Isoquinolin and Naphthydrin Compounds

This invention provides isoquinolin and naphthydrin compounds or pharmaceutically acceptable salts thereof, and for use of the compounds in therapy. Isoquinolin and naphthydrin compounds of this invention are inhibitors of apoptotic signal-regulating kinase 1 (ASK1).

ASK1 is a member of the large mitogen-activated protein kinase kinase kinase ("MAP3K") family ASK1 activation and signaling are associated with broad range of diseases. Compounds that inhibit ASK1 are desired for use in the treatment of ASK1 mediated conditions.

Compounds that inhibit ASK1 are desired for use in the treatment of Nonalcoholic steatohepatitis (NASH). Nonalcoholic steatohepatitis is a liver disease with an etiological constellation characterized by macrovesicular hepatic steatosis, inflammation hepatic ballooning and fibrosis. Currently, there is no approved pharmaceutical medicament specifically for the treatment of nonalcoholic steatohepatitis. There is a need for pharmaceutical medicaments to offer additional treatment options for patients suffering from nonalcoholic steatohepatitis.

U.S. Patent No. 8,742,126 discloses 5-(4-cyclopropyl-1H-imidazol-1-yl)-N-(6-(4-isopropyl-4H-1,2,4-triazol-3-y-l)pyridin-2-yl)-2-fluoro-4-methylbenzamide as an ASK1 inhibitor.

There is a need for compounds that have ASK1 inhibitory activity.

A human is a preferred mammal. As used herein, "patient" refers to a mammal in need of treatment. As used herein, the term "effective amount" or "therapeutically effective amount" of a compound refers to an amount, or a dosage, which is effective in treating a disorder or a disease, such as NASH, chronic kidney disease, or diabetic nephropathy as described herein. The attending diagnostician, as one skilled in the art, can readily determine an effective amount by the use of conventional techniques and by observing results obtained under analogous circumstances. In determining the effective amount or dose of a compound, a number of factors are considered, including but not limited to, the compound to be administered; the co-administration of other agents, if used; the species of mammal; its size, age, and general health; the degree of involvement or the severity of the disorder; the response of the individual patient; the mode of administration; the bioavailability characteristics of the preparation administered; the dose regimen selected; the use of other concomitant medication; and other relevant circumstances.
The pharmaceutical composition is administered to a patient in amounts effective to treat liver disease, more particularly, NASH. An appropriate amount or dose effective to treat a patient can be determined by a health care provider.

The terms "treatment" and "treating" as used herein are intended to refer to all processes wherein there may be a slowing, interrupting, arresting, controlling, or stopping of the progression of an existing disorder and/or symptoms thereof, but does not necessarily indicate a total elimination of all symptoms.

The term "pharmaceutically acceptable carrier, diluent, or excipients" means that the carrier, diluent, and excipients are pharmaceutically compatible with the other ingredients of the composition. In a particular embodiment, the pharmaceutical compositions are formulated as a tablet or capsule for oral administration. The tablet or capsule can include a compound of the present invention in an amount effective to treat liver disease, particularly NASH.

**Biological Assays**

ASK\textsubscript{I} Inhibitor Effect Determined by ASK\textsubscript{I} Enzymatic Assay

The purpose of this assay is to determine the effect of ASK\textsubscript{I} inhibitors on the production of ADP by ASK\textsubscript{I}. The recombinant human ASK\textsubscript{I} (hASK\textsubscript{I}) catalytic domain tagged with Glutathione S-transferase is used, and histidine-tagged full-length human MAP kinase kinase 6 (MKK6) and ATP are the substrate and cofactor, respectively.

The assay is done using an ADP-Glo™ Kinase Assay Kit (Promega, Catalog # V9102) according to the manufacturer’s protocol with the following modifications. Briefly, hASK\textsubscript{I} (0.25 nM) and MKK\textsubscript{6} (300 nM) in a buffer (10 mM MOPS pH 7.0; 10 mM Mg-Acetate; 1 mM DTT; 0.025% NP-40; 0.05% BSA; 1.5% glycerol) are incubated with ASK\textsubscript{I} inhibitors at varying concentrations ranging from 10.00 uM to 0.17 nM for 15 minutes, followed by incubation with ATP (100 uM) for 30 minutes at room temperature. ADP-Glo™ Reagent is added to terminate the kinase reaction and deplete the remaining ATP. The
Kinase Detection Reagent is then added to convert ADP to ATP. The newly synthesized ATP is measured using a luciferase/luciferin reaction, and the luminescence determined by Envision (PerkinElmer). The luminescence intensities are analyzed by GeneData, and fit to a 4 parameter dose response-inhibitor logistics curve to determine IC50 values, using the effects of 5-(4-cyclopropyl-1H-imidazol-1-yl)-2-fluoro-4-methyl-N-[6-[4-(propan-2-yl)-4H-1,2,4-triazol-3-yl]pyridin-2-yl]benzamide as a standard and DMSO vehicle for 100% and 0% inhibition, respectively.

The compounds of Examples 1-4 herein are tested essentially as described above and exhibit IC50 values as shown in Table 1 below.

ASK1 Inhibitor Effect Determined by ASK1 Autophosphorylation (Thr838) Assay

The purpose of this assay is to determine the effect of ASK1 inhibitors on H2O2-stimulated ASK1 autophosphorylation at Thr838 in HEK293 cells overexpressing human ASK1.

HEK293 cells overexpressing human influenza hemagglutinin- (HA-) tagged full length human ASK1 are maintained in DMEM supplemented with 10% FBS at 37 °C and
For the assay, the cells are plated in matrigel-coated 96-well plates (25,000 cells/well) and incubated overnight. The cells are treated with ASK1 inhibitors at varying concentrations ranging from 10.00 µM to 0.17 nM for 1 hour, followed by stimulation with 1 mM H2O2 for 10 minutes. The cells are then lysed with Homogeneous Time-Resolved Fluorescence (HTRF®) lysis buffer (Cisbio, Catalog # 64KL1FDF) containing phosphatase inhibitors (ThermoFisher, Catalog # 78430). pASK1 is quantified by HTRF®, using an anti-HA and anti-pASK1 (Thr838) antibody pair customized by Cisbio, on Envision (PerkinElmer) with emission and excitation wavelengths of 620 and 665 nm, respectively. The ratios of fluorescence intensities at 665 nm and 620 nm are analyzed by GeneData, and fit to a 4 parameter dose response-inhibitor logistics curve to determine IC50 values, using the effects of 5-(4-cyclopropyl-1H-imidazol-1-yl)-2-fluoro-4-methyl-N-{6-[4-(propan-2-yl)-4H-1,2,4-triazol-3-yl]pyridin-2-yl}benzamide as a standard and DMSO vehicle as 100% and 0% inhibition, respectively.

The compounds of Example 1-4 herein are tested essentially as described above and exhibit IC50 values as shown in Table 2 below.
