40 agonist antibody is MOXR0916 (IA7.grl IgG1). In some embodiments, the anti-PDL1 antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 196; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 197; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 198; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 199; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:200; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:201. In certain embodiments, the anti-PDL1 antibody is MPDL3280A.

[0421] In some embodiments, the dose may be between about 0.5mg and about 1500mg of the anti-human OX40 agonist antibody. For example, the dose of the anti-human OX40 agonist antibody may be between about 0.5mg and about 1500mg, between about 0.5mg and about 1400mg, between about 0.5mg and about 1200mg, between about 0.5mg and about 1000mg, between about 0.5mg and about 800mg, between about 0.5mg and about 600mg, between about 0.5mg and about 500mg, between about 0.5mg and about 400mg, between about 0.5mg and about 200mg, between about 0.5mg and about 150mg, between about 0.5mg and about 100mg, between about 0.5mg and about 50mg, between about 0.5mg and about 25mg, between about 0.5mg and about 15mg, between about 0.5mg and about 10mg, between about 0.5mg and about 5mg, or between about 0.5mg and about 1mg. In some embodiments, the dose is less than about any of the following doses (in mg): 1500, 1400, 1200, 1000, 800, 600, 500, 400, 200, 150, 100, 50, 25, 15, 10, 5, or 1. In some embodiments,
the dose is greater than about any of the following doses (in mg): 0.5, 0.8, 1.5, 10, 15, 25, 50, 100, 150, 200, 400, 500, 600, 800, 1000, 1200, or 1400. That is, the dose can be any of a range of doses (in mg) having an upper limit of 1500, 1400, 1200, 1000, 800, 600, 500, 400, 200, 150, 100, 50, 25, 15, 10, 5, or 1 and an independently selected lower limit of 0.5, 0.8, 1.5, 10, 15, 25, 50, 100, 150, 200, 400, 500, 600, 800, 1000, 1200, or 1400, wherein the lower limit is less than the upper limit.

[0422] In some embodiments, the anti-human OX40 agonist antibody dose is selected from about 0.8mg, about 3.2mg, about 12mg, about 40mg, about 80mg, about 130mg, about 160mg, about 300mg, about 320mg, about 400mg, about 600mg, and about 1200mg, e.g., per administration. In certain embodiments, the anti-human OX40 agonist antibody dose is about 300mg. In certain embodiments, the anti-human OX40 agonist antibody dose is selected from 0.8mg, 3.2mg, 12mg, 40mg, 80mg, 130mg, 160mg, 300mg, 320mg, 400mg, 600mg, and 1200mg. In certain embodiments, the anti-human OX40 agonist antibody dose is 300mg.

[0423] In some embodiments, the anti-human OX40 agonist antibody dose is selected from about 0.5mg, about 2mg, about 8mg, about 27mg, about 53mg, about 87mg, about 107mg, about 200mg, about 213mg, about 267mg, about 400mg, and about 800mg, e.g., per administration. In certain embodiments, the anti-human OX40 agonist antibody dose is selected from 0.5mg, 2mg, 8mg, 27mg, 53mg, 87mg, 107mg, 200mg, 213mg, 267mg, 400mg, and 800mg.

[0424] In some embodiments, the administration of the anti-human OX40 agonist antibody may be repeated at one or more additional doses. In some embodiments, each dose of the one or more additional doses is selected from about 0.8mg, about 3.2mg, about 12mg, about 40mg, about 80mg, about 130mg, about 160mg, about 300mg, about 320mg, about 400mg, about 600mg, and about 1200mg, e.g., per administration. In some embodiments, each dose of the one or more additional doses is about 300mg.

[0425] The administration of the anti-human OX40 agonist antibody may be adjusted, e.g., based on the dosing cycle. In some embodiments, the anti-human OX40 agonist antibody dose is selected from about 0.8mg, about 3.2mg, about 12mg, about 40mg, about 80mg, about 130mg, about 160mg, about 300mg, about 320mg, about 400mg, about 600mg, and about 1200mg, e.g., per administration, and the anti-human OX40 agonist antibody may be administered at an interval of about 3 weeks or about 21 days between each administration. In some embodiments, the anti-human OX40 agonist antibody dose is selected from about 0.5mg, about 2mg, about 8mg, about 27mg, about 53mg, about 87mg, about 107mg, about 200mg, about 213mg, about 267mg, about 400mg, and about 800mg, e.g., per administration, and the anti-human OX40 agonist antibody may be administered at an interval of about 2 weeks or about 14 days between each administration. In some embodiments, the dosing interval for the anti-human OX40 agonist antibody may be adjusted, e.g., to match a dosing interval or protocol of a concomitant therapeutic agent or protocol (e.g., a 2-week dosing interval for FOLFOX).

[0426] In some embodiments, 1-10 additional doses of the anti-human OX40 agonist antibody are administered, e.g., in repeated administration as described above. For example, in some
embodiments, 1, 2, 3, 4, 5, 6, 7, 8, 9, or 10 additional doses of the anti-human OX40 agonist antibody may be administered.

[0427] In some embodiments, each dose of the anti-human OX40 agonist antibody administered to the individual may be the same. In other embodiments, each dose of the anti-human OX40 agonist antibody administered to the individual is not the same. Dosing may be modified as described herein, *e.g.*, based on efficacy, toxicity, adverse events, progression, PD, PK, an effect of a second therapeutic agent (*e.g.*, an anti-PDL1 antibody), and so forth.

[0428] Any effective dose known in the art for an anti-PDL1 antibody may be used. In some embodiments, the anti-PDL1 antibody is administered at a dose of about 800mg or about 1200mg. The administration of the anti-PDL1 may be adjusted, *e.g.*, based on the dosing cycle. For example, in certain embodiments, the anti-PDL1 antibody is administered at a dose of 800mg every 2 weeks. Similarly, in certain embodiments, the anti-PDL1 antibody is administered at a dose of 1200mg every 3 weeks.

[0429] In some embodiments, 1-10 additional doses of the anti-PDL1 antibody are administered, *e.g.*, in repeated administration as described above. For example, in some embodiments, 1, 2, 3, 4, 5, 6, 7, 8, 9, or 10 additional doses of the anti-PDL1 antibody may be administered.

[0430] In some embodiments, the anti-human OX40 agonist antibody and/or the anti-PDL1 antibody are administered intravenously. In some embodiments, the anti-human OX40 agonist antibody and/or the anti-PDL1 antibody may be administered at different rates between administrations. For example, as described herein, an initial administration may be performed at a slower rate (*e.g.*, by IV infusion) than a subsequent administration, *e.g.*, to prevent or mitigate infusion-related reactions.

[0431] In some embodiments, the anti-human OX40 agonist antibody and the anti-PDL1 antibody are administered on the same day. In other embodiments, the anti-human OX40 agonist antibody and the anti-PDL1 antibody are administered on different days. In some embodiments, the anti-human OX40 agonist antibody and the anti-PDL1 antibody are administered within 1 day, within 2 days, within 3 days, within 4 days, within 5 days, within 6 days, or within 7 days. In some embodiments, dosing may be staggered within a dosing cycle, *e.g.*, the anti-human OX40 agonist antibody may be administered at each dosing interval (*e.g.*, 2 or 3 weeks), and the anti-PDL1 antibody may be administered every other dosing interval, or vice versa.

[0432] In some embodiments, after administration of a first dose of the anti-human OX40 agonist antibody and/or a first dose of the anti-PDL1 antibody, one or more additional doses of the anti-human OX40 agonist antibody and/or the anti-PDL1 antibody may be administered. In some embodiments, after administering the antibody, the individual is monitored for an adverse event (*e.g.*, as exemplified below), progression and/or treatment efficacy. In some embodiments, if the individual does not exhibit an adverse event (*e.g.*, as described herein), a second dose of the antibody may be administered. In some embodiments, if the treatment exhibits efficacy, a second dose of the antibody
may be administered. In some embodiments, even if progression is observed, a second dose of the antibody may be administered. As described herein, and without wishing to be bound to theory, it is thought that in some cases immunotherapeutic agents such as anti-human OX40 agonist antibodies and/or anti-PDL1 antibodies may induce an initial progression, followed by a response.

[0433] In some embodiments, the second dose of the anti-human OX40 agonist antibody is the same amount as the first dose of the anti-human OX40 agonist antibody. In other embodiments, the second dose of the anti-human OX40 agonist antibody may be greater than the first dose of the anti-human OX40 agonist antibody. In some embodiments, the second dose of the anti-PDL1 antibody is the same amount as the first dose of the anti-PDL1 antibody. It will be appreciated that the particular doses and dose ranges of the anti-human OX40 agonist antibody described above may apply to second doses as well as first doses in any combination or order.

[0434] In some embodiments, the second dose of the anti-human OX40 agonist antibody is not provided until from about 2 weeks to about 4 weeks after the first dose. In some embodiments, the second dose of the anti-human OX40 agonist antibody is not provided until from about 14 days, from about 21 days, or from about 28 days after the first dose. In some embodiments, the second dose of the anti-PDL1 antibody is not provided until from about 2 weeks to about 4 weeks after the first dose. In some embodiments, the second dose of the anti-PDL1 antibody is not provided until about 14 days, about 21 days, or about 28 days after the first dose.

[0435] In some embodiments, the first dose of the anti-human OX40 agonist antibody and the first dose of the anti-PDL1 antibody are administered on the same day. In other embodiments, the first dose of the anti-human OX40 agonist antibody and the first dose of the anti-PDL1 antibody are administered on the different days. In some embodiments, the first dose of the anti-human OX40 agonist antibody and the first dose of the anti-PDL1 antibody are administered within 1 day, within 2 days, within 3 days, within 4 days, within 5 days, within 6 days, or within 7 days.

[0436] In some embodiments, the second dose of the anti-human OX40 agonist antibody and the second dose of the anti-PDL1 antibody are administered on the same day. In other embodiments, the second dose of the anti-human OX40 agonist antibody and the second dose of the anti-PDL1 antibody are administered on the different days. In some embodiments, the second dose of the anti-human OX40 agonist antibody and the second dose of the anti-PDL1 antibody are administered within 1 day, within 2 days, within 3 days, within 4 days, within 5 days, within 6 days, or within 7 days.

[0437] In some embodiments, the second dose of the anti-human OX40 agonist antibody and the second dose of the anti-PDL1 antibody are not provided until about 3 weeks after the first dose of the anti-human OX40 agonist antibody and the first dose of the anti-human OX40 agonist antibody. In some embodiments, the second dose of the anti-human OX40 agonist antibody and the second dose of the anti-PDL1 antibody are not provided until about 21 days after the first dose of the anti-human OX40 agonist antibody and the first dose of the anti-human OX40 agonist antibody.
In some embodiments, the first dose and the second dose of each antibody are administered via the same route. In certain embodiments, the first dose of the anti-human OX40 agonist antibody, the first dose of the anti-PDL1 antibody, the second dose of the anti-human OX40 agonist antibody, and/or the second dose of the anti-PDL1 antibody are administered intravenously.

In one aspect, an anti-human OX40 agonist antibody and an anti-PDL1 antibody for use as a medicament are provided. In further aspects, an anti-human OX40 agonist antibody and an anti-PDL1 antibody for use in treating cancer are provided. In certain embodiments, an anti-human OX40 agonist antibody and an anti-PDL1 antibody for use in a method of treatment are provided. In certain embodiments, the invention provides an anti-human OX40 agonist antibody and an anti-PDL1 antibody for use in a method of treating an individual having cancer comprising administering to the individual an effective amount of the anti-human agonist OX40 antibody in conjunction with an effective amount of an anti-PDL1 antibody. In one such embodiment, the method further comprises administering to the individual an effective amount of at least one additional therapeutic agent, e.g., as described below.

In one aspect, provided is an anti-human OX40 agonist antibody for use in enhancing immune function (e.g., by upregulating cell-mediated immune responses) in an individual having cancer comprising administering to the individual an effective amount of the anti-human agonist OX40 antibody. In one aspect, provided is an anti-human OX40 agonist antibody for use in enhancing T cell function in an individual having cancer comprising administering to the individual an effective amount of the anti-human agonist OX40 antibody. In one aspect, provided are an anti-human OX40 agonist antibody for use in depleting human OX40-expressing cells (e.g., OX40 expressing T cells, e.g., OX40 expressing Treg) comprising administering to the individual an effective amount of the anti-human agonist OX40 antibody. In some embodiments, depletion is by ADCC. In some embodiments, depletion is by phagocytosis. Provided is an anti-human OX40 agonist antibody for treating an individual having tumor immunity.

In further aspects, an anti-human OX40 agonist antibody for use in treating infection (e.g., with a bacteria or virus or other pathogen) is provided. In certain embodiments, the invention provides an anti-human OX40 agonist antibody for use in a method of treating an individual having an infection comprising administering to the individual an effective amount of the anti-human agonist OX40 antibody. In some embodiments, the infection is with a virus and/or a bacteria. In some embodiments, the infection is with a pathogen.

In a further aspect, the invention provides for the use of an anti-OX40 antibody in the manufacture or preparation of a medicament. In a further aspect, the invention provides for the use of an anti-PDL1 antibody in the manufacture or preparation of a medicament. In one embodiment, the medicament is for treatment of cancer. In a further embodiment, the medicament is for use in a method of treating cancer comprising administering to an individual having cancer an effective amount of the medicament containing anti-OX40 antibody and the medicament containing anti-PDL1
antibody. In one such embodiment, the method further comprises administering to the individual an effective amount of at least one additional therapeutic agent, e.g., as described below.

[0443] In one aspect, the medicament is for use in enhancing immune function (e.g., by upregulating cell-mediated immune responses) in an individual having cancer comprising administering to the individual an effective amount of the medicament. In one aspect, the medicament is for use in enhancing T cell function in an individual having cancer comprising administering to the individual an effective amount of the medicament. In some embodiments, the T cell dysfunctional disorder is cancer. In one aspect, the medicament is for use in depleting human OX40-expressing cells (e.g., cell expressing high OX40, e.g., OX40 expressing T cells) comprising administering to the individual an effective amount of the medicament. In some embodiments, depletion is by ADCC. In some embodiments, depletion is by phagocytosis. In one aspect, the medicament is for treating an individual having tumor immunity.

[0444] In further aspects, the medicament is for use in treating infection (e.g., with a bacteria or virus or other pathogen) is provided. In certain embodiments, the medicament is for use in a method of treating an individual having an infection comprising administering to the individual an effective amount of the medicament. In some embodiments, the infection is with virus and/or bacteria. In some embodiments, the infection is with a pathogen.

[0445] In a further aspect, the invention provides a method for treating a cancer. In one embodiment, the method comprises administering to an individual having such cancer an effective amount of an anti-OX40 antibody and an effective amount of an anti-PDL1 antibody. In one such embodiment, the method further comprises administering to the individual an effective amount of at least one additional therapeutic agent, as described below. An "individual" according to any of the above embodiments may be a human.

[0446] In one aspect, provided is a method for enhancing immune function (e.g., by upregulating cell-mediated immune responses) in an individual having cancer comprising administering to the individual an effective amount of the anti-human agonist OX40 antibody and an effective amount of an anti-PDL1 antibody. In one aspect, provided is a method for enhancing T cell function in an individual having cancer comprising administering to the individual an effective amount of the anti-human agonist OX40 antibody and an effective amount of an anti-PDL1 antibody. In one aspect, provided are a method for depleting human OX40-expressing cells (e.g., cells that express high level of OX40, e.g., OX40 expressing T cells) comprising administering to the individual an effective amount of the anti-human agonist OX40 antibody. In some embodiments, depletion is by ADCC. In some embodiments, depletion is by phagocytosis. Provided are an anti-human OX40 agonist antibody and an effective amount of an anti-PDL1 antibody for treating an individual having tumor immunity.

[0447] In some embodiments, examples of cancer further include, but are not limited to, B-cell lymphoma (including low grade/follicular non-Hodgkin's lymphoma (NHL); small lymphocytic (SL) NHL; intermediate grade/follicular NHL; intermediate grade diffuse NHL; high grade immunoblastic
NHL; high grade lymphoblastic NHL; high grade small non-cleaved cell NHL; bulky disease NHL; mantle cell lymphoma; AIDS-related lymphoma; and Waldenstrom's Macroglobulinemia); chronic lymphocytic leukemia (CLL); acute lymphoblastic leukemia (ALL); Hairy cell leukemia; chronic myeloblastic leukemia; and post-transplant lymphoproliferative disorder (PTLD), as well as abnormal vascular proliferation associated with phakomatoses, edema (such as that associated with brain tumors), B-cell proliferative disorders, and Meigs' syndrome. More specific examples include, but are not limited to, relapsed or refractory NHL, front line low grade NHL, Stage III/IV NHL, chemotherapy resistant NHL, precursor B lymphoblastic leukemia and/or lymphoma, small lymphocytic lymphoma, B-cell chronic lymphocytic leukemia and/or prolymphocytic leukemia and/or small lymphocytic lymphoma, B-cell prolymphocytic lymphoma, immunocytoma and/or lymphoplasmacytic lymphoma, lymphoplasmacytic lymphoma, marginal zone B-cell lymphoma, splenic marginal zone lymphoma, extranodal marginal zone—MALT lymphoma, nodal marginal zone lymphoma, hairy cell leukemia, plasmacytoma and/or plasma cell myeloma, low grade/follicular lymphoma, intermediate grade/follicular NHL, mantle cell lymphoma, follicle center lymphoma (follicular), intermediate grade diffuse NHL, diffuse large B-cell lymphoma, aggressive NHL (including aggressive front-line NHL and aggressive relapsed NHL), NHL relapsing after or refractory to autologous stem cell transplantation, primary mediastinal large B-cell lymphoma, primary effusion lymphoma, high grade immunoblastic NHL, high grade lymphoblastic NHL, high grade small non-cleaved cell NHL, bulky disease NHL, Burkitt's lymphoma, precursor (peripheral) large granular lymphocytic leukemia, mycosis fungoides and/or Sezary syndrome, skin (cutaneous) lymphomas, anaplastic large cell lymphoma, angiocentric lymphoma.

[0448] In some embodiments, examples of cancer further include, but are not limited to, B-cell proliferative disorders, which further include, but are not limited to, lymphomas (e.g., B-Cell Non-Hodgkin's lymphomas (NHL)) and lymphocytic leukemias. Such lymphomas and lymphocytic leukemias include e.g. a) follicular lymphomas, b) Small Non-Cleaved Cell Lymphomas/ Burkitt's lymphoma (including endemic Burkitt's lymphoma, sporadic Burkitt's lymphoma and Non-Burkitt's lymphoma), c) marginal zone lymphomas (including extranodal marginal zone B-cell lymphoma (Mucosa-associated lymphatic tissue lymphomas, MALT), nodal marginal zone B-cell lymphoma and splenic marginal zone lymphoma), d) Mantle cell lymphoma (MCL), e) Large Cell Lymphoma (including B-cell diffuse large cell lymphoma (DLCL), Diffuse Mixed Cell Lymphoma, Immunoblastic Lymphoma, Primary Mediastinal B-Cell Lymphoma, Angiocentric Lymphoma—Pulmonary B-Cell Lymphoma), f) hairy cell leukemia, g) lymphocytic lymphoma, Waldenstrom's macroglobulinemia, h) acute lymphocytic leukemia (ALL), chronic lymphocytic leukemia (CLL)/small lymphocytic lymphoma (SLL), B cell prolymphocytic leukemia, i) plasma cell neoplasms, plasma cell myeloma, multiple myeloma, plasmacytoma, and/or j) Hodgkin's disease.

[0449] In some embodiments of any of the methods, the cancer is melanoma, triple-negative breast cancer, ovarian cancer, renal cell cancer, bladder cancer, non-small cell lung cancer, gastric cancer, or
colorectal cancer (including both primary and metastatic tumors). In certain embodiments, the cancer is a renal cell carcinoma (e.g., clear cell renal cell carcinoma).

[0450] In some embodiments of any of the methods, the cancer is a B-cell proliferative disorder. In some embodiments, the B-cell proliferative disorder is lymphoma, non-Hodgkins lymphoma (NHL), aggressive NHL, relapsed aggressive NHL, relapsed indolent NHL, refractory NHL, refractory indolent NHL, chronic lymphocytic leukemia (CLL), small lymphocytic lymphoma, leukemia, hairy cell leukemia (HCL), acute lymphocytic leukemia (ALL), or mantle cell lymphoma. In some embodiments, the B-cell proliferative disorder is NHL, such as indolent NHL and/or aggressive NHL. In some embodiments, the B-cell proliferative disorder is indolent follicular lymphoma or diffuse large B-cell lymphoma. In certain embodiments, the cancer is selected from melanoma, triple-negative breast cancer, ovarian cancer, renal cell cancer, bladder cancer, non-small cell lung cancer, gastric cancer, and colorectal cancer. In some embodiments, the cancer is a locally advanced or metastatic solid tumor, e.g., of any of the solid cancers described herein.

[0451] In some embodiments, the cancer is melanoma. In certain embodiments, the melanoma is advanced or metastatic melanoma. In some embodiments, the melanoma exhibits a BRAF V600 mutation (e.g., a V600E, V600K, or V600D mutation). Melanomas with a BRAF V600 mutation have been treated with B-Raf and/or mitogen-activated protein kinase kinase (MEK) kinase inhibitors. Examples of such inhibitors include without limitation sorafenib, vemurafenib, dabrafenib (GSK21 18436), RAF265, LGX818, trametinib, selumetinib, binimetinib, cobimetinib, PD-325901, CI-1040 (PD184352), PD035901, and the like. In some embodiments, the individual has been treated with a B-Raf and/or mitogen-activated protein kinase kinase (MEK) kinase inhibitor prior to treatment with the anti-human OX40 agonist antibody and/or anti-PD-L1 antibody. In some embodiments, the patient has exhibited disease progression or intolerance to the B-Raf and/or mitogen-activated protein kinase kinase (MEK) kinase inhibitor treatment prior to treatment with the anti-human OX40 agonist antibody and/or anti-PD-L1 antibody.

[0452] In some embodiments, the cancer is renal cell cancer (RCC). In certain embodiments, the RCC is advanced or metastatic RCC. In some embodiments, the RCC exhibits a component of clear cell histology and/or a component of sarcomatoid histology.

[0453] In some embodiments, the cancer is triple-negative breast cancer (TNBC). In certain embodiments, the TNBC is advanced or metastatic TNBC. In some embodiments, TNBC may refer to an adenocarcinoma of the breast that is estrogen receptor negative, progesterone receptor negative, and human epidermal growth factor receptor 2 negative, e.g., as defined by the American Society of Clinical Oncology-College of American Pathologists (ASCO-CAP) guidelines. For example, <1% of tumor cell nuclei may be immunoreactive for estrogen receptor, and <1% of tumor cell nuclei may be immunoreactive for progesterone receptor (Hammond, M.E. et al. (2010) / Clin. Oncol. 28:2784-2795) and HER2 tests demonstrate either immunohistochemistry (IHC) 1+, IHC 0 or in situ hybridization (ISH) negative (Wolff, A.C. et al. (2013) / Clin. Oncol. 31:3997:4013).
In some embodiments, the cancer is non-small cell lung cancer (NSCLC). In certain embodiments, the NSCLC is advanced or metastatic NSCLC. In some embodiments, the NSCLC exhibits a sensitizing epidermal growth factor (EGFR) mutation. Sensitizing EGFR mutations are known to involve the EGFR kinase domain and may include without limitation mutations in exons 18-21, such as exon 19 deletions and the L858R point mutation in exon 21 (for further description and/or additional mutations, see, e.g., Lynch, T.J. et al. (2004) N. Engl. J. Med. 350:2129-2139; Pao, W. et al. (2004) Proc. Natl. Acad. Sci. 101:13306-13311; and Paez, J.G. et al. (2004) Science 304:1497-1500). In some embodiments, the individual has been treated with an EGFR tyrosine kinase inhibitor prior to treatment with the anti-human OX40 agonist antibody and/or anti-PDL1 antibody. In some embodiments, the patient has exhibited disease progression or intolerance to the EGFR tyrosine kinase inhibitor treatment prior to treatment with the anti-human OX40 agonist antibody and/or anti-PDL1 antibody. In some embodiments, the NSCLC exhibits an anaplastic lymphoma kinase (ALK) rearrangement. ALK rearrangements have been implicated in NSCLC, particularly in EGFR tyrosine kinase inhibitor resistance, and many ALK rearrangements are known in the art, including without limitation EML4-ALK, KIF5B-ALK, and TFG-ALK rearrangements (for further description and/or additional mutations, see, e.g., Koivunen, J.P. et al. (2008) Clin. Cancer Res. 14:4275-4283; and Soda, E.M. et al. (2007) Nature 448:561-566). In some embodiments, the individual has been treated with an ALK tyrosine kinase inhibitor prior to treatment with the anti-human OX40 agonist antibody and/or anti-PDL1 antibody. In some embodiments, the patient has exhibited disease progression or intolerance to the ALK tyrosine kinase inhibitor treatment prior to treatment with the anti-human OX40 agonist antibody and/or anti-PDL1 antibody.

In some embodiments, the cancer is urothelial bladder cancer (UBC). In certain embodiments, the UBC is advanced or metastatic UBC. In some embodiments, the UBC exhibits a transitional cell pattern and includes carcinomas of the renal pelvis, ureters, urinary bladder, and/or urethra.

In some embodiments, the cancer is colorectal cancer (CRC). In certain embodiments, the CRC is advanced or metastatic CRC. In some embodiments, the CRC is an adenocarcinoma of the colon or rectum. In some embodiments, the CRC exhibits microsatellite instability-high (MSI-H) status. Approximately 15% of colorectal cancers demonstrate deficiencies in the DNA mismatch repair system (Boland et al. (1998) Cancer Res. 58:5248-5257). These deficiencies are predominantly nonfamilial (sporadic) and lead to an accumulation of somatic mutations particularly in repetitive sequences (mono-, di-, or higher-order nucleotide repeats) and microsatellites. Hence, a defining molecular feature of these tumors is a high level of microsatellite instability, or MSI-H. The associated insertions or deletions in repetitive sequences occurring in coding regions of the genome can lead to the expression and display of mutant peptides, some of which are capable of eliciting T-cell responses (Bauer et al. (2013) Cancer Immunol. Immunother. 62:27-37). The MSI-H phenotype is also associated with mutations in specific oncogenes and tumor suppressors including BRAF and

In some embodiments, the cancer is ovarian cancer (OC). In certain embodiments, the OC is advanced or metastatic OC. In some embodiments, the OC is an epithelial ovarian, fallopian tube, or primary peritoneal cancer.

In some embodiments of any of the methods, the tumor or cancer is refractory. As used herein, the term "refractory" may refer to a tumor/cancer, or be used to describe a patient with said tumor/cancer, for which a prior therapy has been ineffective and/or intolerable. For example, for RCC, a "refractory" patient may be one for whom prior anti-cancer therapy comprising a VEGF inhibitor and/or an mTOR inhibitor has proven to be ineffective and/or intolerable. One skilled in the art will appreciate that such therapies are merely exemplary, and the methods of the present disclosure may be used to treat or delay progression of a cancer such as RCC or any of the other cancers described herein that is refractory to one or more other therapies, as the appropriateness of the benefit/risk profile of an anti-cancer therapy may in some cases be up to clinical judgement of the prescribing oncologist.

In some embodiments of any of the methods, the individual has been previously treated with an immunotherapy agent prior to the administration of the anti-human OX40 agonist antibody and the anti-PDL1 antibody (and optionally a VEGF antagonist such as bevacizumab). It is a surprising finding of the clinical trials disclosed herein that treatment with anti-human OX40 agonist antibody and anti-PDL1 antibody may be efficacious (e.g., resulting in immune activation and/or PD modulation) even in patients previously treated with anti-human OX40 agonist antibody or PD-1 axis binding antagonist as a single-agent or monotherapy treatment. A variety of immunotherapy agents are described herein (the term "immunotherapeutic agent" may be used interchangeably herein). In certain embodiments, the immunotherapy agent is an anti-human OX40 agonist antibody. In certain embodiments, the immunotherapy agent is a PD-1 axis binding antagonist (e.g., an anti-PDL1, anti-PDL2, or anti-PD1 antibody). In some embodiments, the immunotherapy agent is an OX40 agonist, such as an anti-human OX40 agonist antibody. In some embodiments, the prior treatment with the immunotherapy agent is a monotherapy or single-agent treatment. For example, in some embodiments, the prior treatment with the immunotherapy agent comprises treatment with an OX40 agonist (e.g., an anti-human OX40 agonist antibody) in the absence of a PD-1 axis binding antagonist (e.g., an anti-PDL1, anti-PDL2, or anti-PD1 antibody). In other embodiments, the prior treatment with the immunotherapy agent comprises treatment with a PD-1 axis binding antagonist (e.g., an anti-PDL1, anti-PDL2, or anti-PD1 antibody) in the absence of an OX40 agonist (e.g., an anti-human OX40 agonist antibody). In some embodiments, the individual exhibited a stable disease response,
disease progression, and/or intolerance to a prior treatment prior to the administration of the anti-human OX40 agonist antibody and the anti-PDL1 antibody (and optionally aVEGF antagonist such as bevacizumab).

[0460] In some embodiments, provided herein is a method of treating or delaying progression of cancer in an individual comprising administering to the individual (i) MOXR0916 at a dose of 300mg, and (ii) atezolizumab at a dose of 1200mg, wherein the cancer is selected from the group consisting of melanoma, triple-negative breast cancer, ovarian cancer, renal cell cancer, bladder cancer, non-small cell lung cancer, gastric cancer, and colorectal cancer. In certain embodiments, the cancer is renal cell cancer. In certain embodiments, the cancer is colorectal cancer. In some embodiments, the MOXR0916 and atezolizumab are administered on the same day. In some embodiments, the method further comprises repeating the administration of MOXR0916 at a dose of 300mg per administration and atezolizumab at a dose of 1200mg per administration, and wherein the administration is repeated at an interval of about 3 weeks or about 21 days between administrations. In some embodiments, the repeated administrations of the MOXR0916 and the atezolizumab are administered on the same day. In some embodiments, the cancer is RCC. In some embodiments, the cancer is bladder cancer. In some embodiments, MOXR0916 is administered intravenously. In some embodiments, atezolizumab is administered intravenously. In some embodiments, MOXR0916 and atezolizumab are administered intravenously.

[0461] In some embodiments, provided herein is a method of treating or delaying progression of cancer in an individual comprising administering to the individual (i) MOXR0916 at a dose of 160mg, and (ii) atezolizumab at a dose of 1200mg, wherein the cancer is selected from the group consisting of melanoma, triple-negative breast cancer, ovarian cancer, renal cell cancer, bladder cancer, non-small cell lung cancer, gastric cancer, and colorectal cancer. In certain embodiments, the cancer is renal cell cancer. In certain embodiments, the cancer is colorectal cancer. In some embodiments, the MOXR0916 and the atezolizumab are administered on the same day. In some embodiments, the method further comprises repeating the administration of MOXR0916 at a dose of 160mg per administration and atezolizumab at a dose of 1200mg per administration, and wherein the administration is repeated at an interval of about 3 weeks or about 21 days between administrations. In some embodiments, the repeated administrations of the MOXR0916 and the atezolizumab are administered on the same day. In some embodiments, the cancer is RCC. In some embodiments, the cancer is bladder cancer. In some embodiments, MOXR0916 is administered intravenously. In some embodiments, atezolizumab is administered intravenously. In some embodiments, MOXR0916 and atezolizumab are administered intravenously.

[0462] In some embodiments, provided herein is a method of treating or delaying progression of cancer in an individual comprising administering to the individual (i) MOXR0916 at a dose of 320mg, and (ii) atezolizumab at a dose of 1200mg, wherein the cancer is selected from the group consisting of melanoma, triple-negative breast cancer, ovarian cancer, renal cell cancer, bladder cancer, non-small
cell lung cancer, gastric cancer, and colorectal cancer. In certain embodiments, the cancer is renal cell cancer. In certain embodiments, the cancer is colorectal cancer. In some embodiments, the MOXR0916 and atezolizumab are administered on the same day. In some embodiments, the method further comprises repeating the administration of MOXR0916 at a dose of 320mg per administration and atezolizumab at a dose of 1200mg per administration, and wherein the administration is repeated at an interval of about 3 weeks or about 21 days between administrations. In some embodiments, the repeated administrations of the MOXR0916 and the atezolizumab are administered on the same day. In some embodiments, the cancer is RCC. In some embodiments, the cancer is bladder cancer. In some embodiments, MOXR0916 is administered intravenously. In some embodiments, atezolizumab is administered intravenously. In some embodiments, MOXR0916 and atezolizumab are administered intravenously.

In some embodiments, provided herein is a method of treating or delaying progression of cancer in an individual comprising administering to the individual (i) MOXR0916 at a dose of 400mg, and (ii) atezolizumab at a dose of 1200mg, wherein the cancer is selected from the group consisting of melanoma, triple-negative breast cancer, ovarian cancer, renal cell cancer, bladder cancer, non-small cell lung cancer, gastric cancer, and colorectal cancer. In certain embodiments, the cancer is renal cell cancer. In some embodiments, the MOXR0916 and atezolizumab are administered on the same day. In some embodiments, the method further comprises repeating the administration of MOXR0916 at a dose of 400mg per administration and atezolizumab at a dose of 1200mg per administration, and wherein the administration is repeated at an interval of about 3 weeks or about 21 days between administrations. In some embodiments, the repeated administrations of the MOXR0916 and the atezolizumab are administered on the same day. In some embodiments, the cancer is RCC. In some embodiments, the cancer is bladder cancer. In some embodiments, MOXR0916 is administered intravenously. In some embodiments, atezolizumab is administered intravenously. In some embodiments, MOXR0916 and atezolizumab are administered intravenously.

In some embodiments, provided herein is a method of treating or delaying progression of cancer in an individual comprising administering to the individual (i) MOXR0916 at a dose of 300mg, (ii) atezolizumab at a dose of 1200mg, and (iii) bevacizumab at a dose of 15mg/kg, wherein the cancer is selected from the group consisting of melanoma, triple-negative breast cancer, ovarian cancer, renal cell cancer, bladder cancer, non-small cell lung cancer, gastric cancer, and colorectal cancer. In certain embodiments, the cancer is renal cell cancer. In certain embodiments, the cancer is colorectal cancer. In some embodiments, the MOXR0916, atezolizumab, and bevacizumab are administered on the same day. In some embodiments, the method further comprises repeating the administration of MOXR0916 at a dose of 300mg per administration, atezolizumab at a dose of 1200mg per administration, and bevacizumab at a dose of 15mg/kg per administration. In some embodiments, the administration of MOXR0916, atezolizumab, and bevacizumab is repeated at an
interval of about 3 weeks or about 21 days between administrations. In some embodiments, the repeated administrations of the MOXR0916, the atezolizumab, and the bevacizumab are administered on the same day. In some embodiments, MOXR0916 is administered intravenously. In some embodiments, atezolizumab is administered intravenously. In some embodiments, bevacizumab is administered intravenously. In some embodiments, MOXR0916, atezolizumab, and bevacizumab are administered intravenously.

[0465] In some embodiments, provided herein is a method of treating or delaying progression of cancer in an individual comprising administering to the individual (i) MOXR0916 at a dose of 160mg, (ii) atezolizumab at a dose of 1200mg, and (iii) bevacizumab at a dose of 15mg/kg, wherein the cancer is selected from the group consisting of melanoma, triple-negative breast cancer, ovarian cancer, renal cell cancer, bladder cancer, non-small cell lung cancer, gastric cancer, and colorectal cancer. In certain embodiments, the cancer is renal cell cancer. In certain embodiments, the cancer is colorectal cancer. In some embodiments, the MOXR0916, atezolizumab, and bevacizumab are administered on the same day. In some embodiments, the method further comprises repeating the administration of MOXR0916 at a dose of 160mg per administration, atezolizumab at a dose of 1200mg per administration, and bevacizumab at a dose of 15mg/kg per administration, and wherein the administration is repeated at an interval of about 3 weeks or about 21 days between administrations. In some embodiments, the repeated administrations of the MOXR0916, the atezolizumab, and the bevacizumab are administered on the same day. In some embodiments, MOXR0916 is administered intravenously. In some embodiments, atezolizumab is administered intravenously. In some embodiments, bevacizumab is administered intravenously. In some embodiments, MOXR0916, atezolizumab, and bevacizumab are administered intravenously.

[0466] In some embodiments, provided herein is a method of treating or delaying progression of cancer in an individual comprising administering to the individual (i) MOXR0916 at a dose of 320mg, (ii) atezolizumab at a dose of 1200mg, and (iii) bevacizumab at a dose of 15mg/kg, wherein the cancer is selected from the group consisting of melanoma, triple-negative breast cancer, ovarian cancer, renal cell cancer, bladder cancer, non-small cell lung cancer, gastric cancer, and colorectal cancer. In certain embodiments, the cancer is renal cell cancer. In certain embodiments, the cancer is colorectal cancer. In some embodiments, the MOXR0916, atezolizumab, and bevacizumab are administered on the same day. In some embodiments, the method further comprises repeating the administration of MOXR0916 at a dose of 320mg per administration, atezolizumab at a dose of 1200mg per administration, and bevacizumab at a dose of 15mg/kg per administration, and wherein the administration is repeated at an interval of about 3 weeks or about 21 days between administrations. In some embodiments, the repeated administrations of the MOXR0916, the atezolizumab, and the bevacizumab are administered on the same day. In some embodiments, MOXR0916 is administered intravenously. In some embodiments, atezolizumab is administered
intravenously. In some embodiments, bevacizumab is administered intravenously. In some 
embodiments, MOXR0916, atezolizumab, and bevacizumab are administered intravenously.

[0467] In some embodiments, provided herein is a method of treating or delaying progression of 
cancer in an individual comprising administering to the individual (i) MOXR0916 at a dose of 400mg, 
(ii) atezolizumab at a dose of 1200mg, and (iii) bevacizumab at a dose of 15mg/kg, wherein the 
cancer is selected from the group consisting of melanoma, triple-negative breast cancer, ovarian 
cancer, renal cell cancer, bladder cancer, non-small cell lung cancer, gastric cancer, and colorectal 
cancer. In certain embodiments, the cancer is renal cell cancer. In certain embodiments, the cancer is 
colorectal cancer. In some embodiments, the MOXR0916, atezolizumab, and bevacizumab are 
administered on the same day. In some embodiments, the method further comprises repeating the 
administration of MOXR0916 at a dose of 400mg per administration, atezolizumab at a dose of 
1200mg per administration, and bevacizumab at a dose of 15mg/kg per administration, and wherein 
the administration is repeated at an interval of about 3 weeks or about 21 days between 
administrations. In some embodiments, the repeated administrations of the MOXR0916, the 
atezolizumab, and the bevacizumab are administered on the same day. In some embodiments, 
MOXR0916 is administered intravenously. In some embodiments, atezolizumab is administered 
intravenously. In some embodiments, bevacizumab is administered intravenously. In some 
embodiments, MOXR0916, atezolizumab, and bevacizumab are administered intravenously.

[0468] In a further aspect, the invention provides pharmaceutical formulations comprising any of 
the anti-OX40 antibodies, anti-VEGF antibodies, and/or anti-PDL1 antibodies provided herein, e.g., 
for use in any of the above therapeutic methods. In one embodiment, a pharmaceutical formulation 
comprises any of the anti-OX40 antibodies provided herein and a pharmaceutically acceptable carrier, 
and/or (or for use in conjunction with) any of the anti-PDL1 antibodies provided herein and a 
pharmaceutically acceptable carrier, and/or (or for use in conjunction with) any of the anti-VEGF 
antibodies provided herein and a pharmaceutically acceptable carrier. In another embodiment, a 
pharmaceutical formulation comprises any of the anti-OX40 antibodies provided herein and at least 
one additional therapeutic agent, e.g., as described below.

[0469] In some embodiments of any of the methods of the invention, the anti-human OX40 agonist 
antibodies inhibits tumor immunity by inhibiting Treg function (e.g., inhibiting the suppressive 
function of Tregs), killing OX40 expressing cells (e.g., cells that express high levels of OX40), 
increasing effector T cell function and/or increasing memory T cell function. In some embodiments 
of any of the methods of the invention, the anti-human OX40 agonist antibodies treat cancer by 
inhibiting Treg function (e.g., inhibiting the suppressive function of Tregs), killing OX40 expressing 
cells (e.g., cells that express high levels of OX40), increasing effector T cell function and/or 
increasing memory T cell function. In some embodiments of any of the methods of the invention, the 
anti-human OX40 agonist antibodies enhance immune function by inhibiting Treg function (e.g., 
inhibiting the suppressive function of Tregs), killing OX40 expressing cells (e.g., cells that express
high levels of OX40), increasing effector T cell function and/or increasing memory T cell function. In some embodiments of any of the methods of the invention, the anti-human OX40 agonist antibodies enhance T cell function by inhibiting Treg function (e.g., inhibiting the suppressive function of Tregs), killing OX40 expressing cells (e.g., cells that express high levels of OX40), increasing effector T cell function and/or increasing memory T cell function.

[0470] In some embodiments of any of the methods, the anti-human OX40 agonist antibody is a depleting anti-human agonist antibody. In some embodiments, treatment with the anti-human OX40 agonist antibody results in cell depletion (e.g., depletion of OX40-expressing cells, e.g., depletion of cells that express high levels of OX40). In some embodiments, depletion is by ADCC. In some embodiments, depletion is by phagocytosis.

[0471] In some embodiments of any of the methods, the anti-human OX40 agonist antibody inhibits Treg function, e.g., by inhibiting Treg suppression of effector and/or memory T cell function (in some embodiments, effector T cell and/or memory T cell proliferation and/or cytokine secretion), relative to Treg function prior to administration of the OX40 agonist antibody. In some embodiments of any of the methods, the anti-human OX40 agonist antibody increases effector T cell proliferation, relative to effector T cell proliferation prior to administration of the OX40 agonist antibody. In some embodiments of any of the methods, the anti-human OX40 agonist antibody increases memory T cell proliferation, relative to memory T cell proliferation prior to administration of the OX40 agonist antibody. In some embodiments of any of the methods, the anti-human OX40 agonist antibody increases effector T cell cytokine production (e.g., gamma interferon production), relative to effector T cell cytokine production prior to administration of the OX40 agonist antibody. In some embodiments of any of the methods, the anti-human OX40 agonist antibody increases memory T cell cytokine production (e.g., gamma interferon production), relative to memory T cell cytokine production prior to administration of the OX40 agonist antibody. In some embodiments of any of the methods, the anti-human OX40 agonist antibody increases CD4+ effector T cell proliferation and/or CD8+ effector T cell proliferation relative to CD4+ effector T cell proliferation and/or CD8+ effector T cell proliferation prior to administration of the OX40 agonist antibody. In some embodiments of any of the methods, the anti-human OX40 agonist antibody increases memory T cell proliferation (e.g., CD4+ memory T cell proliferation), relative to memory T cell proliferation prior to administration of the OX40 agonist antibody. In some embodiments, the CD4+ effector T cells in the individual have enhanced proliferation, cytokine secretion and/or cytolytic activity relative to proliferation, cytokine secretion and/or cytolytic activity prior to the administration of the anti-human OX40 agonist antibody.

[0472] In some embodiments of any of the methods of the invention, the number of CD4+ effector T cells is elevated relative to prior to administration of the anti-human OX40 agonist antibody. In some embodiments, CD4+ effector T cell cytokine secretion is elevated relative to prior to administration of the anti-human OX40 agonist antibody. In some embodiments of any of the
methods, the CD8+ effector T cells in the individual have enhanced proliferation, cytokine secretion and/or cytolytic activity relative to prior to the administration of the anti-human OX40 agonist antibody. In some embodiments, the number of CD8+ effector T cells is elevated relative to prior to administration of the anti-human OX40 agonist antibody. In some embodiments, CD8+ effector T cell cytokine secretion is elevated relative to prior to administration of the anti-human OX40 agonist antibody.

[0473] In some embodiments of any of the methods of the invention, the anti-human OX40 agonist antibody binds human effector cells, e.g., binds FcγR expressed by human effector cells. In some embodiments, the human effector cell performs ADCC effector function. In some embodiments, the human effector cell performs phagocytosis effector function.

[0474] In some embodiments of any of the methods of the invention, the anti-human OX40 agonist antibody comprising a variant IgGl Fc polypeptide comprising a mutation that eliminates binding to human effector cells (e.g., a DANA or N297G mutation) has diminished activity (e.g., CD4+ effector T cell function, e.g., proliferation), relative to anti-human OX40 agonist antibody comprising native sequence IgGl Fc portion. In some embodiment, the anti-human OX40 agonist antibody comprising a variant IgGl Fc polypeptide comprising a mutation that eliminates binding to human effector cells (e.g., a DANA or N297G mutation) does not possess substantial activity (e.g., CD4+ effector T cell function, e.g., proliferation).

[0475] In some embodiments of any of the methods of the invention, antibody cross-linking is required for anti-human OX40 agonist antibody function. In some embodiments, function is stimulation of CD4+ effector T cell proliferation. In some embodiments, antibody cross-linking is determined by providing anti-human OX40 agonist antibody adhered on a solid surface (e.g., a cell culture plate). In some embodiments, antibody cross-linking is determined by introducing a mutation in the antibody's IgGl Fc portion (e.g., a DANA or N297S mutation) and testing function of the mutant antibody.

[0476] In some embodiments of any of the methods, the memory T cells in the individual have enhanced proliferation and/or cytokine secretion relative to prior to the administration of the anti-human OX40 agonist antibody. In some embodiments, the number of memory T cells is elevated relative to prior to administration of the anti-human OX40 agonist antibody. In some embodiments, memory T cell cytokine secretion (level) is elevated relative to prior to administration of the anti-human OX40 agonist antibody. In some embodiments of any of the methods, the Treg in the individual have decreased inhibition of effector T cell function (e.g., proliferation and/or cytokine secretion) relative to prior to the administration of the anti-human OX40 agonist antibody. In some embodiments, the number of effector T cells is elevated relative to prior to administration of the anti-human OX40 agonist antibody. In some embodiments, effector T cell cytokine secretion (level) is elevated relative to prior to administration of the anti-human OX40 agonist antibody.
In some embodiments of any of the methods of the invention, the number of intratumoral (infiltrating) CD4+ effector T cells (e.g., total number of CD4+ effector T cells, or e.g., percentage of CD4+ cells in CD45+ cells) is elevated relative to prior to administration of the anti-human OX40 agonist antibody. In some embodiments of any of the methods of the invention, number of intratumoral (infiltrating) CD4+ effector T cells that express gamma interferon (e.g., total gamma interferon expressing CD4+ cells, or e.g., percentage of gamma interferon expressing CD4+ cells in total CD4+ cells) is elevated relative to prior to administration anti-human OX40 agonist antibody.

In some embodiments of any of the methods of the invention, the number of intratumoral (infiltrating) CD8+ effector T cells (e.g., total number of CD8+ effector T cells, or e.g., percentage of CD8+ in CD45+ cells) is elevated relative to prior to administration of anti-human OX40 agonist antibody. In some embodiments of any of the methods of the invention, number of intratumoral (infiltrating) CD8+ effector T cells that express gamma interferon (e.g., percentage of CD8+ cells that express gamma interferon in total CD8+ cells) is increased relative to prior to administration of anti-human OX40 agonist antibody.

In some embodiments of any of the methods of the invention, the number of intratumoral (infiltrating) Treg (e.g., total number of Treg or e.g., percentage of Fox3p+ cells in CD4+ cells) is reduced relative to prior to administration of anti-human OX40 agonist antibody.

In some embodiments of any of the methods of the invention, administration of anti-human OX40 agonist antibody is in combination with administration of a tumor antigen. In some embodiments, the tumor antigen comprises protein. In some embodiments, the tumor antigen comprises nucleic acid. In some embodiments, the tumor antigen is a tumor cell.

In some embodiments of any of the methods of the invention, a tumor response to treatment may be evaluated. In some embodiments, RECIST criteria, such as RECIST v1.1, may be used to evaluate tumor response. These criteria are known in the art and may be used to measure a patient's response to a treatment; see, e.g., Eisenhauer, E.A. et al. (2009) Eur. J. Cancer 45:228-247. In some embodiments, RECIST response criteria may include:

(a) Complete response (CR): disappearance of all target lesions. Any pathological lymph nodes (whether target or non-target) must have reduction in short axis to \(< 10\) mm;

(b) Partial response (PR): at least a 30% decrease in the sum of diameters of target lesions, taking as reference the baseline sum of diameters;

(c) Progressive disease (PD): at least a 20% increase in the sum of diameters of target lesions, taking as reference the smallest sum on study (nadir), including baseline. In addition to the relative increase of 20%, the sum must also demonstrate an absolute increase of at least 5 mm. The appearance of one or more new lesions is also considered progression; and

(d) Stable disease (SD): neither sufficient shrinkage to qualify for PR nor sufficient increase to qualify for PD, taking as reference the smallest sum on study.
In other embodiments, modified RECIST criteria may be used to evaluate tumor response. Modified Response Evaluation Criteria in Solid Tumors (RECIST) is derived from RECIST, Version 1.1 (v1.1) conventions (see, e.g., Eisenhauer, E.A. et al. (2009) Eur. J. Cancer 45:228-247) and immune-related response criteria (irRC; see, e.g., Wolchok et al. (2009) Clin. Can. Res. 15:7412-7420; Nishino et al. (2014) J. Immunother. Can. 2:17; and Nishino et al. (2013) Clin. Can. Res. 19:3936-3943). Without wishing to be bound to theory, it is thought that conventional response criteria may not be adequate to characterize the anti-tumor activity of immunotherapeutic agents like anti-human OX40 agonist antibodies and/or anti-PDL1 antibodies, which can produce delayed responses that may be preceded by initial apparent radiographic progression, including the appearance of new lesions. Therefore, modified response criteria have been developed that account for the possible appearance of new lesions and allow radiological progression to be confirmed at a subsequent assessment. A summary of the changes between modified RECIST and RECIST v1.1 is provided in Table B below.

<table>
<thead>
<tr>
<th>RECIST v1.1</th>
<th>Modified RECIST</th>
</tr>
</thead>
<tbody>
<tr>
<td>New lesions after baseline</td>
<td>Define progression</td>
</tr>
<tr>
<td>Non-target lesions</td>
<td>May contribute to the designation of overall progression.</td>
</tr>
<tr>
<td>Radiographic progression</td>
<td>First instance of ≥ 20% increase in the sum of diameters or unequivocal progression in non-target disease.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

In some embodiments, modified RECIST response criteria may include:

(a) Complete response (CR): disappearance of all target and non-target lesions. Lymph nodes that shrink to < 10 mm short axis are considered normal;

(b) Partial response (PR): at least a 30% decrease in the sum of the diameters of all target and all new measurable lesions, taking as reference the baseline sum of diameters, in the absence of CR. Note: the appearance of new measurable lesions is factored into the overall tumor burden, but does not automatically qualify as progressive disease until the sum of the diameters increases by ≥ 20% when compared with the sum of the diameters at nadir;

(c) Progressive disease (PD): at least a 20% increase in the sum of diameters of all target and selected new measurable lesions, taking as reference the smallest sum on study (nadir SLD; this
includes the baseline sum if that is the smallest on study). In addition to the relative increase of 20%, the sum must also demonstrate an absolute increase of at least 5 mm; and
(d) Stable disease (SD): neither sufficient shrinkage to qualify for PR nor sufficient increase to qualify for PD, taking as reference the smallest sum of the diameters while on study.

The assessment of non-target lesions may be captured on the CRF at each timepoint using standard RECIST v1.1 definitions of CR, non-CR/non-PD, and PD (unequivocal progression). However, in determining the overall modified RECIST tumor response, non-target lesions contribute only to the assessment of a complete response. Non-target lesions are not considered in the overall definition of PR, SC, or PD per modified RECIST.

In some embodiments, new lesions alone do not qualify as progressive disease. However, their contribution to total tumor burden may be included in the sum of the diameters, which may be used to determine the overall modified RECIST tumor response.

In some embodiments, responsiveness to treatment may refer to any one or more of: extending survival (including overall survival and progression free survival); resulting in an objective response (including a complete response or a partial response); or improving signs or symptoms of cancer. In some embodiments, responsiveness may refer to improvement of one or more factors according to the published set of RECIST guidelines for determining the status of a tumor in a cancer patient, i.e., responding, stabilizing, or progressing. For a more detailed discussion of these guidelines, see Eisenhauer et al., Eur J Cancer 2009;45: 228-47; Topalian et al., N Engl J Med 2012;366:2443-54; Wolchok et al., Clin Can Res 2009;15:7412-20; and Therasse, P., et al. J. Natl. Cancer Inst. 92:205-16 (2000). A responsive subject may refer to a subject whose cancer(s) show improvement, e.g., according to one or more factors based on RECIST criteria. A non-responsive subject may refer to a subject whose cancer(s) do not show improvement, e.g., according to one or more factors based on RECIST criteria.

Conventional response criteria may not be adequate to characterize the anti-tumor activity of immunotherapeutic agents, which can produce delayed responses that may be preceded by initial apparent radiological progression, including the appearance of new lesions. Therefore, modified response criteria have been developed that account for the possible appearance of new lesions and allow radiological progression to be confirmed at a subsequent assessment. Accordingly, in some embodiments, responsiveness may refer to improvement of one or more factors according to immune-related response criteria2 (irRC). See, e.g., Wolchok et al., Clin Can Res 2009;15:7412 - 20. In some embodiments, new lesions are added into the defined tumor burden and followed, e.g., for radiological progression at a subsequent assessment. In some embodiments, presence of non-target lesions are included in assessment of complete response and not included in assessment of radiological progression. In some embodiments, radiological progression may be determined only on the basis of measurable disease and/or may be confirmed by a consecutive assessment ≥ 4 weeks from the date first documented.
In some embodiments, responsiveness may include immune activation. In some embodiments, responsiveness may include treatment efficacy. In some embodiments, responsiveness may include immune activation and treatment efficacy.

In some embodiments of any of the methods of the invention, the cancer displays human effector cells (e.g., is infiltrated by human effector cells). Methods for detecting human effector cells are well known in the art, including, e.g., by IHC. In some embodiments, the cancer display high levels of human effector cells. In some embodiments, human effector cells are one or more of NK cells, macrophages, monocytes. In some embodiments, the cancer is any cancer described herein. In some embodiments, the cancer is non-small cell lung cancer (NSCLC), glioblastoma, neuroblastoma, melanoma, breast carcinoma (e.g. triple-negative breast cancer), gastric cancer, colorectal cancer (CRC), or hepatocellular carcinoma.

In some embodiments of any of the methods of the invention, the cancer displays cells expressing FcR (e.g., is infiltrated by cells expressing FcR). Methods for detecting FcR are well known in the art, including, e.g., by IHC. In some embodiments, the cancer display high levels of cells expressing FcR. In some embodiments, FcR is FeyR. In some embodiments, FcR is activating FcyR. In some embodiments, the cancer is non-small cell lung cancer (NSCLC), glioblastoma, neuroblastoma, melanoma, breast carcinoma (e.g. triple-negative breast cancer), gastric cancer, colorectal cancer (CRC), or hepatocellular carcinoma.

In some embodiments, any of the methods of the invention may further comprise monitoring the responsiveness of the individual to treatment, e.g., with an anti-human OX40 agonist antibody as described herein. In some embodiments, monitoring the responsiveness of an individual to treatment may include measuring the expression level of one or more marker genes in a sample (e.g., a tumor sample) obtained from the individual after treatment. In some embodiments, the individual may be classified as responsive or non-responsive to treatment based on the expression level of one or more marker genes in a sample (e.g., a tumor sample) obtained from the individual, e.g., as compared with a reference. In some embodiments, the one or more marker genes may be selected from CCR5, CD274 (also known as PD-L1), IL-7, TNFRSF14, TGFB 1, CD40, CD4, PRF1, TNFSF4, CD86, CXCL9, CD3E, LAG3, PDCD1, CCL28, GZMB, INFg, and IL-2RA, and an increased expression level (e.g., as compared with a reference) may indicate responsiveness to treatment. In certain embodiments, increased expression of PD-L1 (e.g., as compared with a reference) may indicate responsiveness to treatment. In some embodiments, the one or more marker genes may be selected from CD8b, EOMES, GZMA, GZMB, INFg, and PRF1, and an increased expression level (e.g., as compared with a reference) may indicate responsiveness to treatment.

Without wishing to be bound to theory, it is thought that increased expression of CCR5, CD274 (also known as PD-L1), IL-7, TNFRSF14, TGFB 1, CD40, CD4, PRF1, TNFSF4, CD86, CXCL9, CD3E, LAG3, PDCD1, CCL28, GZMB, INFg, IL-2RA, GZMA, CD8b, and/or EOMES may be associated with increased Teff activity. In other embodiments, the one or more marker genes may be selected
from CCL22, IL-2, RORC, IL-8, CTLA4, and FOXP3, and a decreased expression level (e.g., as compared with a reference) may indicate responsiveness to treatment. Without wishing to be bound to theory, it is thought that decreased expression of CCL22, IL-2, RORC, IL-8, CTLA4, and/or FOXP3 may be associated with decreased Treg activity.

[0492] In some embodiments, any of the methods of the invention may further comprise monitoring efficacy of treatment (e.g., treatment with an anti-human OX40 agonist antibody as described herein). In some embodiments, monitoring the efficacy of treatment in an individual may include measuring the expression level of one or more marker genes in a sample (e.g., a tumor sample) obtained from the individual after treatment. In some embodiments, the treatment may be classified as efficacious based on the expression level of one or more marker genes in a sample (e.g., a tumor sample) obtained from the individual, e.g., as compared with a reference. In some embodiments, the one or more marker genes may be selected from CCR5, CD274 (also known as PD-L1), IL-7, TNFRSF14, TGFB1, CD40, CD4, PRF1, TNFSF4, CD86, CXCL9, CD3E, LAG3, PDCD1, CCL28, GZMB, IFNg, and IL-2RA, and an increased expression level (e.g., as compared with a reference) may indicate treatment efficacy. In certain embodiments, increased expression of PD-L1 (e.g., as compared with a reference) may indicate treatment efficacy. In some embodiments, the one or more marker genes may be selected from CD8b, EOMES, GZMA, GZMB, IFNg, and PRF1, and an increased expression level (e.g., as compared with a reference) may indicate treatment efficacy. Without wishing to be bound to theory, it is thought that increased expression of CCR5, CD274 (also known as PD-L1), IL-7, TNFRSF14, TGFB1, CD40, CD4, PRF1, TNFSF4, CD86, CXCL9, CD3E, LAG3, PDCD1, CCL28, GZMB, IFNg, IL-2RA, GZMA, CD8b, and/or EOMES may be associated with increased Teff activity. In other embodiments, the one or more marker genes may be selected from CCL22, IL-2, RORC, IL-8, CTLA4, and FOXP3, and a decreased expression level (e.g., as compared with a reference) may indicate treatment efficacy. Without wishing to be bound to theory, it is thought that decreased expression of CCL22, IL-2, RORC, IL-8, CTLA4, and/or FOXP3 may be associated with decreased Treg activity.

[0493] In some embodiments, the expression level of one or more marker genes described herein is compared to a reference. In some embodiments, a reference may include a biopsy obtained from the individual before treatment, a biopsy obtained from an untreated individual, or a reference or baseline value. In some embodiments, the reference is the average, mean, or median level of expression of the corresponding marker gene(s) in samples obtained from individuals that have cancer (e.g., the same type of cancer as the individual receiving treatment). In some embodiments, the reference is the average, mean, or median level of expression of the corresponding marker gene in samples from other subjects having cancer who are not responsive to the OX40 agonist treatment after receiving treatment. For example, a set of samples obtained from cancers having a shared characteristic (e.g., the same cancer type and/or stage, or exposure to a common treatment such as an OX40 agonist) may
be studied from a population, such as with a clinical outcome study. This set may be used to derive a reference, e.g., a reference number, to which a subject's sample may be compared.

[0494] In some embodiments, expression level of an mRNA or protein may be normalized to the expression level of a reference gene. Normalizing the expression level of a particular gene to a reference is thought to enhance reproducibility across samples by factoring differences in sample size and/or mRNA/protein extraction. In these examples, expression level relative to the reference is measured. In some embodiments, multiple reference genes may be used, either singly or in aggregate (e.g., by averaging). In other embodiments, expression level of an mRNA or protein may refer to absolute expression level.

[0495] In some embodiments, a reference gene may be a housekeeping gene. A housekeeping gene is thought to be constitutively expressed in a cell in normal and/or pathological states, such as a gene encoding a protein required for basic cellular function and/or maintenance. Housekeeping genes are typically used as a reference to ensure they will be expressed at a detectable and/or reproducible level across multiple samples. Exemplary housekeeping genes and further description of the use of such genes as a reference may be found, for example, in de Kok, J.B., et al. (2005) Lab Invest. 85(1):154-9.

[0496] Certain aspects of the present disclosure relate to measurement of the expression level of one or more genes in a sample. In some embodiments, a sample may include leukocytes. In some embodiments, the sample may be a tumor sample. A tumor sample may include cancer cells, lymphocytes, leukocytes, stroma, blood vessels, connective tissue, basal lamina, and any other cell type in association with the tumor. In some embodiments, the sample is a tumor tissue sample containing tumor-infiltrating leukocytes. As used herein, any leukocyte associated with a tumor may be considered a tumor-infiltrating leukocyte. Examples of tumor-infiltrating leukocytes include without limitation T lymphocytes (such as CD8+ T lymphocytes and/or CD4+ T lymphocytes), B lymphocytes, or other bone marrow-lineage cells including granulocytes (neutrophils, eosinophils, basophils), monocytes, macrophages, dendritic cells (i.e., interdigitating dendritic cells), histiocytes, and natural killer cells. In some embodiments, a tumor-infiltrating leukocyte may be associated with cancer cells of a tumor. In some embodiments, a tumor-infiltrating leukocyte may be associated with tumor stroma. In some embodiments, the tumor samples are enriched for tumor area by macrodissection.

[0497] In some embodiments, the sample may be processed to separate or isolate one or more cell types (e.g., leukocytes). In some embodiments, the sample may be used without separating or isolating cell types. A tumor sample may be obtained from a subject by any method known in the art, including without limitation a biopsy, endoscopy, or surgical procedure. In some embodiments, a tumor sample may be prepared by methods such as freezing, fixation (e.g., by using formalin or a similar fixative), and/or embedding in paraffin wax. In some embodiments, a tumor sample may be sectioned. In some embodiments, a fresh tumor sample (i.e., one that has not been prepared by the
methods described above) may be used. In some embodiments, a sample may be prepared by incubation in a solution to preserve mRNA and/or protein integrity. A tumor sample containing leukocytes may be assayed by any technique described herein for measuring marker gene expression level.

[0498] Certain aspects of the present disclosure relate to measuring the expression level of one or more marker genes. Any suitable method for measuring gene expression known in the art may be used. In some embodiments, expression level may refer to mRNA expression level. mRNA expression level may be measured by many methods. Such methods may quantify the copies of a specific mRNA present in a sample by measuring the amount of hybridization to an mRNA-specific probe. Other methods may amplify mRNA, or cDNA generated from mRNA, and quantify the amount of amplicon generated to extrapolate how much mRNA was present in a sample. Yet other methods may involve next-generation sequencing of part or all of mRNA transcripts, or cDNA generated from mRNA, then quantifying the number of sequences detected that correspond to particular gene(s). In some embodiments, mRNA expression level is measured by quantitative PCR, semi-quantitative PCR, nucleotide microarray, RNA-seq, in situ hybridization, and/or Northern blotting.

[0499] In some embodiments, expression level may refer to protein expression level. Protein expression level may be measured by many methods. Such methods may quantify proteins present in a sample by using a probe that specifically binds to a particular protein, such as an antibody, then detecting the amount of specific binding in a sample. Other methods may fragment proteins into short peptides, then detect these peptides and quantify how many peptides correspond to particular protein(s). In some embodiments, protein expression level is measured by Western blotting, peptide microarray, immunohistochemistry, flow cytometry, and/or mass spectrometry.

[0500] An "individual" according to any of the above embodiments is preferably a human.

[0501] Antibodies of the invention can be used either alone or in combination with other agents in a therapy. For instance, an antibody of the invention may be co-administered with at least one additional therapeutic agent.

[0502] Such combination therapies noted above encompass combined administration (where two or more therapeutic agents are included in the same or separate formulations), and separate administration, in which case, administration of the antibody of the invention can occur prior to, simultaneously, and/or following, administration of the additional therapeutic agent or agents. In one embodiment, administration of the anti-OX40 antibody and administration of an additional therapeutic agent occur within about one month, or within about one, two or three weeks, or within about one, two, three, four, five, or six days, of each other. Antibodies of the invention can also be used in combination with radiation therapy.

[0503] In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with a chemotherapy or chemotherapeutic
agent. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with a radiation therapy or radiotherapeutic agent. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with a targeted therapy or targeted therapeutic agent. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an immunotherapy or immunotherapeutic agent, for example a monoclonal antibody.

[0504] In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with a PARP inhibitor (e.g., Olaparib, Rucaparib, Niraparib, Cediranib, BMN673, Veliparib), Trabectedin, nab-paclitaxel (albumen-bound paclitaxel, ABRAXANE), Trebananib, Pazopanib, Cediranib, Palbociclib, everolimus, fluoropyrimidine (e.g., FOLFOX, FOLFIRI), IFL, regorafenib, Reolysin, Alimta, Zykdia, Sutent, Torisel (temsirilimus), Inlyta (axitinib, Pfizer), Afinitor (everolimus, Novartis), Nexavar (sorafenib, Onyx / Bayer), Votrient, Pazopanib, axitinib, IMA-901, AGS-003, caboazatinib, Vinflunine, Hsp90 inhibitor (e.g., apatorsin), Ad-GM-CSF (CT-0070), Temazolomide, IL-2, IFNa, vinblastine, Thalomid, dacarbazine, cyclophosphamide, lenalidomide, azacytidine, lenalidomide, bortezomid (VELCADE), amrubicine, carfilzomib, pralatrexate, and/or enzastaurin.

[0505] In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an agonist directed against an activating co-stimulatory molecule. In some embodiments, an activating co-stimulatory molecule may include CD40, CD226, CD28, GITR, CD137, CD27, HVEM, or CD127. In some embodiments, the agonist directed against an activating co-stimulatory molecule is an agonist antibody that binds to CD40, CD226, CD28, OX40, GITR, CD137, CD27, HVEM, or CD127. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an antagonist directed against an inhibitory co-stimulatory molecule. In some embodiments, an inhibitory co-stimulatory molecule may include CTLA-4 (also known as CD152), PD-1, TIM-3, BTLA, VISTA, LAG-3, B7-H3, B7-H4, IDO, TIGIT, MICA/B, or arginase. In some embodiments, the antagonist directed against an inhibitory co-stimulatory molecule is an antagonist antibody that binds to CTLA-4, PD-1, TIM-3, BTLA, VISTA, LAG-3 (e.g., LAG-3-IgG fusion protein (IMP321)), B7-H3, B7-H4, IDO, TIGIT, MICA/B, or arginase.

[0506] In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an antagonist directed against CTLA-4 (also known as CD152), e.g., a blocking antibody. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with ipilimumab (also known as MDX-010, MDX-101, or Yervoy®). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with tremelimumab (also known as ticilimumab or CP-
In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an antagonist directed against B7-H3 (also known as CD276), e.g., a blocking antibody. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with MGA271. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an antagonist directed against a TGF beta, e.g., metelimumab (also known as CAT-192), fresolimumab (also known as GC1008), or LY2157299. 

In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with a treatment comprising adoptive transfer of a T cell (e.g., a cytotoxic T cell or CTL) expressing a chimeric antigen receptor (CAR). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with UCART19. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with WT128z. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with KTE-C19 (Kite). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with CTL019 (Novartis). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with a treatment comprising adoptive transfer of a T cell comprising a dominant-negative TGF beta receptor, e.g., a dominant-negative TGF beta type II receptor. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with a treatment comprising a HERCREEM protocol (see, e.g., ClinicalTrials.gov Identifier NCT00889954).

In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an antagonist directed against CD19. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with MOR00208. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an antagonist directed against CD38. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with daratumumab.

In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an agonist directed against CD137 (also known as TNFRSF9, 4-1BB, or ILA), e.g., an activating antibody. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with urelumab (also known as BMS-663513). In some embodiments, an
anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be
administered in conjunction with an agonist directed against CD40, e.g., an activating antibody. In
some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present
disclosure may be administered in conjunction with CP-870893. In some embodiments, an anti-
human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be
administered in conjunction with an agonist directed against OX40 (also known as CD134), e.g., an
activating antibody. In some embodiments, an anti-human OX40 agonist antibody may be
administered in conjunction with a different anti-OX40 antibody (e.g., AgonOX). In some
embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present
disclosure may be administered in conjunction with an agonist directed against CD27, e.g., an
activating antibody. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1
antibody of the present disclosure may be administered in conjunction with CDX-1 127. In some
embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present
disclosure may be administered in conjunction with an antagonist directed against indoleamine-2,3-
dioxygenase (IDO). In some embodiments, with the IDO antagonist is 1-methyl-D-tryptophan (also
known as 1-D-MT).

[0510] In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of
the present disclosure may be administered in conjunction with an agonist directed against CD137
(also known as TNFRSF9, 4-1BB, or ILA), e.g., an activating antibody. In some embodiments, an
anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be
administered in conjunction with urelumab (also known as BMS-663513). In some embodiments, an
anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be
administered in conjunction with an agonist directed against CD40, e.g., an activating antibody. In
some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present
disclosure may be administered in conjunction with CP-870893 or RO7009789. In some
embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present
disclosure may be administered in conjunction with an agonist directed against OX40 (also known as
CD134), e.g., an activating antibody.). In some embodiments, an anti-human OX40 agonist antibody
and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an
agonist directed against CD27, e.g., an activating antibody. In some embodiments, an anti-human
OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in
conjunction with CDX-1 127 (also known as varlilumab). In some embodiments, an anti-human
OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in
conjunction with an antagonist directed against indoleamine-2,3-dioxygenase (IDO). In some
embodiments, with the IDO antagonist is 1-methyl-D-tryptophan (also known as 1-D-MT). In some
embodiments, the IDO antagonist is an IDO antagonist shown in WO2010/005958 (the contents of
which are expressly incorporated by record herein). In some embodiments the IDO antagonist is 4-
(2-[(Aminosulfonyl)amino]ethyl] amino)-N-(3-bromo-4-fluorophenyl)-N'-hydroxy-1,2,5-oxadiazole-3-carboximidamide (e.g., as described in Example 23 of WO2010/005958). In some embodiments the IDO antagonist is

In some embodiments, the IDO antagonist is INCB24360. In some embodiments, the IDO antagonist is Indoximod (the D isomer of 1-methyl-tryptophan). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an antibody-drug conjugate. In some embodiments, the antibody-drug conjugate comprises mertansine or monomethyl auristatin E (MMAE). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an anti-NaPi2b antibody-MMAE conjugate (also known as DNIB0600A, RG7599 or lifastuzumab vedotin). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with trastuzumab emtansine (also known as T-DM1, ado-trastuzumab emtansine, or KADCYLA®, Genentech). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an anti-MUC16 antibody-MMAE conjugate, DMUC5754A. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an anti-MUC16 antibody-MMAE conjugate, DMUC4064A. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an antibody-drug conjugate targeting the endothelin B receptor (EDNBR), e.g., an antibody directed against EDNBR conjugated with MMAE. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an antibody-drug conjugate targeting the lymphocyte antigen 6 complex, locus E (Ly6E), e.g., an antibody directed against Ly6E conjugated with MMAE, (also known as DLYE5953A). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with polatuzumab vedotin. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an antibody-drug conjugate targeting CD30. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with ADCETRIS (also known as brentuximab vedotin). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with polatuzumab vedotin.
In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an angiogenesis inhibitor. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an antibody directed against a VEGF, e.g., VEGF-A. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with bevacizumab (also known as AVASTIN®, Genentech). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an antibody directed against angiopoietin 2 (also known as Ang2). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with MEDI3617. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an antibody directed against VEGFR2. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with ramucirumab. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with aflibercept. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with ziv-aflibercept (also known as VEGF Trap or Zaltrap®). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with a bispecific antibody directed against VEGF and Ang2. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with a PD-1 axis binding antagonist (e.g., a PD-1 binding antagonist such as an anti-PD-1 antibody, a PD-L1 binding antagonist such as an anti-PD-L1 antibody, and a PD-L2 binding antagonist such as an anti-PD-L2 antibody). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with bevacizumab and PD-180 ulpan 2 (nivolumab, OPDIVO). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with bevacizumab and Merck 3475 (MK-3475, pembrolizumab, KEYTRUDA). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with bevacizumab and CT- Oil (Pdilizumab). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with bevacizumab and YW243.55.S70. In some embodiments, an anti-human OX40 agonist antibody may be administered in conjunction with
bevacizumab and MPDL3280A. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with bevacizumab and MEDI4736. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with bevacizumab and MDX-1105.

In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with a antineoplastic agent. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an agent targeting CSF-1R (also known as MCSFR or CD115). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an agent targeting CSF-1R antibody (also known as IMC-CS4 or LY3022855) In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with anti-CSF-1R antibody, RG7155 (also known as RO5509554 or emactuzumab). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an interferon, for example interferon alpha or interferon gamma. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with Roferon-A (also known as recombinant Interferon alpha-2a). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with GM-CSF (also known as recombinant human granulocyte macrophage colony stimulating factor, rhu GM-CSF, sargramostim, or Leukine®). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with IL-2 (also known as aldesleukin or Proleukin®). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with IL-12. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with IL27. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with IL-15. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with ALT-803. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an antibody targeting CD20. In some embodiments, the antibody targeting CD20 is obinutuzumab (also known as GA101 or Gazyva®) or rituximab. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an antibody targeting GITR. In some embodiments, the antibody targeting GITR is TRX518. In some embodiments, the antibody targeting GITR is MK04166 (Merck).
In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an inhibitor of Bruton’s tyrosine kinase (BTK). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with ibrutinib. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an inhibitor of Isocitrate dehydrogenase 1 (IDH1) and/or Isocitrate dehydrogenase 2 (IDH2). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with AG-120 (Agios).

In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with a cancer vaccine. In some embodiments, the cancer vaccine is a peptide cancer vaccine, which in some embodiments is a personalized peptide vaccine. In some embodiments the peptide cancer vaccine is a multivalent long peptide, a multi-peptide, a peptide cocktail, a hybrid peptide, or a peptide-pulsed dendritic cell vaccine (see, e.g., Yamada et al., Cancer Sci, 104:14-21, 2013). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an adjuvant. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with a treatment comprising a TLR agonist, e.g., Poly-ICLC (also known as Hiltonol®), LPS, MPL, or CpG ODN. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with tumor necrosis factor (TNF) alpha. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with HMGB1. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an IL-10 antagonist. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an IL-4 antagonist. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an IL-13 antagonist. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an IL-17 antagonist. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an HVEM antagonist. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an ICOS agonist, e.g., by administration of ICOS-L, or an agonistic antibody directed against ICOS. In some embodiments, an anti-human OX40 agonist antibody may be administered in conjunction with a
treatment targeting CX3CL1. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with a treatment targeting CXCL9. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with a treatment targeting CXCL10. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with a treatment targeting CCL5. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an LFA-1 or ICAM1 agonist. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with a Selectin agonist.

[0515] In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an inhibitor of B-Raf. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with vemurafenib (also known as Zelboraf®). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with dabrafenib (also known as Tafinlar®). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with encorafenib (LGX818).

[0516] In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an EGFR inhibitor. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with erlotinib (also known as Tarceva®). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an inhibitor of EGFR-T790M. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with gefitinib. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with afatinib. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with cetuximab (also known as Erbitux®). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with panitumumab (also known as Vectibix®). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with rociletinib. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with AZD9291. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an inhibitor of a MEK, such as MEKI (also known as MAP2K1) and/or MEK2 (also
known as MAP2K2). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with cobimetinib (also known as GDC-0973 or XL-518). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with trametinib (also known as Mekinst®). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with with binimetinib.

In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction an inhibitor of B-Raf (e.g., vemurafenib or dabrafenib) and an inhibitor of MEK (e.g., MEK1 and/or MEK2 (e.g., cobimetinib or trametinib). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an inhibitor of ERK (e.g., ERK1/2). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an inhibitor of B-Raf, an inhibitor of MEK, and an inhibitor of ERK1/2. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an inhibitor of EGFR, an inhibitor of MEK, and an inhibitor of ERK1/2. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with one or more MAP kinase pathway inhibitor. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with CK127. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an inhibitor of K-Ras.

In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an inhibitor of c-Met. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with onartuzumab (also known as MetMAb). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an inhibitor of anaplastic lymphoma kinase (ALK). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with AF802 (also known as CH5424802 or alectinib). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with crizotinib. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with ceritinib. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an inhibitor of a phosphatidylinositol 3-kinase (PI3K). In some embodiments, an anti-human
OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with buparlisib (BKM-120). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with piktisib (also known as GDC-0941). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with buparlisib (also known as BKM-120). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with perifosine (also known as KRX-0401). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with a delta-selective inhibitor of a phosphatidylinositol 3-kinase (PI3K). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with idealalisib (also known as GS-1101 or CAL-101). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with taselisib (also known as GDC-0032). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with BYL-719. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an inhibitor of an Akt. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with MK2206. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with GSK690693. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with ipatasertib (also known as GDC-0068). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an inhibitor of mTOR. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with sirolimus (also known as rapamycin). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with temsirolimus (also known as CCI-779 or Torisel®). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with everolimus (also known as RAD001). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with ridaforolimus (also known as AP-23573, MK-8669, or deforolimus). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with OSI-027. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with AZD8055. In some embodiments, an anti-human OX40 agonist
antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with INK128. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with a dual PI3K/mTOR inhibitor. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with XL765. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with GDC-0980. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with BEZ235 (also known as NVP-BEZ235). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with BGT226. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with GSK2126458. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with PF-04691502. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with PF-05212384 (also known as PKI-587).

[0519] In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an agent that selectively degrades the estrogen receptor. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with GDC-0927. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with duligotuzumab. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an inhibitor of LSD1. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an inhibitor of MDM2. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an inhibitor of BCL2. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with venetoclax. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an inhibitor of CHK1. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with GDC-0575. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an inhibitor of activated hedgehog.
signaling pathway. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with ERIVEDGE.

[0520] In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with radiation therapy. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with gemcitabine. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with nab-paclitaxel (ABRAXANE). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with trastuzumab. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with TVEC. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with IL27. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with cyclophosphamide. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an agent that recruits T cells to the tumor. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with lirilumab (IPH2102/BMS-986015). In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with Idelalisib. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with an oncolytic virus. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with carboplatin and nab-paclitaxel. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction with cisplatin and pemetrexed. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1 antibody of the present disclosure may be administered in
conjunction with cisplatin and gemcitabine. In some embodiments, an anti-human OX40 agonist
antibody and/or anti-PDL1 antibody of the present disclosure may be administered in conjunction
with FOLFOX. In some embodiments, an anti-human OX40 agonist antibody and/or anti-PDL1
antibody of the present disclosure may be administered in conjunction with FOLFIRI.

0522] Such combination therapies noted above encompass combined administration (where two
or more therapeutic agents are included in the same or separate formulations), and separate
administration, in which case, administration of the one or more antibodies of the invention can occur
prior to, simultaneously, and/or following, administration of the additional therapeutic agent and/or
adjuvant. Antibodies of the invention can also be used in combination with radiation therapy.

0523] An antibody of the invention (and any additional therapeutic agent) can be administered by
any suitable means, including parenteral, intrapulmonary, and intranasal, and, if desired for local
treatment, intralesional administration. Parenteral infusions include intramuscular, intravenous,
intraarterial, intraperitoneal, or subcutaneous administration. Dosing can be by any suitable route, e.g.
by injections, such as intravenous or subcutaneous injections, depending in part on whether the
administration is brief or chronic. Various dosing schedules including but not limited to single or
multiple administrations over various time-points, bolus administration, and pulse infusion are
contemplated herein.

0524] In certain embodiments, the antibody is administered intravenously. In some embodiments,
the antibody is administered by intravenous infusion. For example, the antibody may be delivered via
intravenous infusion over approximately 90 minutes, approximately 60 minutes, or approximately 30
minutes. In some embodiments, if a patient tolerates an infusion over a particular duration (e.g. a 90
minute infusion), subsequent infusions may be administered over a shorter duration (e.g. 30 or 60
minutes). Infusions may be slowed or interrupted for infusion-associated symptoms.

0525] Antibodies of the invention would be formulated, dosed, and administered in a fashion
consistent with good medical practice. Factors for consideration in this context include the particular
disorder being treated, the particular mammal being treated, the clinical condition of the individual
patient, the cause of the disorder, the site of delivery of the agent, the method of administration, the
scheduling of administration, and other factors known to medical practitioners. The antibody need
not be, but is optionally formulated with one or more agents currently used to prevent or treat the
disorder in question. The effective amount of such other agents depends on the amount of antibody
present in the formulation, the type of disorder or treatment, and other factors discussed above. These
are generally used in the same dosages and with administration routes as described herein, or about
from 1 to 99% of the dosages described herein, or in any dosage and by any route that is
empirically/clinically determined to be appropriate.

0526] For the prevention or treatment of disease, the appropriate dosage of an antibody of the
invention (when used alone or in combination with one or more other additional therapeutic agents)
will depend on the type of disease to be treated, the type of antibody, the severity and course of the

150
disease, whether the antibody is administered for preventive or therapeutic purposes, previous therapy, the patient's clinical history and response to the antibody, and the discretion of the attending physician. The antibody is suitably administered to the patient at one time or over a series of treatments. Depending on the type and severity of the disease, about 1 μg/kg to 40 mg/kg of antibody can be an initial candidate dosage for administration to the patient, whether, for example, by one or more separate administrations, or by continuous infusion. One typical daily dosage might range from about 1 μg/kg to 100 mg/kg or more, depending on the factors mentioned above. For repeated administrations over several days or longer, depending on the condition, the treatment would generally be sustained until a desired suppression of disease symptoms occurs. Such doses may be administered intermittently, e.g. every week or every three weeks (e.g. such that the patient receives from about two to about twenty, or e.g. about six doses of the antibody). An initial higher loading dose, followed by one or more lower doses may be administered. However, other dosage regimens may be useful. The progress of this therapy is easily monitored by conventional techniques and assays.

[0527] It is understood that any of the above formulations or therapeutic methods may be carried out using an immunoconjugate of the invention in place of or in addition to an anti-OX40 antibody and/or anti-PD1 antibody of the present disclosure.

III. Articles of Manufacture and Kits

[0528] In another aspect of the invention, an article of manufacture or kit containing materials useful for the treatment, prevention and/or diagnosis of the disorders described above is provided. The article of manufacture comprises a container and a label or package insert on or associated with the container. Suitable containers include, for example, bottles, vials, syringes, IV solution bags, etc. The containers may be formed from a variety of materials such as glass or plastic. The container holds a composition which is by itself or combined with another composition effective for treating, preventing and/or diagnosing the condition and may have a sterile access port (for example the container may be an intravenous solution bag or a vial having a stopper pierceable by a hypodermic injection needle). At least one active agent in the composition is an antibody of the invention. The label or package insert indicates that the composition is used for treating the condition of choice. Moreover, the article of manufacture may comprise (a) a first container with a composition contained therein, wherein the composition comprises an antibody of the invention; and (b) a second container with a composition contained therein, wherein the composition comprises a further cytotoxic or otherwise therapeutic agent. The article of manufacture in this embodiment of the invention may further comprise a package insert indicating that the compositions can be used to treat a particular condition. Alternatively, or additionally, the article of manufacture may further comprise a second (or third) container comprising a pharmaceutically-acceptable buffer, such as bacteriostatic water for
injection (BWFI), phosphate-buffered saline, Ringer's solution and dextrose solution. It may further include other materials desirable from a commercial and user standpoint, including other buffers, diluents, filters, needles, and syringes.

**[0529]** In some embodiments, the article of manufacture or kit contains a container including an anti-human OX40 agonist antibody of the present disclosure for administration at a dose described herein, e.g., a dose selected from about 0.8mg, about 3.2mg, about 12mg, about 40mg, about 130mg, about 400mg, and about 1200mg. In some embodiments, the article of manufacture or kit contains a container including an anti-PDL1 antibody of the present disclosure for administration at a dose described herein, e.g., a dose of about 1200mg. For example, the container may contain an amount of antibody higher than the intended dose, e.g., to account for incomplete transfer of the antibody during administration. In some embodiments, the article of manufacture or kit contains a container including an anti-VEGF antibody of the present disclosure for administration at a dose described herein, e.g., a dose of about 15mg/kg.

**[0530]** In some embodiments, provided herein is a kit comprising a medicament comprising an anti-human OX40 agonist antibody and/or an anti-PDL1 antibody described herein and/or an anti-VEGF antibody described herein and an optional pharmaceutically acceptable carrier. In some embodiments, the kit further comprises instructions for administration of the medicament for treatment of cancer.

**[0531]** It is understood that any of the above articles of manufacture may include an immunoconjugate of the invention in place of or in addition to an anti-OX40 antibody and/or an anti-PDL1 antibody.

**Example 1: A Phase I Dose Escalation Study of the Safety and Pharmacokinetics of MOXR0916 and MPDL3280A in Patients with Locally Advanced or Metastatic Solid Tumors**

**Study Design**

This is a Phase Ib, open-label, multicenter, dose-escalation study designed to evaluate the safety, tolerability, and pharmacokinetics of the combination of MOXR0916 (1A7, gr 1 IgGl) and MPDL3280A in patients with locally advanced, recurrent, or metastatic incurable solid malignancy that has progressed after available standard therapy; or for which standard therapy has proven to be ineffective or intolerable, or is considered inappropriate; or for which a clinical trial of an investigational agent is a recognized standard of care. Approximately 184-360 patients may be enrolled in this study at approximately 30 study centers globally.
This study includes a screening period, a treatment period, and a post-treatment follow-up period. Patients may be enrolled in two stages: a dose-escalation stage and an expansion stage (FIG. 1).

As described in greater detail below, MOXR0916 and MPDL3280A are each administered by intravenous (IV) infusion on Day 1 of 21-day cycles. In the absence of unacceptable toxicity or clinically compelling disease progression, treatment with both agents may be continued beyond Cycle 1 based on a favorable assessment of benefit and risk by the investigator.

All adverse events (AEs) may be monitored and recorded for at least 90 days after the last dose of study treatment or until initiation of another systemic anti-cancer therapy, whichever occurs first. After this period, the Sponsor should be notified if the investigator becomes aware of any serious adverse events if the event is believed to be related to prior study drug treatment. Adverse events may be graded according to National Cancer Institute Common Terminology Criteria for Adverse Events Version 4 (NCI CTCAE v4.0).

To characterize the pharmacokinetic (PK) properties of MOXR0916 and MPDL3280A and pharmacodynamic responses to treatment, blood samples are taken at various timepoints before and after dosing. Patients undergo tumor assessments at screening and during the study. Patients may be permitted to continue study treatment even if standard RECIST v1.1 criteria for progressive disease are met, provided they meet the criteria for continued treatment. All patients who discontinue MOXR0916 and MPDL3280A for reasons other than disease progression (e.g., adverse events) continue tumor assessments. Patients who discontinue MOXR0916 and MPDL3280A may return to the clinic for a treatment discontinuation visit within 30 days after the last dose of study treatment. All patients may be followed for survival and subsequent anti-cancer therapy information approximately every 3 months until death, loss to follow-up, or study termination, unless the patient requests to be withdrawn from follow-up.

Study Objectives

The primary objective for this study is to evaluate the safety and tolerability of the combination of MOXR0916 and MPDL3280A in patients with locally advanced or metastatic solid tumors.

The secondary objectives for this study are as follows:

(a) To estimate the maximum tolerated dose (MTD) of MOXR0916 when administered in combination with MPDL3280A and to characterize the dose-limiting toxicities (DLTs);
(b) To identify a recommended Phase II dose for MOXR0916 administered in combination with MPDL3280A;
(c) To characterize the pharmacokinetics of MOXR0916 and MPDL3280A when administered in combination;
(d) To characterize the immunogenic potential of MOXR0916 and MPDL3280A when administered in combination by measuring anti-MOXR0916 and anti-MPDL3280A antibodies, respectively, and assessing their relationship with other outcome measures; and

(e) To make a preliminary assessment of the anti-tumor activity of the combination of MOXR0916 and MPDL3280A in patients with locally advanced or metastatic solid tumors.

The exploratory objectives for this study are as follows:

(a) To make a preliminary assessment of biomarkers that might act as pharmacodynamic indicators of activity of the combination of MOXR0916 and MPDL3280A in patients with locally advanced or metastatic solid tumors; and

(b) To make a preliminary assessment of biomarkers that might act as predictors of anti-tumor activity of the combination of MOXR0916 and MPDL3280A in patients with locally advanced or metastatic solid tumors.

**Study Population**

Patients must meet the following criteria for study entry, which include cancer-specific (both general and specific for the dose-expansion stage) and general inclusion criteria.

**Cancer-specific inclusion criteria include the following:**

(a) Histologic documentation of locally advanced, recurrent or metastatic incurable solid malignancy that has progressed after available standard therapy; or for which standard therapy has proven to be ineffective or intolerable, or is considered inappropriate; or for which a clinical trial of an investigational agent is a recognized standard of care;

(b) Confirmed availability of representative tumor specimens in paraffin blocks (preferred) or ≥ 15 unstained slides, with an associated pathology report. Acceptable samples include core needle biopsies for deep tumor tissue (minimum three cores) or excisional, incisional, punch, or forceps biopsies for cutaneous, subcutaneous, or mucosal lesions. Fine-needle aspiration, brushing, cell pellet from effusions or ascites, and lavage samples are not acceptable. Tumor tissue from bone metastases is not evaluable for PD-L1 expression and is therefore not acceptable. If adequate tissue from distinct time points (such as time of initial diagnosis and time of disease recurrence) and/or multiple metastatic tumors is available, priority should be given to the tissue most recently collected (ideally subsequent to the most recent systemic therapy). Multiple samples may be collected for a given patient, on the basis of availability; however, the requirement for a block or ≥ 15 unstained slides should be satisfied by a single biopsy or resection specimen. Prior to signing the main study informed consent form, patients may sign a pre-screening consent form to specifically allow the collection and testing of archival or fresh tumor specimens. A patient with insufficient or unavailable archival tissue may be eligible, upon discussion with the Medical Monitor, if the patient meets any of the following:

- Can provide at least 10 unstained, serial slides; Is willing to consent to and undergo a pretreatment
core, punch, or excisional/incisional biopsy sample collection of the tumor; or Is to be enrolled in a dose-escalation cohort; and

In some embodiments, modified RECIST criteria may be used to evaluate tumor response. Modified Response Evaluation Criteria in Solid Tumors (RECIST) is derived from RECIST, Version 1.1 (v1.1) conventions (see, e.g., Eisenhauer, E.A. et al. (2009) Eur. J. Cancer 45:228-247) and immune-related response criteria (irRC; see, e.g., Wolchok et al. (2009) Clin. Can. Res. 15:7412-7420; Nishino et al. (2014) J. Immunother. Can. 2:17; and Nishino et al. (2013) Clin. Can. Res. 19:3936-3943). Conventional response criteria may not be adequate to characterize the anti-tumor activity of immunotherapeutic agents like MPDL3280A, which can produce delayed responses that may be preceded by initial apparent radiographic progression, including the appearance of new lesions. Therefore, modified response criteria have been developed that account for the possible appearance of new lesions and allow radiological progression to be confirmed at a subsequent assessment. For a summary of the changes between modified RECIST and RECIST v1.1, see Table B above.

When not otherwise specified, RECIST v1.1 conventions apply. Briefly, modified RECIST criteria for determining objective tumor response for target lesions include:
(a) Complete response (CR): disappearance of all target and non-target lesions. Lymph nodes that shrink to < 10 mm short axis are considered normal;
(b) Partial response (PR): at least a 30% decrease in the sum of the diameters of all target and all new measurable lesions, taking as reference the baseline sum of diameters, in the absence of CR. Note: the appearance of new measurable lesions is factored into the overall tumor burden, but does not automatically qualify as progressive disease until the sum of the diameters increases by ≥ 20% when compared with the sum of the diameters at nadir;
(c) Progressive disease (PD): at least a 20% increase in the sum of diameters of all target and selected new measurable lesions, taking as reference the smallest sum on study (nadir SLD; this includes the baseline sum if that is the smallest on study). In addition to the relative increase of 20%, the sum must also demonstrate an absolute increase of at least 5 mm; and
(d) Stable disease (SD): neither sufficient shrinkage to qualify for PR nor sufficient increase to qualify for PD, taking as reference the smallest sum of the diameters while on study.

The assessment of non-target lesions may be captured on the CRF at each timepoint using standard RECIST v1.1 definitions of CR, non-CR/non-PD, and PD (unequivocal progression). However, in determining the overall modified RECIST tumor response, non-target lesions contribute only to the assessment of a complete response. Non-target lesions are not considered in the overall definition of PR, SC, or PD per modified RECIST.
New lesions alone do not qualify as progressive disease. However, their contribution to total tumor burden is included in the sum of the diameters, which is used to determine the overall modified RECIST tumor response.

Cancer-specific inclusion criteria unique to patients in the dose-expansion stage include the following:

(a) **Expansion Part I biopsy cohort:** Accessible lesion(s) that permit a total of at least two biopsies (pretreatment and on-treatment) without unacceptable risk of a significant procedural complication. Acceptable samples include core needle biopsies for deep tumor tissue or lymph nodes or excisional, incisional, punch, or forceps biopsies for cutaneous, subcutaneous, or mucosal lesions. Fine needle aspirates, cell pellets from effusions or ascites, lavage samples, and bone biopsies are not permitted. Target lesions considered for core needle biopsies should be deemed suitable for retrieval of at least three cores at a given timepoint (minimum diameter 18-gauge). If multiple lesions are available, it is preferable to obtain the on-treatment biopsy from the same lesion (or organ) as the pretreatment biopsy, if feasible, to avoid introduction of heterogeneity related to site of metastasis;

(b) **Expansion Part II biopsy cohort:** Cutaneous or subcutaneous tumors $\geq 5$ mm in diameter amenable to serial biopsy (pretreatment and on-treatment) by excisional, incisional or punch biopsies without unacceptable risk of a major procedural complication. If more than one biopsy is planned to be taken from one lesion, the lesion must be large enough to permit successive biopsies $\geq 1$ cm apart. If multiple lesions are available, it is preferable to obtain the on-treatment biopsy from the same lesion (or organ) as the pretreatment biopsy, if feasible, to avoid introduction of heterogeneity related to site of metastasis;

(c) **Melanoma cohort:** Histologically confirmed incurable, advanced metastatic melanoma (patients whose tumors have a known BRAF V600 mutation must also have experienced disease progression, during or after treatment, or intolerance to treatment with a BRAF and/or mitogen-activated protein kinase kinase (MEK) kinase inhibitor);

(d) **RCC cohort:** Histologically confirmed incurable, advanced RCC with component of clear cell histology and/or component of sarcomatoid histology;

(e) **TNBC cohort:** Histologically confirmed incurable, advanced estrogen receptor-, progesterone receptor-, and human epidermal growth factor receptor 2 (HER2)-negative (triple-negative) adenocarcinoma of the breast, as defined by the American Society of Clinical Oncology College of American Pathologists (ASCO-CAP) guidelines:

(i) $< 1\%$ of tumor cell nuclei are immunoreactive for estrogen receptor and $< 1\%$ of tumor cell nuclei are immunoreactive for progesterone receptor (Hammond, M.E. *et al.* (2010) *J. Clin. Oncol.* 28:2784-2795) AND

(ii) HER2 tests demonstrate either immunohistochemistry (IHC) 1+, IHC 0 or in situ hybridization (ISH) negative (Wolff, A.C. *et al.* (2013) *J. Clin. Oncol.* 31:3997:4013);
Note: Submitted archival tumor tissue must be evaluated for PD-L1 expression prior to enrollment. Patients whose tumor tissue is not evaluable for PD-L1 expression are not eligible. If multiple tumor specimens are submitted (e.g., an archival specimen and tissue from relapsed disease), patients may be eligible if at least one specimen is evaluable for PD-L1. In the event that enrollment (i.e., beyond approximately 20 patients) is limited to PD-L1 selected patients, the PD-L1 score of the patient may be the maximum PD-L1 score among the samples;

(f) **NSCLC cohort:** Histologically confirmed incurable, advanced NSCLC:
   (i) Patients whose tumors have a known sensitizing epidermal growth factor receptor (EGFR) mutation must also have experienced disease progression (during or after treatment) or intolerance to treatment with an EGFR tyrosine kinase inhibitor;
   (ii) Patients whose tumors have a known anaplastic lymphoma kinase (ALK) rearrangement must also have experienced disease progression (during or after treatment) or intolerance to treatment with an ALK tyrosine kinase inhibitor;

Note: Submitted archival tumor tissue must be evaluated for PD-L1 expression prior to enrollment. Patients whose tumor tissue is not evaluable for PD-L1 expression are not eligible. If multiple tumor specimens are submitted (e.g., an archival specimen and tissue from relapsed disease), patients may be eligible if at least one specimen is evaluable for PD-L1. In the event that enrollment (i.e., beyond approximately 20 patients) is limited to PD-L1 selected patients, the PD-L1 score of the patient may be the maximum PD-L1 score among the samples;

(g) **UBC cohort:** Histologically confirmed incurable, advanced transitional cell carcinoma of the urothelium (including renal pelvis, ureters, urinary bladder, urethra) (Patients with mixed histologies are required to have a dominant transitional cell pattern). Note: Submitted archival tumor tissue must be evaluated for PD-L1 expression prior to enrollment. Patients whose tumor tissue is not evaluable for PD-L1 expression are not eligible. If multiple tumor specimens are submitted (e.g., an archival specimen and tissue from relapsed disease), patients may be eligible if at least one specimen is evaluable for PD-L1. In the event that enrollment (i.e., beyond approximately 20 patients) is limited to PD-L1 selected patients, the PD-L1 score of the patient may be the maximum PD-L1 score among the samples;

(h) **CRC cohort:** Histologically confirmed incurable, advanced adenocarcinoma of the colon or rectum (Tumors of appendiceal origin are not eligible). At least 5 patients with microsatellite instability-high (MSI-H) tumors (e.g., as described above) by local laboratory testing may be enrolled in this cohort; and

(i) **OC cohort:** Histologically confirmed incurable, advanced epithelial ovarian, fallopian tube, or primary peritoneal cancer. Borderline ovarian epithelial neoplasms (e.g., tumors of low malignant potential, atypical proliferative tumors) are excluded.

**0547** General inclusion criteria include the following:

(a) Age ≥ 18 years;
(b) Eastern Cooperative Oncology Group (ECOG) performance status of 0 or 1 (see Table C below for a description of this 0-5 point scale);
(c) Life expectancy ≥ 12 weeks;
(d) Adequate hematologic and end organ function, defined by the following laboratory results obtained within 14 days prior to the first study treatment (Cycle 1, Day 1):
   (i) Absolute neutrophil count (ANC) ≥ 1500 cells/µL;
   (ii) White blood cell (WBC) counts ≥ 2,500/µL;
   (iii) Lymphocyte count ≥ 500/µL;
   (iv) Platelet count ≥ 100,000/µL (without transfusion within 14 days prior to Cycle 1, Day 1);
   (v) Hemoglobin ≥ 9.0 g/dL (patients may be transfused or receive erythropoietic treatment to meet this criterion);
   (vi) Total bilirubin ≤ 1.5 x upper limit of normal (ULN);
   (vii) Aspartate aminotransferase (AST) and alanine aminotransferase (ALT) ≤ 3.0 x ULN
   (viii) Alkaline phosphatase ≤ 2.5 x ULN with the following exception: Patients with documented liver or bone metastases: alkaline phosphatase ≤ 5 x ULN;
   (ix) Serum albumin ≥ 2.5 g/dL;
   (x) Prothrombin time (PT) and activated partial thromboplastin time (aPTT) ≤ 1.5 x ULN
   (This applies only to patients who do not receive therapeutic anticoagulation; patients receiving therapeutic anticoagulation should be on a stable dose);
   (xi) Measured or calculated creatinine clearance ≥ 50 mL/min on the basis of the Cockcroft-Gault glomerular filtration rate estimation:
   \[(140 - \text{age}) \times (\text{weight in kg}) \times (0.85 \text{ if female}) \]
   \[72 \times (\text{serum creatinine in mg/dL})\]
   (e) Serum pregnancy test for women of childbearing potential (including women who have had a tubal ligation) must be performed and documented as negative within 14 days prior to Cycle 1, Day 1;
(f) For women who are not postmenopausal (> 12 months of non-therapy-induced amenorrhea) or surgically sterile (absence of ovaries and/or uterus): agreement to remain abstinent or use single or combined contraceptive methods that result in a failure rate of < 1% per year during the treatment period and for at least 90 days after the last dose of study drug. Abstinence is only acceptable if it is in line with the preferred and usual lifestyle of the patient. Periodic abstinence (e.g., calendar, ovulation, symptothermal, or postovulation methods) and withdrawal are not acceptable methods of contraception. Examples of contraceptive methods with a failure rate of < 1% per year include tubal ligation, male sterilization, hormonal implants, established, proper use of combined oral or injected hormonal contraceptives, and certain intrauterine devices. Alternatively, two methods (e.g., two
barrier methods such as a condom and a cervical cap) may be combined to achieve a failure rate of < 1% per year. Barrier methods must always be supplemented with the use of a spermicide.

(g) For men: agreement to remain abstinent or use a condom plus an additional contraceptive method that together result in a failure rate of < 1% per year during the treatment period and for at least 90 days after the last dose of study drug and agreement to refrain from donating sperm during this same period. Men with a pregnant partner must agree to remain abstinent or use a condom for the duration of the pregnancy. Abstinence is only acceptable if it is in line with the preferred and usual lifestyle of the patient. Periodic abstinence (e.g., calendar, ovulation, symptothermal, or postovulation methods) and withdrawal are not acceptable methods of contraception.

[0548] In addition, patients who meet any of the following exclusion criteria are excluded from study entry. Types of exclusion criteria include cancer-specific, treatment-specific, and general exclusion criteria.

[0549] Cancer-specific exclusion criteria include the following:

(a) Any anti-cancer therapy, including chemotherapy, hormonal therapy, or radiotherapy, within 3 weeks prior to initiation of study treatment, with the following exceptions:

(i) Hormonal therapy with gonadotropin-releasing hormone (GnRH) agonists or antagonists for prostate cancer;

(ii) Hormone-replacement therapy or oral contraceptives;

(iii) Herbal therapy > 1 week before Cycle 1, Day 1 (herbal therapy intended as anti-cancer therapy must be discontinued at least 1 week before Cycle 1, Day 1);

(iv) Palliative radiotherapy for painful metastases or metastases in potentially sensitive locations (e.g., epidural space) > 2 weeks prior to Cycle 1, Day 1;

(v) Tyrosine kinase inhibitors (TKIs) approved for treatment of NSCLC that have been discontinued > 7 days prior to Cycle 1, Day 1. Baseline scans must be obtained after discontinuation of prior TKIs;

(b) Eligibility based on prior treatment with cancer immunotherapy (CIT) depends on the mechanistic class of the drug and the cohort for which the patient is being considered, as described below:
(i) Dose-escalation cohorts: Prior treatment with immunomodulatory monoclonal antibodies (mAbs) or mAb-derived therapies is allowed provided that no immune-related Grade ≥ 3 adverse events (other than Grade 3 endocrinopathy managed with replacement therapy) were observed and at least 5 elimination half-lives of the drug have elapsed between the last dose of prior treatment and the proposed Cycle 1, Day 1;

(ii) Expansion cohorts other than Part I and Part II biopsy cohorts: Prior treatment with immunomodulatory monoclonal antibodies (mAbs) or mAb-derived therapies is allowed provided that no immune-related Grade ≥ 3 adverse events (other than Grade 3 endocrinopathy managed with replacement therapy) were observed and at least 6 weeks have elapsed between the last dose of prior treatment and the proposed Cycle 1, Day 1. with the following exceptions: prior OX40 agonists are not allowed, and prior PD-L1/PD-1 pathway inhibitors are not allowed;

(iii) All cohorts: Prior treatment with cancer vaccines, cytokines, toll-like receptor (TLR) agonists, and inhibitors of indoleamine 2,3-dioxygenase or tryptophan-2,3-dioxygenase (IDO/TDO) is allowed provided that no immune-related Grade ≥ 3 adverse events (other than Grade 3 endocrinopathy managed with replacement therapy) were observed and at least 6 weeks or 5 half-lives of the drug, whichever is shorter, have elapsed between the last dose and the proposed Cycle 1, Day 1. Minimum washout is 3 weeks for any prior systemic cancer therapy. CIT not explicitly described in this protocol should be discussed with the Medical Monitor to determine potential eligibility;

(iv) Serial biopsy cohorts: Prior treatment with immunomodulatory monoclonal antibodies (mAbs) or mAb-derived therapies is allowed provided that no immune-related Grade ≥ 3 adverse events (other than Grade 3 endocrinopathy managed with replacement therapy) were observed and at least 6 weeks have elapsed between the last dose of prior treatment and the proposed Cycle 1, Day 1. The treatment history of patients enrolling in the Expansion Part I and Expansion Part II serial biopsy cohorts may be monitored such that approximately half of the patients in each cohort are naïve to prior OX40 and PD-L1/PD-1 pathway agents;

c) Adverse events from prior anti-cancer therapy that have not resolved to Grade ≤ 1 except for alopecia or endocrinopathy managed with replacement therapy. Any Grade ≤ 2 immune-related adverse event related to prior immunomodulatory therapy must have resolved completely. Patients treated with corticosteroids for immune-related adverse events must demonstrate absence of related symptoms or signs for ≥ 4 weeks following discontinuation of corticosteroids;

d) Primary central nervous system (CNS) malignancy, or untreated/active CNS metastases (progressing or requiring anticonvulsants or corticosteroids for symptomatic control);

(i) Patients with a history of treated CNS metastases are eligible, provided they meet all of the following criteria: measurable disease outside the CNS; radiographic demonstration of improvement upon the completion of CNS-directed therapy and no evidence of interim progression between the completion of CNS-directed therapy and the screening radiographic study; the screening CNS radiographic study is ≥ 4 weeks since completion of radiotherapy; corticosteroids and
anticonvulsants discontinued for ≥ 2 weeks prior to enrollment with no ongoing symptoms attributable to CNS metastases (anticonvulsants at a stable dose are allowed); (e) Leptomeningeal disease; (f) Uncontrolled tumor-related pain: 
   (i) Symptomatic lesions amenable to palliative radiotherapy (e.g., bone metastases or metastases causing nerve impingement) should be treated prior to enrollment; and
   (ii) Asymptomatic metastatic lesions whose further growth would likely cause functional deficits or intractable pain (e.g., epidural metastasis that is not currently associated with spinal cord compression) should be considered for loco-regional therapy if appropriate prior to enrollment; (g) Uncontrolled pleural effusion, pericardial effusion, or ascites requiring recurrent drainage procedures (once monthly or more frequently) (Patients with indwelling catheters, e.g., PleurX, are allowed); (h) Malignancies other than disease under study within 5 years prior to Cycle 1, Day 1, with the exception of those with a negligible risk of metastasis or death (such as adequately treated carcinoma in situ of the cervix, basal or squamous cell skin cancer, localized prostate cancer, or ductal carcinoma in situ).

**[0550] Treatment-specific exclusion criteria include the following:**
(a) History of autoimmune disease, including but not limited to systemic lupus erythematosus, rheumatoid arthritis, inflammatory bowel disease, vascular thrombosis associated with antiphospholipid syndrome, Wegener’s granulomatosis, Sjogren’s syndrome, Bell’s palsy, Guillain-Barre syndrome, multiple sclerosis, vasculitis, or glomerulonephritis, with the following caveats:
   (i) Patients with a history of autoimmune hypothyroidism on a stable dose of thyroid replacement hormone may be eligible;
   (ii) Patients with stable vitiligo may be eligible;
(b) Treatment with systemic immunosuppressive medications (including but not limited to prednisone, cyclophosphamide, azathioprine, methotrexate, thalidomide, and TNFa antagonists) within 2 weeks prior to Cycle 1, Day 1.
(c) Patients who have received acute, low-dose, systemic immunosuppressant medications (e.g., a one-time dose of dexamethasone for nausea) may be enrolled in the study after discussion with and approval by the Medical Monitor:
   (i) The use of inhaled corticosteroids is allowed;
   (ii) The use of mineralocorticoids (e.g., fludrocortisone) for patients with orthostatic hypotension is allowed; and
   (iii) Physiologic doses of corticosteroids for adrenal insufficiency are allowed;
(d) History of idiopathic pulmonary fibrosis, pneumonitis (including drug induced), organizing pneumonia (i.e., bronchiolitis obliterans, cryptogenic organizing pneumonia, etc.), or evidence of
active pneumonitis on screening chest CT scan (History of radiation pneumonitis in the radiation field (fibrosis) is permitted);
(e) Positive test for HIV infection;
(f) Active hepatitis B (defined as having a positive hepatitis B surface antigen [HBsAg] test at screening). Patients with past or resolved hepatitis B infection (defined as having a negative HBsAg test and a positive IgG antibody to hepatitis B core antigen [anti-HBc]) are eligible;
(g) Active hepatitis C (Patients positive for hepatitis C virus (HCV) antibody are eligible only if PCR is negative for HCV RNA);
(h) Active tuberculosis;
(i) Severe infections within 4 weeks prior to Cycle 1, Day 1, including but not limited to hospitalization for complications of infection, bacteremia, or severe pneumonia;
(j) Signs or symptoms of infection within 2 weeks prior to Cycle 1, Day 1:
(k) Received oral or IV antibiotics within 2 weeks prior to Cycle 1, Day 1. Patients receiving prophylactic antibiotics (e.g., for prevention of a urinary tract infection or chronic obstructive pulmonary disease) are eligible;
(l) Prior allogeneic bone marrow transplantation or prior solid organ transplantation;
(m) Administration of a live, attenuated vaccine within 4 weeks before Cycle 1, Day 1 or anticipation that such a live attenuated vaccine may be required during the study. Influenza vaccination should be given during influenza season only. Patients must not receive live, attenuated influenza vaccine (e.g., FluMist®) within 4 weeks prior to Cycle 1, Day 1 or at any time during the study;
(n) History of severe allergic, anaphylactic, or other hypersensitivity reactions to chimeric or humanized antibodies or fusion proteins.

[0551] General exclusion criteria include the following:
(a) Inability to comply with study and follow-up procedures;
(b) Pregnancy, lactation, or breastfeeding. Serum pregnancy test (for women of childbearing potential, including women who have had a tubal ligation) must be performed and documented as negative within 14 days prior to Cycle 1, Day 1;
(c) Significant cardiovascular disease, such as New York Heart Association cardiac disease (Class II or greater), myocardial infarction within the previous 3 months, unstable arrhythmias, or unstable angina;
(d) Known clinically significant liver disease, including active viral, alcoholic, or other hepatitis, cirrhosis, and inherited liver disease;
(e) Major surgical procedure within 28 days prior to Cycle 1, Day 1 or anticipation of need for a major surgical procedure during the course of the study;
(f) Any other diseases, metabolic dysfunction, physical examination finding, or clinical laboratory finding giving reasonable suspicion of a disease or condition that contraindicates the use of an
investigational drug or that may affect the interpretation of the results or render the patient at high risk from treatment complications.

Dose Escalation Stage

[0552] As set forth above and illustrated in FIG. 1, patients are enrolled in a dose-escalation stage and an expansion stage.

[0553] Approximately 18 to 30 patients may be enrolled in the dose-escalation stage. Cohorts of at least 3 patients each may be treated at escalating doses of MOXR0916 in combination with a fixed dose of MPDL3280A (1200 mg) in accordance with the dose-escalation rules described below to determine the MTD or maximum administered dose (MAD). Enrollment of the first two patients in each dose-escalation cohort may be staggered such that their respective Cycle 1, Day 1 treatments are administered >72 hours apart.

[0554] Initially, the dose-limiting toxicity (DLT) assessment window is 21 days (Days 1-21 of Cycle 1). If a delayed DLT is observed (e.g., as described herein), the DLT assessment window may be extended to 42 days after the first administration of MOXR0916 and MPDL3280A for all patients in that cohort and any subsequent dose-escalation cohorts. Adverse events identified as DLTs or delayed DLTs are reported to the Sponsor within 24 hours.

[0555] Any dose-escalation stage patient who does not complete the DLT assessment window (either 21 or 42 days, depending on the DLT assessment window in effect at the time) for a reason other than a DLT is considered non-evaluable for dose-escalation decisions and the MTD assessment and may be replaced by an additional patient at that same dose level. Patients who receive supportive care during the DLT assessment window that confounds the evaluation of DLTs (not including supportive care described below as part of the DLT definition) may be replaced at the discretion of the Medical Monitor. A patient who has any component of study treatment held during the DLT assessment window for a reason other than a DLT such that administration of the next planned dose is delayed by more than 7 days, may be considered non-evaluable for dose-escalation decisions and the MTD assessment and may be replaced by an additional patient at that same dose level.

[0556] Any one of the following adverse events is considered a DLT if it occurs during the DLT assessment window in a patient enrolled in a dose-escalation cohort and is assessed by the investigator to be related to study treatment:

(a) Grade ≥ 3 non-hematologic, non-hepatic adverse event, with the following exceptions:
   (i) Grade 3 nausea, vomiting, or diarrhea that resolves to Grade ≤ 2 with standard-of-care therapy in ≤ 3 days;
   (ii) Grade 3 fatigue that resolves to Grade ≤ 2 in ≤ 3 days;
   (iii) Grade 3 fever (> 40 degrees C for ≤ 24 hours);
   (iv) Grade 3 adverse event of tumor flare (defined as local pain, irritation, or rash localized at sites of known or suspected tumor) that resolves to Grade ≤ 2 in ≤ 7 days;
(v) Grade 3 laboratory abnormalities that are asymptomatic and considered by the investigator not to be clinically significant that resolve to Grade ≤ 2 in ≤ 7 days;

(vi) Grade 3 rash that resolves to Grade ≤ 2 in ≤ 7 days with therapy equivalent to prednisone 10 mg/day or less;

(b) Grade ≥ 4 neutropenia (absolute neutrophil count [ANC] < 500/μL) lasting > 7 days;

(c) Grade ≥ 3 febrile neutropenia;

(d) Grade ≥ 4 anemia;

(e) Grade ≥ 4 thrombocytopenia, or Grade 3 thrombocytopenia associated with clinically significant bleeding;

(f) Grade ≥ 3 elevation of serum hepatic transaminase (alanine aminotransferase [ALT] or aspartate aminotransferase [AST]) lasting > 7 days. For patients with Grade 1 ALT or AST elevation at baseline as a result of liver metastases, only a Grade ≥ 3 elevation that is also >3x baseline lasting > 7 days may be considered a DLT;

(g) Grade ≥ 3 elevation of serum bilirubin; and

(h) ALT or AST > 3 x upper limit of normal (ULN) AND total bilirubin > 2 x ULN.

[0557] A delayed DLT is defined as an adverse event that meets one of the above DLT criteria but occurs between 3 and 6 weeks after the first administration of MOXR0916 and MPDL3280A (Study Days 22-42).

[0558] The starting dose of MOXR0916 is 0.8 mg, administered by IV infusion every 21 days to patients in the first cohort. The escalation increment between successive dose levels is no greater than 4-fold between successive dose levels, and the proposed doses for evaluation are 0.8 mg, 3.2 mg, 12 mg, 40 mg, 130 mg, 400 mg, and 1200 mg. Depending on new nonclinical efficacy, clinical safety, and PK data, intermediate dose levels of MOXR0916 may be evaluated. MPDL3280A is administered at a fixed dose of 1200 mg IV every 21 days.

[0559] In addition to any DLTs, other available relevant demographic, adverse event, laboratory, dose administration, and PK/PD data are reviewed prior to all dose-escalation decisions, which are made by the Medical Monitor in consultation with the Principal Investigators and a committee composed of the following Sponsor representatives: safety scientist, statistician, and PK scientist. Based on review of these emergent clinical data, intermediate dose levels may be evaluated.

[0560] Dose escalation occurs in accordance with the rules listed below irrespective of the duration of the DLT window:

(a) A minimum of 3 patients is initially enrolled in each cohort;

(b) If none of the first 3 DLT- evaluable patients experiences a DLT, enrollment of the next cohort at the next highest dose level may proceed;

(c) If 1 of the first 3 DLT- evaluable patients experiences a DLT, the cohort is expanded to 6 patients. If there are no further DLTs in the first 6 DLT- evaluable patients, enrollment of the next cohort at the next highest dose level may proceed;
(d) If 2 or more of the first 6 DLT-evaluable patients in a cohort experience a DLT, the MTD is exceeded and dose escalation stops. An additional 3 patients are then evaluated for DLTs at the preceding dose level, unless 6 patients have already been evaluated at that level. However, if the dose level at which the MTD is exceeded is \( \geq 2 \)-fold higher than the preceding dose level, 6 patients may be evaluated at an intermediate dose level;

(e) If the MTD is exceeded at any dose level, the highest dose at which fewer than 2 of 6 DLT-evaluable patients (i.e., \( < 33\% \)) experience a DLT is declared the MTD;

(f) If the MTD is not exceeded at any dose level, the highest dose administered in this study is declared the MAD;

(g) Any dose level may be expanded beyond 3 patients in the absence of a DLT if warranted based on Sponsor and investigator evaluation of non-DLT adverse events, including events occurring after Cycle 1 and events observed in the expansion cohorts; and

(h) If two or more patients in a single cohort experience Grade \( \geq 2 \) adverse events attributed to study treatment or one or more AEs meeting the criteria for DLT are observed at any time during study treatment, the dose may be increased by no more than 2-fold between dose levels for any subsequent dose escalation.

In addition, the following rules apply specifically to the first instance in which a delayed DLT is observed. The dose level at which the delayed DLT was observed is referred to as the “index” dose level or cohort:

(a) Enrollment at or above the index dose level is temporarily suspended, unless the index cohort has enrolled fewer than 3 patients, in which case a total of 3 patients may be initially enrolled in that cohort;

(b) The DLT assessment window is extended to 42 days after the first administration of study treatment. This extended window is effective immediately for patients already enrolled at or above the index dose level. Any subsequent enrollment and dose escalation may proceed according to the general rules above, with a 42-day assessment window; and

(c) Patients who have been enrolled at a dose level higher than the index dose level have the option to reduce their dose to a lower dose level, at the discretion of the investigator. A patient who undergoes dose reduction prior to completing the DLT assessment window and does not experience a DLT may be considered non-evaluable for dose-escalation decisions and the MTD assessment. If a DLT occurs after such dose reduction may within 42 days of the initial treatment at the dose level higher than the index dose level, the DLT may be assigned to the originally assigned dose level.

Based on available preliminary safety and PK data (collected in this study or in the ongoing Phase 1a Study G029313 of single-agent MOXR0916), dose escalation may be halted or modified by the Sponsor as deemed appropriate. The MOXR0916 dose administered in this study may not exceed either the highest dose administered or the MTD of Study G029313.
Expansion Stage

[0563] Approximately 166-330 patients are enrolled in the expansion stage, which includes two parts (FIG. 1).

[0564] Part I includes a cohort of 6-30 patients who are eligible for serial biopsies (core needle, punch, forceps, or excisional/incisional). The objectives of Part I are to explore tumor biomarkers of pharmacodynamic (PD) activity and obtain additional safety, tolerability, and PK data at multiple dose levels. The initial MOXR0916 dose level in this cohort may be 3.2 mg or higher (in combination with MPDL3280A 1200 mg) based on pharmacodynamic biomarker data collected in this study and the ongoing Study G029313. Enrollment in Part I at the selected initial dose level can only begin after the escalation cohort treated at that dose has satisfied the rules permitting further escalation. Thereafter, enrollment may proceed at or below the highest dose level that has already cleared its DLT assessment in the dose-escalation stage.

[0565] Part II includes multiple cohorts to better characterize the safety, tolerability, PK variability, biomarkers of anti-tumor activity, and preliminary efficacy of MOXR0916 in combination with MPDL3280A in specific cancer types. Enrollment in Part II expansion cohorts may be initiated at a selected dose level at or below the MAD or MTD of MOXR0916 in combination with MPDL3280A, as determined by the Sponsor in consultation with study investigators, based on assessment of accumulating safety, tolerability, clinical PK, pharmacodynamic, and anti-tumor activity data. Some of these cohorts require prospective determination of tumor PD-L1 status. As shown in FIG. 4A, the planned expansion cohorts in Part II may include approximately:

(a) 20-40 patients with melanoma;
(b) 20-40 patients with renal cell cancer (RCC);
(c) 20-40 patients with triple negative breast cancer (TNBC) (Expansion beyond approximately 20 patients may be limited to PD-L1-selected patients, based on prospective testing of tumor tissue during screening or pre-screening);
(d) 20-40 patients with non-small cell lung cancer (NSCLC) (Expansion beyond approximately 20 patients may be limited to PD-L1-selected patients, based on prospective testing of tumor tissue during screening or pre-screening);
(e) 20-40 patients with urothelial bladder cancer (UBC) (Expansion beyond approximately 20 patients may be limited to PD-L1-selected patients, based on prospective testing of tumor tissue during screening or pre-screening);
(f) 20-40 patients with colorectal cancer (CRC) (At least 5 of these patients have tumors that are known to be microsatellite instability-high (MSI-H) by local testing);
(g) 20-40 patients with ovarian cancer (OC);
(h) 10-20 patients with tumors amenable to serial excisional, incisional or punch biopsies; and
(i) Up to 40 patients with tumor types without designated cohorts, selected by the Sponsor in consultation with investigators, may be included in an additional exploratory "basket" cohort. A
maximum of approximately 10 patients with a particular histology are enrolled in this cohort unless anti-tumor activity and/or clinical benefit per investigator is observed.

[0566] In the United States, the Sponsor may provide to the Center for Devices and Radiological Health (CDRH) performance characteristics of the assay prior to testing of tumor tissue for determination of PD-L1 status. In the event that the Expansion Part I and Expansion Part II biopsy cohorts are available concurrently, and a patient meets criteria for both cohorts, the patient may be enrolled in Part II.

[0567] Whereas Part II (with the exception of serial biopsy cohort dedicated to patients with primary or acquired resistance to PD-L1/PD-1 blockade) can exclude patients with prior PD-L1/PD-1 inhibitors, Part III is dedicated to patients with solid tumors whose most recent anti-cancer therapy included PD-L1/PD-1 blockade. As shown in FIG. 4A, this group of cohorts includes a total of approximately 60-160 patients with one of the following malignancies:

(a) Melanoma;
(b) RCC;
(c) NSCLC;
(d) UBC;
(e) TNBC;
(f) gastric or gastroesophageal junction adenocarcinoma (GC);
(g) head and neck squamous cell carcinoma (HNSCC); and
(h) additional tumor types without designated cohorts, selected by the Sponsor in consultation with investigators, may be included in an exploratory "basket" cohort if activity in one or more of the above diseases is judged to be promising.

[0568] The Sponsor, in consultation with the investigators, evaluates all available safety data on an ongoing basis to assess the tolerability of the dose levels studied. If the frequency of Grade 3 or 4 toxicities observed in an expansion-stage cohort (including delayed adverse events and events that would otherwise meet the criteria for a DLT) or other unacceptable toxicities, suggest that the MTD has been exceeded at that dose level, accrual at that dose level may be halted in the expansion and escalation cohorts and, if applicable, further dose escalation may be halted. Consideration is then given to resuming enrollment in the expansion stage at a lower dose level. In addition, if accumulating tolerability, PK, or PD data suggest that the dose level in an expansion stage cohort is suboptimal for evaluation of anti-tumor activity, consideration may be given to enrolling new patients in that cohort to a different dose level. At no time may a dose level studied in the expansion stage exceed the highest dose level that has met escalation criteria in the dose-escalation stage.

[0569] Patients enrolled in either of the dedicated expansion-stage biopsy cohorts may be required to undergo serial tumor biopsies: at baseline after eligibility criteria (other than the requirement for available archival tissue) have been fulfilled, and approximately 2 weeks after the first administration of MOXR0916 and MPDL3280A (on or between Days 15-21 of Cycle 1). Additional biopsies may
be collected at the investigator’s discretion, preferably at the time of radiographic response or progression. In the Expansion Part I biopsy cohort, tissue biopsy methods may include core needle, punch, forceps, or excisional/incisional biopsies. In the Expansion Part II biopsy cohort, punch or excisional/incisional biopsies are required.

[0570] In either biopsy cohort, a recent archival specimen may be used in place of a fresh baseline biopsy under the following circumstances:

(a) The specimen meets the sample criteria (e.g., number of cores or size of punch);
(b) The specimen was collected within 3 months of the proposed Cycle 1, Day 1;
(c) The specimen was collected subsequent to any systemic therapy or radiation therapy administered to the relevant anatomic region;
(d) The specimen originates from the same lesion or organ as the proposed site of the on-treatment biopsy.

[0571] Patients whose baseline biopsy is found to be unevaluable (i.e., due to insufficient material or lack of tumor cells in the sample) may decline to undergo an on-treatment biopsy but may receive study treatment. Such patients, as well as patients whose on-treatment biopsy is found to be unevaluable, may be replaced for the purpose of serial biopsy assessment.

[0572] Patients who are enrolled in cohorts other than the dedicated biopsy cohorts may be asked to undergo optional biopsies (core needle, punch, forceps, or excisional/incisional) to explore PD changes related to the activity of MOXR0916 and MPDL3280A. The recommended biopsy timepoints are the same as described above. On-treatment biopsies may not be pursued if the baseline sample is unevaluable and no recent archival specimen is available for comparison.

Dose Reduction

[0573] There is no dose reduction of MPDL3280A, which is to be administered at a fixed dose of 1200 mg every 21 days. In general, there may be no intrapatient dose escalation or dose reduction for MOXR0916 in this study. However, if available cumulative safety data suggest that a dose level initially selected for expansion in combination with MPDL3280A exceeds the MTD, accrual at that dose level may be halted in the expansion and escalation cohorts and, if applicable, further dose escalation may be halted. In this circumstance, individual patients may have the option of dose reduction to the new dose level of MOXR0916 selected for expansion in combination with MPDL3280A if the following criteria are met: The patient's initially assigned dose is equal to (or greater than) the dose level that has been closed to further enrollment; and the overall benefit/risk balance favors continued treatment, in the opinion of the investigator.

Treatment after Disease Progression

[0574] Patients may continue study treatment after standard RECIST v1.1 criteria for progressive disease are met provided they meet all the following criteria: absence of symptoms and signs
(including worsening of laboratory values, e.g., new or worsening hypercalcemia) indicating unequivocal progression of disease; no decline in ECOG performance status; and absence of tumor progression at critical anatomical sites that cannot be readily managed and stabilized by protocol-allowed medical interventions prior to repeat dosing. Patients provide written consent to acknowledge discussion with the treating investigator of the benefit-risk balance of continuing study treatment beyond radiographic progression.

[0575] If radiographic disease progression is confirmed at a subsequent tumor assessment, patients may be considered for continued study treatment at the investigator’s discretion after discussion with the Medical Monitor, if they continue to meet the criteria above and have evidence of clinical benefit, as evidenced by at least one of the following: tumor shrinkage (at least 30% decrease in diameter from baseline) of one or more evaluable lesions; or improvement in one or more symptoms or signs attributable to the underlying cancer (e.g., decreased requirement for narcotics for pain, decreased dyspnea associated with pleural effusion, weight gain) as assessed by the investigator.

Dosage, Administration, and Compliance

[0576] The approximate dose levels of MOXR0916 proposed to be evaluated in this study include 0.8, 3.2, 12, 40, 130, 400, and 1200 mg administered every 3 weeks by IV infusion. Intermediate dose levels of MOXR0916 may be evaluated based on new nonclinical efficacy, clinical safety, and clinical PK data after consultation with participating investigators. Doses are not dependent on body weight.

[0577] The initial dose of MOXR0916 may be delivered over 90 ± 10 minutes (although the infusion may be slowed or interrupted for patients who experience infusion-associated symptoms), followed by a 90-minute observation period. If the 90-minute infusion is tolerated without infusion-associated adverse events, the second infusion may be delivered over 60 ± 10 minutes, followed by a 60 minute observation period. If the 60-minute infusion is well tolerated, all subsequent infusions may be delivered over 30 ± 10 minutes, followed by a 30-minute observation period. Patients who have previously received MOXR0916 on Study G029313 may receive the initial dose at the fastest rate that was previously tolerated. There may be no dose reduction for MOXR0916 in this study except as specified above under "Dose Reduction."

[0578] The dose of MPDL3280A to be administered in combination with MOXR0916 in this study is 1200 mg IV every 3 weeks. This dose is fixed and not dependent on body weight.

[0579] MPDL3280A may be administered after the MOXR0916 infusion and subsequent observation period.

[0580] The initial dose of MPDL3280A may be delivered over 60 ± 10 minutes. If the first infusion is tolerated without infusion-associated adverse events, the second infusion may be delivered over 30 ± 10 minutes. If the 30-minute infusion is well tolerated, all subsequent infusions may be delivered over 30 (+ 10) minutes. All doses of MPDL3280A may be followed by a 30-minute
observation period. Patients who have previously received MPDL3280A on another clinical trial may receive the initial dose at the fastest rate that was previously tolerated. There is no dose reduction for MPDL3280A in this study.

Concomitant Therapy

[0581] Concomitant therapy includes any medication (e.g., prescription drugs, over-the-counter drugs, herbal or homeopathic remedies, nutritional supplements) used by a patient from 7 days prior to screening to the treatment discontinuation visit (and from 7 days prior to re-screening to the re-treatment discontinuation visit). All medications should be reported to the investigator and recorded.

[0582] Patients who experience infusion-associated symptoms may be treated symptomatically with acetaminophen, ibuprofen, diphenhydramine, and/or ranitidine or another H2 receptor antagonist, as per standard practice (for sites outside the U.S., equivalent medications may be substituted per local practice). Serious infusion-associated events manifested by dyspnea, hypotension, wheezing, bronchospasm, tachycardia, reduced oxygen saturation, or respiratory distress should be managed with supportive therapies as clinically indicated (e.g., supplemental oxygen and p2-adrenergic agonists). Premedication may be administered for Cycles ≥ 2 at the discretion of the treating physician after consultation with the Medical Monitor.

[0583] Systemic corticosteroids and TNFa antagonists may attenuate potential beneficial immunologic effects of treatment with MOXR0916 and MPDL3280A but may be administered at the discretion of the treating physician in an emergency or after consultation with the Medical Monitor. If feasible, alternatives to corticosteroids should be considered. The use of inhaled corticosteroids and mineralocorticoids (e.g., fludrocortisone for patients with orthostatic hypotension or adrenocortical insufficiency) is allowed. Physiologic doses of corticosteroids for adrenal insufficiency are allowed. Megestrol administered as an appetite stimulant is also permitted.

[0584] Patients who use oral contraceptives, hormone-replacement therapy, prophylactic or therapeutic anticoagulation therapy (such as low molecular weight heparin or warfarin at a stable dose level), or other maintenance therapy for non-malignant indications should continue their use. Males and females of reproductive potential should use highly effective means of contraception.

[0585] Use of the following therapies is prohibited during the study:

(a) Any concomitant therapy intended for the treatment of cancer, whether health authority-approved or experimental, including (but not limited to) the following: chemotherapy, hormonal therapy, immunotherapy, radiotherapy, investigational agents, or herbal therapy;

   (i) Radiotherapy may be considered for pain palliation (e.g., treatment of known bony metastases) if patients are otherwise deriving benefit. For patients in a dose escalation cohort, palliative radiotherapy should be deferred until completion of the DLT assessment window. Study treatment administration may be suspended during radiotherapy with agreement from the Medical Monitor;
(ii) Patients experiencing a mixed response may undergo local therapy (e.g., surgery, stereotactic radiosurgery, radiotherapy, radiofrequency ablation) for control of three or fewer lesions upon approval by the Medical Monitor;

(iii) Patients who undergo radiotherapy to or resection of a target lesion may subsequently become unevaluable for response determination according to RECIST v1.1 or modified RECIST;

(b) Immunostimulatory agents, including but not limited to IFNa, IFNy, or IL2, during the entire study;

(c) Immunosuppressive medications, including but not limited to cyclophosphamide, azathioprine, methotrexate, and thalidomide; and

(d) Granulocyte colony-stimulating factors (e.g., granulocyte colony-stimulating factor, granulocyte macrophage colony-stimulating factor, and/or pegfilgrastim);

(e) traditional herbal medicines; and

(f) receptor activator of nuclear factor kappa B (RANK) inhibitor (i.e., denosumab). Patients who are receiving denosumab prior to enrollment must be willing and eligible to receive a bisphosphonate instead while on study.

Outcome Measures

[0586] The safety and tolerability of MOXR0916 and MPDL3280A is assessed using the following primary safety outcome measures: incidence and nature of DLTs; and incidence, nature, and severity of adverse events graded according to NCI CTCAE v4.0.

[0587] In addition, safety may be assessed using the following secondary safety outcome measures: incidence of anti-MOXR0916 antibodies and anti-MPDL3280A antibodies and the potential correlation with PK, PD, and safety parameters; change in vital signs; change in clinical laboratory results, including ECGs; and number of cycles received and dose intensity.

[0588] The following pharmacokinetic (PK) parameters may be derived from concentration-time profile of MOXR0916 and MPDL3280A following administration, when appropriate as data allow: total exposure (AUC); Cmax; Cmin; CL; and Vss. Other parameters such as accumulation ratio, half-life, and dose proportionality may also be calculated.

[0589] The following activity outcome measures may be assessed:

(a) Objective response, defined as a complete response (CR) or partial response (PR) confirmed ≥ 4 weeks after initial documentation, determined using RECIST v1.1;

(b) Duration of objective response, defined as the time from the first occurrence of a documented, objective response until the time of relapse or death from any cause, determined using RECIST v1.1;

(c) Progression-free survival (PFS), defined as the time from the first study treatment (Day 1) to the first occurrence of progression or death from any cause, whichever occurs first, determined using RECIST v1.1;

(d) Objective response, duration of objective response, and PFS determined using modified RECIST;
Overall survival (OS), defined as the time from first study treatment to death from any cause.

The following exploratory PD outcome measures may be assessed: changes in T, B, and NK cell numbers (T, B, and NK assay) in blood; changes in prevalence of various immune cell subpopulations in blood (e.g., effector/memory T cells, regulatory T cells, and MDSCs); changes in activation, proliferation, and functional status of T-cell subsets in blood; identification and profiling of exploratory biomarkers in plasma (i.e., interleukin-2 [IL2], IFNy, and other markers); changes in tumor-infiltrating CD8+ T cells (and other exploratory markers) in freshly obtained tumor tissue prior to and during study treatment; and changes in tumor-infiltrating T-cell activity (measured by expression of granzyme B and other markers) in freshly obtained tumor tissue prior to and during study treatment.

The following additional exploratory biomarker outcome measures may be assessed when appropriate: status of PD-L1 and OX40 (and other exploratory markers) in tumor tissue; status of immune infiltrate in tumor tissue, including enumeration and characterization of various immune cell subpopulations; and analysis of single nucleotide polymorphisms (SNPs) in genes including but not limited to those that encode Fc receptors.

**Study Assessments**

A complete physical examination performed at screening should include an evaluation of the head, eyes, ears, nose, and throat, and the cardiovascular, dermatological, musculoskeletal, respiratory, gastrointestinal, genitourinary, and neurological systems. Any abnormality identified at baseline should be recorded.

At subsequent visits (or as clinically indicated), limited, symptom-directed physical examinations should be performed. Changes from baseline abnormalities should be recorded in the patient's medical record. New or worsened clinically significant abnormalities should be recorded as adverse events.

As part of tumor assessments, the physical exam should also include evaluation for lymphadenopathy, splenomegaly, hepatomegaly, and cutaneous neoplasms or metastases. All patients should be monitored for symptoms of CNS metastases and such reported symptoms should be followed by a full neurological examination. A brain MRI or contrast enhanced head CT should be done as clinically indicated to confirm or refute new or worsening brain involvement.

All known sites of disease must be documented at screening and re-assessed at each subsequent tumor evaluation. Screening and subsequent tumor assessments must include CT scans (with IV contrast unless contraindicated and oral contrast as appropriate per institutional standards) or MRI of the chest, abdomen, and pelvis. If a CT scan for tumor assessment is performed in a positron emission tomography (PET)/CT scanner, the CT acquisition must be consistent with the standards for a full-contrast CT scan. Brain imaging (either MRI or contrast-enhanced CT) is required at screening for patients with treated brain metastases and as clinically indicated based on symptoms or signs.
suggestive of new or worsening CNS metastases. In the event of an equivocal head CT, a brain MRI is required to clarify the presence or extent of suspected brain metastases. Further investigations such as bone scans and CT scans of the neck should also be performed if there is any clinical suspicion of disease at any site that may not be demonstrated by the minimum schedule of assessments listed above. At the investigator’s discretion, other methods of assessment of measurable disease as per RECIST v1.1 may be used.

The same radiographic procedures used to assess disease sites at screening should be used throughout the study (e.g., the same contrast protocol for CT scans). Response may be assessed by the investigator on the basis of physical examinations and the imaging modalities detailed above, using both RECIST v1.1 and modified RECIST criteria. Assessments should be performed by the same evaluator if possible to ensure internal consistency across visits.

Patients who continue treatment beyond radiographic disease progression per RECIST v1.1 may be monitored with a follow-up scan in 6 (± 2) weeks (i.e., at the next scheduled tumor assessment when the scan frequency is every 2 cycles or as an unscheduled tumor assessment when the scan frequency is every 4 cycles), or earlier if clinically indicated. Tumor assessments should be continued every 2 cycles thereafter until two consecutive scans demonstrate stability or improvement with respect to the first scan that showed radiographic disease progression, at which point the scan frequency should revert or transition to every 4 cycles if applicable.

After initial study treatment discontinuation, follow-up tumor assessments may be performed until death, disease progression, initiation of another systemic anti-cancer therapy, loss to follow-up, withdrawal of consent, or study termination, whichever occurs first.

FDG-PET/CT imaging scans may be acquired at baseline and at the time of the first tumor assessment. In addition, an optional FDG-PET/CT scan may be performed at the first evidence of radiographic disease progression to assess whether apparent increases in tumor volume related to immunomodulatory activity of MOXR0916 and MPDL3280A (i.e., pseudoprogression) may be distinguished from neoplastic proliferation and disease progression. PET/CT scans at other timepoints are optional. All FDG-PET/CT scans are to be acquired in accordance with the specification provided in the imaging manual. A combination PET and CT scanner should be used for all acquisitions. The baseline FDG-PET/CT scan should be performed during the screening period only after all other inclusion and exclusion criteria have been satisfied, unless it was integrated with a diagnostic quality full-contrast CT scan that fulfills the screening tumor assessment requirement. All FDG-PET/CT scans should be acquired before any scheduled invasive procedure such as a tumor biopsy if at all possible (biopsy location may need to be noted to ensure accurate assessment during central PET imaging review).

The planned duration of the study is approximately 3 years. The end of this study is defined as the completion of the 90-day adverse event reporting period for the last patient receiving study treatment. This is expected to occur approximately 12 months after the last patient has been enrolled.
Example 2: A Phase I b dose escalation study of the OX40 agonist MOXR0916 and the PD-L1 inhibitor atezolizumab in patients with advanced solid tumors

Background

[0601] OX40 is a co-stimulatory receptor that is transiently expressed by T cells upon antigen recognition. In murine models, OX40 engagement by an agonist anti-OX40 antibody can promote durable tumor regression associated with co-stimulation of effector T cells and reduction of regulatory T cells. MOXR0916 is a humanized effector-competent agonist IgGl monoclonal antibody (mAb) that targets OX40, and atezolizumab is an engineered humanized IgGl mAb that targets PD-L1. The purpose of this study is to examine the safety and pharmacokinetics (PK) of agonist anti-OX40 antibody treatment in combination with anti-PD-L1 antibody treatment.

Methods

[0602] A Phase I, open-label, multicenter study was conducted as described in Example 1 to evaluate the safety and PK of MOXR0916 and atezolizumab in patients (pts) with locally advanced or metastatic solid tumors (FIG. 4A). A 3+3 dose-escalation was conducted with a 21-day window to evaluate dose-limiting toxicity (DLT). Escalating doses of MOXR0916 in combination with a fixed 1200 mg dose of atezolizumab were administered every 3 weeks (q3w). An expansion cohort to enable immune profiling of serial tumor biopsies was also enrolled. Prior immunotherapy with adequate washout was allowed if there was no history of Grade (G) ≥3 immune-mediated adverse events (AEs).

Results

[0603] 25 patients were treated in 7 dose escalation cohorts (dose levels 0.8 to 600 mg) and 19 additional patients were treated in a serial biopsy cohort. The median number of prior therapies for metastatic disease was 2 (range 0-7), and 5 patients had received prior PD-1/PD-L1 antibodies. No DLTs, G4/5 AEs attributed to study treatment, or related AEs leading to treatment discontinuation were reported. The majority of treatment-related AEs were G1 in severity; 1 related G3 event (pneumonitis responsive to corticosteroids) was reported. The PK of each mAb was consistent with its established single agent profile.

[0604] In a parallel phase I single-agent MOXR0916 study, at doses >40 mg q3w, MOXR0916 PK was linear and consistent with IgGl mAb (FIG. 2) and sustained peripheral blood OX40 receptor saturation was achieved (FIGS 3A-G). Dose-dependent peripheral receptor occupancy was observed, with continuous peripheral OX40 saturation achieved at doses >40 mg. Doses >200 mg are projected to achieve continuous tumor OX40 saturation in cycle 1 (95% occupancy at trough assuming 20:1 blood:tumor partioning). PD-L1 expression increased post MOXR0916 treatment in RCC, NSCLC, melanoma, and cervical tumors.

[0605] A transient, bimodal increase in plasma cytokines was observed with MOXR0916+Atezolizumab treatment. The observed early (6hr, C1D2) increase in IP-10 and
comparatively lower increase in IFN\(\gamma\) may be attributable to MOXR0916. The observed increase in IP-10 and comparatively higher increase in IFN\(\gamma\) at CID15 may be attributed to atezolizumab or MOXR+ atezolizumab.

[0606] Objective responses were observed, including two PRs in PD(L)-1-na\(\bar{t}\)ve patients diagnosed with RCC and bladder cancer, respectively. The RCC patient was observed with a confirmed partial response (PR) after commencement in the MOXR0916 300 mg + atezolizumab 1200 mg q3w study described above. The patient had previously been part of a phase I single-agent MOXR0916 study for 8 cycles (i.e., approximately 24 weeks) with a best response of stable disease. The bladder cancer patient was part of the first dose escalation cohort (see FIG. 4A). The regimen selected for dose expansion was MOXR0916 300 mg + atezolizumab 1200 mg q3w.

[0607] 10\% of all patients enrolled in the MOXR0916 and atezolizumab study had received prior treatment with an OX40 agonist (e.g., an anti-OX40 agonist antibody), and 18\% of all patients enrolled in the MOXR0916 and atezolizumab study had received prior treatment with a PD-L1 or PD-1 inhibitor (e.g., an anti-PD-L1 or anti-PD-1 antibody). In the MOXR0916 and atezolizumab study, evidence of immune activation was observed in patients previously treated with single-agent OX40 agonist antibody or single-agent anti-PD-1 antibody in multiple cancer types. For example, the RCC patient described above, who had previously been treated with MOXR0916, showed a confirmed partial response with evidence of pharmacodynamic (PD) modulation in paired tumor biopsies upon combination treatment with MOXR0916 and atezolizumab (e.g., PD-L1 status shifting from negative to positive upon combination treatment). These results demonstrate immune activation including adaptive upregulation of PD-L1 upon combination treatment with MOXR0916 and atezolizumab, including PD modulation in patients whose immediate prior therapy was single-agent OX40 agonist antibody or single-agent anti-PD-1 antibody.

Conclusions

[0608] The combination of MOXR0916 and atezolizumab was well-tolerated. An expansion phase, with each agent administered at its recommended monotherapy dose, is ongoing in selected tumor types.

Example 3: A Phase Ib, Open Label, Dose Escalation Study of the Safety and Pharmacokinetics of MOXR0916, Atezolizumab, and Bevacizumab in Patients with Locally Advanced or Metastatic Solid Tumors

Study Design

[0609] This is a Phase Ib, open label, multicenter, dose escalation study designed to evaluate the safety, tolerability, and pharmacokinetics of the combination of MOXR0916, atezolizumab, and bevacizumab in patients with locally advanced, recurrent, or metastatic incurable solid malignancy that has progressed after available standard therapy; or for which standard therapy has proven to be
ineffective or intolerable, or is considered inappropriate; or for which a clinical trial of an investigational agent is a recognized standard of care.

[0610] This study consists of a screening period, a treatment period, and a post treatment follow up period. The study includes a dose escalation stage and an expansion stage. MOXR0916, atezolizumab, and bevacizumab are each administered by intravenous (IV) infusion on Day 1 of 21 day cycles. In the absence of unacceptable toxicity or clinically compelling disease progression, treatment with all agents may be continued beyond Cycle 1 based on a favorable assessment of benefit and risk by the investigator.

[0611] All adverse events are monitored and recorded for at least 90 days after the last dose of study treatment or until initiation of another systemic anti-cancer therapy, whichever occurs first. After this period, the Sponsor is notified if the investigator becomes aware of any serious adverse events if the event is believed to be related to prior study drug treatment. Adverse events are graded according to NCI CTCAE v4.0.

[0612] To characterize the PK properties of MOXR0916, atezolizumab, and bevacizumab and pharmacodynamic responses to treatment, blood samples are taken at various timepoints before and after dosing. Patients undergo tumor assessments at screening and during the study. Patients may be permitted to continue study treatment even if standard RECIST v1.1 criteria for progressive disease are met, provided they meet the criteria for continued treatment. All patients who discontinue study treatment for reasons other than disease progression (e.g., adverse events) continue tumor assessments. Patients who discontinue study treatment may return to the clinic for a treatment discontinuation visit within 30 days after the last dose of study treatment. All patients are followed for survival and subsequent anti-cancer therapy information approximately every 3 months until death, loss to follow up, or study termination, unless the patient requests to be withdrawn from follow up.

**Study Objectives**

[0613] The primary objective for this study is to evaluate the safety and tolerability of the combination of MOXR0916, atezolizumab, and bevacizumab, in patients with locally advanced or metastatic solid tumors.

[0614] The secondary objectives for this study are as follows:

(a) To estimate the MTD of MOXR0916 when administered in combination with atezolizumab and bevacizumab, and to characterize the DLTs;

(b) To identify a recommended Phase II dose for MOXR0916 administered in combination with atezolizumab and bevacizumab;

(c) To characterize the pharmacokinetics of MOXR0916, atezolizumab, and bevacizumab when administered in combination;
(d) To characterize the immunogenic potential of MOXR0916, atezolizumab, and bevacizumab when administered in combination by measuring anti-MOXR0916, anti-atezolizumab, and anti-bevacizumab antibodies, respectively, and assessing their relationship with other outcome measures; and
(e) To make a preliminary assessment of the anti-tumor activity of the combination of MOXR0916, atezolizumab, and bevacizumab, in patients with locally advanced or metastatic solid tumors.

[0615] The exploratory objectives for this study are as follows:
(a) To make a preliminary assessment of biomarkers that might act as pharmacodynamic indicators of activity of the combination of MOXR0916, atezolizumab, and bevacizumab, in patients with locally advanced or metastatic solid tumors; and
(b) To make a preliminary assessment of biomarkers that might act as predictors of anti-tumor activity of the combination of MOXR0916, atezolizumab, and bevacizumab, in patients with locally advanced or metastatic solid tumors.

Study Population
[0616] Cancer specific inclusion criteria include the following:
(a) Histologic documentation of locally advanced, recurrent or metastatic incurable solid malignancy that has progressed after available standard therapy; or for which standard therapy has proven to be ineffective or intolerable, or is considered inappropriate; or for which a clinical trial of an investigational agent is a recognized standard of care;
(b) Confirmed availability of representative tumor specimens in paraffin blocks (preferred) or ≥ 15 unstained slides, with an associated pathology report. Acceptable samples include core needle biopsies for deep tumor tissue (minimum three cores) or excisional, incisional, punch, or forceps biopsies for cutaneous, subcutaneous, or mucosal lesions. Fine-needle aspiration, brushing, cell pellet from effusions or ascites, and lavage samples are not acceptable. Tumor tissue from bone metastases is not evaluable for PD-L1 expression and is therefore not acceptable. If adequate tissue from distinct time points (such as time of initial diagnosis and time of disease recurrence) and/or multiple metastatic tumors is available, priority is given to the tissue most recently collected (ideally subsequent to the most recent systemic therapy). Multiple samples may be collected for a given patient, on the basis of availability; however, the requirement for a block or ≥ 15 unstained slides is satisfied by a single biopsy or resection specimen. Prior to signing the main study informed consent form, patients may sign a pre-screening consent form to specifically allow the collection and testing of archival or fresh tumor specimens. A patient with insufficient or unavailable archival tissue may be eligible, upon discussion with the Medical Monitor, if the patient meets any of the following: Can provide at least 10 unstained, serial slides; is willing to consent to and undergo a pretreatment core, punch, or excisional/incisional biopsy sample collection of the tumor; or is to be enrolled in a dose-
escalation cohort. If the location of the tumor renders the tumor biopsy medically unsafe, eligibility may be provided with Medical Monitor approval;
(c) Measurable disease per RECIST v1.1;
(d) Dose Escalation Stage: Histologically confirmed incurable, advanced RCC. Both clear cell and nonclear cell histologies are permitted in the dose escalation stage. Prior therapy for RCC, including prior VEGF inhibitors and/or prior PD-L1/PD-1 inhibitors, are permitted.
(e) Dose Expansion Stage: 1L RCC cohort: Histologically confirmed incurable, advanced RCC with component of clear cell histology and/or component of sarcomatoid histology. Patients must not receive prior systemic therapy for RCC, including adjuvant systemic therapy. Prior treatment with placebo in the adjuvant setting is allowed. 2L+ RCC cohort: Histologically confirmed incurable, advanced RCC with component of clear-cell histology and/or component of sarcomatoid histology. Patients have demonstrated disease progression during or following at least one systemic therapy for RCC. Prior VEGF inhibitors and prior PD-L1/PD-1 inhibitors are permitted.

Cancer specific exclusion criteria include:
(a) Any anti-cancer therapy, whether investigational or approved, including chemotherapy, hormonal therapy, or radiotherapy, within 3 weeks prior to initiation of study treatment, with the following exceptions:
   (i) Hormonal therapy with gonadotropin releasing hormone agonists or antagonists for prostate cancer;
   (ii) Hormone replacement therapy or oral contraceptives;
   (iii) Kinase inhibitors approved as anti-cancer therapy by the FDA or local health authorities that have been discontinued > 7 days prior to Cycle 1, Day 1; baseline scans are obtained after discontinuation of prior TKIs and criteria pertaining to adverse events attributed to prior cancer therapies must be satisfied;
   (iv) Herbal therapy > 1 week before Cycle 1, Day 1 (herbal therapy intended as anti cancer therapy must be discontinued at least 1 week before Cycle 1, Day 1); and
   (v) Palliative radiotherapy for painful metastases or metastases in potentially sensitive locations (e.g., epidural space) > 2 weeks prior to Cycle 1, Day 1;
(b) Eligibility based on prior treatment with cancer immunotherapy (CIT) depends on the mechanistic class of the drug and the cohort for which the patient is being considered, as described below. In addition, all criteria pertaining to adverse events attributed to prior cancer therapies must be satisfied:

   MOXR0916 + atezolizumab + bevacizumab (triplet) arm (dose escalation and expansion part IV):
   Prior treatment with immunomodulatory monoclonal antibodies (mAbs) or mAb-derived therapies is allowed provided that at least 6 weeks have elapsed between the last dose of prior treatment and the proposed Cycle 1 Day 1, with the following exceptions:
(i) Prior PD-L1/PD-1 pathway inhibitors are not subject to a specific washout beyond the 3-week minimum for any systemic anti-cancer therapy;

(ii) Prior OX40 agonists are not subject to a specific washout beyond the 3-week minimum for any systemic anti-cancer therapy.

All cohorts:

Prior treatment with cancer vaccines, cytokines, toll-like receptor (TLR) agonists, and inhibitors of indoleamine 2,3-dioxygenase or tryptophan-2,3-dioxygenase (IDO/TDO) is allowed provided that at least 6 weeks or 5 half-lives of the drug, whichever is shorter, have elapsed between the last dose and the proposed Cycle 1, Day 1. Minimum washout is 3 weeks for any prior systemic cancer therapy.

(c) Any history of an immune related Grade 4 adverse event attributed to prior cancer immunotherapy (other than endocrinopathy managed with replacement therapy or asymptomatic elevation of serum amylase or lipase). Any history of an immune related Grade 3 adverse event attributed to prior cancer immunotherapy (other than endocrinopathy managed with replacement therapy or asymptomatic elevation of serum amylase or lipase) that resulted in permanent discontinuation of the prior immunotherapeutic agent and/or occurred ≤ 6 months prior to Cycle 1 Day 1. Adverse events from prior anti-cancer therapy that have not resolved to Grade ≤ 1 except for alopecia or endocrinopathy managed with replacement therapy. All immune related adverse events related to prior immunomodulatory therapy (other than endocrinopathy managed with replacement therapy or stable vitiligo) must have resolved completely to baseline. Patients treated with corticosteroids for immune related adverse events must demonstrate absence of related symptoms or signs for ≥ 4 weeks following discontinuation of corticosteroids;

(d) Primary CNS malignancy, or untreated CNS metastases or active (progressing or requiring corticosteroids for symptomatic control) CNS metastases;

(i) Patients with a history of treated asymptomatic CNS metastases are eligible, provided they meet all of the following criteria: measurable disease outside the CNS; no ongoing requirement for corticosteroids as therapy for CNS disease, with corticosteroids discontinued for ≥ 2 weeks prior to enrollment; anticonvulsants at a stable dose are allowed; no stereotactic radiation within 7 days or whole-brain radiation within 14 days prior to Cycle 1, Day 1; no evidence of interim progression between the completion of CNS directed therapy and the screening radiographic study. Patients with new asymptomatic CNS metastases detected at the screening scan must receive radiation therapy and/or surgery for CNS metastases. Following treatment, these patients may then be eligible without the need for an additional brain scan prior to randomization, if all other criteria are met.

(e) Any history of leptomeningeal disease;

(f) Uncontrolled tumor-related pain:

(i) Symptomatic lesions amenable to palliative radiotherapy (e.g., bone metastases or metastases causing nerve impingement) are treated prior to enrollment; and
(ii) Asymptomatic metastatic lesions whose further growth would likely cause functional
deficits or intractable pain (e.g., epidural metastasis that is not currently associated with spinal cord
correction) are considered for loco-regional therapy if appropriate prior to enrollment.
(g) Uncontrolled pleural effusion, pericardial effusion, or ascites requiring recurrent drainage
procedures (once monthly or more frequently). Patients with indwelling catheters (e.g., PleurX) are
allowed;
(h) Malignancies other than disease under study within 5 years prior to Cycle 1, Day 1, with the
exception of those with a negligible risk of metastasis or death (such as adequately treated carcinoma
in situ of the cervix, basal or squamous cell skin cancer, localized prostate cancer, or ductal carcinoma
in situ);
[0618] Treatment-specific exclusion criteria include the following:
(a) History of autoimmune disease, including but not limited to systemic lupus erythematosus,
rheumatoid arthritis, inflammatory bowel disease, vascular thrombosis associated with
antiphospholipid syndrome, Wegener's granulomatosis, Sjogren's syndrome, Bell's palsy, Guillain
Barre syndrome, multiple sclerosis, vasculitis, or glomerulonephritis, with the following caveats:
   (i) Patients with a history of autoimmune hypothyroidism on a stable dose of thyroid
   replacement hormone may be eligible;
   (ii) Patients with controlled Type 1 diabetes mellitus on a stable insulin dosing regimen
   may be eligible; and
   (iii) Patients with eczema, psoriasis, lichen simplex chronicus, or vitiligo with
dermatologic manifestations only (e.g. no psoriatic arthritis) may be eligible provided they meet the
following conditions: rash must cover less than 10% of body surface area (BSA); disease is well
controlled at baseline and only requiring low potency topical steroids; no acute exacerbations of
underlying condition within the last 12 months (not requiring psoralen plus ultraviolet A radiation
[PUVA], methotrexate, retinoids, biologic agents, oral calcineurin inhibitors, high potency or oral
steroids).
(b) Treatment with systemic immunosuppressive medications (including but not limited to
prednisone, cyclophosphamide, azathioprine, methotrexate, thalidomide, and TNFa antagonists)
within 2 weeks prior to Cycle 1, Day 1;
(c) Patients who have received acute, low dose, systemic immunosuppressant medications (e.g., a
one-time dose of dexamethasone for nausea) may be enrolled in the study after discussion with and
approval by the Medical Monitor;
   (i) The use of inhaled corticosteroids (e.g., fluticasone for chronic obstructive pulmonary
disease) is allowed;
   (ii) The use of oral mineralocorticoids (e.g., fludrocortisone for patients with orthostatic
hypotension or adrenocortical insufficiency) is allowed; and
   (iii) Physiologic doses of corticosteroids for adrenal insufficiency are allowed.
(d) History of idiopathic pulmonary fibrosis, pneumonitis (including drug induced), organizing pneumonia (i.e., bronchiolitis obliterans, cryptogenic organizing pneumonia, etc.), or evidence of active pneumonitis on screening chest CT scan. History of radiation pneumonitis in the radiation field (fibrosis) is permitted. History of drug-induced pneumonitis that was asymptomatic (defined by radiographic findings only) and reversible (without any anti-inflammatory therapies) is permitted;

(e) Positive test for HIV infection;

(f) Active hepatitis B (defined as having a positive hepatitis B surface antigen [HBsAg] test at screening). Patients with past or resolved hepatitis B infection (defined as having a negative HBsAg test and a positive IgG antibody to hepatitis B core antigen [anti-HBc]) are eligible;

(g) Active hepatitis C (patients positive for hepatitis C virus (HCV) antibody are eligible only if PCR is negative for HCV RNA);

(h) Active tuberculosis;

(i) Severe infections, including but not limited to bacteremia, severe pneumonia, or hospitalizations for complications of infection within 4 weeks prior to Cycle 1, Day 1;

(j) Patients with recent infections that are not judged to be severe are excluded if they have either:

   (i) Signs or symptoms of infection within 2 weeks prior to Cycle 1, Day 1. Patients with uncomplicated viral upper respiratory tract infections are eligible provided symptoms have resolved to baseline;

   (ii) Received oral or IV antibiotics (including anti-fungal or anti-viral therapy) within 2 weeks prior to Cycle 1, Day 1. Patients receiving prophylactic antibiotics (e.g., for prevention of a urinary tract infection or chronic obstructive pulmonary disease) are eligible;

(k) Prior allogeneic bone marrow transplantation or prior solid organ transplantation;

(l) Administration of a live, attenuated vaccine within 4 weeks before Cycle 1, Day 1 or anticipation that such a live attenuated vaccine may be required during the study. Influenza vaccination is given during influenza season only. Patients must not receive live, attenuated influenza vaccine (e.g., FluMist®) within 4 weeks prior to Cycle 1, Day 1 or at any time during the study; and

(m) History of severe allergic, anaphylactic, or other hypersensitivity reactions to chimeric or humanized antibodies or fusion proteins.

[0619] Exclusion criteria specific to patients assigned to the triplet arm include:

(a) Inadequately controlled hypertension (defined as systolic blood pressure > 150 mmHg and/or diastolic blood pressure > 100 mmHg. Anti-hypertensive therapy to maintain a systolic blood pressure < 150 mmHg and/or diastolic blood pressure < 100 mmHg is permitted;

(b) Prior history of hypertensive crisis or hypertensive encephalopathy;

(c) Clinically significant cardiovascular disease, such as cerebrovascular accidents within 6 months prior to initiation of study treatment, myocardial infarction within 6 months prior to initiation of study treatment, unstable angina, New York Heart Association (NYHA) Grade II or greater CHF, or serious cardiac arrhythmia uncontrolled by medication or potentially interfering with study treatment;
(d) History of stroke or transient ischemic attack within 6 months prior to Cycle 1 Day 1;
(e) Significant vascular disease (e.g., aortic aneurysm requiring surgical repair or recent peripheral arterial thrombosis) within 6 months prior to Cycle 1 Day 1;
(f) History of Grade ≥ 4 venous thromboembolism;
(g) History of Grade ≥ 2 hemoptysis (defined as ≥ 2.5 mL of bright red blood per episode) within 3 months prior to screening for NSCLC patients and 1 month prior to screening for other tumor type other than NSCLC;
(h) Evidence of bleeding diathesis or clinically significant coagulopathy (in the absence of therapeutic anticoagulation);
(i) Current or recent (within 10 calendar days prior to Cycle 1 Day 1) use of dipyramidole (> 400 mg/day), ticlopidine (> 500 mg/day), clopidogrel (>75 mg/day), aspirin (>325 mg/day), or cilostazol (> 200 mg/day);
(j) Prophylactic or therapeutic use of low molecular weight heparin (e.g., enoxaparin), direct thrombin inhibitors, or warfarin are permitted, provided, where appropriate anticoagulation indices are stable. Patients should have been on a stable dose (for therapeutic use) for at least 2 weeks (or until reaching steady state level of the drug) prior to the first study treatment;
(k) Core biopsy or other minor surgical procedure, excluding placement of a vascular access device, within 7 calendar days prior to the first dose of bevacizumab;
(l) History of abdominal or tracheoesophageal fistula or GI perforation within 6 months prior to Cycle 1 Day 1;
(m) Clinical signs or symptoms of GI obstruction or requirement for routine parenteral hydration, parenteral nutrition, or tube feeding;
(n) Evidence of abdominal free air not explained by paracentesis or recent surgical procedure;
(o) Serious, non-healing or dehiscent wound, active ulcer, or untreated bone fracture;
(p) Proteinuria, as demonstrated by urine dipstick or > 1.0 g of protein in a 24-hour urine collection. All patients with ≥ 2+ protein on dipstick urinalysis at baseline must undergo a 24-hour urine collection for protein;
(q) Known hypersensitivity to any component of bevacizumab; and
(r) Intrathoracic lung cancer of squamous cell histology. Mixed tumors are categorized by the predominant cell type.

Dose escalation stage

[0620] Approximately 6 to 12 patients are enrolled in the MOXR0916 + atezolizumab + bevacizumab dose escalation study. The starting dose of MOXR0916 is 300 mg, administered by IV infusion every 21 days to patients in the first cohort. If the starting dose is tolerated by the first cohort, a second cohort of 3 patients is dosed. If the starting dose is tolerated by both cohorts (e.g.,
the MTD is not exceeded), the study progresses to Expansion Part IV (see FIG. 4B). Depending on new nonclinical efficacy, clinical safety, and PK data, intermediate dose levels of MOXR0916 may be evaluated. Atezolizumab is administered at a fixed dose of 1200 mg IV every 21 days. Bevacizumab are administered at a weight-based dose of 15 mg/kg IV every 21 days.

[0621] If the starting dose is not tolerated, or if warranted by clinical safety or PK data, intermediate or lower dose levels of MOXR0916 may be evaluated. Cohorts of at least 3 patients each are treated at escalating doses of MOXR0916 in combination with a fixed dose of atezolizumab (1200 mg) and a weight-based dose (15 mg/kg) of bevacizumab in accordance with the dose escalation rules to determine the MTD or maximum administered dose (MAD). Initially, the DLT assessment window is 21 days (Days 1-21 of Cycle 1). If a delayed DLT is observed, the DLT assessment window is extended to 42 days after the first administration of MOXR0916 and atezolizumab for all patients in that cohort and any subsequent dose escalation cohorts. Adverse events identified as DLTs or delayed DLTs, are reported to the Sponsor within 24 hours.

[0622] Intrapatient dose escalation of MOXR0916 to a dose level that has already met criteria for further escalation are allowed if all of the following conditions are met: the patient has completed at least 4 cycles at their originally assigned dose level and has a documented anti-therapeutic antibody titer; the patient has not experienced a DLT or an adverse event occurring outside the DLT window that would otherwise meet the definition of a DLT; the patient is clinically stable with no decrement in performance status; the Medical Monitor has approved the dose escalation.

Expansion Stage

[0623] Approximately 50-100 patients are enrolled in the expansion stage (Part IV) to better characterize the safety, tolerability, PK variability, biomarkers of anti-tumor activity, and preliminary efficacy of MOXR0916 in combination with atezolizumab and bevacizumab. The expansion stage enrolls: 20-40 patients with treatment-naive RCC; 10-20 patients with RCC with one or more prior lines of systemic therapy; and up to 40 patients in an additional "basket" of patients with tumor types other than RCC that may be opened if activity in RCC is judged to be promising (FIGS. 4A & 4B). Enrollment may be restricted on the basis of prospectively determined tumor PD-L1 or OX40 status based on evolving biomarker data. In this circumstance, patients whose tumor tissue is determined to be unevaluable for expression of the pertinent biomarker is ineligible.

Dosage, Administration, and Compliance

[0624] Administration of MOXR0916, atezolizumab, and bevacizumab is performed in a setting with emergency medical facilities with access to a critical care unit and staff who are trained to monitor for and respond to medical emergencies. On days of scheduled study treatment infusion, the order of administration is MOXR0916 (first infusion), atezolizumab (second infusion) and bevacizumab (last infusion), with an intervening observation period (minimum of 30 minutes).
The approximate dose levels of MOXR0916 proposed to be evaluated in this study include 0.8, 3.2, 12, 40, 130, 300, 400, and 1200 mg administered every 3 weeks by IV infusion. Intermediate dose levels of MOXR0916 may be evaluated based on new nonclinical efficacy, clinical safety, and clinical PK data after consultation with participating investigators. Doses are not dependent on body weight.

The initial dose of MOXR0916 is delivered over 60 ± 10 minutes (although the infusion may be slowed or interrupted for patients who experience infusion-associated symptoms), followed by a 30-minute observation period. If the 60-minute infusion is tolerated without infusion-associated adverse events, all subsequent infusions may be delivered over 30 ± 10 minutes, followed by a 30-minute observation period. Patients who have previously received MOXR0916 may receive the initial dose at the fastest rate that was previously tolerated.

The dose of atezolizumab to be administered in combination with MOXR0916 in this study is 1200 mg IV every 3 weeks. This dose is fixed and not dependent on body weight. Atezolizumab is administered after the MOXR0916 infusion and subsequent observation period.

The initial dose of atezolizumab is delivered over 60 ± 10 minutes. If the first infusion is tolerated without infusion-associated adverse events, the second infusion may be delivered over 30 ± 10 minutes. If the 30-minute infusion is well tolerated, all subsequent infusions may be delivered over 30 (± 10) minutes. All doses of atezolizumab are followed by a 30-minute observation period. Patients who have previously received atezolizumab on another clinical trial may receive the initial dose at the fastest rate that was previously tolerated. There is no dose reduction for atezolizumab in this study.

The dose of bevacizumab in this study is 15 mg/kg administered by IV infusion every 3 weeks. Body weight at baseline is used to calculate the required dose of bevacizumab. If a weight change of > 10% from baseline is observed, the treatment dosage is modified accordingly (i.e., this becomes the new weight for dose calculation). Otherwise, it is not necessary to recalculate the dose for each administration. On the day of infusion, MOXR0916 is administered first, followed by atezolizumab and bevacizumab infusions.

The initial dose of bevacizumab is delivered over 90 ± 10 minutes, followed by a 30-minute observation period. If the 90-minute infusion is tolerated without infusion-associated adverse events, the second infusion may be delivered over 60 ± 10 minutes, followed by a 30 minute observation period. If the 60-minute infusion is well tolerated, all subsequent infusions may be delivered over 30 ± 10 minutes, followed by a 30-minute observation period. Bevacizumab administration may be subject to an investigational site's standard procedures. Patients who have previously received bevacizumab may receive the initial dose at the fastest rate that was previously tolerated. There is no dose reduction for bevacizumab in this study.
Outcome Measures
[0631] The safety and tolerability of MOXR0916, atezolizumab, and bevacizumab is assessed using the following primary safety outcome measures: incidence and nature of DLTs; and incidence, nature, and severity of adverse events graded according to NCI CTCAE v4.0.
[0632] In addition, safety is assessed using the following secondary safety outcome measures: incidence of anti-MOXR0916, anti-atezolizumab, and anti-bevacizumab antibodies and the potential correlation with PK, pharmacodynamic, and safety parameters; change in vital signs; change in clinical laboratory results, including ECGs; and number of cycles received and dose intensity.
[0633] The following pharmacokinetic parameters are derived from serum concentration-time profiles of MOXR0916 following administration, when appropriate as data allow: AUC; Cmax; Cmin; CL; and Vss. The following pharmacokinetic parameters are derived from serum concentration-time profiles of atezolizumab and bevacizumab following administration, when appropriate as data allow: Cmax; and Cmin. Other parameters such as accumulation ratio, half-life, and dose proportionality may also be calculated.
[0634] The following activity outcome measures may be assessed:
(a) Objective response, defined as a complete response (CR) or partial response (PR) confirmed ≥ 4 weeks after initial documentation, determined using RECIST v.1.1;
(b) Duration of objective response, defined as the time from the first occurrence of a documented, objective response until the time of relapse or death from any cause, determined using RECIST v.1.1;
(c) Progression-free survival (PFS), defined as the time from the first study treatment (Day 1) to the first occurrence of progression or death from any cause, whichever occurs first, determined using RECIST v.1.1;
(d) Objective response, duration of objective response, and PFS determined using modified RECIST; and
(e) Overall survival (OS), defined as the time from first study treatment to death from any cause.
[0635] The following exploratory PD outcome measures may be assessed: changes in T, B, and NK cell numbers (T, B, and NK assay) in blood; changes in prevalence of various immune cell subpopulations in blood (e.g., effector/memory T cells, regulatory T cells, and MDSCs); changes in activation, proliferation, and functional status of T-cell subsets in blood; identification and profiling of exploratory biomarkers in plasma (i.e., interleukin-2 [IL2], IFNy, and other markers); changes in tumor-infiltrating CD8+ T cells (and other exploratory markers) in freshly obtained tumor tissue prior to and during study treatment; and changes in tumor-infiltrating T-cell activity (measured by expression of granzyme B and other markers) in freshly obtained tumor tissue prior to and during study treatment.
[0636] The following additional exploratory biomarker outcome measures may be assessed when appropriate: status of PD-L1 and OX40 (and other exploratory markers) in tumor tissue; status of immune infiltrate in tumor tissue, including enumeration and characterization of various immune cell
subpopulations; and analysis of single nucleotide polymorphisms (SNPs) in genes including but not limited to those that encode Fc receptors.

**Example 4: Tumor immune modulation observed in first-in-human Phase I dose escalation study of the OX40 agonist MOXR0916 in patients with refractory solid tumors**

[0637] In an RCC tumor biopsy from one patient that received MOXR0916 at a dose of 3.2mg administered in the parallel phase I single-agent MOXR0916 study cited in reference to FIG. 2 above, tumor immune modulation was observed. FIG. 5 shows the postdose fold change in gene expression (as compared to predose levels) of various immune-related genes. Upregulated genes included CCR5, CD274, IL-7, TNFRSF14, TGFB1, CD40, CD4, PRF1, TNFSF4, CD86, CXCL9, CD3E, LAG3, PDCD1, CCL28, GZMB, IFNg, and IL-2RA. This gene expression pattern indicates an increase in Teff activation. Downregulated genes included CCL22, IL-2, RORC, IL-8, CTLA4, and FOXP3. Importantly, expression of these genes is thought to be associated with Treg cells, thus suggesting a decrease in Treg activity. PD-L1 expression was also assayed in the tumor biopsy using IHC, which demonstrated an increase in PD-L1-positive area (relative to overall tumor area) from a predose score of <1% to a postdose score of 5%. Treg cells were also enumerated in the tumor biopsy using immunofluorescence staining against CD3 and Foxp3 as markers. These data indicated a predose Treg frequency (*i.e.*, CD3+Foxp3+ cells) of 2.15% of all cells, as compared to a postdose frequency of 0.58%. In summary, these data indicate a reduction in Tregs, an increase in Teff activation, and an increase in PD-L1 expression upon MOXR0916 treatment.

[0638] In summary, these data, particularly the increase in PD-L1 expression seen after OX40 agonist treatment, suggest that MOXR0916 treatment may enhance the efficacy of, or otherwise act synergistically with, atezolizumab treatment, *e.g.*, through reduction in Tregs, an increase in Teff activation, and an increase in PD-L1 expression. The safety and complementary mechanism of action of MOXR0916 supports its use in combination with atezolizumab.

[0639] Although the foregoing invention has been described in some detail by way of illustration and example for purposes of clarity of understanding, the descriptions and examples should not be construed as limiting the scope of the invention. The disclosures of all patent and scientific literature cited herein are expressly incorporated in their entirety by reference.
CLAIMS

WHAT IS CLAIMED IS:

1. A method of treating or delaying progression of cancer in an individual comprising administering to the individual:
   (i) an anti-human OX40 agonist antibody at a dose selected from the group consisting of about 0.8mg, about 3.2mg, about 12mg, about 40mg, about 80mg, about 130mg, about 160mg, about 300mg, about 320mg, about 400mg, about 600mg, and about 1200mg, wherein the anti-human OX40 agonist antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:2; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:3; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:4; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:7; and
   (ii) an anti-PDL1 antibody at a dose of about 800mg or about 1200mg, wherein the anti-PDL1 antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:196; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:197; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:198; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:199; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:200; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:201; wherein the individual is a human.

2. The method of claim 1, wherein the anti-human OX40 agonist antibody is administered at a dose of about 300mg.

3. The method of claim 1 or claim 2, wherein the anti-human OX40 agonist antibody and the anti-PDL1 antibody are administered intravenously.

4. The method of claim 1 or claim 2, wherein the anti-human OX40 agonist antibody and the anti-PDL1 antibody are administered on the same day.

5. The method of claim 1 or claim 2, wherein the anti-human OX40 agonist antibody and the anti-PDL1 antibody are administered on different days, and wherein the anti-PDL1 antibody is administered within 7 or fewer days of administering the anti-human OX40 agonist antibody.

6. The method of any one of claims 1-5, further comprising repeating the administration of the anti-human OX40 agonist antibody at one or more additional doses, wherein each dose of the one or more additional doses is selected from the group consisting of about 0.8mg, about 3.2mg, about 12mg, about 40mg, about 80mg, about 130mg, about 160mg, about 300mg, about 320mg, about 400mg, about 600mg, and about 1200mg per administration and is administered at an interval of about 2 weeks or about 14 days between each administration.
7. The method of any one of claims 1-5, further comprising repeating the administration of the anti-human OX40 agonist antibody at one or more additional doses, wherein each dose of the one or more additional doses is selected from the group consisting of about 0.8mg, about 3.2mg, about 12mg, about 40mg, about 80mg, about 130mg, about 160mg, about 300mg, about 320mg, about 400mg, about 600mg, and about 1200mg per administration and is administered at an interval of about 3 weeks or about 21 days between each administration.

8. The method of claim 6 or claim 7, wherein 1-10 additional doses of the anti-human OX40 agonist antibody are administered.

9. The method of any one of claims 1-8, further comprising repeating the administration of the anti-PDL1 antibody at one or more additional doses, wherein each dose of the one or more additional doses is about 800mg and is administered at an interval of about 2 weeks or about 14 days between each administration.

10. The method of any one of claims 1-8, further comprising repeating the administration of the anti-PDL1 antibody at one or more additional doses, wherein each dose of the one or more additional doses is about 1200mg and is administered at an interval of about 3 weeks or about 21 days between each administration.

11. The method of claim 9 or claim 10, wherein 1-10 additional doses of the anti-PDL1 antibody are administered.

12. The method of any one of claims 6-11, wherein each dose of the anti-human OX40 agonist antibody administered to the individual is the same.

13. The method of any one of claims 6-11, wherein each dose of the anti-human OX40 agonist antibody administered to the individual is not the same.

14. The method of any one of claims 6-13, wherein each dose of the anti-human OX40 agonist antibody is administered intravenously.

15. The method of claim 14, wherein a first dose of the anti-human OX40 agonist antibody is administered to the individual at a first rate, wherein, after the administration of the first dose, one or more additional doses of the anti-human OX40 agonist antibody are administered to the individual at one or more subsequent rates, and wherein the first rate is slower than the one or more subsequent rates.

16. The method of any one of claims 9-15, wherein each dose of the anti-PDL1 antibody is administered intravenously.

17. The method of claim 16, wherein a first dose of the anti-PDL1 antibody is administered to the individual at a first rate, wherein, after the administration of the first dose, one or more additional doses of the anti-PDL1 antibody are administered to the individual at one or more subsequent rates, and wherein the first rate is slower than the one or more subsequent rates.

18. The method of any one of claims 1-17, wherein the anti-human OX40 agonist antibody is a humanized antibody.
19. The method of any one of claims 1-14, wherein the anti-human OX40 agonist antibody comprises a heavy chain variable domain (VH) sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99%, or 100% sequence identity to the amino acid sequence of SEQ ID NO: 56, 58, 60, 62, 64, 66, 68, 183, or 184.

20. The method of claim 19, wherein the VH sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% identity contains substitutions (e.g., conservative substitutions), insertions, or deletions relative to the reference sequence, but an anti-human OX40 agonist antibody comprising that sequence retains the ability to bind to human OX40.

21. The method of claim 19 or claim 20, wherein a total of 1 to 10 amino acids have been substituted, inserted and/or deleted in SEQ ID NO: 56.

22. The method of any one of claims 1-21, wherein the anti-human OX40 agonist antibody comprises a light chain variable domain (VL) having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99%, or 100% sequence identity to the amino acid sequence of SEQ ID NO: 57, 59, 61, 63, 65, 67, or 69.

23. The method of claim 22, wherein the VL sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% identity contains substitutions (e.g., conservative substitutions), insertions, or deletions relative to the reference sequence, but an anti-human OX40 agonist antibody comprising that sequence retains the ability to bind to human OX40.

24. The method of claim 22 or claim 23, wherein a total of 1 to 10 amino acids have been substituted, inserted and/or deleted in SEQ ID NO: 57.

25. The method of any one of claims 1-24, wherein the anti-human OX40 agonist antibody comprises a VH sequence of SEQ ID NO: 56.

26. The method of any one of claims 1-25, wherein the anti-human OX40 agonist antibody comprises a VL sequence of SEQ ID NO: 57.

27. The method of any one of claims 1-26, wherein the anti-human OX40 agonist antibody comprises a VH sequence of SEQ ID NO: 56 and a VL sequence of SEQ ID NO: 57.

28. The method of any one of claims 1-27, wherein the anti-human OX40 agonist antibody is a full length human IgGl antibody.

29. The method of any one of claims 1-28, wherein the anti-human OX40 agonist antibody is MOXR0916.

30. The method of any one of claims 1-29, wherein the anti-human OX40 agonist antibody is formulated in a pharmaceutical formulation comprising (a) the anti-human OX40 agonist antibody at a concentration between about 10 mg/mL and about 100 mg/mL, (b) a polysorbate, wherein the polysorbate concentration is about 0.02% to about 0.06%; (c) a histidine buffer at pH 5.0 to 6.0; and (d) a saccharide, wherein the saccharide concentration is about 120 mM to about 320 mM.

31. The method of any one of claims 1-30, wherein the anti-PDL1 antibody is a monoclonal antibody.
32. The method of any one of claims 1-30, wherein the anti-PDL1 antibody is an antibody fragment selected from the group consisting of Fab, Fab'-SH, Fv, scFv, and (Fab')₂ fragments.

33. The method of any one of claims 1-30, wherein the anti-PDL1 antibody is a humanized antibody or a human antibody.

34. The method of any one of claims 1-33, wherein the anti-PDL1 antibody comprises a human IgG1 having Asn to Ala substitution at position 297 according to EU numbering.

35. The method of any one of claims 1-34, wherein the anti-PDL1 antibody comprises a heavy chain variable region comprising the amino acid sequence of EVQLVESGGGLVQPGGSLRLSCLAASGFTSFSDSWIHWVRQAPKGGLEWAVAWISPYGGSTY YADSVKGRFTISADTSKNTAYLQMNSLRAGTAVYVCARRHWPGFQGTLVTVS (SEQ ID NO:202) or EVQLVESGGGLVQPGGSLRLSCLAASGFTSFSDSWIHWVRQAPKGGLEWAVAI SPYGGSTYYADSVKGRFTISADTSKNTAYLQMNSLRAGTAVYVCARRHWPGFQGTLVTSSASTK (SEQ ID NO:203).

36. The method of any one of claims 1-35, wherein the anti-PDL1 antibody comprises a light chain variable region comprising the amino acid sequence of DIQMTQSPSSLSASVGRVTITCRASQDVSTAVAWYYQQKPGKAPKLLIY SASF LYSGVPSRFSGSGTDFTLTISSLQPEDFATYYCQQYLHYHPATFGQGTKVEIKR (SEQ ID NO:204).

37. The method of claim 35 or claim 36, wherein the anti-PDL1 antibody comprises a heavy chain variable region comprising the amino acid sequence of EVQLVESGGGLVQPGGSLRLSCLAASGFTSFSDSWIHWVRQAPKGGLEWAVAI SPYGGSTYYADSVKGRFTISADTSKNTAYLQMNSLRAGTAVYVCARRHWPGFQGTLVTVS (SEQ ID NO:202) or EVQLVESGGGLVQPGGSLRLSCLAASGFTSFSDSWIHWVRQAPKGGLEWAVAI SPYGGSTYYADSVKGRFTISADTSKNTAYLQMNSLRAGTAVYVCARRHWPGFQGTLVTSSASTK (SEQ ID NO:203) and a light chain variable region comprising the amino acid sequence of DIQMTQSPSSLSASVGRVTITCRASQDVSTAVAWYYQQKPGKAPKLLIY SASF LYSGVPSRFSGSGTDFTLTISSLQPEDFATYYCQQYLHYHPATFGQGTKVEIKR (SEQ ID NO:204).

38. The method of any one of claims 1-37, wherein the anti-PDL1 antibody comprises a heavy chain sequence that has at least 85%, at least 90%, at least 91%, at least 92%, at least 93%, at least 94%, at least 95%, at least 96%, at least 97%, at least 98%, at least 99% or 100% sequence identity to the heavy chain sequence: EVQLVESGGGLVQPGGSLRLSCLAASGFTSFSDSWIHWVRQAPKGGLEWAVAWISPYGGSTY YADSVKGRFTISADTSKNTAYLQMNSLRAGTAVYVCARRHWPGFQGTLVTSSASTK (SEQ ID NO:203).
The method of any one of claims 1-38, wherein the anti-PDL1 antibody comprises a light chain sequence that has at least 85%, at least 90%, at least 91%, at least 92%, at least 93%, at least 94%, at least 95%, at least 96%, at least 97%, at least 98%, or at least 99% or 100% sequence identity to the light chain sequence:

DIQMTQSPSSLASVGSADTKTFVESQGQGTHPLAPGQTPQKTVKVEIKRTVEAESVQKVDNALQSGNSQESVTEQDSKDSTYSLTLSSTLTL SKADYEKHKVYACEVTHQGQLSSPVTSKSFNREGC (SEQ ID NO:205).

40. The method of any one of claims 1-39, wherein the anti-PDL1 antibody is MPDL3280A.

41. The method of any one of claims 1-40, wherein the method further comprises administering to the individual an anti-VEGF antibody.

42. The method of claim 41, wherein the anti-VEGF antibody is bevacizumab.

43. The method of claim 42, wherein bevacizumab is administered to the individual at a dose of about 15mg/kg.

44. The method of claim 43, further comprising the administration of bevacizumab at one or more additional doses, wherein each dose is about 15mg/kg and is administered at an interval of about 3 weeks or about 21 days between each administration.

45. The method of any one of claims 41-44, wherein the anti-human OX40 agonist antibody, the anti-PDL1 antibody, and anti-VEGF antibody are administered to the individual on the same day.

46. The method of any one of claims 41-45, wherein the anti-human OX40 agonist antibody, the anti-PDL1 antibody, and anti-VEGF antibody are administered intravenously.

47. The method of any one of claims 1-46, wherein the treatment results in a sustained response in the individual after cessation of the treatment.

48. The method of any one of claims 1-47, wherein the treatment results in a complete response (CR) or partial response (PR) in the individual.

49. The method of any one of claims 1-48, wherein the individual has a cancer selected from the group consisting of melanoma, triple-negative breast cancer, ovarian cancer, renal cell cancer, bladder cancer, non-small cell lung cancer, gastric cancer, and colorectal cancer.

50. The method of claim 49, wherein the individual has melanoma, wherein the melanoma has a BRAF V600 mutation, and wherein, prior to the administration of the anti-human OX40 agonist antibody and the anti-PDL1 antibody, the individual has been treated with a B-Raf and/or mitogen-activated protein kinase kinase (MEK) kinase inhibitor and exhibited disease progression.
or intolerance to the B-Raf and/or mitogen-activated protein kinase kinase (MEK) kinase inhibitor treatment.

51. The method of claim 49, wherein the individual has non-small cell lung cancer, wherein the non-small cell lung cancer has a sensitizing epidermal growth factor receptor (EGFR) mutation, and wherein, prior to the administration of the anti-human OX40 agonist antibody and the anti-PDL1 antibody, the individual has been treated with an EGFR tyrosine kinase inhibitor and exhibited disease progression or intolerance to the EGFR tyrosine kinase inhibitor treatment.

52. The method of claim 49, wherein the individual has non-small cell lung cancer, wherein the non-small cell lung cancer has an anaplastic lymphoma kinase (ALK) rearrangement, and wherein, prior to the administration of the anti-human OX40 agonist antibody and the anti-PDL1 antibody, the individual has been treated with an ALK tyrosine kinase inhibitor and exhibited disease progression or intolerance to the ALK tyrosine kinase inhibitor treatment.

53. The method of claim 49, wherein the individual has colorectal cancer, and wherein the colorectal cancer exhibits microsatellite instability-high (MSI-H) status.

54. The method of claim 49, wherein the individual has renal cell cancer, and wherein the renal cell cancer is refractory to a prior therapy.

55. The method of claim 54, wherein the prior therapy comprises treatment with a VEGF inhibitor, an mTOR inhibitor, or both.

56. The method of claim 1, wherein the anti-human OX40 agonist antibody is MOXR0916 administered at a dose of 300mg, wherein the anti-PDL1 antibody is atezolizumab administered at a dose of 1200mg, and wherein the cancer is selected from the group consisting of melanoma, triple-negative breast cancer, ovarian cancer, renal cell cancer, bladder cancer, non-small cell lung cancer, gastric cancer, and colorectal cancer.

57. The method of claim 56, wherein the MOXR0916 and the atezolizumab are administered on the same day.

58. The method of claim 56 or claim 57, further comprising repeating the administration of MOXR0916 at a dose of 300mg per administration, and repeating the administration of atezolizumab at a dose of 1200mg per administration, wherein the MOXR0916 and the atezolizumab are administered at an interval of about 3 weeks or about 21 days between each administration.

59. The method of claim 58, wherein the repeated administrations of the MOXR0916 and the atezolizumab are administered on the same day.

60. The method of any one of claims 56-59, wherein the MOXR0916 and the atezolizumab are administered intravenously.

61. The method of claim 1, wherein the method further comprises administering bevacizumab at a dose of 15mg/kg, wherein the anti-human OX40 agonist antibody is MOXR0916 administered at a dose of 300mg, wherein the anti-PDL1 antibody is atezolizumab administered at a dose of
1200mg, and wherein the cancer is selected from the group consisting of melanoma, triple-negative breast cancer, ovarian cancer, renal cell cancer, bladder cancer, non-small cell lung cancer, gastric cancer, and colorectal cancer.

62. The method of claim 61, wherein the MOXR0916, the atezolizumab, and the bevacizumab are administered on the same day.

63. The method of claim 61 or claim 62, further comprising repeating the administration of MOXR0916 at a dose of 300mg per administration, repeating the administration of atezolizumab at a dose of 1200mg per administration, and repeating the administration of bevacizumab at a dose of 15mg/kg per administration, wherein the MOXR0916, the atezolizumab, and the bevacizumab are administered at an interval of about 3 weeks or about 21 days between each administration.

64. The method of claim 63, wherein the repeated administrations of the MOXR0916, the atezolizumab, and the bevacizumab are administered on the same day.

65. The method of any one of claims 61-64, wherein the MOXR0916, the atezolizumab, and the bevacizumab are administered intravenously.

66. The method of any one of claims 1-65, further comprising, after administering to the individual the anti-human OX40 agonist antibody and the anti-PDL1 antibody, monitoring the responsiveness of the individual to said treatment by:
   (a) measuring an expression level of one or more marker genes in a sample obtained from the cancer of the individual, wherein the one or more marker genes are selected from the group consisting of CCR5, CD274, IL-7, TNFRSF14, TGFB1, CD40, CD4, PRF1, TNFSF4, CD86, CXCL9, CD3E, LAG3, PDCD1, CCL28, GZMB, IFNγ, and IL-2RA; and
   (b) optionally, classifying the individual as responsive or non-responsive to treatment with the anti-human OX40 agonist antibody and the anti-PDL1 antibody based on the expression level of the one or more marker genes in the sample, as compared with a reference, wherein an increased expression level of the one or more marker genes as compared with the reference indicates a responsive individual.

67. The method of any one of claims 1-65, further comprising, after administering to the individual the anti-human OX40 agonist antibody and the anti-PDL1 antibody, monitoring the responsiveness of the individual to said treatment by:
   (a) measuring an expression level of one or more marker genes in a sample obtained from the cancer of the individual, wherein the one or more marker genes are selected from the group consisting of CD8b, EOMES, GZMA, GZMB, IFNγ, and PRF1; and
   (b) optionally, classifying the individual as responsive or non-responsive to treatment with the anti-human OX40 agonist antibody and the anti-PDL1 antibody based on the expression level of the one or more marker genes in the sample, as compared with a reference, wherein an increased
expression level of the one or more marker genes as compared with the reference indicates a responsive individual.

68. The method of any one of claims 1-65, further comprising, after administering to the individual the anti-human OX40 agonist antibody and the anti-PDL1 antibody, monitoring the responsiveness of the individual to said treatment by:

(a) measuring an expression level of one or more marker genes in a sample obtained from the cancer of the individual, wherein the one or more marker genes are selected from the group consisting of CCL22, IL-2, RORC, IL-8, CTLA4, and FOXP3; and

(b) optionally, classifying the individual as responsive or non-responsive to treatment with the anti-human OX40 agonist antibody and the anti-PDL1 antibody based on the expression level of the one or more marker genes in the sample, as compared with a reference, wherein a decreased expression level of the one or more marker genes as compared with the reference indicates a responsive individual.

69. The method of any one of claims 1-68, wherein, prior to the administration of the anti-human OX40 agonist antibody and the anti-PDL1 antibody, the individual has been treated with an immunotherapy agent.

70. The method of claim 69, wherein the prior treatment with the immunotherapy agent is a monotherapy.

71. The method of claim 69 or claim 70, wherein the individual exhibited a stable disease or disease progression prior to the administration of the anti-human OX40 agonist antibody and the anti-PDL1 antibody.

72. The method of any one of claims 69-71, wherein the prior treatment with the immunotherapy agent comprises treatment with an OX40 agonist in the absence of a PD-1 axis binding antagonist.

73. The method of claim 72, wherein the OX40 agonist is an anti-human OX40 agonist antibody.

74. The method of any one of claims 69-71, wherein the prior treatment with the immunotherapy agent comprises treatment with a PD-1 axis binding antagonist in the absence of an OX40 agonist.

75. The method of claim 74, wherein the OX40 agonist is an anti-human OX40 agonist antibody.

76. The method of any one of claims 72-75, wherein the PD-1 axis binding antagonist is an anti-PDL1 antibody.

77. The method of any one of claims 72-75, wherein the PD-1 axis binding antagonist is an anti-PD1 antibody.

78. A method for determining whether a cancer patient responds to a treatment with an anti-human OX40 agonist antibody and an anti-PDL1 antibody, comprising measuring an expression level of one or more marker genes in a sample obtained from the cancer of the individual, wherein the one or more marker genes are selected from the group consisting of CCR5, CD274, IL-7, TNFRSF14, TGFB1, CD40, CD4, PRF1, TNFSF4, CD86, CXCL9, CD3E, LAG3, PDCD1, CCL28, GZMB, IFNg, and IL-2RA, wherein the expression level of the one or more marker genes is compared
with a reference, and wherein an increased expression level of the one or more marker genes as compared with the reference indicates that the cancer patient responds to said treatment.

79. A method for determining whether a cancer patient responds to a treatment with an anti-human OX40 agonist antibody and an anti-PDL1 antibody, comprising measuring an expression level of one or more marker genes in a sample obtained from the cancer of the individual, wherein the one or more marker genes are selected from the group consisting of CD8b, EOMES, GZMA, GZMB, IFNg, and PRF1, wherein the expression level of the one or more marker genes is compared with a reference, and wherein an increased expression level of the one or more marker genes as compared with the reference indicates that the cancer patient responds to said treatment.

80. A method for determining whether a cancer patient responds to a treatment with an anti-human OX40 agonist antibody and an anti-PDL1 antibody, comprising measuring an expression level of one or more marker genes in a sample obtained from the cancer of the individual, wherein the one or more marker genes are selected from the group consisting of CCL22, IL-2, RORC, IL-8, CTLA4, and FOXP3, wherein the expression level of the one or more marker genes is compared with a reference, and wherein a decreased expression level of the one or more marker genes as compared with the reference indicates that the cancer patient responds to said treatment.

81. A kit for treating or delaying progression of cancer in an individual, comprising:

(i) a container comprising an anti-human OX40 agonist antibody for administration at a dose selected from the group consisting of about 0.8mg, about 3.2mg, about 12mg, about 40mg, about 80mg, about 130mg, about 160mg, about 300mg, about 320mg, about 400mg, about 600mg, and about 1200mg, wherein the anti-human OX40 agonist antibody comprises: an HVR-H1 comprising the amino acid sequence of SEQ ID NO:2; an HVR-H2 comprising the amino acid sequence of SEQ ID NO:3; an HVR-H3 comprising the amino acid sequence of SEQ ID NO:4; an HVR-L1 comprising the amino acid sequence of SEQ ID NO:5; an HVR-L2 comprising the amino acid sequence of SEQ ID NO:6; and an HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:7;

(ii) a container comprising an anti-PDL1 antibody for administration at a dose of about 800mg or about 1200mg, wherein the anti-PDL1 antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:196; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:197; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:198; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:199; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:200; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO:201; and

(iii) a package insert with instructions for treating or delaying progression of cancer in an individual, wherein the individual is a human.
Doublet (MOXR0916 + Atezolizumab) Arm

Dose Escalation

- MOXR 0.8 mg
  - Atezol 1200 mg
- MOXR 3.3 mg
  - Atezol 1200 mg
- MOXR 12 mg
  - Atezol 1200 mg
- MOXR 40 mg
  - Atezol 1200 mg
- MOXR 130 mg
  - Atezol 1200 mg
- MOXR 400 mg
  - Atezol 1200 mg
- MOXR 1200 mg
  - Atezol 1200 mg

- Expansion Part I will begin at a dose of 3.2 mg or higher after the escalation cohort treated at the selected initial dose has cleared the DLT assessment window.

- Expansion Part II will begin at or below the MAD or MTD.

- Advanced, incurable, refractory solid tumors
- MOXR0916 (MOXR) and atezolizumab (atezol) IV q21d
- 3+3 escalation
- ≥ 72 hours between first 2 patients in each cohort
- Initially, the DLT window will be 21 days; if a delayed DLT is observed, the window will be extended to 42 days.

Expansion Part I Biopsy cohort

- MOXR level 1
  - Atezol 1200 mg
- MOXR level 2
  - Atezol 1200 mg
- MOXR level 3
  - Atezol 1200 mg

Expansion Part II

- NSCLC
  - 20-40
- TNBC
  - 20-40
- Melanoma
  - 20-40
- Colorectal
  - 20-40
- Bladder
  - 20-40
- Gastric/GEJ
  - 20-40
- Renal
  - 20-40
- Ovarian
  - 20-40

Biopsy PD-L1/1PD-1 naive

- Up to 40 Prior PR/CR x ixxx
- 10-22

Expansion Part III: Prior PD-L1/1PD-1 (n=60-160)

- NSCLC
- TNBC
- Melanoma
- HNSCC
- Bladder
- Gastric/GEJ
- Renal
- Basset

- a. Up to 40 patients who are eligible for serial biopsies. Core needle, excisional, incisional, punch, forceps biopsies are acceptable.
- b. MOXR0916 dose of 3.2 mg or higher.
- c. Enrollment proceeds at or below the highest dose that has cleared its DLT assessment.
- d. Cohort sizes are approximate.
- e. Patient selection based on prospective determination of tumor PD-L1 or OX40 status may be implemented in some cohorts.
- f. Expansion beyond approximately 20 patients may be limited to PD-L1-selected patients based on prospective tumor testing.
- g. At least 5 patients with MSI-H tumors will be enrolled.
- h. May be open to tumor types without designated cohorts, as selected by the Sponsor in consultation with investigators.
- i. PD-L1/1PD-1 inhibitor monotherapy must represent the most recent anti-cancer therapy. Enrollment will be stratified according to the patient’s prior best response to the PD-L1/1PD-1 inhibitor.
- j. Not restricted based on tumor type.
- k. Limited to patients with NSCLC, UC, TNBC, GC, melanoma, RCC, or HNSCC.
- l. Limited to patients with a prior PD-L1/1PD-1 inhibitor (either monotherapy or as part of a combination regimen) as the most recent anti-cancer therapy.
- m. If no activity is observed in the first 20 patients with a specific tumor type, enrollment will be suspended for that tumor type.
- n. Enrollment will be managed according to the patient’s prior clinical response to the prior PD-L1/1PD-1 inhibitor (i.e., whether treatment duration was ≥ 6 months) and whether the prior PD-L1/1PD-1 inhibitor was given in combination with a cytotoxic agent.
- o. For melanoma patients, the most recent systemic anti-cancer therapy may be anti-CTLA4, administered with or without a PD-L1/1PD-1 inhibitor.

FIG. 4A
### Triplet (MOXR0916 + Atezolizumab + Bevacizumab) Arm

#### Dose Escalation

<table>
<thead>
<tr>
<th>MOXR level 1</th>
<th>Atezo 1200 mg</th>
<th>Bev 15 mg/kg</th>
</tr>
</thead>
<tbody>
<tr>
<td>MOXR level 2, etc</td>
<td>Atezo 1200 mg</td>
<td>Bev 15 mg/kg</td>
</tr>
</tbody>
</table>

---

#### Expansion Part II will begin at or below the MAD or MTD

- Advanced, incurable solid tumors
- MOXR0916 (MOXR), atezolizumab (Atezo), and bevacizumab (Bev) IV q21d
- MOXR0916 dose will start at 300 mg and may be de-escalated or escalated according to 3+3 rules
- ≥ 72 hours between first 2 patients in each cohort

---

#### Expansion Part IV

- 1L RCC\(^p\)
- 2L+ RCC\(^q\)
- Basket\(^n\)

---

\(d\) Cohort sizes are approximate.  
\(e\) Patient selection based on prospective determination of tumor PD-L1 or OX40 status may be implemented in some cohorts.  
\(n\) May be opened to tumor types without designated cohorts, as selected by the Sponsor in consultation with investigators  
\(p\) No prior systemic therapy for RCC is permitted.  
\(q\) Prior systemic therapy for RCC is required. Prior VEGF inhibitors and prior PD-L1/PD-1 inhibitors are permitted.

</table>

* Special categories of cited documents:
  * "A" document defining the general state of the art which is not considered to be of particular relevance
  * "E" earlier application or patent published on or after the international filing date
  * "L" document which may throw doubts on priority claim(s) one of which is cited to establish the publication date of another citation or other special reason (as specified)
  * "O" document referring to an oral disclosure, use, exhibition or other means
  * "P" document published prior to the international filing date but later than the priority date claimed

*T* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

*X* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

*Y* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

*A" document member of the same patent family

1. With regard to any nucleotide and/or amino acid sequence disclosed in the international application, the international search was carried out on the basis of a sequence listing:
   a. \(\checkmark\) forming part of the international application as filed:
      \(\uparrow\) in the form of an Annex C/ST.25 text file.
      \(\downarrow\) on paper or in the form of an image file.
   b. \(\square\) furnished together with the international application under PCT Rule 13fer1 (a) for the purposes of international search only in the form of an Annex C/ST.25 text file.
   c. \(\square\) furnished subsequent to the international filing date for the purposes of international search only:
      \(\uparrow\) in the form of an Annex C/ST.25 text file (Rule 13fer1 (a)).
      \(\downarrow\) on paper or in the form of an image file (Rule 13fer1 (b) and Administrative Instructions, Section 7.13).

2. \(\square\) In addition, in the case that more than one version or copy of a sequence listing has been filed or furnished, the required statements that the information in the subsequent or additional copies is identical to that forming part of the application as filed or does not go beyond the application as filed, as appropriate, were furnished.
